Overview

You can review the Release Notes of Cloudera Runtime 7.1.9 for release-specific information related to new features and improvements, bug fixes, deprecated features and components, known issues, and changed features that can affect product behavior.

7.1.9 SP1

These are Release Notes for CDP Private Cloud Base 7.1.9 SP1.

Information for CDP Private Cloud Base 7.1.9 SP1 are found [here](#).

What's new in Cloudera Runtime 7.1.9 SP1

Understand the functionalities and improvements to features of components in Cloudera Runtime 7.1.9 SP1.

Atlas

Compression algorithm changed for Atlas HBase tables

The default compaction algorithm was changed from Gzip to Snappy for Atlas HBase tables. This can result in up to 50% lower compaction time. For more information, see the `compressionType` property in [HBase entities created in Atlas](#)

Atlas diagnostic bundle introduced

Atlas can provide you the necessary diagnostic data in a single GZ file inside the diagnostic zip package to help you and the Cloudera Support to troubleshoot problems. For more information on downloading and sending the compressed logs from the Cloudera Manager, see [Manually Triggering Collection and Transfer of Diagnostic Data to Cloudera](#).

Spark connector available

With the new Spark connector you can run Spark job for Atlas even when Kafka brokers are not available. For more information, see [Spark connector configuration in Apache Atlas](#).

Relationship Search is configurable

By default, Relationship Search is disabled by the new property to save time when starting or restarting Atlas. A new property is introduced in Atlas to configure Relationship Search. For more information, see [Using Relationship search](#).

Chinese, Japanese and Korean alphabet supported in searches

Chinese, Japanese and Korean characters are supported in the following search scenarios:

- Any type based searches including filter operators together with AND, OR filter operators
- Searches with multiple attribute filters, such as classification and description text
- Searches involving tags and operators
- Searches with custom attribute filters
- Searches including the "*" wildcard character

For more information on searching in Atlas, see [Using Free-text Search](#).

Atlas On-prem to On-prem Replication (Technical Preview)

Replicate governance metadata provided by Cloudera Atlas and data lineage using replication policies in Replication Manager.

This feature is available in this version of CDP but is not ready for production deployment.

Cloudera encourages you to explore this technical preview feature in non-production environments

and provide feedback on your experiences through the Cloudera Community Forums or through your account managers and field team contacts. For more information regarding limitations and unsupported features, see [Atlas replication policies \(technical preview\)](#).

Custom audit filter updates

The DELETE API call was updated for the single rule deletion. For more information, see [Using custom audit filters](#).

Audit aging enhancements and bug fixes

- Added note on use of regular expressions for configuring custom audit aging. For more information, see [Using custom audit aging](#).
- Added note that by default, Audit Aging is disabled through REST API. For more information, see [Using audit aging](#).
- Changed the default behavior of the `atlas.audit.sweep.out.entity.types` and `atlas.audit.sweep.out.action.types` properties. They are no longer applicable by default with sweep out option enabled. For more information, see [Using Sweep out configurations](#).

Hue

Added support for Python 3.10

Hue is now supported with Python 3.10 on Ubuntu 22, SLES 15 SP4, and SLES 15 SP5 operating systems. See [Installing Python 3](#).

Added support for PostgreSQL 16

Hue supports PostgreSQL 16 as its backend database.

Added support for Oracle 21c and 23ai

Hue supports Oracle 23ai (LTS, Latest) and Oracle 21c (Latest) as its backend database. For the supported `cx_Oracle` information and installation instructions, see [Using Oracle database with Hue](#).

Security improvements

- Upgraded the Interactive Python (IPython) command-line shell to version 8.10.0 to address CVE 2023-24816.
- Upgraded the Python library to version 3.10 to resolve the ReDoS (Regular expression Denial of Service) attacks and address CVE 2022-42969.
- Upgraded SQLParse to version 0.4.4 to prevent the ReDoS attacks and address CVE 2023-30608.

Added DEBUG-level logging in Hue server logs

The Hue servers logs now contain DEBUG-level information in addition to INFO-level information. Cloudera has fixed multiple logging issues, overall. Only INFO-level logging is enabled by default. However, you can turn on DEBUG-level logging from Cloudera Manager. See [Enabling debug logging for Hue server logs](#).

The requirement of installing pycopg2 package from the source on a FIPS-enabled cluster

If you use PostgreSQL as a backend database for Hue on a FIPS cluster on RHEL 8, you must install a version of the `psycopg2` package from the source to be at least 2.9.5 on all Hue hosts because the `psycopg2-binary` package uses its version of the `libssl` library file which does not support FIPS. See [Installing the pycopg2 Python package for PostgreSQL database on a FIPS cluster \(RHEL 8\)](#).

Upgrade considerations

If you are using MySQL as a backend database for Hue, then you must perform the upgrade tasks in the following order to avoid potential issues:

1. Install Python 3.10 on all Hue hosts.
2. Install the MySQL Client package.
3. Stop the Hue service.

4. Upgrade Cloudera Manager to CM 7.11.3 CHF7.
5. Start Cloudera Manager.
6. Upgrade CDP Private Cloud Base to 7.1.9 SP1.
7. Start the Hue service.

For detailed instructions about each step, see [Upgrading CDP Private Cloud Base to a higher version](#).

Note: You must start Hue only after upgrading Cloudera Manager, Python version, and CDP Private Cloud Base to 7.1.9 SP1.

Note: On CDP Private Cloud Base 7.1.9 SP1, Python 3.10 is not mandatory for using Hue with MySQL as its backend database.

Zero downtime upgrade (ZDU) considerations

If you are using the ZDU approach to upgrade to 7.1.9 SP1, then you must start Hue only after upgrading Cloudera Manager to 7.11.3 CHF 7, Python to version 3.10, and CDP Private Cloud Base to 7.1.9 SP1. Hue does not start after upgrading only Cloudera Manager and Python but not CDP.

Hive

Added support for Hive DatabaseType in JDBC storage handler

You can now connect to Apache Hive using JdbcStorageHandler to access the hive data source. For more information, see [Using JdbcStorageHandler to query external database](#).

HBase

HBase supports truncating the regions in a table

You can now truncate individual regions of an HBase table using the `truncate_region` command.

The command syntax is as follows.

```
truncate_region 'REGIONNAME'
```

```
truncate_region 'ENCODED_REGIONNAME'
```

For example,

```
hbase:008:0> list_regions 'employee'
```

START_KEY	END_KEY	SIZE	REQ	LOCALITY	SERVER_NAME REGION_NAME
ccycloud-4.nightly-7x-by.root.comops.site,	22101,	1718869191555			
employee,,	1718877308795.66828b0fe6ceda3e28608617eb6f6b3f.				
	2	1	2	1.0	
ccycloud-2.nightly-7x-by.root.comops.site,	22101,	1718869191308			
employee,2,	1718877308795.ff9b19452fecea6353694583e3473b5b.				
	2	1	2	1.0	

```
2 rows
Took 0.1088 seconds
hbase:014:0> truncate_region 'employee,2,1718877308795.ff9b19452fecea6353694583e3473b5b.'
```

```
Took 0.6236 seconds
hbase:010:0> truncate_region 'ff9b19452fecea6353694583e3473b5b'
```

```
Took 0.6500 seconds
```

Kafka

Kafka connect fails to start on FIPS cluster

New properties are introduced for Kafka and Kafka Connect. These properties enable you to fine-tune the retry behavior of the Kafka and Kafka Connect Ranger plugins. Configuring these properties can help you avoid retry and timeout-related communication failures between the Kafka and Range services. The properties introduced are as follows:

- Ranger Kafka Plugin Policy Rest Client Retry Interval Ms
- Ranger Kafka Plugin Policy Rest Client Max Retry Attempts
- Ranger Kafka Connect Plugin Policy Rest Client Retry Interval Ms
- Ranger Kafka Connect Plugin Policy Rest Client Max Retry Attempts

For more information, see [Kafka Properties in Cloudera Runtime 7.1.9](#).

Kudu

Added support for Python 3.10

Kudu now supports Python 3.10. For more information regarding python setup see [Kudu Python client](#).

Impala

Added support for ZDU

Impala now supports zero-downtime upgrades (ZDU) in High Availability clusters. For details, see [Configuring components before starting ZDU](#).

Added support for Impala High Availability

Impala now supports High Availability (HA) by deploying pairs of StateStore and Catalog instances in primary/standby mode, ensuring continuous operation during failures. For details, see [Configuring Impala for High Availability](#).

Key HSM

CDPD-66512: Enabled FIPS for Luna 7 server

Added support for Key HSM with FIPS enabled Luna Server.

Key Trustee Server

KT-7452: Support added for RHEL 9

Added RHEL 9 support for KTS. You should manually install Python 2 and crontabs package in order to run keytrustee-server on RHEL 9.

KT-7581: Support added for RHEL 8.10

Added RHEL 8.10 support for KTS.

Navigator Encrypt

CDPD-61686: Support added for RHEL 9.2

Added RHEL 9.2 support for Navigator Encrypt.

KT-7440: Support added for Ubuntu 22

Added Ubuntu 22 support for NavEncrypt.

KT-7513: Navigator Encrypt generates keytab file when working with KMS

When using KMS as the key manager, Navigator Encrypt generates a keytab file for it to use to authenticate with Ranger KMS.

Ranger

Red Hat Enterprise Linux 8.10 support

Ranger KMS now supports Red Hat Enterprise Linux 8.10.

Ranger KMS

CDPD-66512: Enabled FIPS for Luna 7 server

Added support for Ranger KMS and Ranger KMS KTS with FIPS enabled Luna Server.

CDPD-67530: Support added for FIPS on JDK17

Ranger KMS now supports FIPS on JDK17.

CDPD-67536: Support added for Python 3.10

Ranger KMS now supports Python 3.10.

CDPD-68973/CDPD-68284: Support added for Oracle23c database

Ranger KMS supports Oracle23c database.

CDPD-69178: Support for ext libraries in higher versions of java

During Luna client installation, you need to copy Luna API and jar files to the JRE ext library. This ext directory does not exist in Java11 (or Java9+). Cloudera added support for ext libraries in higher versions of java.

Sqoop

Secure options to provide Hive password during a Sqoop import

When importing data into Hive using Sqoop and if LDAP authentication is enabled for Hive, the necessity to set the Hive password parameter directly in the command-line poses a potential vulnerability. Passwords provided in plaintext within command-line interfaces are susceptible to unauthorized access or interception, compromising sensitive credentials and, subsequently, the security of the entire data transfer process.

Learn about the secure options that you can use to provide the Hive password during Sqoop-Hive imports instead of the earlier way of providing the password as plaintext in the command-line interface.

CDS 3.3 Powered by Apache Spark

Apache Spark 3 integration with Schema Registry

Apache Spark 3 integrated with Schema Registry provides a library to leverage Schema Registry for managing Spark schemas and to serialize and/or de-serialize messages in Spark data sources and sinks. For more information, see [Apache Spark 3 integration with Schema Registry](#).

YARN Queue Manager

Support for YARN Queue Manager data Migration from H2 to PostgreSQL database

You can now migrate YARN Queue Manager from an H2 database to a PostgreSQL database post-installation or upgrade. All your existing data in the H2 database will be transferred to PostgreSQL. The YARN Queue Manager will establish connections using the PostgreSQL database.

Note: Migration supports only one-way transfer from H2 to PostgreSQL. Reverting to H2 after the migrating is not supported, and data migration from PostgreSQL back to H2 is not possible.

For more information, see [Migrating from H2 to PostgreSQL database in YARN Queue Manager](#).

YARN Queue Manager UI behaviour in mixed resource allocation mode

The mixed resource allocation mode in YARN is supported through safety valves. If you open the Queue Manager UI or access the Queue Manager APIs while this mode is active, the Queue Manager blocks access and informs you that mixed resource allocation is active and the Queue Manager is inaccessible until complete compatibility is achieved.

For more information, see [YARN Queue Manager UI behavior in mixed resource allocation mode](#).

Upgrade CDP 7.1.9 to CDP 7.1.9 SP1

You can perform an In-place upgrade from CDP 7.1.9 to CDP 7.1.9 SP1. For more information, see [CDP to CDP](#) documentation.

Upgrade CDP 7.1.8 latest Cumulative hotfix to CDP 7.1.9 SP1

You can perform an In-place upgrade from CDP 7.1.8 latest Cumulative hotfix to CDP 7.1.9 SP1. For more information, see [CDP to CDP](#) documentation.

Upgrade CDP 7.1.7 SP3 to CDP 7.1.9 SP1

You can perform an In-place upgrade from CDP 7.1.7 SP3 to CDP 7.1.9 SP1. For more information, see [CDP to CDP](#) documentation.

Upgrade CDH 6.3.x to CDP 7.1.9 SP1

You can perform In-place upgrade from CDH6.3.x to CDP 7.1.9 SP1. For more information, see [CDH 6 to CDP](#) documentation.

Upgrade CDH 6.2.x to CDP 7.1.9 SP1

You can perform In-place upgrade from CDH6.2.x to CDP 7.1.9 SP1. For more information, see [CDH 6 to CDP](#) documentation.

Upgrade HDP 3 to CDP 7.1.9 SP1

You can perform In-place one-stage upgrade from HDP 3 to CDP 7.1.9 SP1 using CMA 3.3. For more information, see [HDP 3 to CDP](#) documentation.

Upgrade HDP 2 to CDP 7.1.9 SP1

You can perform In-place one-stage upgrade from HDP 2 to CDP 7.1.9 SP1 using CMA 3.3. However, you must first upgrade from HDP 2 to CDP 7.1.8 or CDP 7.1.7 SP2 and then upgrade to CDP 7.1.9 SP1. For more information, see [HDP 2 to CDP](#) documentation.

Rollback CDP CDP 7.1.9 SP1 to CDP 7.1.9

You can downgrade or rollback an upgrade from CDP Private Cloud Base 7.1.9 SP1 to CDP 7.1.9. The rollback restores your CDP cluster to the state it was in before the upgrade, including Kerberos and TLS/SSL configurations. For more information, see [Rollback CDP 7.1.9 SP1 to CDP 7.1.9](#) documentation.

Rollback CDP 7.1.9 SP1 to CDP 7.1.8 latest Cumulative hotfix

You can downgrade or rollback an upgrade from CDP Private Cloud Base 7.1.9 SP1 to CDP 7.1.8 latest Cumulative hotfix. The rollback restores your CDP cluster to the state it was in before the upgrade, including the Kerberos and TLS/SSL configurations. For more information, see [Rollback CDP 7.1.9 SP1 to CDP 7.1.8 latest Cumulative hotfix](#) documentation.

Rollback CDP 7.1.9 SP1 to CDP 7.1.7 SP3

You can downgrade or rollback an upgrade from CDP Private Cloud Base 7.1.9 SP1 to CDP 7.1.7 SP3. The rollback restores your CDP cluster to the state it was in before the upgrade, including the Kerberos and TLS/SSL configurations. For more information, see [Rollback CDP 7.1.9 SP1 to CDP 7.1.7 SP3](#) documentation.

Rollback CDP 7.1.9 SP1 to CDH 6.3.x

You can downgrade or rollback an upgrade from CDP Private Cloud Base 7.1.9 SP1 to CDH 6.3.x. The rollback restores your CDH cluster to the state it was in before the upgrade, including the Kerberos and TLS/SSL configurations. For more information, see [Rollback CDP 7.1.9 SP1 to CDH 6.3.x](#) documentation.

Rollback CDP 7.1.9 SP1 to CDH 6.2.x

You can downgrade or rollback an upgrade from CDP Private Cloud Base 7.1.9 SP1 to CDH 6.2.x. The rollback restores your CDH cluster to the state it was in before the upgrade, including the Kerberos and TLS/SSL configurations. For more information, see [Rollback CDP 7.1.9 SP1 to CDH 6.2.x](#) documentation.

Rollback CDP 7.1.9 SP1 to HDP 3 or HDP 2

You can downgrade or rollback an upgrade from CDP Private Cloud Base 7.1.9 SP1 to HDP 3 or HDP 2. The rollback restores your CDH cluster to the state it was in before the upgrade, including the Kerberos and TLS/SSL configurations. For more information, see [Rollback CDP 7.1.9 SP1 to HDP 3 or HDP 2](#) documentation.

Cloudera Runtime 7.1.9 SP1 Download URL

Know more about the CDP 7.1.9 SP1. This service pack was released on July 19, 2024.

Cloudera Runtime 7.1.9.1000 download URL:

Parcel Repository Location

```

What's new in Platform Support

You must be aware of the platform support for the Cloudera Runtime 7.1.9 SP1 release.

Platform Support Enhancements

New OS support:

- RHEL 9.4
- RHEL 9.2
- RHEL 8.10
- RHEL 8.8 FIPS (extended RHEL 8.8 support for FIPS customers with JDK 11 and 17 versions)
- Oracle 9.2
- Oracle 9.2 UEK
- Oracle 8.10 (supported with Red Hat Compatible Kernel (RHCK) only)
- Ubuntu 22.04
- SLES 15 SP5

For more information about the minor version operating system support, see [Cloudera Support Matrix](#).

New DB Versions:

- PostgreSQL 17 (from 7.1.9 SP1 CHF 9 onwards)
- PostgreSQL 16
- PostgreSQL 15
- MariaDB 10.11

- Oracle 23c
- Oracle 21c
- Oracle 19c

New JDK version: Support for FIPS + OpenJDK 17 (From Cloudera Runtime 7.1.9 SP1 release onwards). For more information, see [JDK FIPS prerequisites for CDP](#).

Cloudera Runtime 7.1.9 SP1 component versions

You must be familiar with the versions of all the components in the Cloudera Runtime 7.1.9 SP1 distribution to ensure the compatibility of these components with other applications. You must also be aware of the available Technical Preview components and use them only in a testing environment.

The component version number has three parts, [****Apache component version number****].[*Runtime version number*].[*Runtime Build number*]. For example, if the listed Apache HBase component version number is 2.4.17.7.1.9.1000-103, 2.4.17 is the upstream Apache HBase component version, 7.1.9 is the Runtime version, and 103 is Runtime build. You can also view the component version numbers in Cloudera Manager.

Cloudera Runtime 7.1.9.1073-8

You must be familiar with the versions of all the components in the Cloudera Runtime 7.1.9 SP1 CHF 15 distribution to ensure the compatibility of these components with other applications. You must also be aware of the available Technical Preview components and use them only in a testing environment.

Apache Components

Component	Version
Apache Arrow	0.8.0.7.1.9.1073-8
Apache Atlas	2.1.0.7.1.9.1073-8

Using the Cloudera Runtime Maven repository 7.1.9 SP1

Information about using Maven to build applications with Cloudera Runtime components.

If you want to build applications or tools for use with Cloudera Runtime components and you are using Maven or Ivy for dependency management, you can pull the Cloudera Runtime artifacts from the Cloudera Maven repository. The repository is available at repository.cloudera.com.

Important: When you build an application JAR, do not include CDH JARs, because they are already provided. If you do, upgrading CDH can break your application. To avoid this situation, set the Maven dependency scope to provided. If you have already built applications which include the CDH JARs, update the dependency to set scope to provided and recompile.

The following is a sample POM (pom.xml) file:

```
<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/maven-v4_0_0.xsd">
  <repositories>
    <repository>
      <id>cloudera</id>
      <url>https://repository.cloudera.com/artifactory/cloudera-repos/</url>
    </repository>
  </repositories>
</project>
```

Runtime 7.1.9.1073-8

The following table lists the project name, groupId, artifactId, and version required to access each RUNTIME artifact.

Project	groupId	artifactId	version
Atlas	org.apache.atlas	atlas-authorization	2.1.0.7.1.9.1073-8

Fixed issues in Cloudera Runtime 7.1.9 SP1

You can review the list of reported issues and their fixes in Cloudera Runtime 7.1.9 SP1. Fixed issues represent selected issues that were previously logged through Cloudera Support, but are now addressed in the current Runtime release. These issues may have been reported in previous versions of Runtime as a known issue; meaning they were reported by customers or identified by Cloudera Quality Engineering teams.

Fixed Issues in Atlas

Review the list of Atlas issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-69894: Atlas uses the upstream iceberg-hive-runtime package instead of the CDP build

The version of the iceberg-hive-runtime artifact is changed to a snapshot version, so downstream patches, bugfixes and CVE fixes will be pulled.

CDPD-69162: Upgrade jersey version to jersey 2

The Jersey version is upgraded to use Jersey 2 after Jackson Databind is updated to 2.15.

CDPD-66567: fetchType as "incremental" does full export instead of "CONNECTED"

An additional check is added for the Hive and Iceberg table export request to check if the fetch type is incremental or not.

CDPD-65509: Atlas Import/Export with iceberg_table type is copying Hive External Entity also

An additional check is added for the Hive and Iceberg table export request to check if the fetch type is incremental or not.

CDPD-59028, CDPD-62893: Cloudera Runtime 7.1.9 SPx Audit aging should be possible with only ttl or audit count instead of both

The issue was fixed by enabling the separate configuration of time-to-live and audit count limit parameters. For more information, see [Using default audit aging](#)

CDPD-62837: hive_storagedesc is incomplete in Atlas

The HDFS data pertaining to Hive tables that have undergone migration using the Navigator to Atlas transition process might be missing some information. The Nav2Atlas module was changed to set the relationType as "hive_table_storagedesc" of relationship attribute "table" for every entity of "hive_storagedesc".

CDPD-62834: Status of deleted table is ACTIVE in Atlas after navigator2atlas migration

Deleted Hive tables migrated using the Navigator to Atlas transition may be shown as active in Atlas. The Nav2Atlas module was changed to set the relationType as "hive_table_storagedesc" of relationship attribute "table" for every entity of "hive_storagedesc".

CDPD-59033: Compression algorithm changed from Gzip to Snappy in Atlas HBase tables

The default compression algorithm was changed from Gzip to 'Snappy' in Atlas HBase tables.

CDPD-57021: Relationship Search feature should be configurable

Relationship Search feature is made configurable to reduce time taken for iterating all the edges.

CDPD-55697: Clean Atlas application log in case of HA mode

The unwanted error logs are removed from the Atlas application log file.

CDPD-67977: Nullpointer exception during incremental Atlas Export

An incremental export with glossary and terms associated with exported entities was causing a null pointer exception, which is now resolved.

CDPD-67553: Parallel Atlas Import is failing with unexpected errors

Import operation of an entity is retried thrice when the transaction fails because of a PermanentLockingException. This issue is now resolved.

CDPD-59586: OperationType does not support Contains operation

Support for sub-string and wild character '*' is not present for attributeName=operationType in the Custom Audit Filters feature. Hence, attributeValue can not be checked with the contains operator. This is fixed by adding support for substrings and the wildcard character "*" for the attribute operationType.

CDPD-65804: Atlas cannot search comments containing Chinese or Japanese characters

Entities whose comments contain Chinese or Japanese characters can be now searched by using the comment (string), containing filters.

CDPD-69654: Atlas parallel export fails with the formation of incomplete .zip files

An extra flag is added in Atlas. By enabling it (skipUpdateReplicationAttr:true), it will skip updating each entity for adding replicatedTo/replicatedFrom attribute, which will ultimately increase the performance of exporting and importing.

CDPD-69176: Entity search with "begins with" operator does not return correct results for some Japanese characters

Entities containing Japanese or Chinese can also be searched by using the "begins with" search filter.

CDPD-68655: Tag searches with multiple Japanese or multiple Chinese characters do not return the correct results

Tag searches work with multiple Japanese or Chinese characters included for `hdfs_path` entities.

CDPD-68643: Basic search query with '<Japanese search string>*' does not always return results

Searches including Japanese characters and the asterisk character can be reliably made.

CDPD-68328: Faceted `hdfs_path` entity type searches containing Japanese or Chinese characters do not return results only with query format searches.

`Hdfs_path` type entity queries can employ multiple filters (attribute, classification) concurrently.

CDPD-68189: Faceted searches do not give correct results for the "contains" operator applied to Chinese words with multiple characters.

Chinese words with multiple characters can be searched reliably.

CDPD-67022: Imports fail with 403 error by users with export, import permissions but without create, read, write, and update entity permissions

After the update, following a successful import, Atlas creates an entity of type `_{}AtlasAuditEntry{}` and no longer throws an `_UNAUTHORIZED_ACCESS` error with status code 403 because lacking create, read, write or update user permissions.

CDPD-67020: Imports fail by users with export or import permissions but no other permission for entities

After the update, during an export process, the following applies:

- The `AtlasServerService` creates a new `AtlasServer` entity if it does not exist already.
- The `xportImportAuditService` creates an entity with type `__ExportImportAuditEntry` if adequate read and write permissions are not present for the mentioned entities, exceptions are no longer thrown and the creation of the `atlas-export-result.json` is no longer skipped in the flow. The import with this export no longer throws a `NullPointerException` due to the missing `atlas-export-result.json`.

CDPD-67022: Imports fail with 403 error by users with export, import permissions but without create, read, write, and update entity permissions

After the update, following a successful import, Atlas creates an entity of type `_{}AtlasAuditEntry{}` and no longer throws an `_UNAUTHORIZED_ACCESS` error with status code 403 because lacking create, read, write or update user permissions.

Fixed Issues in Arrow

Review the list of Arrow issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-69641: Use Centralised Guava version in Arrow

Upgraded guava library from version 28.1-jre to 32.0.1-jre due to CVE-2023-2976

Apache patch information**Fixed Issues in Avro**

Review the list of Avro issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-66671: Avro - Upgrade commons-compress to 1.26.0 due to CVE-2023-42503, CVE-2024-25710 and CVE-2024-26308

Upgraded commons-compress library from 1.22 to 1.26.0 due to CVE-2023-42503, CVE-2024-25710 & CVE-2024-26308

CDPD-63092: Out of memory issues due to CVE-2023-39410

When deserializing untrusted or corrupted data, it is possible for a reader to consume memory beyond the allowed constraints and therefore leading to out of memory on the system. This issue affects Java applications using Apache Avro Java SDK up to and including 1.11.2. Users should update to apache-avro version 1.11.3 which addresses this issue.

Fixed issues in Calcite

Review the list of Calcite issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-69166: Backport CALCITE-6280 to 7.1.9 SP1

Backport of CALCITE-6280

Apache Patch Information

- CALCITE-6280

Fixed issues in Cloud Connectors

There are no fixed issues for Cloud Connectors in Cloudera Runtime 7.1.9 SP1.

Fixed issues in Cruise Control

Review the list of Cruise Control issues that are resolved in Cloudera Runtime 7.1.9 SP1.

OPSAPS-69978: Cruise Control capacity.py script fails on Python 3.8

Cruise Control no longer fails to start on Python 3 when the capacity information is queried during the startup process. The script querying the capacity information is now fully compatible with Python 3.

Fixed Issues in Hadoop

There are no fixed issues for Hadoop in Cloudera Runtime 7.1.9 SP1.

Apache Patch Information

None

Fixed Issues in HDFS

There are no fixed issues for HDFS in Cloudera Runtime 7.1.9 SP1.

CDPD-49723:CacheReplicationMonitor holds lock for extended period causing NameNode outage

CacheReplicationMonitor periodically scans cache directives and cached BlockMap. As more cache directives are added, the scan takes longer, holding a global write lock and preventing the NameNode from processing other requests. The issue is fixed in HDFS-15273, which addresses lock optimization for the effective utilization of Centralized Cache Management.

Apache Patch Information

None

Fixed Issues in HBase

Review the list of HBase issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-70354: Backport of HBASE-28595

This is a backport of HBASE-28595 - Losing exception from scan RPC can lead to partial results.

CDPD-69218: Backport of HBASE-27230

This is a backport of HBASE-27230 - RegionServer must be aborted when WAL . sync throws TimeoutIOException.

Apache Patch Information

- HBASE-28595
- HBASE-27230

Fixed Issues in Hive

Review the list of Hive issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-70428: Issue with legacy timestamp conversion in Parquet files

When converting legacy timestamps in Parquet files, the date 'February 29, 200' can cause issues. This happens because the Julian day for February 29, 200 CE, differs between the Julian and Gregorian calendars.

Hive, which stores timestamps in UTC, encounters this issue when converting the date '200 CE/03/01' between timezones. Even if the original date was '200 CE/03/01' in the Asia/Singapore timezone, the conversion process leads to the "not a leap year exception" for February 29, 200.

```
java.time.DateTimeException: Invalid date 'February 29' as '200'
is not a leap year
```

This issue has been fixed.

CDPD-67820: Select query failure due to decimal column data type change in Parquet

When you change the data type of a decimal column to STRING, CHAR, or VARCHAR in a Parquet file, the select queries on that column fail. This issue arises because the Parquet format handles these data types differently, causing mismatches and query failures.

This issue has been fixed.

CDPD-67819: Incorrect results for IN UDF on Parquet column of CHAR/VARCHAR type

When you use the IN UDF on a Parquet column of CHAR or VARCHAR type, you encounter incorrect results. To fix this issue CAST operations are added during the conversion process to properly handle these data types.

CDPD-33110: Hive queries stuck because of excessive aborted transactions

Hive queries can become unresponsive due to a high number of aborted transactions. The excessive number of aborted transactions causes the cleaner thread to consume all the memory of the Hive Metastore (HMS) while attempting to clean these transactions.

The issue was addressed by deleting aborted transactions directly instead of preloading them. This approach prevents the cleaner thread from overloading the HMS memory.

CDPD-69846: HPLSQL not using Hive variables

This issue is observed in CDP Private Cloud Base 7.1.9 and higher versions. When passing Hive variables using the --hivevar variable through Beeline, the variables are not utilized within HPLSQL procedures or cursors, leading to an unhandled exception in HPL/SQL.

This issue has been fixed.

CDPD-67350: DirectSQL and JDO results are different when fetching partitions by timestamp in DST shift

Fetching partition metadata from Hive Metastore using Java Data Objects (JDO) by timestamp does not provide correct result in DST shift in partition pruning.

The issue has been fixed.

CDPD-66902: Query runtime optimization

Optimized SQL query to remove duplicate records from COMPLETED_TXN_COMPONENTS to improve runtime.

CDPD-61611: Impala stats blocks Hive partitioned table rename

The issue occurs when the Impala tries to rename a Hive acid table, which has the Impala stats beforehand.

```
ERROR : Failed
org.apache.hadoop.hive.ql.metadata.HiveException: Unable to alter
table. Cannot change stats state for a transactional table defa
ult.parqtest without providing the transactional write state for
verification (new write ID 6, valid write IDs null; current sta
te null; new state {})
```

To address the issue, as the Impala rename does not change the table's stats, even though the write ID list for this table is absent, the absence is ignored when verifying the stats in such a case.

CDPD-55916: Confusing exception message in DagUtils.localizeResource

Hive jobs occasionally fail, during resource localization when a Tez session is created. DagUtils#localizeResource is responsible for copying the client's hive-exec.jar into HDFS. This process can be triggered from multiple threads concurrently, in which case one thread performs the copy while the others wait, polling for arrival of the destination file.

If there is an IOException during this process, it is assumed that the thread attempting the write failed, and all others abort. No information about the underlying IOException is logged. Instead, the log states:

```
java.io.IOException: Previous writer likely failed to write hdfs
:///....Failing because I am unlikely to write too
```

To address this issue, the logging is improved by stating that a failure on the writing thread is just one possible reason for the error. It also logs the exception stack trace to make it easier to find the real root cause.

CDPD-68278: Netty HttpPostRequestDecoder Vulnerability

Netty's HttpPostRequestDecoder can be tricked into accumulating unlimited data, leading to potential vulnerabilities.

To address the issue, upgraded Netty from version 4.1.100.Final to 4.1.108.Final.

CDPD-68251: Upgrade Commons-configuration2 to Version 2.10.1

To address the issue, upgrade Commons-configuration2 version to 2.10.1 to fix a crash caused by complex data structures.

Fixed Issues in Hue

Review the list of Hue issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-61651: Schema and tables are not being displayed in the Phoenix Editor as Phoenix is case-sensitive

Schema and table names in Phoenix are case-sensitive. Hue used the UPPER() function earlier while processing queries, resulting in issues when running Phoenix queries. This issue has been resolved by removing the UPPER() function for databases and tables.

CDPD-61550: ABFS File Browser lists a maximum of 5000 files

Earlier, when you browsed ADLS Gen 2 storage using Hue's ABFS File Browser, it displayed only 5000 objects. This issue has been fixed by including a continuation token in the response header (x-ms-continuation).

CDPD-45438: Hue Importer does not validate the column name; displays an error if the column name contains a space

If column names contained spaces in the file you were trying to import into Hue, then you encountered the following error: AnalysisException: Invalid column/field name. When you fixed the column name and proceeded with importing the file, the rename operation also failed. This issue has been fixed. Hue now validates the column names to verify whether they contain spaces and does not allow you to proceed without correcting the column names.

Note: Hue only allows alphanumeric characters and underscores (_) in column names for all dialects and engines.

CDPD-59802: Hue is unable to process parallel requests

An issue with the Impala file reader not getting closed after use caused a leak in the connection pool. Because of the leak, the Hue Query Processor could not read Impala event files after a few queries. This issue has been fixed by ensuring that the file reader is closed and that the ingestion of the Impala query works as expected.

Fixed Issues in Impala

Review the list of Impala issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-67912: Multiple fixes address performance issues with improved memory tracking for row batch serialization during KRPC shuffling

Queries shuffling large row batches were consuming untracked memory during row batch serialization, leading to higher memory usage without proper accounting.

Memory for tuple_data_ and compression scratch is now tracked using MemTrackerAllocator, and memory estimation. Added to account for outbound row batch allocation. Memory for row batch serialization is now fully tracked, leading to more accurate memory usage in queries that shuffle rows.

CDPD-67901: Support python 3.10

The impala-shell commands now works with Python 3.10 on SLES 15 operating system.

CDPD-60005: Fix for two Catalogd with force active failure

The issue has been resolved.

CDPD-67493: Catalogd performance fix

The Catalogd performance is enhanced by the following improvements done through:

- Impala now reloads events to update metadata across Catalogd replicas for refresh or invalidate commands.
- Impala now handles events thrown by Hive Metastore when a compaction is committed, allowing for automatic refreshing after compactions.
- Impala now skips redundant refresh events by processing only the first event, reducing overhead.
- Catalogd now skips preceding events after a manual table refresh, allowing it to quickly catch up with Hive Metastore events.
- Impala now efficiently processes notification events in Catalogd.
- Refined batching logic in Catalogd optimizes event processing by grouping events across different sources per table, enhancing efficiency.

- Impala now optimizes event processing by skipping unnecessary events and better handling manual refreshes to prevent disruptions.
- Catalogd's event processor now reloads file metadata specifically for truncate table operations, in Hive Metastore alter table events.
- Impala's event batching now efficiently manages events for a table, even if there are unrelated events in between.
- Impala now includes table-level metrics added to the Catalogd webUI page, such as avg-events-process-duration and events-consuming-delay.
- Impala now accurately processes subsequent `ALTER_PARTITION` events after creating a partition through `INSERT` operation, ensuring enhanced event processing stability and accuracy.

Fixed Issues in Iceberg

Review the list of Iceberg issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-45139: Improve Iceberg V2 reads with a custom Iceberg Position Delete operator

This fix helps by improving the Impala query performance when reading Iceberg tables with delete files.

CDPD-47349: Use hive.metastore.table.owner during table creation

Creation of an Iceberg table used to happen in two steps. The first step creates a table, however, the table is created with the wrong owner. The second step runs the ALTER TABLE statement to set the correct table owner.

This fix resolves the issue by creating an Iceberg table with the correct owner in a single step. When creating an Iceberg table, Impala specifies the owner in the hive.metastore.table.owner table property.

CDPD-55029: Include snapshot ID of Iceberg tables in query plan or profile

This fix includes the snapshot ID of Iceberg tables for the Iceberg SCAN operators, which is useful to enable queries to be re-executed. Re-executing queries are useful because they help you to better investigate performance problems and bugs.

CDPD-59657: Iceberg V2 operator provides incorrect results in PARTITIONED mode

When PARTITIONED mode is used, the fix introduced through [IMPALA-12327](#) performs a binary search when the position-based difference between the current row and previous row is not one.

CDPD-60282: Need better cardinality estimation for Iceberg V2 tables with deletes

Currently, the cardinality of the IcebergDeleteNode is the same as the cardinality of the left-hand side (LHS) and does not take into account the cardinality of the right-hand side (RHS). The RHS contains position delete records, therefore, all the records in RHS remove a record from the LHS.

If there are joins on the Iceberg table, they have the same selectivity on the data records and on the delete records.

This fix updates the cardinality of the IcebergDeleteNode to use the following formula:

$$\text{Cardinality of DELETE operator} = \text{Cardinality(LHS)} - (\text{Cardinality(RHS)} * \text{selectivity of LHS})$$

CDPD-60946/CDPD-60717: Iceberg tables created through Trino are incompatible with Impala

The Trino SQL engine creates Iceberg tables without setting `hive.engine.enabled=true` and does not provide users with an option to manually set this property. Therefore, Trino always creates Iceberg tables with non-HiveIceberg storage descriptors.

Impala uses the Input/Output/SerDe properties to determine the table type, however, a table is also considered to be an Iceberg table if the table property, `table_type=ICEBERG` is set.

The fix introduced through [IMPALA-12413](#) ensures that modifications to the table from Impala goes through its Iceberg library (with `engine.hive.enabled=true`). This results in setting the HiveIceberg storage descriptors and allows Trino to be compatible with Iceberg tables.

CDPD-66786: Impala returns incorrect results when the optimized Iceberg V2 operator is used

If you are using Impala to read Iceberg V2 tables, then you might have noticed Impala returning incorrect results when the optimized V2 operator is used. This issue has been resolved by resetting the delete state when it detects records from files that do not have delete records.

CDPD-67632: Optimized count(*) for Iceberg table gives wrong results after a Spark rewrite_data_files

Spark's `rewrite_data_files` action can leave dangling Delete files in the Iceberg table. Delete files are not applicable to any data files. This can cause incorrect results in Impala when it runs simple `count(*)` queries with the help of table statistics stored in the Iceberg metadata layer.

This fix resolves the issue and Impala now returns the correct results even with the presence of dangling Delete files.

Fixed Issues in Kafka

Review the list of Kafka issues that are resolved in Cloudera Runtime 7.1.9 SP1.

OPSAPS-69481: Some Kafka Connect metrics missing from Cloudera Manager due to conflicting definitions

Cloudera Manager now registers the metrics `kafka_connect_connector_task_metrics_batch_size_avg` and `kafka_connect_connector_task_metrics_batch_size_max` correctly.

Apache patch information

None.

Fixed Issues in Kerberos

There are no fixed issues for kerberos in Cloudera Runtime 7.1.9 SP1.

Fixed Issues in Key HSM

Review the list of Key HSM issues that are resolved in Cloudera Runtime 7.1.9 SP1.

KT-7540: Keytrustee-keyhsm - Upgrade protobuf-java to 3.16.3/3.19.6/3.20.3/3.21.7 due to CVE-2022-3171

Upgraded protobuf-java version to 3.16.3/3.19.6/3.20.3/3.21.7 for keyhsm due to CVE.

KT-7536: Keytrustee-keyhsm - Upgrade Jetty to 9.4.54.v20240208 due to CVE-2024-22201

Upgraded Jetty version to 9.4.54.v20240208 due to CVE

KT-7530: Keytrustee-keyhsm - Upgrade Spring Framework to 6.1.6/6.0.19/5.3.34 due to CVE-2024-22243, CVE-2024-22259 and CVE-2024-22262

Upgraded Spring Framework version to 6.1.6/6.0.19/5.3.34 for keyhsm due to CVE

Fixed Issues in Key Trustee KMS

Review the list of Key Trustee KMS issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-69936: KEYTRUSTEE_SERVER-1 first run failure on 7.1.9 SP1 ("Composite command feature flag is not enabled")

Fixed as part of OPSAPS-70560

Fixed Issues in Kudu

Review the list of Kudu issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-67914 : Kudu - 7.1.9 SP1 Supportability Backports

Fixed Kudu supportability issues.

CDPD-67911 : Critical Bug Fix Backports

Fixed critical issues.

Apache patch information

Supportability fixes in Kudu:

- KUDU-3402: Fixed tracing.html to work with the newer versions of browsers.
- KUDU-3455: Optimized C++ Kudu client when pruning hash partition for in-list predicate.
- KUDU-3487:
 - No more leader step down is performed during rebalancing if the replication factor is 1.
 - Enhancements are made to Kudu diagnostic parse_metrics to differentiate between the values not present and zero value.
 - Added a new metric acceptor_dispatch_times to track dispatching times of newly accepted connections by AcceptorPool.
 - Optimized verification of security related parameters.
 - Expose the most recently seen value in histogram for better troubleshooting.
 - Increased the value of --rpc_acceptor_listen_backlog to 512 to help busy Kudu clusters with larger bursts of incoming requests.
 - Introduced metrics --rpc_listened_socket_rx_queue_size and --rpc_pending_connections to understand and debug issues at network level.
 - Fixed a rare condition that occurred during --rpc_pending_connections metric collection. Optimized memory usage by not allocating memory for undo deltas.
- KUDU-3337: The create_unsafe_meta parameter is now added to aid during power outage situations, where metadata of a tablet is lost. Slow DNS threshold logging for Java Kudu client is now 200 ms. Added additional HTTP headers into Kudu embedded webserver's responses to avoid getting flagged by security scanners.
- KUDU-3534: Additional logging is not performed to log timestamp of two matching DELETE REDO mutations. Added sequenceId into Remote Procedure Call (RPC) trace of Java Kudu client to provide better tracking of retries performed.

- KUDU-3518: Fixed the addition of a new unexpected scan predicate on a primary key column when scanning Kudu tables.
- KUDU-3561: As expected tablet entities in Prometheus format are now skipped without any warning.
- KUDU-3566: Corrected the output of various Kudu metrics backed by High Dynamic Range (HDR) histograms. Added a new option kudu fs in the tool, to locate a given block on file system by the block's ID.
- KUDU-3569: Fixed race condition when optimizing primary key predicates.
- KUDU-3570: Addressed heap-use-after-free and data race issues reported in the MajorDeltaCompactionOp operation.

Critical fixes in Kudu:

- KUDU-3448: It is now possible to encrypt IPKI and TSK private keys.
- KUDU-3500: Optimized Kudu writes by not starting write operations expired in the prepare queue.
- KUDU-3495: Fixed issue where writing using stale Kudu table object resulted in unexpected results.
- KUDU-3461: Avoid Impala crash by returning error if invalid tablet ID is found.
- KUDU-3516: Optimized the process of picking next delta store to be compacted.
- KUDU-3514: Added per-RPC metric to track timeouts.
- KUDU-3483: Fixed flushing data in AUTO_FLUSH_BACKGROUND mode when table schema is stale.
- KUDU-3521:
 - Fixed server crash when the clock was synchronized by PTPd.
 - Improved logging on rejected write requests to help troubleshooting.
 - In the Kudu CLI tool, the `local_replica copy_from_remote` command now returns a non-OK status when tablet copy operations fail.
- KUDU-3535: Fixed a concurrent problem while traversing the traces of Kudu RPC in the Java Kudu client
- KUDU-3526: Scanner in Java Kudu client now binds with a tserver. Fixed NullPointerException (NPE) in Java Kudu client that occurred in busy clusters.
- KUDU-3558: The tool now displays errors early when keytab file flag is empty without starting the Ranger subprocess.
- KUDU-3549: Fixed Prometheus metrics for non-arithmetic gauges.
- KUDU-3486: Tombstoned replica reports are now sent periodically to delete other replicas.
- KUDU-3562: Fixed integer overflow in available space metrics.
- KUDU-3564: Fixed issue where table with range specific hash schema when queried with InList predicate lead to incorrect results.

Fixed Issues in Knox

Review the list of Knox issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-68193: Exclude services/roles from being discovered

New gateway-site.xml properties were added to exclude certain services and roles from being discovered during CM service discovery. The property names are `gateway.cloudera.manager.service.discovery.excluded.service.types` and `gateway.cloudera.manager.service.discovery.excluded.role.types`.

CDPD-68084: [7.1.x] KnoxCLI command for generating descriptor for a role type from a list of hosts

Adding a command to `knoxccli` that can generate a topology descriptor from a list of URLs. The command usage/parameters are described in <https://github.com/apache/knox/pull/835>.

CDPD-68065: [7.1.x] - Add configurable socket / read timeout parameter to discovery client

The following gateway-site.xml properties were added for better control over CM service discovery timeouts in Knox:

- `gateway.cloudera.manager.service.discovery.connect.timeout.ms`
- `gateway.cloudera.manager.service.discovery.connect.read.ms`
- `gateway.cloudera.manager.service.discovery.connect.write.ms`

CDPD-67816: [Analyze] [Knox] [ST] Multiple tests fail on fips due one of the Knox instance restart fail

The Knox Gateway may not start due to a `NullPointerException` in the `ClouderaManagerClusterConfigurationMonitor` class. This could happen when the previously persisted CM cluster config file is empty. This ticket addresses that issue. There is an easy workaround: remove the content of the `$KNOX_DATA_DIR/cm_clusters` folder by running the `'rm -f /var/lib/knox/gateway/data/cm-clusters/*'` command.

CDPD-67600: Knox - Upgrade postgresql to 42.5.5/42.6.1/42.7.2 due to CVE-2024-1597

Upgraded postgresql to 42.5.5/42.6.1/42.7.2 due to CVE-2024-1597.

CDPD-67568: Intermittent HTTP 401 error codes in Oozie tests due to Shiro unable to login: null

Switched back to `org.kushuke.libpam4j` dependency because the one from `org.glassfish.main.libpam4j` produced unforeseen errors.

CDPD-65490: The Knox topology did not update within 600 seconds

There was an issue while Knox compared the generated XML topology with the one that is currently deployed, in highly concurrent environments. The fix was to make the code, that parses the new topology, `threadsafe`.

CDPD-60630: Knox was redirecting YARN Node Manager URLs to HTTP instead of HTTPS

The YARN service definition was modified such that it no longer hard-codes the HTTP scheme in any of its URL rewrite rules, making it applicable to proxying YARN deployed with and without TLS.

Apache patch information

- KNOX-3026
- KNOX-3000
- KNOX-3022

Fixed Issues in Livy

There are no fixed issues for Livy in Cloudera Runtime 7.1.9 SP1.

Fixed Issues in MapReduce

There are no fixed issues for MapReduces in Cloudera Runtime 7.1.9 SP1.

Fixed Issues in Navigator Encrypt

Review the list of Navigator Encrypt issues that are resolved in Cloudera Runtime 7.1.9 SP1.

KT-7503: Navigator Encrypt, when using KMS, does not do kinit on host reboot

When working with Ranger KMS, it is a requirement that user root obtain a Kerberos ticket otherwise any Navigator Encrypt request to Ranger KMS will fail with an `Unauthorized request` error. If a ticket does not exist during a host reboot, `NavEncrypt` will be unable to mount any drives. This means when a host reboots `NavEncrypt` needs to obtain a Kerberos ticket.

KT-7513: Navigator Encrypt needs to generate a Kerberos keytab file when working with Ranger KMS

There is a new script that builds a Kerberos keytab file if you are using Navigator Encrypt with Ranger KMS. It is called `navencrypt-gen-keytab` and invokes Cloudera Manager to create the keytab.

This script works with Cloudera Manager to create a keytab file to be used by Navigator Encrypt. It accepts the URL of Cloudera Manager and credentials that works with Cloudera Manager. The script format is as follows:

```
navencrypt-gen-keytab <cm-url> <user:pw>
```

KT-7519: When removing the kernel module, Navigator Encrypt needs better version checking

When removing the kernel module from the system, Navigator Encrypt now makes better version checks.

KT-7528: Log message emitted when drive is mounted with Navigator Encrypt

When a drive is mounted by Navigator Encrypt (by using navencrypt-prepare) the log message emitted is useless. This is what it looks like:

```
2024-02-22 17:47:32,342 +0000 level=INFO app=mount-navencrypt action=mount 11
```

This issue is fixed now.

KT-7529: Logging issues in Navigator Encrypt

Currently, the message "Registration was successful" is emitted too soon before all the operations for a successful registration are completed. Now this message is emitted after all deposits are written to the Key Manager.

Currently all messages in the navencrypt log include a timestamp with "+0000" in the timestamp, which indicates GMT. Now the log entries look like the following format with the new timestamp:

```
2024-02-28T11:53:01-0800 level=INFO app=navencrypt action=control  
Fetching deposit from Key Manager  
2024-02-28T11:53:06-0800 level=INFO app=navencrypt action=control  
Deposit fetched successfully
```

KT-7559: Page allocation failures in kernel memory

A problem has been fixed whereby Navigator Encrypt was causing the kernel to hang while obtaining kernel memory.

Due to this fix, the command "navencrypt acl --update" has to be run before the 7.1.9.1000 version is started.

ENGESC-25935: Page allocation failure

If a customer is running RHEL 8.8 (which is Linux Kernel 4.18), it is possible for the kernel to report a page allocation failure and cause a kernel panic.

This issue is fixed now.

Fixed Issues in Oozie

Review the list of Oozie issues that are resolved in Cloudera Runtime 7.1.9 SP1.

Apache patch information

None

Fixed issues in Ozone

Review the list of Ozone issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-68972: When a leader Ozone Manager election gets stuck, the leader OM is not available. This causes the failure of the OM operation.

This issue is now resolved.

CDPD-61426: Improve Ozone metadata performance by avoiding duplicated internal lookups.

This issue is now resolved.

CDPD-57118: Improve Ozone metadata performance by optimizing internal locking implementation.

This issue is now resolved.

CDPD-69167: Upgrade Bouncy Castle to 1.78.

Upgraded Bouncy Castle Java release version to 1.78 to address issues identified in CVE-2023-33202, CVE-2023-33201, CVE-2024-29857, CVE-2024-30171, and CVE-2024-30172.

CDPD-68255: Upgrade Commons-configuration2 to 2.10.1.

Upgrade Commons-configuration2 version to 2.10.1 to address issues identified in CVE-2024-29133 and CVE-2024-29131.

CDPD-68159: File encryption information is not properly set when overwriting a file.

When a file is overwritten, the new version of the file uses encryption information of the old version file. This issue is now resolved.

CDPD-62273: Incorrect error message is displayed when deleting a file in a .snapshot path.

Correct error message is displayed now when deleting a file in the .snapshot path.

CDPD-62272: Return error response when creating a directory in the .snapshot path.

This issue has been fixed by displaying an error if the directories in the the reserved .snapshot path are deleted.

CDPD-61779: SnapshotDiff cannot accept continuation token greater than the length of the actual snapdiff.

This issue has been fixed by displaying an invalid token exception if the token is out of the range.

CDPD-67224: Upgrade Spring Framework to 6.1.6/6.0.19/5.3.34.

Upgrading spring framework to 5.3.34 to address issues identified in CVE-2024-22243, CVE-2024-22259, and CVE-2024-22262.

CDPD-67146: Add permission check for snapshot diff.

Only users with bucket read permission are allowed to get snapshot diff between two snapshots.

CDPD-64545: Recon Backport HDDS-9599 to CDP Private Cloud Base 7.1.9 SP1.

This issue is now resolved by highlighting the search icon in the OM DB Insights of Recon to navigate to containers.

CDPD-64540: Recon Backport HDDS-9161 to CDP Private Cloud Base 7.1.9 SP1.

This issue is now resolved.

CDPD-64500: Option to enable Ratis in SCM.

Starting CDP Private Cloud Base 7.1.9 SP1, you can enable Ratis in SCM on an existing Non-HA cluster by modifying ozone.scm.ratis.enable property. Enabling Ratis is prerequisite for making SCM Highly Available. This issue is now resolved.

CDPD-64285: Implement snapshot list pagination.

This issue is now resolved by adding the listOptions to list snapshot CLI to make the pagination work correctly.

CDPD-63165: The InvalidStateTransitionException exception is displayed after recommissioning SCM.

When a new SCM is bootstrapped with Container CLOSE transactions in Raft Log for the containers that are closed due to Pipeline failure, the newly bootstrapped SCM will fail to start as those containers are in OPEN state on the new SCM. To avoid this, the finalization of containers is now done only by the leader SCM and this operation goes through Ratis so that the followers also update the container state in the DB. This issue is now resolved.

CDPD-56768: ReplicationFactor may be one or three.

This issue occurs when distcp tries to create target replicas with a replication factor of 1 when the source replicas were Erasure Coded. This issue is now resolved.

Technical Service Bulletins

TSB 2024-749: Possible Ozone Snapshot Chain Corruption in 7.1.9.0

Fixed Issues in ORC

Review the list of ORC issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-69642: Use Centralised Guava version in ORC

Upgraded guava library from version 28.1-jre to 32.0.1-jre due to CVE-2023-2976

Fixed Issues in Parquet

There are no fixed issues for Parquet in Cloudera Runtime 7.1.9 SP1.

Fixed Issues in Phoenix

Review the list of Phoenix issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-69580: Backport of PHOENIX-6687

This is a backport of PHOENIX-6687 - the region server hosting the SYSTEM.CATALOG file fails to serve any metadata requests as the default handler pool threads are exhausted.

CDPD-60862: DDL refers to "Data Definition Language", a subset of SQL statements that change the structure of the database schema in some way, typically by creating, deleting, or modifying schema objects such as databases, tables, and views. Cloudera services that support DDL include Impala, Hive (using HiveQL), Spark (using SparkSQL), HBase, Phoenix, Flink, and Kafka.

This issue is fixed.

CDPD-35925: Omid service fails to start rarely. Restarting it solves the problem most of the times.

This issue is fixed.

Apache Patch Information

- PHOENIX-6687

Fixed Issues in Ranger

Review the list of Ranger issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-70349: Ranger admin's service/metrics/status returns 404 and throws error in catalina.out

NA

CDPD-70423: Ranger replication failure during ranger-replication-transform

Ranger replication policy fails in the "Transforming services, policies and roles from Ranger" step during the policy execution. The fix has been provided for this scenario.

CDPD-68920: Custom Service Descriptors (CSD) changes for RMS metrics for Hive and Ozone service mappings

Ranger RMS metrics was previously supported only for Hive and HDFS service mappings. Ranger RMS now supports multiple source service types. Ranger RMS provides mappings for Hive-HDFS

as well as Hive-Ozone services, where Hive, HDFS, Ozone, Ranger, and Ranger RMS services are installed and RMS is enabled.

CDPD-68831: Ranger react UI - Some modules showed hard coded time zone string like "Indian Standard Time"

Ranger react UI popup was showing details of an admin audit log that had a hard coded string namely "Indian Standard Time". Certain logs table headers also had hard coded string namely "Indian Standard Time". The fix has been provided for this scenario.

CDPD-68807: Upgrade Spring Framework to 6.1.6/6.0.19/5.3.34 due to CVE-2024-22243, CVE-2024-22259 and CVE-2024-22262

Upgrade Spring Framework to 5.3.34

CDPD-68737: Upgrade opensearch to 1.3.15 due to CVE-2023-45807

Upgrade opensearch to 1.3.15

CDPD-66624: Transform URLs with or without / at the end

In Ranger replication Resource and Hive URL mapping, there are different paths:

For example:

/user/hive/warehouse/

s3a://bucket/path

Including a / separator or not can cause issues during transformation.

Fix is provided for Resource and Hive URL prefixed based transformations to be aware of potential / signs at the end of URLs and handle the transformation correctly.

CDPD-68590: Ranger RMS gives all permissions to the user through the Create permission

An additional check is now made to ensure that the user attempting to alter a HDFS directory that maps to the Hive database who is the owner of the Hive database for the attempted operation is allowed.

CDPD-68489: Upgrade jline to 3.25.1 due to CVE-2023-50572

Upgraded jline to 3.25.1 due to CVE-2023-50572

CDPD-68375: Enhance handling of subAccess authorization in Ranger HDFS plugin

Currently, Ranger performs authorization of the HDFS commands which require access to the hierarchy of files/directory rooted at the argument passed to the HDFS command.

CDPD-68365: Audit logs for tag masking policy is displaying the service name along with datamask type

A fix is provided to not display the service type name along with datamask type in audit logs for tag based masking policy.

CDPD-68252: Upgrade Commons-configuration2 to 2.10.1 due to CVE-2024-29133 and CVE-2024-29131

Upgraded Commons-configuration to v2.10.1 due to CVEs

CDPD-68024: Use name validation regex instead of service name validation regex for display name

Currently, in the Service creation / edit form in Ranger react UI, there is a validation for the display name which does not allow spaces. The validation has to be modified to include spaces, otherwise it does allow you to edit the Service from the UI.

CDPD-67864: Upgrade Spring Security to 5.7.12/5.8.11/6.1.8/6.2.3 due to CVE-2024-22257

Upgrade Spring security to 5.7.12

CDPD-67750: Upgrade telemetry to 1.36.0

Upgrade telemetry version to 1.36.0

CDPD-67749: Upgrade protobuf-java to 3.21.7 due to CVE-2022-3171

Upgrade protobuf-java to 3.21.7

CDPD-67746: Upgrade Nimbus-JOSE-JWT to 9.37.3 due to CVE-2023-52428

Upgrade Nimbus-JOSE-JWT to 9.31

CDPD-67744: Exclude Apache Derby from ranger-rms module due to CVE-2022-46337

Exclude Apache Derby from the ranger-rms module

CDPD-67530: Support FIPS on JDK17

Successfully validated Ranger and Ranger KMS for FIPS with JDK 17.

CDPD-67316: Add an eye icon for password visibility in Ranger login page

The Ranger login page did not support password visibility functionality. Users were not able to verify the entered password. Users can now view the entered password by clicking on the eye icon on the password field in the Ranger login page.

CDPD-67315: Filtering the resources in the search filter options on the policy listing page based on policy type.

N/A

CDPD-67314: Handling local storage data for column show/hide functionality

Implemented Column Hide/Show functionality in the Audit > Plugin Status tab.

CDPD-67110: Upgrade json-smart due to CVE-2023-1370

Upgraded json-smart to 2.4.10 due to CVEs

CDPD-67098: Upgrade commons-compress to 1.26.0 due to CVE-2024-25710 and CVE-2024-26308

Upgraded commons-compress to 1.26.0 due to CVE-2024-25710 and CVE-2024-26308

CDPD-66512: Enabling FIPS for Luna 7 server

A fix was provided.

CDPD-66501: Remove/Replace OpenSAML v3 due to EOL

Removed OpenSAML v3.4.5 due to EOL

CDPD-65650: Pagination on the Ranger Admin - Plugin Status page

The Ranger Admin UI's "Plugin Status" page now supports pagination. Previously, the Ranger Admin UI displayed only (the first or random) 200 entries, which was not easy to navigate. Also, the ordering/sorting on columns was only a "client side" sorting which hampered viewing some entries (only if searched by Host Name for example, it was possible). With bigger clusters it was a usability issue.

CDPD-65125: User Agent info not logged under "Login sessions" when login fails

User agent information will not be available for failed login.

CDPD-64634: Update ServiceDef icons on the service manager page

The service manager page previously used a folder icon for displaying ServiceDefs. Presently, the service manager page displays a real logo or icon that is specific to each ServiceDef.

CDPD-64334: Ranger - Upgrade Bouncy Castle to 1.77 due to CVE-2023-33202 and CVE-2023-33201

Bouncy Castle lib version upgraded to v1.77

CDPD-63694: Ranger plugin sends audits with Public Key Infrastructure (PKI) authentication with Solr user and causing PKI Exception

The error occurs when the workload Solr sends the audits to the infra Solr. The Ranger plugins' own solrclient uses PKI whatever the Solr configuration is.

CDPD-63984: HBase shell revoke command failed with 'HTTP 400 Error: processSecureRevokeRequest processing failed'

A fix was provided for this issue.

CDPD-62362: Ranger plugin sends audit information with Public Key Infrastructure (PKI) authentication with Solr user and causing PKI Exception

A fix is provided to handle the error when the workload Solr sends the audit information to the infra Solr.

CDPD-65125: User Agent information not logged under "Login sessions" when login fails

A fix is provided where the User Agent information is available for failed login.

CDPD-61934: Filter audits for cc_metric_reporter user on Kafka service repository

A lot of audits are generated for cc_metric_reporter user for the Kafka service repository for the resource "__CruiseControlMetrics". These audits will fill up the audit logs, and not much value is added by these audits. A fix is provided by adding Filter audits for cc_metric_reporter user on Kafka service repository.

Fixed Issues in Ranger KMS

Review the list of Ranger issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-58035: Luna HSM w/ Hardware in FIPS mode fails

When using a Luna HSM with firmware version of 7.7.2 or newer in FIPS mode, the HSM fails to encrypt.

This issue is fixed now.

Fixed Issues in Schema Registry

There are no fixed issues for Streams Replication Manager in Cloudera Runtime 7.1.9 SP1.

Fixed Issues in Solr

There are no fixed issues for Solr in Cloudera Runtime 7.1.9 SP1.

Apache patch information

None

Fixed Issues in Spark

There are no fixed issues for Spark in Cloudera Runtime 7.1.9 SP1.

Apache Patch Information**Fixed Issues in Spark Atlas Connector**

Review the list of Spark Atlas Connector issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-53836: Request for fault tolerant Spark atlas hook

Added fault tolerant mode to the Spark Atlas connectors. For more information see the [Spark connector configuration in Apache Atlas](#) documentation.

Apache Patch Information

Fixed Issues in Sqoop

There are no fixed issues for Sqoop in Cloudera Runtime 7.1.9 SP1.

CDPD-59557: Secure options to provide the Hive password for Sqoop Hive imports

This fix introduces secure options that you can use to provide the Hive password during Sqoop-Hive imports instead of the earlier way of providing the password as plaintext in the command-line interface.

Fixed Issues in Streams Replication Manager

There are no fixed issues for Streams Replication Manager in Cloudera Runtime 7.1.9 SP1.

Fixed Issues in Streams Messaging Manager

There are no fixed issues for SMM in Cloudera Runtime 7.1.9 SP1.

Fixed Issues in Tez

There are no fixed issues for Tez in Cloudera Runtime 7.1.9 SP1.

Apache Patch Information

None

Fixed Issues in YARN and YARN Queue Manager

Review the list of YARN and YARN Queue Manager issues that are resolved in Cloudera Runtime 7.1.9 SP1.

COMPX-16696: YARN Queue Manager - Dropwizard version upgrade to 2.1.11

Dropwizard is upgraded to version 2.1.11 from an older, vulnerable version. After upgrade, YARN Queue Manager now does not disable the replacement rules.

COMPX-16626: YARN Queue Manager - Upgrade Bouncy Castle version to 1.78 due to CVE-2024-29857, CVE-2024-30171 and CVE-2024-30172

Upgrade the Bouncy Castle version to 1.78 to fix the following vulnerabilities.

- CVE-2024-29857: Importing an EC certificate with specially crafted F2m parameters can cause high CPU usage during parameter evaluation.
- CVE-2024-30171: Possible timing-based leakage in RSA-based handshakes due to exception processing eliminated.
- CVE-2024-30172: A crafted signature and public key can be used to trigger an infinite loop in the Ed25519 verification code.

COMPX-16386: CDPD - Upgrade Spring Security version to 5.7.12/5.8.11/6.1.8/6.2.3 due to CVE-2023-34042 and CVE-2024-22257

Upgrade the Spring Security version to 5.7.12/5.8.11/6.1.8/6.2.3 to fix the following vulnerabilities.

- CVE-2023-34042: The `spring-security.xsd` file inside the `spring-security-config` JAR file is world-writable. If extracted, it could be written by anyone with access to the file system. While there are no known exploits currently, this is an example of “CWE-732: Incorrect Permission Assignment for Critical Resource” and could potentially result in an exploit. You should update to the latest version of Spring Security to mitigate any future risks associated with this issue.
- CVE-2024-22257: In Spring Security, versions 5.7.x prior to 5.7.12, 5.8.x prior to 5.8.11, 6.0.x prior to 6.0.9, 6.1.x prior to 6.1.8, and 6.2.x prior to 6.2.3, an application is potentially vulnerable to broken access control when it directly uses the `AuthenticatedVoter#vote` method with a null `Authentication` parameter.

COMPX-11626: Improved management of HDFS delegation tokens in YARN

YARN now efficiently manages HDFS delegation tokens before log aggregation attempts to write logs to HDFS. Tokens are iterated through and renewed as necessary. If renewal fails and a token expires, it is promptly removed from the credentials, ensuring smoother operation of log aggregation processes.

COMPX-11263: Inconsistent display of updated configuration values in YARN Queue Manager UI

The YARN Queue Manager UI intermittently displayed old configuration values after updates. This issue has been fixed, and the UI now reliably shows only the new values entered by the user immediately after an update.

CDPD-66169: Apache Hadoop - Upgrade of bcpkix-jdk15on library version to address CVE-2019-17359

The bcpkix-jdk15on library has been upgraded to version 1.70 in Hadoop to address the security vulnerability identified in CVE-2019-17359.

CDPD-60630: Knox redirecting YARN Node Manager URLs to HTTP instead of HTTPS

The YARN service definition is modified to remove the hard-coded HTTP scheme from its URL rewrite rules. This change ensures compatibility with proxying YARN whether it is deployed with or without TLS, resolving the issue of Knox redirecting YARN Node Manager URLs to HTTP instead of HTTPS.

Apache patch information

None

Fixed Issues in Zeppelin

Review the list of Zeppelin issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-68796: Zeppelin - Upgrade Apache Maven to 3.8.6 due to CVE-2021-26291

Upgraded to Apache Maven 3.8.6 to resolve CVE-2021-26291 by no longer following HTTP (non-SSL) repository references in POM files, thereby mitigating the risks of malicious code injection.

Fixed Issues in Zookeeper

Review the list of Zookeeper issues that are resolved in Cloudera Runtime 7.1.9 SP1.

CDPD-67821: Information disclosure vulnerability in persistent watcher handling (CVE-2024-23944)

Apache ZooKeeper has fixed an information disclosure vulnerability (CVE-2024-23944) caused by a missing ACL check in persistent watcher handling. Attackers may exploit this by attaching a persistent watcher to a parent znode, allowing them to monitor child znode's without ACL verification, exposing the full path of znodes. This path may contain sensitive information, like usernames or login IDs. The issue is fixed in ZOOKEEPER-4799.

Apache patch information

- ZOOKEEPER-4799

Known issues in Cloudera Runtime 7.1.9 SP1

You must be aware of the known issues and limitations, the areas of impact, and workaround in Cloudera Runtime 7.1.9 SP1.

Note: CDSW does not support RPM-based installation on CDP Private Base. (RPM installation is deprecated and only supported on HDP and CDH 5. For CDH6 and onward, Cloudera recommends you to use CSD-based installations.)

Known Issues in Atlas

Learn about the known issues in Atlas, the impact or changes to the functionality, and the workaround.

CDPD-6565: Issue with ddlQueries in Atlas for Hive/Impala tables created in default/non-default db using DAS/HUE respectively

ddlQueries are not created for Impala origin table. ddlQueries created for Impala/Hive CTAS tables have difference in names as compared to same operation for Hive table. The Impala table has the query in the ddlQueries entity name.

None

CDPD-55301: ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created through spark3-shell

The ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created using spark3-shell.

None

CDPD-56085: LOAD DATA INPATH to iceberg_table creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas

Running a query like LOAD DATA INPATH to iceberg_table, creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas. So in Atlas, a deleted entity is created corresponding to the temporary table <iceberg_table_name>_tmp*.

None

CDPD-58581: storage_handler is not set in Atlas for Impala to Iceberg in-place migrated tables

The storage_handler property is not set for Iceberg tables created in Impala, because in-place migration is not supported in Impala for the current release.

None

CDPD-58554: Discard audits of specific classification, label, and business metadata

Support to control audits for specific classification, label, and business metadata is not present in the Custom Audit Filters feature.

None

OPSAPS-67783: During rolling upgrade one among two Atlas server failed to start but Cloudera Manager considered as success

Cloudera Manager marks the Execute command Start on service Atlas-1 as a success even when Atlas service had failed to start successfully. In such cases, Atlas logs give the exact reason for Atlas start-up failure.

None

CDPD-19358: "IsIndexable" and "isOptional" value of a typedef's attribute is modified post migration.

None.

CDPD-11941: Table creation events missed when multiple tables are created in the same Hive command

When multiple Hive tables are created in the same database in a single command, the Atlas audit log for the database may not capture all the table creation events. When there is a delay between creation commands, audits are created as expected.

None.

CDPD-11940: Database audit record misses table delete

When a hive_table entity is created, the Atlas audit list for the parent database includes an update audit. However, at this time, the database does not show an audit when the table is deleted.

None.

CDPD-11692: Navigator table creation time not converted to Atlas

In converting content from Navigator to Atlas, the create time for Hive tables is not moved to Atlas.

None

CDPD-10574: Suggestion order doesn't match search weights

At this time, the order of search suggestions does not honor the search weight for attributes.

None.

CDPD-7982: HBase bridge stops at HBase table with deleted column family

Bridge importing metadata from HBase fails when it encounters an HBase table for which a column family was previously dropped. The error indicates:

```
Metadata service API org.apache.atlas.AtlasClientV2$API_V2@58112bc4 failed with status 404 (Not Found) Response Body
({ "errorCode": "ATLAS-404-00-007", "errorMessage": "Invalid
instance creation/updation parameters passed :
hbase_column_family.table: mandatory attribute value missing in
type hbase_column_family" })
```

None.

CDPD-6675: Irregular qualifiedName format for Azure storage

The qualifiedName for hdfs_path entities created from Azure blob locations (ABFS) does not have the clusterName appended to it as do hdfs_path entities in other location types.

None.

CDPD-5933, CDPD-5931: Unexpected search results when using regular expressions in basic searches on classifications

When you include a regular expression or wildcard in the search criteria for a classification in Basic Search, the results may differ unexpectedly from when full classification names are included. For example, the Exclude sub-classifications option is respected when using a full classification name as the search criteria; when using part of the classification name and the wildcard (*) with Exclude sub-classifications turned off, entities marked with sub-classifications are not included in the results. Other instances of unexpected results include case-sensitivity.

None.

CDPD-4762: Spark metadata order may affect lineage

Atlas may record unexpected lineage relationships when metadata collection from the Spark Atlas Connector occurs out of sequence from the metadata collection from HMS. For example, if an ALTER TABLE operation in Spark that is changing a table name and is reporting to Atlas before HMS has processed the change, Atlas may not show the correct lineage relationships to the altered table.

None.

CDPD-4545: Searches for Qualified Names with "@" does not fetch the correct results

When searching Atlas qualifiedName values that include an "at" character (@), Atlas does not return the expected results or generate appropriate search suggestions.

Consider leaving out the portion of the search string that includes the @ sign, and use the wildcard character * instead.

CDPD-3208: Table alias values are not found in search

When table names are changed, Atlas keeps the old name of the table in a list of aliases. These values are not included in the search index in this release, so after a table name is changed, searching on the old table name does not return the entity for the table.

None.

CDPD-3160: Hive lineage missing for INSERT OVERWRITE queries

Lineage is not generated for Hive INSERT OVERWRITE queries on partitioned tables. Lineage is generated as expected for CTAS queries from partitioned tables.

None.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a logout event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent access to Atlas after logging out, close all browser windows and exit the browser.

CDPD-1892: Ranking of top results in free-text search not intuitive

The Free-text search feature ranks results based on which attributes match the search criteria. The attribute ranking is evolving and therefore the choice of top results may not be intuitive in this release.

If you don't find what you need in the top 5 results, use the full results or refine the search.

CDPD-1884: Free text search in Atlas is case sensitive

The free text search bar in the top of the screen allows you to search across entity types and through all text attributes for all entities. The search shows the top 5 results that match the search terms at any place in the text (*term* logic). It also shows suggestions that match the search terms that begin with the term (term* logic). However, in this release, the search results are case-sensitive.

If you don't see the results you expect, repeat the search changing the case of the search terms.

CDPD-1823: Queries with ? wildcard return unexpected results

DSL queries in Advanced Search return incorrect results when the query text includes a question mark (?) wildcard character. This problem occurs in environments where trusted proxy for Knox is enabled, which is always the case for CDP.

None.

CDPD-1664: Guest users are redirected incorrectly

Authenticated users logging in to Atlas are redirected to the CDP Knox-based login page. However, if a guest user (without Atlas privileges) attempts to log in to Atlas, the user is redirected instead to the Atlas login page.

To avoid this problem, open the Atlas Dashboard in a private or incognito browser window.

CDPD-922: The IsUnique relationship attribute not honored

The Atlas model includes the ability to ensure that an attribute can be set to a specific value in only one relationship entity across the cluster metadata. For example, to add metadata tags to relationships that you wanted to make sure were unique in the system, you can design the relationship attribute with the property IsUnique equal true. However, in this release, the IsUnique attribute is not enforced.

None.

DOCS-13759: Tag Propagation stops after a certain depth while the lineage is being extended

When a tag is added to an entity at timestamp T1, the entities along the lineage to which the tag must be propagated is calculated at T1. Before tag propagation completes, if the lineage is extended, tag does not propagate to the entities in the extended lineage.

DOCS-13760: System Attributes search, __classificationNames: Search with parent tag does not return entities associated to its children tags

System attribute search with __classificationNames = parent_tag returns entities associated to parent_tag only and not entities associated to its children tag.

Instead of using system attribute, employ the basic search attribute classification which lists entities associated with inherited classifications.

CDPD-41142: When a Kafka console consumer group is run, more than one update audits are seen

After running the console consumer with a consumer group, verify the consumer group entity created, along with the metrics and notifications for the consumer group and topic. The expected result can be: one ENTITY_CREATE audit and one ENTITY_UPDATE audit. But more than one ENTITY_UPDATE audits are seen.

CDPD-40165: Two audits are created for SPARK CTAS table

When following Spark queries are fired:

```
spark.sql("create table table1(id int)")
spark.sql("create table table2 as select * from table1")
```

HMS sends "ENTITY_CREATE" and "ENTITY_FULL_UPDATE_V2".

The extra ENTITY_FULL_UPDATE_V2 message received from HMS is sent as a part of ALTER_TABLE_ADDCOLS event from the HMS Hook side. This behaviour is observed only when the queries are run from Spark SQL and not when run the same queries are run from Beeline.

CDPD-39197: Debug metrics returns empty data

When debug metrics is enabled and some operations are performed, the response is empty

CDPD-36495: Updating legacyAttribute from False to True resets the initially created relationshipAttributes values

Creating types, entities, and to start, you must set the relationship with is_legacy_attribute value as **False**.

Later, update the value relationshipDef is_legacy_attribute to True.

For the entities that were created before updating the is_legacy_attribute to True, the relationship Attributes value is reset.

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-29409: Hive import: Suggestion suggests entity which is deleted.

Suggestions suggests tables of a database, which is a deleted entity.

CDPD-25152: Tag propagation through deferred actions consumes additional time as compared to default flow

The additional time might be due to the small overhead added to create / update task vertex and which is run in the background. This also depends on number of tasks queued to be executed.

CDPD-42954: Zeppelin notebook fails after enabling Atlas-HDFS hook

The Zeppelin notebooks are failing with errors after enabling Atlas-HDFS hook in the CDP cluster.

When the below properties are set for atlas-client.properties in Cloudera Manager:

- atlas.jaas.KafkaClient.option.keyTab
- atlas.jaas.KafkaClient.option.principal

Along with adding the properties in /etc/atlas/conf/atlas-application.properties, Cloudera Manager also adds these properties to atlas-application.properties for other services (like Spark).

Adding these properties interferes with the normal flow of the services (like Spark)

To enable HDFS lineage feature, instead of setting these properties through Cloudera Manager, users can manually add the properties directly in /etc/atlas/conf/atlas-application.properties

CDPD-40346: The ddlQueries and ALTERTABLE_ADDCOLS lineage missing for Impala tables.

The ALTERTABLE_ADDCOLS lineage has some issue when an Impala table is altered and the corresponding lineage is not created.

CDPD-67112: Import transforms do not work as expected when replacing a string which already has ":"

The character “:” is not supported in path replacements. The import succeeds but location remains unchanged. The character “:” must be avoided.

None

CDPD-69150: Unable to add labels or user defined properties in Japanese

Adding Japanese labels or user defined properties results in the error message: “Invalid label: ###, label should contain alphanumeric characters, _ or -”

None

CDPD-69279: Quick search does not return entities when using Japanese or Chinese characters to search properties

Entities, such as `hdfs_path`, are not returned by the search when their indexable properties are searched using partial search terms made of Japanese or Chinese characters. Only exact matches return results when searching the indexed properties made of Japanese or Chinese characters.

None

CDPD-68191: Suggestions do not return the correct results when searching multiple Chinese characters

Free text search does not return results when searching Chinese phrases made of multiple characters. Partial searches return the correct results.

None.

CDPD-71219: Regression : Suggestions don't work for single character words on indexable attributes

When searching for entities whose name (entity names are indexable) is a single character, search results are returned but suggestions are not. When searching for entities whose description (entity descriptions are not indexable) is a single character, both search results and suggestions are returned.

None.

CDPD-71482: BCFKS keystore type is not recognized by the Atlas client

The Schema Registry - Atlas integration fail on the FIPS environment because the BCFKS keystore type is not recognized by the Atlas client. Currently, it is hard-coded as "JKS".

None.

CDPD-67450: Table name renaming operation is not updating or creating iceberg_table entity

Renaming an Iceberg table does not update the corresponding Atlas entity.

None.

CDPD-67089: Export/Import: When a table with Ozone path is exported as "connected", only the Ozone key is exported.

When table with Ozone path is exported as "connected", only Ozone key is exported. Other Ozone entities, such as Ozone volume, Ozone bucket are not exported.

None.

CDPD-43772: Performance issues with Atlas service

If there are lot of update operations and the compression type of column families of `atlas_janus` table is SNAPPY, then the Kafka message processing might become slower.

- Consider setting compression type of column families of `atlas_janus` table as GZ.

CDPD-74467: Ranger TagSync does not support ofs path parsing for Ozone-Atlas

When trying to create Hive table on top of Ozone ofs path with the command `ofs://ozone1/volume1/bucket1/table_oz_demo1`, Ranger TagSync fails with an error.

Upgrade to Cloudera Private Cloud Base 7.1.9 SP1 CHF3.

CDPD-76035: Resource lookup for Atlas service is failing

Once the Atlas configuration snippet `atlas.authentication.method.file` is enabled and a classification is created, these do not synchronize correctly to the **Type Category** resource field setting of Apache Ranger. The newly created classification won't be able to be selected as the **Type Name**.

CDPD-71411: Atlas Hbase import fails with jackson-databind exception

The jackson-annotations is not updated to match jackson-databind (2.15.0). This causes the `NoSuchFieldError` error intermittently during an HBase import because of a version mismatch (older 2.12.7 on classpath).

CDPD-77911: Missing Log4j Redactor dependency

The missing `org.cloudera.logredactor` dependency can result impossible Log4j errors during startup. Additionally, it can lead to unwanted data leak because of incorrect log redaction.

CDPD-79160: NPE while deleting BusinessMetadata

If business metadata is created without adding any applicable types, a `NullPointerException` is produced when we try to delete that business metadata.

None

Apache Jira: [ATLAS-4863](#)

CDPD-80921: Without permission for one glossary, /glossary call throws exception

When you don't have the permission for a glossary, the `/glossary` call results in an exception, blocking authorization for all glossaries. The error message is the following:

```
{  "errorCode": "ATLAS-403-00-001",  "errorMessage": "hrt_qa is
not authorized to perform read entity: guid=*****_****_****_
****_*****"}

```

CDPD-69140: Incremental export: When an entity has tag propagated and is exported, the tag is not propagated to it in the export

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After exporting the last table, it will not have the propagated tag.

Apache JIRA: [ATLAS-4889](#)

CDPD-69213: Export/Import, Incremental Export: When entity exported has a tag propagated from entity which is deleted, tag is not propagated to it at target

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After dropping the first table and exporting the entire lineage, the child tables will not have the propagated tag.

Apache JIRA: [ATLAS-5055](#)

CDPD-76789: Creating tag with name description throws `java.lang.ClassCastException`

Creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options" can lead to HTTP 500 error in Apache Atlas.

Avoid creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options".

CDPD-77435: RAZ: Import-hive on Cloudera Data Engineering cluster fails

Running import-hive command on RAZ enabled Cloudera Data Engineering cluster fails with error `"NoClassDefFoundError: com/sun/jersey/core/spi/factory/ResponseBuilderImpl"`.

CDPD-70321: Atlas Parallel import is failing with various errors

During a parallel import-export activity with six iceberg table policies with exportOption as `db1.*` for all six exports, all import fail after the exports.

CDPD-75994: Post DL regular upgrade (non ZDU) to 7.3.1, "Exception in `getKafkaConsumer` ,WakeupException: null" is seen

After the data lake is upgraded to 7.3.1, sometimes Atlas Hook does not function when Apache Atlas and Apache Kafka are started at the same time, thus Atlas is unable to connect to Kafka while Kafka is still being set up. Atlas performs only three attempts.

Restart the cluster, after the upgrade to trigger to reconnect to Apache Kafka. The Kafka consumer creation should be retried if the Kafka service is unavailable during Atlas startup.

DOCS-26821: Iceberg entities created in 7.2.17 Atlas-Hook (Hive,Impala,Spark) is not ingested by 7.2.18/7.3.1 Atlas Server

When using an Atlas hook from 7.3.1 with an earlier version of Atlas server (7.1.9 SP1 CHF5 or earlier) to create an Iceberg table, the older data model of Iceberg cannot process the features of the new data models. For example, when encountering relationships or attributes in queries which do not have a definition in the earlier model, Iceberg fails to create new tables with an error message. The data model of the Iceberg in Cloudera Runtime 7.1.9 SP1 CHF5 or later is not backward compatible with earlier data models.

It is recommended to upgrade your Atlas server version to at least 7.1.9 SP1 CHF5 or later.

CDPD-28741: Atlas node start failure : PermanentLockingException: Expected value mismatch for KeyColumn

In an Atlas High Availability (HA) enabled environment, starting both Atlas hosts at the same time can result in both trying to access or modify the same graph database resulting in a race condition. One instance successfully modifies the patch vertex, while the other instance triggers a Locking Exception (Concurrent modification exception).

Start Atlas instances in sequence and not in parallel to avoid the potential race condition. If the exception is already present, restart the second Atlas instance after triggering the PermanentLockingException.

CDPD-79099: Unable to import hive tables using import script in Public Cloud

The validation of import .zip files can cause the org.apache.atlas.AtlasServiceException error if the .zip file contains Atlas shell entities missing mandatory attributes such as a name. Therefore, the import of shell entities fails.

CDPD-88230: Bulk import operations currently do not construct lineage as expected

Bulk import operations do not create lineage consistently, even when the entities are imported successfully.

CDPD-88302: Bulk import operations currently do not create audits for the imported entities

Bulk import operations do not create audits for the imported entities.

Known Issues in Avro

Learn about the known issues in Avro, the impact or changes to the functionality, and the workaround.

CDPD-23451: Avro library depends on the already EOL jackson-mapper-asl 1.9.13-cloudera.1 that also contains a couple of CVEs. The jackson library is part of the Avro API so cannot be changed without a complete rebase.

None.

Known issues in Cloud Connectors

Learn about the known issues in Cloud Connectors, the impact or changes to the functionality, and the workaround.

CDPD-76378 Uploading files to S3 takes longer than expected

Uploading files to S3 on long haul networks is delayed if the file is smaller than 64MB. As the 100-continue header is not received immediately, the files are uploaded only after several retries. The delay in uploading is caused by the fs.s3a.connection.expect.continue S3A configuration parameter. The fs.s3a.connection.expect.continue S3A configuration property controls whether or not a PUT request to the S3 store sets the "Expect: 100-continue" header, and awaits a 100 CONTINUE response before uploading any data. This allows throttling and other transient problems to be reported by the S3 store before there is an attempt by the client to upload any data.

By default, the value of the configuration property is set to true, which means that the header is set, and a 100 CONTINUE response is required.

If there is a significant delay in uploading files or if the write time of jobs increases, you can set the `fs.s3a.connection.expect.continue` configuration property for your service to false.

Known issues in Cruise Control

Learn about the known issues in Cruise Control, the impact or changes to the functionality, and the workaround.

Rebalancing with Cruise Control does not work due to the metric reporter failing to report the CPU usage metric

On the Kafka broker, the Cruise control metric reporter plugin may fail to report the CPU usage metric.

If the CPU usage metric is not reported, the `numValidWindows` in Cruise Control will be 0 and proposal generation as well as partition rebalancing will not work. If this issue is present, the following message will be included in the Kafka logs:

```
WARN com.linkedin.kafka.cruisecontrol.metricsreporter.CruiseControlMetricsReporter:
    [CruiseControlMetricsReporterRunner]: Failed reporting CPU
    util.
```

```
java.io.IOException: Java Virtual Machine recent CPU usage is not
    available.
```

This issue is only known to affect Kafka broker hosts that have the following specifications:

- CPU: Intel(R) Xeon(R) CPU E5-2699 v4 @ 2.20GHz
- OS: Linux 4.18.5-1.el7.elrepo.x86_64 #1 SMP Fri Aug 24 11:35:05 EDT 2018 x86_64
- Java version: 8-18

Move the broker to a different machine where the CPU is different. This can be done by moving the host to a different cluster. For more information, see the [Moving a Host Between Clusters](#).

Note: Cluster nodes affected by this issue are not displayed as unhealthy.

OPSAPS-69978: Cruise Control capacity.py script fails on Python 3

Cruise Control might fail to start on Python 3 when capacity information is queried during the startup process. This is caused by a breaking change between Python 2 and 3.

None

Known Issues in Hadoop

There are no known issues for Hadoop in Cloudera Runtime 7.1.9 SP1.

Known Issues in HBase

This topic describes known issues and workarounds for using HBase in Cloudera Runtime 7.1.9 SP1.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL

- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

IntegrationTestReplication fails if replication does not finish before the verify phase begins

During IntegrationTestReplication, if the verify phase starts before the replication phase finishes, the test will fail because the target cluster does not contain all of the data. If the HBase services in the target cluster does not have enough memory, long garbage-collection pauses might occur.

Workaround: Use the -t flag to set the timeout value before starting verification.

HDFS encryption with HBase

Cloudera has tested the performance impact of using HDFS encryption with HBase. The overall overhead of HDFS encryption on HBase performance is in the range of 3 to 4% for both read and update workloads. Scan performance has not been thoroughly tested.

Workaround: N/A

AccessController postOperation problems in asynchronous operations

When security and Access Control are enabled, the following problems occur:

- If a Delete Table fails for a reason other than missing permissions, the access rights are removed but the table may still exist and may be used again.
- If `hbaseAdmin.modifyTable()` is used to delete column families, the rights are not removed from the Access Control List (ACL) table. The `postOperation` is implemented only for `postDeleteColumn()`.
- If Create Table fails, full rights for that table persist for the user who attempted to create it. If another user later succeeds in creating the table, the user who made the failed attempt still has the full rights.

Workaround: N/A

Apache Issue: [HBASE-6992](#)

Snappy compression with /tmp directory mounted with noexec option

Using the HBase client applications such as *hbase hfile* on the cluster with Snappy compression could result in `UnsatisfiedLinkError`.

Workaround: Add `-Dorg.xerial.snappy.tmpdir=/var/hbase/snappy-tempdir` to Client Java Configuration Options in Cloudera Manager that points to a directory where `exec` option is allowed.

HBase shutdown can lead to inconsistencies in META

Cloudera Manager uses an incorrect shutdown command. This prevents graceful shutdown of the HBase service and forces Cloudera Manager to kill the processes instead. It can lead to inconsistencies in Meta.

Workaround: Run the following command instead of shutting down the HBase service using Cloudera Manager.

```
hbase master stop --shutdownCluster
```

The command output must end with Closing master protocol: MasterService phrase. You can verify the command execution by checking the master logs. The log must contain Cluster shutdown req

uested of master=xxx and the closing of regions. Upon successful execution, the RegionServers start shutting down.

Note: The command does not stop the *REST Server* and the *Thrift Server* role instances. You can safely shut down them from Cloudera Manager later.

If you find any inconsistencies, please contact Cloudera Support.

The custom JWT Principal claim is not usable for HBase

The `hbase.security.oauth.jwt.token.principal.claim` configuration property does not exist in the 7.1.9 SP1 version. The purpose of this property is to allow the use of a Subject or Principal claim different from the default sub claim.

Workaround: Use the standard sub claim in the JWT token.

HBase procedures might hang because WriteAheadLog for ProcedureStore does not progress

HBase Master might hang and cause longer recovery when the WriteAheadLog is stuck while persisting to the ProcedureStore. HBase Master eventually aborts itself, however, the operations that rely on the ProcedureStore (for example, region movements and table creation) do not progress during this period.

Workaround: Restart the active HBase Master to speed up the recovery.

CDPD-77399: HBase fails to register the servlet metrics and throws `ClassNotFoundException: org.apache.hadoop.metrics.MetricsServlet`

The `MetricsServlet` class is a Hadoop 2-based metric servlet unavailable in Hadoop 3 deployments.

Workaround: Ignore this WARN log message during HBase Master and RegionServer startup.

Apache Issue: [HBASE-28315](#)

Known Issues in HDFS

Learn about the known issues in HDFS, the impact or changes to the functionality, and the workaround.

CDPD-67230: Rolling restart can cause failed writes on small clusters

In a rolling restart, if the cluster has less than 10 datanodes existing writers can fail with an error indicating a new block cannot be allocated and all nodes are excluded. This is because you have attempted to use all the datanodes in the cluster, and failed to write to each of them as they were restarted. This only happen on small clusters of less than 10 datanodes, because larger clusters have more spare nodes to allow the write to continue.

None.

CDPD-60873: `java.io.IOException:Encountered "status=ERROR, status message, ack with firstBadLink"` while fixing the HDFS corrupt file during rollback.

Increase the value of `dfs.client.block.write.retries` to the number of nodes in the cluster and perform Deploy client configuration procedure for rectification.

CDPD-60431: Configuration difference between 7.1.7 SP2 and 7.1.9.0 results

Component	Configuration	Old Value	New Value	Description
HDFS	<code>dfs.permissions.ConflictSummary.subAccess</code>	Not Set	True	Performance optimization for NameNode content summary API
HDFS	<code>dfs.datanode.handler.count</code>	3	10	Optimal value for DN server threads on large clusters

None.

CDPD-60387: Configuration difference between 7.1.8.3 and 7.1.9.0 results

Component	Configuration	Old Value	New Value	Description
HDFS	dfs.namenode.access.precision	None	0	Optimal value for NameNode performance on large clusters
HDFS	dfs.datanode.handler.count	8	10	Optimal value for DN server threads on large clusters

None.

OPSAPS-64307: When the JournalNodes on a cluster are restarted, the Add new NameNode wizard for HDFS service might fail to bootstrap the new NameNode. If there was no new fsImage created from the time JournalNodes restarted, during the restart the edit logs were rolled in the system.

If the bootstrapping fails during the Add new NameNode wizard, then perform the following steps:

1. Delete the newly added NameNode and FailoverController
2. Move the active HDFS NameNode to safe mode
3. Perform the Save Namespace operation on the active HDFS NameNode
4. Leave safe mode on the active HDFS NameNode
5. Add the new NameNode again

Note: Entering safe mode disables writes to HDFS which causes a service disruption. If you cannot enter the safe mode, delete the newly added NameNode and FailoverController in the HDFS service and wait until HDFS automatically creates a new fsImage and then add the new NameNode again with the wizard.

OPSAPS-64363: Deleting of additional Standby Namenode does not delete the ZKFC role and this has to be done manually.

None.

CDPD-28390: Rolling restart of the HDFS JournalNodes may time out on Ubuntu20.

If the restart operation times out, you can manually stop and restart the Name Node and Journal Node services one by one.

OPSAPS-55788: WebHDFS is always enabled. The Enable WebHDFS option does not take effect.

None.

OPSAPS-63299: Disable HA command for a nameservice does not work if the nameservice has more than 2 NameNodes defined.

None.

OPSAPS-63301: Deleting nameservice command does not delete all the NameNodes belonging to the nameservice, if there are more than two NameNodes that are assigned to the nameservice.

None.

Unsupported features

The following HDFS features are currently not supported in Cloudera Data Platform:

- ACLs for the NFS gateway ([HADOOP-11004](#))
- Aliyun Cloud Connector ([HADOOP-12756](#))
- Allow HDFS block replicas to be provided by an external storage system ([HDFS-9806](#))
- Consistent standby Serving reads ([HDFS-12943](#))

- Cost-based RPC FairCallQueue ([HDFS-14403](#))
- HDFS Router Based Federation ([HDFS-10467](#))
- NameNode Federation ([HDFS-1052](#))
- NameNode Port-based Selective Encryption ([HDFS-13541](#))
- Non-Volatile Storage Class Memory (SCM) in HDFS Cache Directives ([HDFS-13762](#))
- OpenStack Swift ([HADOOP-8545](#))
- SFTP FileSystem ([HADOOP-5732](#))
- Storage policy satisfier ([HDFS-10285](#))

Known Issues in Hive

Learn about the known issues in Hive, the impact or changes to the functionality, and the workaround.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60770: Beeline Authentication Issue with Special Characters in Passwords

When LDAP is enabled, users cannot authenticate with Beeline if the password contains a special character. For example, the following string fails:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>;user=user@XXX;password='R3G#xpXyoy1M0Jb1'
```

Use the -p parameter to execute the Beeline command:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>; -n user@XXX -p 'R3G#xpXyoy1M0Jb1'
```

CDPD-43769: Inconsistent behavior with CHAR comparisons and string literals

In Hive, 'char' data to 'string' data comparison is considered as equal, but 'char' data to 'varchar' data comparison is considered as not equal if the data has trailing spaces. For example,

```
create table test(colchar char(10), colvarchar varchar(20), colstring string);
insert into test values ('a ', 'a ', 'a ');

select count(*) from test where colchar = colstring;
Output returns 1 because char and string data is considered as equal

select count(*) from test where colchar = colvarchar;
```

Output returns 0 because char and varchar data is considered as not equal

It is recommended that you use 'varchar or string' data type instead of 'char' data type for any character or string representation.

CDPD-44060: Issue rebuilding Hive Materialized Views

The ALTER MATERIALIZED VIEW <view_name> REBUILD; command to rebuild Materialized View fails with the following error:

```
Error: Error while compiling statement: FAILED: SemanticException
org.apache.hadoop.hive.ql.parse.SemanticException: Another process
is rebuilding the materialized
view activecore.top_apps_custom (state=42000,code=40000)
```

This can occur if the Materialized View Rebuild command is abruptly killed or if more than one Materialized View Rebuild command is issued for the same Materialized View. As a result, LOCK entry in the backend metastore DB table 'materialization_rebuild_locks' is not deleted and when the command is issued again, it will fail for that Materialized View.

To resolve this issue, perform the following steps to manually delete the stale locks:

1. From the backend DB, run the following command and check if there are any entries for the view to confirm if stale locks are present:

```
select mrl_db_name, mrl_tbl_name, mrl_last_heartbeat from ma
terialization_rebuild_locks where lower(mrl_tbl_name)='<view
_name>';
```

2. Create a backup of the table if there are multiple entries:

```
create table bkp_top_apps_custom as
select mrl_db_name, mrl_tbl_name, mrl_last_heartbeat from ma
terialization_rebuild_locks where lower(mrl_tbl_name)='<view
_name>';
```

3. Delete the stale lock entries from the table:

```
delete from materialization_rebuild_locks where lower(mrl_tb
l_name)='<view_name>';
```

For more information, see the related [Cloudera Community article](#).

CDPD-42726: Wrong results for agg queries from stats after running multi-insert query on managed table

Multiple inserts at the same time into the same partition results in invalid stats. For example:

```
create table source(p int, key int, value string);
insert into source(p, key, value) values (101,42,'string42');

create table stats_part(key int,value string) partitioned by (p
int);
from source
insert into stats_part select key, value, p
insert into stats_part select key, value, p;

select count(*) from stats_part;
-- In this scenario, StatsOptimizer helps serving this query be
cause the result should be rowNum of the partition p=101.
-- The result is 1, however, the result should be 2.
```

Rewrite the multi-insert statement by merging the branches inserting into the same partition to one branch.

CDPD-57574: Query execution fails due to `NullPointerException` in `DagUtils.setupQuickStart`

Hive queries may fail at runtime with a `NullPointerException` while executing the Tez graph at `DagUtils.setupQuickStart` method. A part of the stack trace from the error is shown below:

```
ERROR : Failed to execute tez graph.
java.lang.NullPointerException: null at org.apache.hadoop.hive.ql.exec.tez.DagUtils.setupQuickStart(DagUtils.java:1724)
```

The error usually occurs from an invalid plan that has cycles created by semi-join or map-join edges.

Disable some of the optimizations in order to remove the cycles from the plan. It is sufficient to set one of the following properties:

- `set hive.tez.dynamic.partition.pruning=false;`
- `set hive.tez.dynamic.semijoin.reduction=false;`
- `set hive.auto.convert.join=false;`

To avoid any undesired performance regressions, disable the optimization(s) only for specific queries and not globally (through Cloudera Manager) for the whole workload or cluster.

CDPD-43107: `SemanticException` for `INSERT INTO` statement when Hive Cost-based Optimizer (CBO) is disabled

If you are running the `INSERT INTO` query and `hive.cbo.enable` is set to "false", the query fails with a `SemanticException`. For example,

```
set hive.cbo.enable=false;

CREATE TABLE mytable (
  id INT,
  str STRING
);

INSERT INTO mytable (id, str) VALUES (1, 'a');
```

```
Output:
org.apache.hadoop.hive.ql.parse.SemanticException: 0:0 Expected
2 columns for insclause-0/default@mytable; select produces 1 col
umns. Error encountered near token 'a'
```

This issue occurs only when columns are specified for the target table in the query. `INSERT INTO mytable values (1, 'a');` does not result in an exception.

Enable CBO and run the query.

CDPD-43957: `HiveServer` shuts down during replication due to high resource usage

During Hive replication (both bootstrap and incremental), you may notice that the `HiveServer` (HS2) shuts down periodically with the following error:

```
java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientE
xception: Unable to read HiveServer2 configs from ZooKeeper
at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.ja
va:265)
at org.apache.hive.jdbc.HiveDriver.connect(HiveDriver.java:107)
at java.sql.DriverManager.getConnection(DriverManager.java:664)
at java.sql.DriverManager.getConnection(DriverManager.java:247)
at com.cloudera.enterprise.hive3qt.Hive3QueryTool$HiveOperation.
execute(Hive3QueryTool.java:682)
```

```

    at com.cloudera.enterprise.hive3qt.Hive3QueryTool.main(Hive3QueryTool.java:935)
    Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper

    ... 5 more
    Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Tried all existing HiveServer2 uris from ZooKeeper.
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.getServerHosts(ZooKeeperHiveClientHelper.java:132)
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.configureConnParams(ZooKeeperHiveClientHelper.java:172)
    ... 8 more

```

This issue occurs when you replicate at scale with an unbalanced cluster setup that has all the roles running on the Cloudera Manager host. As a result, Cloudera Manager ends up in a bottleneck situation because HS2 crashes, preventing further replication. The logs (/var/log/messages) indicate that there were a large number of Java processes running on the host, which exhausted the host's memory and triggered an Out Of Memory Killer process to stop HS2.

You can restart HS2 and reinitiate replication. However, the replication process may take a longer time to complete.

- Follow these recommendations when setting up your source and target clusters:
 - Ensure that no HS2, Hive metastore (HMS), DataNode, or NameNode roles are running on the Cloudera Manager host.
 - Ensure that you have multiple instances of HS2 and HMS roles on different nodes.
 - It is recommended that you have the HS2 and HMS roles on different nodes than the DataNodes or NameNodes.

These practices increase the possibility of Hive replication at scale completing successfully.

- Limit the scale of Hive replication by temporarily disabling replication policies.

CDPD-40730: Parquet change can cause incompatibility

Parquet files written by the parquet-mr library in CDP 7.1.9, where the schema contains a timestamp with no UTC conversion will not be compatible with older versions of Parquet readers. The effect is that the older versions will still consider these timestamps as they would require UTC conversions and will thus end up with a wrong result. You can encounter this problem only when you write Parquet-based tables using Hive, and tables have the non-default configuration `hive.parquet.write.int64.timestamp=true`.

None.

CDPD-41274: HWC + Oozie issue: Could not open client transport with JDBC Uri

Currently only Spark cluster mode is supported in the Oozie Spark Action with Hive Warehouse Connector (HWC).

Use Spark action in cluster mode.

```

<spark xmlns="uri:oozie:spark-action:1.0">
  ...
  <mode>cluster</mode>
  ...
</spark>

```

CDPD-26556: After an upgrade, querying a CTAS table under certain conditions might throw an exception

If you upgrade your Hive cluster from CDH 6 to CDP 7, create a CTAS table in the CDP cluster from a table you upgraded from CDH, you might see the following exception when you query the new table:

```
class org.apache.hadoop.io.IntWritable cannot be cast to class org.apache.hadoop.hive.serde2.objectinspector.StandardUnionObjectInspector$StandardUnion
```

This issue involves CDH-based tables having columns of complex types ARRAY, MAP, and STRUCT.

CDPD-45370: Cartesian join fails with an empty table

When the configuration `hive.tez.cartesian-product.enabled` is set to true, query fails if one of the tables involved in a Cartesian join has zero rows. This results in an `IllegalArgumentException` with the message `Number of items is 0. Should be positive`.

To address this issue, set `hive.tez.cartesian-product.enabled` to false before running the query.

Apache Jira: [\[HIVE-26582\]](#)

CDPD-23506: OutOfMemoryError in LLAP

Long running spark-shell applications can leave sessions in interactive Hiveserver2 until the Spark application finishes (user exists from spark-shell), causing memory pressure in case of a high number of queries in the same shell (1000+).

You must close spark-shell so that sessions are closed. Add the owner of the database or the tables as a user with read or read/write access to the tables directly.

CDPD-23041: DROP TABLE on a table having an index does not work

If you migrate a Hive table to CDP having an index, DROP TABLE does not drop the table. Hive no longer supports indexes ([HIVE-18448](#)). A foreign key constraint on the indexed table prevents dropping the table. Attempting to drop such a table results in the following error:

```
java.sql.BatchUpdateException: Cannot delete or update a parent row: a foreign key constraint fails ("hive"."IDXS", CONSTRAINT "IDXS_FK1" FOREIGN KEY ("ORIG_TBL_ID") REFERENCES "TBLS" ("TBL_ID"))
```

There are two workarounds:

- Drop the foreign key "IDXS_FK1" on the "IDXS" table within the metastore. You can also manually drop indexes, but do not cascade any drops because the IDXS table includes references to "TBLS".
- Launch an older version of Hive, such as Hive 2.3 that includes IDXS in the DDL, and then drop the indexes as described in [Language Manual Indexing](#).

Apache Issue: [Hive-24815](#)

CDPD-17766: Queries fail when using spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive.

Do not specify `spark.sql.hive.hiveserver2.jdbc.url.principal` in the JDBC URL to invoke Hive remotely.

Workaround: specify `principal=hive.server2.authentication.kerberos.principal` as shown in the following syntax:

```
jdbc:hive://<host>:<port>/<dbName>;principal=hive.server2.authentication.kerberos.principal;<otherSessionConfs>?<hiveConfs>#<hiveVars>
```

CDPD-13636: Hive job fails with OutOfMemory exception in the Azure DE cluster

Set the parameter `hive.optimize.sort.dynamic.partition.threshold=0`. Add this parameter in Cloudera Manager (Hive Service Advanced Configuration Snippet (Safety Valve) for `hive-site.xml`)

CDPD-10848: HiveServer Web UI displays incorrect data

If you enabled auto-TLS for TLS encryption, the HiveServer2 Web UI does not display the correct data in the following tables: Active Sessions, Open Queries, Last Max n Closed Queries

Technical Service Bulletins**TSB 2021-501: JOIN queries return wrong result for join keys with large size in Hive**

JOIN queries return wrong results when performing joins on large size keys (larger than 255 bytes). This happens when the fast hash table join algorithm is enabled, which is enabled by default.

Knowledge article

For the latest update on this issue, see the corresponding Knowledge article: [TSB 2021-501: JOIN queries return wrong result for join keys with large size in Hive](#)

TSB 2023-702: Potential wrong result for queries with date partition filter for clusters in GMT+ timezone

In Cloudera Data Platform (CDP) Private Cloud Base 7.1.7 Service Pack (SP) 2 Cumulative Hotfix (CHF) 11, a fix was introduced in Hive Metastore (HMS) to address a parsing issue with date strings. This fix caused a regression in Hive clusters where the HMS time zone is set ahead of GMT for the following combination of tables and queries: a table that is partitioned on a DATE column and a SELECT query on that table containing a WHERE clause filter on the same DATE column. For such queries, during the partition pruning phase, the date string would be converted to a date without timezone and compared with the partition value retrieved by HMS. This causes wrong results (0 rows) because the date values do not match.

The regression was identified in CDP Private Cloud Base 7.1.7 SP2 CHF14, but it exists in CHF11 through CHF16 as well as on certain versions of 7.1.8 and 7.1.9.

This issue does not affect clusters where the time zones are behind GMT. For example, if the time zone of the cluster is set USA/Los Angeles, which is 8 hours behind GMT, a date '2023-10-02' will remain as '2023-10-02' after converting to GMT (adding 8 hours). On the other hand, using Asia/Hong Kong time as an example, which is 8 hours ahead of GMT, the same date would become '2023-10-01' after converting to GMT (subtracting 8 hours), which leads to the wrong results.

Upstream JIRA

Known Issues in Hue

Learn about the known issues in Hue, the impact or changes to the functionality, and the workaround.

OPSAPS-69659: Hue service fails on restart with "Unable to find pycopg2 2.5.4" error

Hue service fails to restart and you see the following error: Unable to find pycopg2 2.5.4. This could be because you have installed Python in a non-default location and Hue is unable to locate the pycopg2 PostgreSQL database adapter.

You must specify the path where you have installed Python in the PYTHONPATH property in the Hue Advanced Configuration Snippet using Cloudera Manager.

1. Log in to Cloudera Manager as an Administrator.

2. Go to Clusters Hue Configurations and add the following key and value in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

Key: PYTHONPATH

Value: `[***PYTHON-PATH***]`

Replace `[***PYTHON-PATH***]` with the actual location where you have installed Python. For example, `/opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python3.8/site-packages`

3. Click Save Changes.
4. Restart the Hue service.

CDPD-58978: Batch query execution using Hue fails with Kerberos error

When you run Impala queries in a batch mode, you encounter failures with a Kerberos error even if the keytab is configured correctly. This is because submitting Impala, Sqoop, Pig, or pyspark queries in a batch mode launches a shell script Oozie job from Hue and this is not supported on a secure cluster.

There is no workaround. You can submit the queries individually.

CDPD-59677: Unable to view Phoenix tables on the left assist in Hue

On clusters secured with Knox, you may not be able to see Phoenix tables on the left assist that are present under the default database (that is, an empty("") database).

None.

CDPD-58142: A query is not pre-populated in the Hue editor after clicking on the “Re Execute” button

When you click Re Execute to rerun a query from the Job Browser Queries Query Details page, the query does not get populated on the Hue editor, as expected.

None.

CDPD-54376: Clicking the home button on the File Browser page redirects to HDFS user directory

When you are previewing a file on any supported filesystem, such as S3 or ABFS, and you click on the Home button, you are redirected to the HDFS user home directory instead of the user home directory on the said filesystem.

None.

CDPD-41306: pip3.8 freeze command does not work and results into an error

You see the `/usr/lib/hue/build/env/bin/python: No such file or directory` error when you run the following command:

```
build/env/bin/pip3.8 freeze
```

Run the freeze command as follows by specifying the paths of python3.8 and pip3.8:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/python3.8 /opt/cloudera/parcels/CDH/lib/hue/build/env/bin/pip3.8 freeze
```

CDPD-43293: Unable to import Impala table using Importer

Creating Impala tables using the Hue Importer may fail.

If you have both Hive and Impala services installed on your cluster, then you can import the table using by selecting the Hive dialect from Tables Sources .

If only Impala service is installed on your cluster, then go to Cloudera Manager Clusters Hue Configurations and add the following line in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[beeswax]
max_number_of_sessions=1
```

CDPD-41136: Importing files from the local workstation is disabled by default

Cloudera has disabled the functionality to import files from your local workstation into Hue because it may cause errors. You may not see the Local File option in the Type drop-down menu on the **Importer** page by default.

You can enable the functionality to import files from your local workstation by specifying the following parameter in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field in Hue configurations in Cloudera Manager:

```
[indexer]
enable_direct_upload=true
```

DWX-8602: Unable to import a large CSV file from the local workstation

You may see an error message while importing a CSV file into Hue from your workstation, stating that you cannot import files of size more than 200 KB.

Upload the file to S3 or ABFS and then import them into Hue using the Importer.

CDPD-39330: Unable to use the pip command in CDP

You may not be able to use the pip command in CDP 7.1.7 or higher and may see the following error when using pip in a command: "ImportError: cannot import name chardet".

Follow the steps listed on [Unable to use pip command in CDP](#).

CDPD-24294: Hue uses the unsafe-inline directive in its Content Security Policy (CSP) header

Hue 4 web interface uses the unsafe-inline directive in its CSP header. As a result, the application server does not set the CSP header in its HTTP responses, and therefore does not benefit from the additional protection against potential cross-site scripting issues and other modern application vulnerabilities which a properly configured CSP may provide. This could lead to application vulnerability.

Cloudera recommends deploying additional security measures such as a firewall within the Hue server to control allowed connections, and SSO-based authentications mechanisms such as LDAP or SAML.

OPSAPS-61244: Cloudera Manager displays stale Hue configuration after upgrading to CDP 7.1.x from CDH 6.

After upgrading from CDH 6 to CDP 7.1.x, you may see stale configurations in Cloudera manager for the Hue service.

Manually restart the Hue service from Cloudera Manager.

ENGESC-9091: Setting idle session timeout for Hue does not work when the cluster is secured using Knox SSO

If Hue is configured with desktop.auth.backend.KnoxSpnegoDjangoBackend as the Authentication Backend, then the automatic idle session logout that is set by configuring the idle_session_timeout property does not take effect. You may also see 404 error while accessing Hue from the Knox UI when the idle_session_timeout property is not set to -1.

None

DOCS-10377: Hue UI is blank upon login after upgrading to CDP 7.1.7 from CDH 6

If your cluster was secured using Knox, and if you have upgraded from CDH 6 to CDP 7.1.7, then you may see a blank Hue screen. This could happen because the knox_proxyhosts parameter is newly introduced in CDP, and it is possible that this parameter is not configured in Cloudera Manager under Hue configuration.

Specify the host on which you have installed Knox in the Hue Knox Proxy Hosts configuration as follows:

1. Log in to Cloudera Manager as an Administrator.
2. Obtain the host name of the Knox Gateway by going to Clusters Knox service Instances .

3. Go to **Clusters Hue service Configuration** and search for the **Knox Proxy Hosts** field.

Note: Cloudera Manager displays the following warning if the **Knox Proxy Hosts** field is empty when **Knox Gateway** is enabled on the CDP cluster: The parameter `knox_proxyhosts` cannot be empty. This can happen if there are no **Knox Gateways**. Please set the `knox_proxyhosts` to the list of hosts that have **Knox Gateways**.

4. Specify the **Knox Gateway** hostname in the **Knox Proxy Hosts** field.
5. Click **Save Changes** and restart the **Hue** service.

OPSAPS-58927: Connection failed error when accessing the Search app (Solr) from Hue

If you are using **Solr** with **Hue** to generate interactive dashboards and for indexing data, and if you have deployed two **Solr** services on your cluster and selected the second one as a dependency for **Hue**, then **Cloudera Manager** assigns the hostname of the first **Solr** service and the port number of the second **Solr** service generating an incorrect **Solr** URL in the `search` section of the `hue.ini` file. As a result, you may see a “Connection failed” error when you try to access the **Search** app from the **Hue** web UI.

1. Log into **Cloudera Manager** as an **Administrator**.
2. Go to **Clusters Hue service Configuration** and add the following lines in the **Hue Service Advanced Configuration Snippet (Safety Valve)** for `hue_safety_valve.ini` field:

```
[search]
# URL of the Solr Server
solr_url=http://[***HOSTNAME***]:[***PORT***]/solr/
```

For example:

```
solr_url=http://solr2:4567/solr/
```

3. Click **Save Changes**.
4. Restart the **Hue** service.

CLR-72251: Invalid S3 URI error while accessing S3 bucket

The **Hue** Load Balancer merges the double slashes (//) in the **S3** URI into a single slash (/) so that the URI prefix `/filebrowser/view=S3A://` is changed to `/filebrowser/view=S3A:/`. This results in an error when you try to access the **S3** buckets from the **Hue** File Browser through the port 8889.

The **Hue** web UI displays the following error: “Unknown error occurred”.

The **Hue** server logs record the “ValueError: Invalid S3 URI: S3A” error.

To resolve this issue, add the following property in the **Hue** Load Balancer **Advanced Configuration Snippet**:

1. Sign in to **Cloudera Manager** as an administrator.
2. Go to **Clusters Hue service Configurations Load Balancer** and search for the **Load Balancer Advanced Configuration Snippet (Safety Valve)** for `httpd.conf` field.
3. Specify **MergeSlashes OFF** in the **Load Balancer Advanced Configuration Snippet (Safety Valve)** for `httpd.conf` field.
4. Click **Save Changes**.
5. Restart the **Hue** Load Balancer.

You should be able to load the **S3** browser from both 8888 and 8889 ports.

Alternatively, you can use the **Hue** server port 8888 instead of the load balancer port 8889 to resolve this issue.

CLR-72255: Error while rerunning Oozie workflow

You may see an error such as the following while rerunning an already executed and finished Oozie workflow through the Hue web interface: E0504: App directory [hdfs://cdh/user/hue/oozie/workspaces/hue-oozie-1571929263.84] does not exist.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

CDPD-16407: Python-psycopg2 package version 2.8.4 not compatible with Hue

Ubuntu 18.04 provides python-psycopg2 package version 2.8.4 but it is not compatible with Hue because of a bug in the Django framework.

Downgrade the package at the OS level by running the following command:

```
sudo apt install python-psycopg2==2.7.5
```

or install python-psycopg2 package using pip by running the following command:

```
sudo pip install psycopg2==2.7.5
```

DOCS-6344: Hue limitation after upgrading from CDH to CDP Private Cloud Base

The hive.server2.parallel.ops.in.session configuration property changes from TRUE to FALSE after upgrading from CDH to CDP Private Cloud Base. Current versions of Hue are compatible with this property change; however, if you still would like to use an earlier version of Hue that was not compatible with this property being FALSE and shared a single JDBC connection to issue queries concurrently, the connection will no longer work after upgrading.

CDPD-43956: Manually replace UUID when importing Oozie workflows containing sub-workflows

When importing Oozie workflows that contain sub-workflows, you must replace all the UUID entries with unique new entries. If you change the UUID of a sub-workflow, you must update that reference in the parent workflow to avoid circular dependencies.

Query history displays "Result Expired" message

You see the "Result Expired" message under the Query History column on the **Queries** tab for queries which were run back to back. This is a known behaviour.

None.

Unsupported features

CDPD-59595: Spark SQL does not work with all Livy servers that are configured for High Availability

SparkSQL support in Hue with Livy servers in HA mode is not supported. Hue does not automatically connect to one of the Livy servers. You must specify the Livy server in the Hue Advanced Configuration Snippet as follows:

```
[desktop]
[spark]
livy_server_url=http(s)://[***LIVY-FOR-SPARK3-SERVER-HOST***]:
[***LIVY-FOR-SPARK3-SERVER-PORT***]
```

Moreover, you may see the following error in Hue when you submit a SparkSQL query: Expecting value: line 2 column 1 (char 1). This happens when the Livy server does not respond to the request from Hue.

Specify all different Livy servers in the `livy_server_url` property one at a time and use the one which does not cause the issue.

CDPD-18491: PySpark and SparkSQL are not supported with Livy in Hue

Hue does not support configuring and using PySpark and SparkSQL with Livy in CDP Private Cloud Base.

Importing and exporting Oozie workflows across clusters and between different CDH versions is not supported

You can export Oozie workflows, schedules, and bundles from Hue and import them only within the same cluster if the cluster is unchanged. You can migrate bundle and coordinator jobs with their workflows only if their arguments have not changed between the old and the new cluster. For example, hostnames, NameNode, Resource Manager names, YARN queue names, and all the other parameters defined in the `workflow.xml` and `job.properties` files.

Using the import-export feature to migrate data between clusters is not recommended. To migrate data between different versions of CDH, for example, from CDH 5 to CDP 7, you must take the dump of the Hue database on the old cluster, restore it on the new cluster, and set up the database in the new environment. Also, the authentication method on the old and the new cluster should be the same because the Oozie workflows are tied to a user ID, and the exact user ID needs to be present in the new environment so that when a user logs into Hue, they can access their respective workflows.

Note: Migrating Oozie workflows from HDP clusters is not supported.

Technical Service Bulletins

TSB 2023-704: File corruption when downloading files larger than 1 MB from ABFS with Hue File Browser

An issue within the upstream Apache Hue (Hue) application results in file corruption when downloading files larger than 1MB files from Azure Blob Filesystem (ABFS) using the Hue File Browser. Only the downloaded files are affected by this issue, the source files remain intact.

Knowledge article

For the latest update on this issue, see the corresponding Knowledge article: [TSB 2023-704: File corruption when downloading files larger than 1 MB from ABFS with Hue File Browser](#)

TSB 2023-703: Risk of Data Loss when using Hue S3 File Browser

There is a risk of losing data when moving one or more files or folders in Amazon S3 storage with the Hue File Browser. When the user selects the destination folder in the modal window the following scenarios can occur:

1. If the user selects the same destination folder as the source folder, and clicks the Move button, the selected files will be permanently deleted.
2. If the user selects a different destination folder from the source folder and clicks the Move button before the User Interface (UI) has completely loaded (the loading is indicated by a spinner), the action could lead to the following outcomes:
 - a. If the previously visible destination folder was the same as the source folder, the file will be permanently deleted.
 - b. If the previously visible destination folder was different from the source folder, the file(s) will be moved to the previously visible destination folder and not to the intended destination folder.

Knowledge article

For the latest update on this issue, see the corresponding Knowledge article: [TSB 2023-703: Risk of Data Loss when using Hue S3 File Browser](#)

Known Issues in Iceberg

Learn about the known issues in Iceberg, the impact or changes to the functionality, and the workaround.

CDPD-75422: Impala schema case sensitivity issue with workaround

Impala's schema is case insensitive, causing errors with mixed case schema elements created through Spark during predicate pushdown.

- Create tables through Impala to ensure lower case schema.
- Avoid upper case in Spark: Do not use upper case when creating tables through Spark.
- Fix existing tables: Use ALTER TABLE to rename upper case columns:

```
ALTER TABLE `database`.`iceberg_table` CHANGE COLUMN ID id string;
```

Apache Jira: [IMPALA-13463](#)

Known Issues in Impala

Learn about the known issues in Impala, the impact or changes to the functionality, and the workaround.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94720: Impala startup failure due to invalid TLS v1.3 ciphers

When running Impala on a machine with OpenSSL 1.1.1, providing an invalid or TLS v1.2 ciphersuite in the `--tls_ciphersuites` startup flag causes the process to fail during startup. While OpenSSL 3.x ignores invalid ciphers, OpenSSL 1.1.1 returns an error if any ciphersuite in the list is invalid, even if other valid TLS v1.3 ciphers are present.

Ensure that the list in the `--tls_ciphersuites` startup flag contains only valid TLS v1.3 ciphersuites and does not contain any TLS v1.2 ciphersuites.

Apache Jira: [IMPALA-14625](#)

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-59625: Impala shell in RHEL 9 with Python 2 as default does not work

If you try to run `impala-shell` on RHEL 9 by setting the default python executable available in `PATH` to Python 2, it will fail since RHEL 9 is compatible only with Python 3.

If you run into such issues, set this parameter pointing to Python 3, `IMPALA_PYTHON_EXECUTABLE=python3`.

CDPD-42958: After upgrading the CDH 7.1.9 from CDH 6.x, under certain conditions you cannot insert data into a table

Under the following conditions, after upgrading from CDH 6.x to CDH 7.1.9 you cannot insert data into a table from Impala:

- On CDH 6.x, you created a database with Impala in a user specified HDFS location.
- Using Hive, you then created a table in the database.

Under these conditions, the database and table are stored in the user-specified HDFS directory. After upgrading, the HDFS directory of the table is read-only for Impala. Consequently, from Impala you cannot insert new data into the table because Impala does not have write permission on the HDFS directory.

Workaround: To resolve this issue, use either one of the following workarounds:

- Using the Ranger Web UI, in the policy repository `cm_hdfs`, grant the user 'impala' write permission on the directory where the table resides.
- Enter the following command to grant write permission to user 'impala' on the HDFS directory where the table resides.

```
hdfs dfs -setfacl -m default:user:impala:rwx <HDFS directory>
```

CDPD-80019: Impala fails to start due to large catalog-update topic

Impala coordinators fail to start if the catalog-update statestore topic exceeds 2GB, hitting the Thrift 0.16.0 message size limit (`thrift_rpc_max_message_size`). This prevents the coordinator from processing the update.

- Enable local catalog mode: `--use_local_catalog=true`
- In Cloudera Manager, go to Impala Configuration search for "Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)" and click 
- Add property name and value:

```
Name : --catalog_topic_mode
Value: minimal
```

- Save changes.

Apache Jira: [IMPALA-12350](#)

Impala cannot update table if the 'external.table.purge' property is not set to true

Impala cannot update a table using DDL statements if the 'external.table.purge' property is FALSE. ALTER TABLE statements return success with no changes to the table.

ALTER TABLE statements should be issued twice if "external.table.purge" was FALSE initially.

Note: For Iceberg tables, Impala users should always use CREATE TABLE since the Impala CREATE TABLE statement sets the flag to TRUE. However, Impala CREATE EXTERNAL TABLE sets the flag to FALSE.

Impala's known limitation when querying compacted tables

When the compaction process deletes the files for a table from the underlying HDFS location, the Impala service does not detect the changes as the compactions does not allocate new write ids.

When the same table is queried from Impala it throws a 'File does not exist' exception that looks something like this:

```
Query Status: Disk I/O error on <node>:22000: Failed to open HDF
S file hdfs://nameservice1/warehouse/tablespace/managed/hive/<da
tabase>/<table>/xxxxx
Error(2): No such file or directory Root cause: RemoteException:
File does not exist: /warehouse/tablespace/managed/hive/<data
base>/<table>/xxxx
```

Use the [REFRESH/INVALIDATE](#) statements on the affected table to overcome the 'File does not exist' exception.

CDPD-28431: Intermittent errors could be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

Impala api calls via knox require configuration if the knox customized kerberos principal name is a default service user name

To access impala api calls via knox, if the knox customized kerberos principal name is a default service user name, then configure "authorized_proxy_user_config" by clicking Clusters->impala->configuration. Include the knox customized kerberos principal name in the comma separated list of values <knox_custom_kerberos_principal_name>="*" where <knox_custom_kerberos_principal_name> is the value of the Kerberos Principal in the Knox service. Select Clusters>Knox>Configuration and search for Kerberos Principal to display this value.

CDPD-21828: Multiple permission assignment through grant is not working

None

Problem configuring masking on tables using Ranger

The following Knowledge Base article describes the behavior when we configure masking on tables using Ranger. This configuration works for Hive, but breaks queries in some scenarios for Impala.

For a workaround, see the following Knowledge Base article: [ERROR: "AnalysisException: No matching function with signature: mask\(FLOAT\)" when Impala jobs fail with the following error with signature: mask\(FLOAT\)](#)

IMPALA-11871: INSERT statement does not respect Ranger policies for HDFS

In a cluster with Ranger auth (and with legacy catalog mode), even if you provide RWX to cm_hdfs -> all-path for the user impala, inserting into a table whose HDFS POSIX permissions happen to exclude impala access will result in "AnalysisException: Unable to INSERT into target table (default.t1) because Impala does not have WRITE access to HDFS location: hdfs://XXXXXXXXXXXXX"

IMPALA-532: Impala should tolerate bad locale settings

If the LC_* environment variables specify an unsupported locale, Impala does not start.

Add LC_ALL="C" to the environment settings for both the Impala daemon and the Statestore daemon.

Avro Scanner fails to parse some schemas

The default value in Avro schema must match type of first union type, e.g. if the default value is null, then the first type in the UNION must be "null".

Swap the order of the fields in the schema specification. For example, use ["null", "string"] instead of ["string", "null"]. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

IMPALA-691: Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the impalad daemon.

To monitor overall memory usage, use the `top` command, or add the memory figures in the Impala web UI `/memz` tab to JVM memory usage shown on the `/metrics` tab.

IMPALA-1024: Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Remove trailing semicolon from the Avro schema.

IMPALA-1652: Incorrect results with basic predicate on CHAR typed column

When comparing a CHAR column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Use the `RPAD()` function to blank-pad literals compared with `CHAR` columns to the expected length.

IMPALA-1821: Casting scenarios with invalid/inconsistent results

Using a `CAST()` function to convert large literal values to smaller types, or to convert special values such as NaN or Inf, produces values not consistent with other database systems. This could lead to unexpected results from queries.

None

IMPALA-2005: A failed CTAS does not drop the table if the insert fails

If a `CREATE TABLE AS SELECT` operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Drop the new table manually after a failed CREATE TABLE AS SELECT

IMPALA-2422: % escaping does not work correctly when occurs at the end in a LIKE clause

If the final character in the RHS argument of a LIKE operator is an escaped \% character, it does not match a % final character of the LHS argument.

None

IMPALA-2603: Crash: impala::Coordinator::ValidateCollectionSlots

A query could encounter a serious error if includes multiple nested levels of INNER JOIN clauses involving subqueries.

None

IMPALA-3094: Incorrect result due to constant evaluation in query with outer join

An OUTER JOIN query could omit some expected result rows due to a constant such as FALSE in another join clause. For example:

```
explain SELECT 1 FROM alltypestiny a1
  INNER JOIN alltypesagg a2 ON a1.smallint_col = a2.year AND fals
e
  RIGHT JOIN alltypes a3 ON a1.year = a1.bigint_col;
+-----+
| Explain String |
+-----+
| Estimated Per-Host Requirements: Memory=1.00KB VCores=1 |
| 00:EMPTYSET |
+-----+
```

IMPALA-3509: Breakpad minidumps can be very large when the thread count is high

The size of the breakpad minidump files grows linearly with the number of threads. By default, each thread adds 8 KB to the minidump size. Minidump files could consume significant disk space when the daemons have a high number of threads.

Add `-\-minidump_size_limit_hint_kb=size` to set a soft upper limit on the size of each minidump file. If the minidump file would exceed that limit, Impala reduces the amount of information for each thread from 8 KB to 2 KB. (Full thread information is captured for the first 20 threads, then 2 KB per thread after that.) The minidump file can still grow larger than the "hinted" size. For example, if you have 10,000 threads, the minidump file can be more than 20 MB.

IMPALA-4978: Impala requires FQDN from hostname command on Kerberized clusters

The method Impala uses to retrieve the host name while constructing the Kerberos principal is the `gethostname()` system call. This function might not always return the fully qualified domain name, depending on the network configuration. If the daemons cannot determine the FQDN, Impala does not start on a Kerberized cluster.

Test if a host is affected by checking whether the output of the `hostname` command includes the FQDN. On hosts where `hostname` only returns the short name, pass the command-line flag `##hostname=FULLY_QUALIFIED_DOMAIN_NAME` in the startup options of all Impala-related daemons.

IMPALA-6671: Metadata operations block read-only operations on unrelated tables

Metadata operations that change the state of a table, like `COMPUTE STATS` or `ALTER RECOVER PARTITIONS`, may delay metadata propagation of unrelated unloaded tables triggered by statements like `DESCRIBE` or `SELECT` queries.

None

IMPALA-7072: Impala does not support Heimdal Kerberos

None

OPSAPS-46641: A single parameter exists in Cloudera Manager for specifying the Impala Daemon Load Balancer. Because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

The workaround is to use the load balancer configuration either without a port specification, or with the Beeswax port: this will configure BDR. To configure Hue use the "Hue Server Advanced Configuration Snippet (Safety Valve) for `impalad_flags`" to specify the the load balancer address with the `HiveServer2` port.

CDPD-28139: Set `spark.hadoop.hive.stats.autogather` to false by default

As an Impala user, if you submit a query against a table containing data ingested using Spark and you are concerned about the quality of the query plan, you must run `COMPUTE STATS` against such a table in any case after an ETL operation because `numRows` created by Spark could be incorrect. Also, use other stats computed by `COMPUTE STATS`, e.g., Number of Distinct Values (NDV) and NULL count for good selectivity estimates.

For example, when a user ingests data from a file into a partition of an existing table using Spark, if `spark.hadoop.hive.stats.autogather` is not set to false explicitly, `numRows` associated with this partition would be 0 even though there is at least one row in the file. To avoid this, the workaround is to set `"spark.hadoop.hive.stats.autogather=false"` in the "Spark Client Advanced Configuration Snippet (Safety Valve) for `spark-conf/spark-defaults.conf`" in Spark's CM Configuration section.

Some of the unresolved issues include:

- IMPALA-6841
- IMPALA-635

Known Issues in Kafka

Learn about the known issues in Kafka, the impact or changes to the functionality, and the workaround.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker) in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Save Changes > Restart SMM.

The offsets.topic.replication.factor property must be less than or equal to the number of live brokers

The offsets.topic.replication.factor broker configuration is now enforced upon auto topic creation. Internal auto topic creation will fail with a GROUP_COORDINATOR_NOT_AVAILABLE error until the cluster size meets this replication factor requirement.

None

Requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true

The first few produce requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true.

Increase the number of retries in the producer configuration setting retries.

Performance degradation when SSL Is enabled

In some configuration scenarios, significant performance degradation can occur when SSL is enabled. The impact varies depending on your CPU, JVM version, Kafka configuration, and message size. Consumers are typically more affected than producers.

Configure brokers and clients with ssl.secure.random.implementation = SHA1PRNG. It often reduces this degradation drastically, but its effect is CPU and JVM dependent.

OPSAPS-43236: Kafka garbage collection logs are written to the process directory

By default Kafka garbage collection logs are written to the agent process directory. Changing the default path for these log files is currently unsupported.

None

RANGER-3809: Idempotent Kafka producer fails to initialize due to an authorization failure

Kafka producers that have idempotence enabled require the Idempotent Write permission to be set on the cluster resource in Ranger. If permission is not given, the client fails to initialize and an error similar to the following is thrown:

```
org.apache.kafka.common.KafkaException: Cannot execute transactional method because we are in an error state
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeFailWithError(TransactionManager.java:1125)
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeAddPartition(TransactionManager.java:442)
    at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:1000)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:914)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:800)
    .
    .
    .
    Caused by: org.apache.kafka.common.errors.ClusterAuthorizationException: Cluster authorization failed.
```

Idempotence is enabled by default for clients in Kafka 3.0.1, 3.1.1, and any version after 3.1.1. This means that any client updated to 3.0.1, 3.1.1, or any version after 3.1.1 is affected by this issue.

This issue has two workarounds, do either of the following:

- Explicitly disable idempotence for the producers. This can be done by setting `enable.idempotence` to `false`.
- Update your policies in Ranger and ensure that producers have Idempotent Write permission on the cluster resource.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

DBZ-4990: The Debezium Db2 Source connector does not support schema evolution

The Debezium Db2 Source connector does not support the evolution (updates) of schemas. In addition, schema change events are not emitted to the schema change topic if there is a change in the schema of a table that is in capture mode. For more information, see [DBZ-4990](#).

None.

CFM-3532: The Stateless NiFi Source, Stateless NiFi Sink, and HDFS Stateless Sink connectors cannot use Snappy compression

This issue only affects Stateless NiFi Source and Sink connectors if the connector is running a dataflow that uses a processor that uses Hadoop libraries and is configured to use Snappy compression. The HDFS Stateless Sink connector is only affected if the Compression Codec or Compression Codec for Parquet properties are set to SNAPPY.

If you are affected by this issue, errors similar to the following will be present in the logs.

```
Failed to write to HDFS due to java.lang.UnsatisfiedLinkError: org.apache.hadoop.util.NativeCodeLoader.buildSupportsSnappy()
```

```
Failed to write to HDFS due to java.lang.RuntimeException: native snappy library not available: this version of libhadoop was built without snappy support.
```

Download and deploy missing libraries.

Important: Ensure that you complete steps 1-11 on all Kafka Connect hosts. Additionally, ensure that the advanced configuration snippet in step 12 is configured for all Kafka Connect role instances.

1. Create the /opt/nativelibs directory.

```
mkdir /opt/nativelibs
```

2. Change the owner to kafka.

```
chown kafka:kafka /opt/nativelibs
```

3. Locate the directory containing the Hadoop native libraries and copy its contents to the directory you created.

```
cp /opt/cloudera/parcels/CDH/lib/hadoop/lib/native/* /opt/nativelibs
```

4. Verify that libsnpappy.so was copied to the directory you created.
5. Remove the following from /opt/nativelibs.

```
libhadoop.a
libhadoop.so
libhadoop.so.1.0.0
```

6. Run the following command.

```
hadoop version
```

The command returns the Hadoop version running in the cluster. Note down the first three digits in the version.

7. Go to <https://archive.apache.org/dist/hadoop/common/> and download the Hadoop version that matches the first three digits of the version running in the cluster.

For example, if your Hadoop version is 3.1.1.7.1.9.0-296, then you need to download Hadoop 3.1.1.

8. Extract the downloaded archive.
9. Copy the following libraries from the downloaded archive to /opt/nativelibs on the cluster host.

```
libhadoop.a
libhadoop.so.1.0.0
```

The libraries are located in `hadoop-[*VERSION*]/lib/native`.

10. Create a symlink named libhadoop.so and point it to /opt/nativelibs/libhadoop.so.1.0.0.

```
ln -s /opt/nativelibs/libhadoop.so.1.0.0 /opt/nativelibs/libhadoop.so
```

11. Change the owner of every entry within /opt/nativelibs to kafka.

```
chown -h kafka:kafka /opt/nativelibs/*
```

12. In Cloudera Manager, go to Kafka service Configuration .
13. Add the following key-value pair to Kafka Connect Environment Advanced Configuration Snippet (Safety Valve).
 - Key: LD_LIBRARY_PATH
 - Value: /opt/nativelibs
14. Click Save Changes.
15. Restart the Kafka service.

OPSAPS-69481: Some Kafka Connect metrics missing from Cloudera Manager due to conflicting definitions

The metric definitions for `kafka_connect_connector_task_metrics_batch_size_avg` and `kafka_connect_connector_task_metrics_batch_size_max` in recent Kafka CSDs conflict with previous definitions in other CSDs. This prevents Cloudera Manager from registering these metrics. It also results in SMM returning an error. The metrics also cannot be monitored in Cloudera Manager chart builder or queried using the Cloudera Manager API.

Contact Cloudera support for a workaround.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Unsupported Features

The following Kafka features are not supported in Cloudera Data Platform:

- Only Java and .Net based clients are supported. Clients developed with C, C++, Python, and other languages are currently not supported.
- The Kafka default authorizer is not supported. This includes setting ACLs and all related APIs, broker functionality, and command-line tools.
- SASL/SCRAM is only supported for delegation token based authentication. It is not supported as a standalone authentication mechanism.
- Kafka KRaft in this release of Cloudera Runtime is in technical preview and does not support the following:
 - Deployments with multiple log directories. This includes deployments that use JBOD for storage.
 - Delegation token based authentication.
 - Migrating an already running Kafka service from ZooKeeper to KRaft.
 - Atlas Integration.

Limitations

Collection of Partition Level Metrics May Cause Cloudera Manager's Performance to Degrade

If the Kafka service operates with a large number of partitions, collection of partition level metrics may cause Cloudera Manager's performance to degrade.

If you are observing performance degradation and your cluster is operating with a high number of partitions, you can choose to disable the collection of partition level metrics.

Important: If you are using SMM to monitor Kafka or Cruise Control for rebalancing Kafka partitions, be aware that both SMM and Cruise Control rely on partition level metrics. If partition level metric collection is disabled, SMM will not be able to display information about partitions. In addition, Cruise Control will not operate properly.

Complete the following steps to turn off the collection of partition level metrics:

1. Obtain the Kafka service name:
 - a. In Cloudera Manager, Select the Kafka service.
 - b. Select any available chart, and select Open in Chart Builder from the configuration icon drop-down.
 - c. Find \$SERVICENAME= near the top of the display.

The Kafka service name is the value of \$SERVICENAME.
2. Turn off the collection of partition level metrics:
 - a. Go to Hosts Hosts Configuration .
 - b. Find and configure the Cloudera Manager Agent Monitoring Advanced Configuration Snippet (Safety Valve) configuration property.

Enter the following to turn off the collection of partition level metrics:

```
[KAFKA_SERVICE_NAME]_feature_send_broker_topic_partition_entity_update_enabled=false
```

Replace [KAFKA_SERVICE_NAME] with the service name of Kafka obtained in step 1. The service name should always be in lower case.

- c. Click Save Changes.

Known Issues in Kerberos

Learn about the known issues in Kerberos, the impact or changes to the functionality, and the workaround.

Known issues in Key Trustee Server

Learn about the known issues in Key Trustee Server, the impact or changes to the functionality, and the workaround.

KTS setup on FIPS cluster gets stuck if KTS is in HA

Key Trustee Server setup gets stuck if KTS is in HA for Centos 7.9 in FIPS mode.

Create Date is not fetched from Key Trustee Server

During key migration from KTS to Ranger KMS , create date is not fetched from KTS.

Known Issues in Knox

Learn about the known issues in Knox, the impact or changes to the functionality, and the workaround.

CDPD-79963: Knox service might fail due to JARs picked up from the /usr/share/java folder

Knox service might fail due to Java Archive (JAR) files picked up from the /usr/share/java folder.

None.

CDPD-67478: Custom topologies cannot be deleted

You cannot delete custom topologies that were created.

- Edit the custom topology in Cloudera Manager, removing all service declarations and leaving only the providerConfigRef configuration.
- Refresh the Knox configuration.

Knox Issue with JDK version

jdk-1.8.0_391 is not supported.

Cloudera recommends using Cloudera supported JDKs.

CDPD-61088: When downgrade is performed from CDP 7.1.9 to CDP 7.1.7 SP2, Knox may fail to start

When you downgrade from CDP 7.1.9 to CDP 7.1.7 SP2, Knox might fail to start with the following error message:

Failed to start gateway: org.apache.knox.gateway.services.ServiceLifecycleException: Keystore was not loaded properly - the provided password may not match the password for the keystore. org.apache.knox.gateway.services.ServiceLifecycleException: Keystore was not loaded properly - the provided password may not match the password for the keystore.

Remove the faulty credential store and restart Knox.

CDPD-60996: When downgrade is performed from CDP 7.1.9 to CDP 7.1.7 SP2, Knox is unable to connect to Cloudera Manager.

Restart Knox service after the downgrade process completes.

CDPD-28431: Intermittent errors can be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a log-out event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent additional access to Atlas, close all browser windows and exit the browser.

CDPD-22785: Improvements and issues needs to be addressed in convert-topology Knox CLI command

None

OPSAPS-67480: In CDP 7.1.9, default Ranger policy is added from the cdp-proxy-token topology, so that after a new installation of CDP 7.1.9, the knox-ranger policy includes cdp-proxy-token. However, upgrades do not add cdp-proxy-token to cm_knox policies automatically.

Manually add cdp-proxy-token to the Knox policy, using Ranger Admin Web UI.

1. Log in to Cloudera Manager Ranger Admin Web UI, as a Ranger administrator.
2. On Ranger Admin Web UI Service Manager Resource Knox, click cm_knox.
3. In Knox Policies, open the CDP Proxy UI, API and Token policy.
4. In Knox Topology*, add cdp-proxy-token.
5. Click Save.
6. Restart Ranger.

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the hadoop.auth cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the www-authenticate: Negotiate header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at Clusters SMM Streams Messaging Manager Web UI and log in using the Kerberos username and password.

On FIPS cluster, Knox-Impala connection is failing with SSL error code 5

The Knox-Impala connection is failing with SSL error code 5 on FIPS clusters. This prevents accessing Impala through Knox.

CDPD-78656: Health test for Knox fails if the gateway.client.auth.needed = true is set

The health test for Knox Gateway fails if the gateway.client.auth.needed parameter is set to true. Environments using the "curl" call are impacted. The curl call from CM is not specifying any certificate (store) while Knox is configured to require one.

To avoid the startup failure, use gateway.client.auth.wanted = true.

CDPD-71751: Creation of alias from the Cloudera Manager UI fails on FIPS

Users attempting to create aliases through the Cloudera Manager UI face issues in FIPS.

The alias(es) can be created using the Knox CLI:

1. ssh to Knox host.
2. Export these directories: export KNOX_GATEWAY_DATA_DIR="/var/lib/knox/gateway/data"; export KNOX_GATEWAY_CONF_DIR="/var/lib/knox/gateway/conf"
3. Set the FIPS-specific options for the Knox CLI:

```
export KNOX_CLI_MEM_OPTS="- --add-exports=java.base/sun.security.provider=bctls --add-exports=java.base/sun.security.provider=com.safelogic.cryptocomply.fips.core --add-modules=com.safelogic.cryptocomply.fips.core --add-modules=bctls --module-path=<BCTLS_JARS_DIR> -Dcom.safelogic.cryptocomply.fips.approved_only=true"
```

<BCTLS_JARS_DIR> is the directory containing the SafeLogic bctls and fips core jar files.

4. Run the following command to create the alias: /opt/cloudera/parcels/CDH/lib/knox/bin/knoxcli.sh create-alias <ALIAS_NAME> <ALIAS_VALUE>
5. Verify the addition using /opt/cloudera/parcels/CDH/lib/knox/bin/knoxcli.sh list-alias.

For HA deployments, users must do it on every Knox host (whereas the Save Alias command applies the change to all hosts automatically).

Known Issues in Kudu

Learn about the known issues in Kudu, the impact or changes to the functionality, and the workaround.

- Kudu HMS Sync is disabled and is not yet supported

You get "The user 'kudu' is not part of group 'hive' on the following hosts: " warning by the Host Inspector

If you are using fine grained authorization for Kudu, and you are also using Kudu-HMS integration with HDFS-Sentry sync, then you may get the "The user 'kudu' is not part of group 'hive' on the following hosts: " warning while upgrading.

Workaround: Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Known Issues in Livy

Failed to start navencrypt-mount.service

After installing NavEncrypt on SLES, if the command "systemctl status navencrypt-mount" fails with the error: "Failed to start navencrypt-mount.service: Unit navencrypt-mount.service failed to load: No such file or directory", the systemd files need to be reloaded..

Run the command:

```
(sudo) systemctl daemon-reload
```

Crash in Navigator Encrypt kernel module if --profile-file= option is used with ACLs

When you add ACLs with the `acl --add --rule` command, if you include any ACLs that uses the `--profile-file=` option, the kernel module (and host) crashes during Navigator Encrypt shutdown.

None

Known Issues in Oozie

Learn about the known issues in Oozie, the impact or changes to the functionality, and the workaround.

OPSAPS-74399: Missing jars from Spark 3 ShareLib when using with CDS 3.5

The `spark-common-utils_2.12-3.5.4.3.5.7191000.0-XX.jar` and `spark-sql-api_2.12-3.5.4.3.5.7191000.0-XX.jar` files are missing from the Spark 3.5.4 sharelib directory causing the Spark 3 actions to fail.

Perform the troubleshooting steps as described in [Troubleshoot Spark 3 ShareLib compatibility behaviour](#).

CDPD-41274: Hive Warehouse Connector (HWC) and Oozie issue: Can not open client transport with JDBC URI

Currently, only Spark cluster mode is supported in the Oozie Spark action with Hive Warehouse Connector (HWC).

```
Use Spark action in cluster mode.
    <spark xmlns="uri:oozie:spark-action:1
.0">
        ...
    <mode>cluster</mode>
    ...
</spark>
```

CDPD-26975: Using the ABFS / S3A connectors in an Oozie workflow where the operations are "secured" may trigger an IllegalArgumentException with the error message java.net.URISyntaxException: Relative path in absolute URI.

Set the following XML configuration in the Datahub cluster's Cloudera Manager:

1. In the Cloudera Manager Admin Console, go to the Oozie service.
2. Go to the Configuration tab.
3. In the Oozie Server Advanced Configuration Snippet (Safety Valve) for `oozie-site.xml` field, set the following:

Set the following if you are using Amazon S3:

```
<property>
pAccessorService.fs.s3a</name>
tmp/s3a</value>
    <name>oozie.service.Hadoop
    <value>fs.s3a.buffer.dir=
```

```
</property>
```

Set the following if you are using ABFS:

```
<property>
  <name>oozie.service.HadoopAccessorService.fs.abfs</name>
  <value>fs.azure.buffer.dir=/tmp/abfs</value>
</property>

<property><name>oozie.service.HadoopAccessorService.fs.abfss</name>
  <value>fs.azure.buffer.dir=/tmp/abfss</value>
</property>
```

4. Enter a Reason for change, and then click Save Change to commit the changes.
5. Restart the Oozie service.

OOZIE-3549: Oozie fails to start when Cloudera Manager 7.x is used with Cloudera Runtime 6.x and Java 11 because Oozie does not set the trust-store password.

The issue is fixed in OOZIE-3549 and is already included in CDP 7.x but not in CDH 6.x. If you are on CDH 6.x and want to upgrade to Java 11 or your Cloudera Manager version to 7.x then you must request for a patch.

Oozie jobs fail (gracefully) on secure YARN clusters when the JobHistory server is down.

If the JobHistory server is down on a YARN (MRv2) cluster, Oozie attempts to resubmit a job three times by default. If the job fails, Oozie automatically puts the workflow in a SUSPEND state.

When the JobHistory server is running again, use the `resume` command to inform Oozie to continue the workflow from the point at which it stopped.

Unsupported Feature

The following Oozie features are currently not supported in Cloudera Data Platform:

- Non-support for Apache Pig action (CDPD-1070)
- Conditional coordinator input logic process

Cloudera does not support using Derby database with Oozie. You can use it for testing or debugging purposes, but Cloudera does not recommend using it in production environments. This may cause failures while upgrading from CDH to CDP.

Known Issues in Ozone

Learn about the known issues in Ozone, the impact or changes to the functionality, and the workaround.

CDPD-54885: Ozone Prometheus does not work with TLS

The Prometheus service shipped by Ozone does not support TLS mode. So, Prometheus is not able to gather metrics from Ozone endpoints when TLS is enabled.

Go to `Ozone Configuration Ozone Prometheus Endpoint Token` and update the Ozone Prometheus Endpoint Token with any random string. This makes a token available in the process directory of the Ozone endpoint in plaintext, which Prometheus can use to get around the TLS limitation.

CDPD-69681: Ozone Ranger plugin does recursive listing for ACL checks

Ozone Ranger plugin does recursive listing in unoptimized path for performing ACL check on a directory. Recursive rename and delete operations on directories with layers of subdirectories causes a performance problem.

[Enable Ranger subaccess optimization for rename and delete operations in Ozone.](#)

Apache Issue: [HDDS-10823](#)

CDPD-51490: Installing HDFS and Ozone datanode instances on the same server (in case of a small test or development platform), can cause the Ozone UI to fail as it attempts to use the same default port 9864 already taken by HDFS.

On the Ozone configuration, overwrite the `hdds.datanode.client.port` value = 19864 and restart the Ozone service. This will allow Ozone UI to load without colliding with the HDFS service.

ENGESC-26990: Standalone Ozone deployment in a cluster is not supported.

A cluster with Ozone but without HDFS is not supported. Setting the `fs.defaultFs` parameter to Ozone is not certified yet.

None.

The Prometheus binary is not available in CDP Private Cloud Base 7.1.9 SP1 for the Ubuntu operating system.

You can install Prometheus separately and specify the path to the parent directory, for example `/usr/bin`, in the `prometheus.location` parameter in Ozone.

In CDP Private Cloud Base 7.1.9 SP1, there is a missing block location in the output of Ozone debug chunkinfo command for EC bucket.

None.

In CDP Private Cloud Base 7.1.9 SP1 and CDP Private Cloud Base 7.1.7 SP3, there is an intermittent key put failure after stopping the OM leader.

None.

In CDP Private Cloud 7.1.9 SP1, Recon certificates are not available after running the `ozone admin cert list` command. This issue is present when upgrading from a lower version of CDP to CDP Private Cloud 7.1.9 SP1.

1. Ensure that the Recon user is included in the `hdds.security.client.datanode.container.protocol.acl` configuration in the `hadoop-policy.xml` file under `/var/run/cloudera-scm-agent/process/*-ozone-STORAGE_CONTAINER_MANAGER/ozone-conf`.
2. If the Recon user is not listed, SCM rejects Recon's request for certificates. This step must be completed before proceeding to the next step.
3. Remove the keys folder in the Recon metadata directory and restart the cluster. This action results in new keys and certificates being generated from SCM.

On upgrading the cluster from CDP Private Cloud Base 7.1.7 SP3 to CDP Private Cloud Base 7.1.9 SP1, you cannot create snapshots on a pre-upgrade volume or bucket and `PERMISSION_DENIED` error is displayed. This is because from CDP Private Cloud Base 7.1.7 SP3, complete Kerberos owner name with domain is used. However, in CDP Private Cloud Base 7.1.9 SP1 the Kerberos owner short name is used.

You must update the Kerberos owner name for the bucket with the user short name and then create snapshot by running the following commands:

- `ozone sh bucket update --user={user_short_name} {volume}/{bucket}`
- `ozone sh snapshot create {volume}/{bucket} {snapshot_name}`

CDPD-70409: Recon Overview Page UI fails to load if Recon Solr health displays an error. This is because the Solr service is not enabled on the cluster.

You must manually enable the Solr service on the cluster:

1. Log in to Cloudera Manager UI.
2. Navigate to Clusters.
3. Select the Ozone service.
4. Go to Configurations.
5. Search for `solr_service` and select the option.
6. Click Save.

CDPD-69017: An Ozone Manager fails to retrieve the certificates of other OMs. OM retrieval of certificates is necessary for delegation token verification. This problem occurs after an OM leader changes until jobs possess a ticket from the previous OM leader.

Copy the certificates of other OMs to the certificate directories of all OMs.

The [JDK-8292158](#) and [HADOOP-18699](#) bugs affect the following OpenJDK versions:

- OpenJDK 11 (versions lower than 11.0.18)
- OpenJDK 11 (versions lower than 11.0.18-oracle)
- OpenJDK 15 (versions lower than 15.0.10)
- OpenJDK 17 (versions lower than 17.0.6)
- OpenJDK 17 (versions lower than 17.0.6-oracle)
- OpenJDK 19 (versions lower than 19.0.2)

As a result, the Hadoop clients can experience network connection failure under the following conditions:

- The host is capable of supporting AVX-512 instruction sets.
- AVX-512 is enabled in Java Virtual Machine (JVM). This should be enabled by default on AVX-512 capable hosts, equivalent to specifying the JVM argument `-XX:UseAVX=3`
- Hadoop native library (for example, `libhadoop.so`) is not available. So the HDFS client falls back using Hotspot JVM's `aesctr_encrypt` implementation for AES/CTR/NoPadding.
- Client uses an affected JDK.

You must append `-XX:UseAVX=2` to the client JVM args and upgrade to one of the following OpenJDK versions which has the fix:

- OpenJDK 11 release: version 11.0.18 and higher
- OpenJDK 11 release: version 11.0.18-oracle and higher
- OpenJDK 15 release: version 15.0.10 and higher
- OpenJDK 17 release: version 17.0.6 and higher
- OpenJDK 17 release: version 17.0.6-oracle and higher
- OpenJDK 19 release: version 19.0.2 and higher

After upgrading the cluster from CDP Private Cloud Base 7.1.8 to CDP Private Cloud Base 7.1.9 and if Ozone is in the Non-HA environment, an exception message is observed during the finalization of the Ozone upgrade.

During the finalization of the upgrade, a `ClassNotFoundException` message for `org.cloudera.log4j.redactor.RedactorAppender` class may be displayed. The error message can be ignored because the upgrade is successful. The error existed previously and does not affect the Ozone service and its operation.

None.

CDPD-68951: In CDP Private Cloud Base 7.1.9 CHF2 version and lower, the command `ozone sh key list <bucket_path>` displays the `isFile` flag in a key's metadata as false even when the key is a file. This issue is rectified in CDP Private Cloud Base 7.1.9 CHF3. However, the pre-existing (pre-upgrade) key's metadata cannot be changed.

None

CDPD-67771: When using S3A committer `fs.s3a.committer.name=directory` with `fs.s3a.committer.staging.conflict-mode=replace` to write to FSO buckets, the client fails with the following error.

```
DIRECTORY_NOT_FOUND
org.apache.hadoop.ozone.om.exceptions.OMException:
Failed to find parent directory of xxxxxxxx at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
```

```

org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.runCommand(OzoneManag
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.lambda
$1(OzoneManagerStateMachine.java:363) at
java.base/java.util.concurrent.CompletableFuture
$AsyncSupply.run(CompletableFuture.java:1700) at java.base/
java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1128)
at java.base/java.util.concurrent.ThreadPoolExecutor
$Worker.run(ThreadPoolExecutor.java:628) at java.base/
java.lang.Thread.run(Thread.java:834)

```

This occurs because S3A uses multipart upload to commit job results in a batch. The staging committer's replace mode deletes the target directory before completing Memory Protection Unit (MPU). The problem is that File System Optimization (FSO) does not create intermediate directories during MPU, it does only for regular file/dir/key requests.

Use `fs.s3a.committer.name=magic` for affected versions.

CDPD-64398: In SCM with non-HA configuration, Secret key manager does not initialise. Hence, the startup of OM and DataNode fails because it cannot get a secret key. This key is used when security is enabled and used in Block token and container token verification while communicating between the Ozone client, OM, and Datanode.

This issue does not occur in SCM with HA configuration.

You must force exit from the safe mode for SCM. This triggers the initialization of the Secret key manager. Below are the options:

- exit safe mode manually whenever SCM is started
- disable safe mode by setting `hdds.scm.safemode.enabled=false` in safety valve for SCM configuration

Impact of disabling safe mode and the purpose of safe mode:

- Write should not fail once the cluster is out of safe mode
- Read of existing data should not fail after the cluster is out of safe mode
- Unnecessary re-replication should be avoided during cluster restart

So disabling safe mode does not have any major impact on Ozone.

HDDS-9512: Ozone DataNode's new client port conflicts with HDFS DataNode's web port if both Ozone and HDFS DataNode roles are placed on the same host.

You must set `hdds.datanode.client.port` to any unused port. For example, 19864, through the Ozone DataNode safety valve.

CDPD-52412: keyManagerImpl#listStatus exceeds the maximum RPC length.

To reduce the payload, you must increase the part size.

OPSAPS-68159: If you did not deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Error when distributing parcel to host, Ignoring non-compliant parcel manifest error is displayed after Cloudera Manager is upgraded to 7.11.3.

If you encounter the error, perform the following steps:

1. Deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.11.3.

2. Restart the cluster with a delay of 10 minutes.
3. Continue to upgrade CDH 7.1.8 to CDH 7.1.9.

OPSAPS-68159: If you did not deactivate the Ozone parcel 718.2.x on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Ozone roles during the CDH 7.1.8 upgrade to CDH 7.1.9.

If you encounter the error, perform the following steps:

1. Deactivate the Ozone parcel 718.2.x.
2. Restart the Ozone service.
3. Perform Finalize Upgrade for the Ozone service.

Step result: The Ozone roles will be displayed in green.

CDPD-60989: The packaging version for Apache Ozone points to the 1.2.0 older version. This is a version string problem and not a packaging issue. The version of the Apache Ozone binary is closest to 1.4.0.

None. This only affects the JAR versioning.

CDPD-60366: Native library loader fails when system property native.lib.tmp.dir is not set. It fails because the library is copied to / instead of the cwd.

Setting native.lib.tmp.dir to a certain path like /tmp should solve the issue. To set this system property, you must add -Dnative.lib.tmp.dir=/tmp to ozone_java_opts in Cloudera Manager configuration of the Ozone cluster.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-60598: DataNode can consume up to the JVM heap size worth of direct memory buffers under specific failure scenarios. This can lead to a DataNode crash. This is due to Netty allocating and not freeing the direct memory buffers.

Restarting DataNode will resolve this issue.

CDPD-60466: The Ozone client is missing in the Cloudera Manager's Service Monitor node. This causes Ozone Canary's health check to fail.

Ensure you install Ozone CLI on the same node as Cloudera Manager's Service Monitor.

CDPD-60012: The Ozone SCM may be stuck in safe mode after upgrade to 7.1.9. This is due to a bug in how the SCM accounts for open storage containers.

The workaround is to temporarily set the Ozone configuration hdds.scm.safemode.threshold.pct to a lower value like 0.90 and restart the SCM.

CDPD-59679: In some scenarios, excess UNHEALTHY replicas of EC containers may not be removed from the cluster.

None

CDPD-50116: Topology-aware reads can provide better performance by routing applications to the closest replica of a file, if available, on the same physical node or same rack. However this feature is disabled by default in CDP 7.1.9.

This feature can be enabled by setting ozone.network.topology.aware.read to true using Cloudera Manager safety valve.

CDPD-57165: The DataNode disk usage thread may abort due to Ratis log tailing.

Use org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory to calculate disk usage. Configure in the ozone-site.xml property: hdds.datanode.du.factory value: org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory

OPSAPS-63510: When Ozone Container Balancer is started using Activate Container Balancer from Cloudera Manager, it runs on the Storage Container Manager (SCM) host which is the Ratis leader. However, the link to the Full Log File under Role Log in the Cloudera Manager command window for the Activate Container Balancer command may not link to the leader SCM's logs.

1. Find the leader SCM. Using Cloudera Manager and SCM Web UI: Go to Clusters Ozone **Web UI** . Open any of the Storage Container Manager web UI. In the UI, search for SCM Roles (HA) in the Status section. The leader SCM's hostname is mentioned. Or using Terminal: Log in to any Ozone host and run `ozone admin scm roles`. Note the leader.
2. After finding the leader SCM, search in this leader host's logs for ContainerBalancer related logs.

OPSAPS-67373: Toggling the Enable Ozone S3 Multi-Tenancy feature configuration in the Cloudera Manager Ozone service configuration page affects more service roles than actually needed.

Enabling multi-tenancy only requires restarting the Ozone Managers.

CDPD-55513: Hive external table replication policy does not migrate Hive tables in HDFS storage to Ozone.

To replicate data from HDFS to Ozone, see [Migrating your data from HDFS to Ozone](#). You can use HMS Mirror to replicate the metadata.

OPSAPS-67757: Hive external tables in Ozone storage cannot be replicated using Hive external table replication policies.

To replicate the Hive external tables' data, consider using DistCp. To replicate the metadata of Hive external tables, consider using HMS Mirror.

Remove bucket recursively using `rb -f force` command from AWS S3 cannot work for FSO buckets.

Use the Ozone shell command `ozone sh bucket delete -r [***BUCKET ADDRESS***]`

CDPD-59126: Info log displays "noexec permission on /tmp/liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86" on client while executing command with noexec on /tmp.

To suppress Info log related to `liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86` library: Export `OZONE_OPTS` environment variable on the client terminal by running the command `export OZONE_OPTS="-Dorg.apache.ratis.thirdparty.io.netty.native.workdir=/var/tmp $OZONE_OPTS"`

For more information, see [Changing temporary path for Ozone services and CLI tools](#).

OPSAPS-67650: Ozone uses RocksDB as a library to persist metadata locally.

By default, RocksDB places certain executables in `/tmp`, and thus encounters errors when `/tmp` is mounted with `noexec`.

The workaround is to configure RocksDB to put executables at another location. On a PhatCat node, the steps are:

1. Go to Cloudera Manager UI OZONE Configuration .
2. Find Ozone Service Environment Advanced Configuration Snippet (Safety Valve) and set the following environment variable: `ROCKSDB_SHARED_LIB_DIR=/VAR/TMP`
3. Restart Ozone.

For more information, see [Changing temporary path for Ozone services and CLI tools](#).

CDPD-49137: Ozone Manager Kerberos token expires for SCM communication and OM does not log in again.

Sometimes, OM's Kerberos token is not updated and it stops to communicate with SCM. When this occurs, writes start failing.

Restart OM or set the safety valve `hadoop.kerberos.keytab.login.autorenewal.enabled = true`

CDPD-56684: Keys get deleted when you do not have permission on volume

When a volume is deleted, it recursively deletes the buckets and keys inside it and only then deletes the volume. The volume delete ACL check is done only in the end, due to which you may end up deleting all the data inside the volume without having delete permission on the volume.

Note: There was no bucket/key permission available which allowed the user to delete them recursively.

CDPD-50610: Large file uploads are slow with OPEN and stream data approach

Hue file browser uses the append operation for large files. This API is not supported by Ozone in 7.1.9 and therefore large file uploads can be slow or timeout from the browser.

Use native Ozone client to upload large files instead of the Hue file browser.

OPSAPS-64097: Ozone service restart failed at SCM

Stopping SCM service using Cloudera Manager can sometimes timeout and need a retry. The Cloudera Manager API waits for 90 seconds which is not sufficient under certain circumstances.

Retry the shutdown using Cloudera Manager if the SCM still shows as running after a refresh of the service status.

OPSAPS-66469: Ozone-site.xml is missing if the host does not contain HDFS roles

The client side ozone-site.xml (/etc/hadoop/conf/ozone-site.xml) is not generated by Cloudera Manager if the host does not have any HDFS role. Because of this, issuing Ozone commands from that host fails because it cannot find the service name to host name mapping. The error message is similar to this: # ozone sh volume list o3://ozoneabc 23/03/06 18:46:15 WARN ha.OMProxyInfo: OzoneManager address ozoneabc:9862 for serviceID null remains unresolved for node ID null Check your ozone-site.xml file to ensure ozone manager addresses are configured properly.

Add the HDFS gateway role on that host.

OPSAPS-67607: Cloudera Manager FirstRun failure at the “Upload YARN MapReduce Framework JARs” step.

If this failure is attributed to the broken symbolic link, /var/lib/hadoop-hdfs/ozone-filesystem-hadoop3.jar, it is likely due to the presence of the user hdfs on the node prior to CDP parcel activation. As a result, the Cloudera Manager agent skips the initialization related to HDFS, leading to the non-creation of the /var/lib/hadoop-hdfs directory.

Create the directory “/var/lib/hadoop-hdfs” on all nodes followed by the deactivation and activation of the CDP parcel (deactivate and activate the Ozone parcel instead, in case Ozone parcel is used).

CDPD-50447: When SCM High Availability is enabled, each of the SCM web UIs report the host of the web UI as the leader of HA, and the other two as followers. This gives wrong information

Correct output is available by running the `ozone admin scm roles --service-id=<ID>` command.

OPSAPS-66501: Currently it is not possible to configure High Availability for SCM roles in Ozone post deployment. You should be able to change the HA configuration through Cloudera Manager, bringing it in line with other services.

At present it requires deleting Ozone and then adding it back with the SCM HA configuration in place and manually cleaning up the Ozone data in between. For more information, read the [KB article](#).

OPSAPS-66500: Currently, it is not possible to enable Kerberos in Ozone after it has been deployed, despite all the required configuration changes being created when the box is checked in the Ozone configurations in Cloudera Manager.

Ozone must be deleted and redeployed with Kerberos enabled. Due to OPSAPS-66499, this requires manual data cleanup in between. For more information, read the [KB article](#).

OPSAPS-66499: When you delete Ozone from a cluster using Cloudera Manager, Ozone data is not cleaned up. This may cause issues when Ozone is redeployed.

You must clean up the data manually. For more information, read the [KB article](#).

OPSAPS-62327: In an Ozone cluster without any gateway roles, Ozone is unable to deploy client configurations and displays the ConfigGenException error.

You must add the Ozone gateway roles to the cluster.

CDPD-49027: SCM certificates are not renewed automatically

The certificates that are there to ensure encrypted communication and authentication between Ozone internal services are not renewed automatically for Storage Container Managers.

Certificate revocation

Once these certificates expire, a manual re-bootstrap of the internal Ozone certificates is necessary.

To revoke a certificate, remove the full trust chain to stop trusting a compromised certificate. For this, remove the SCM certificates or any other certificates from the system. During the startup of the system, new certificates are created and distributed. The old certificates are not trusted anymore as the root CA certificate changes as well.

Procedure to force revoke internal certificates:

1. Stop Ozone service and all of its roles including SCMs
2. Include SCM's certs folders. Note that the Primordial SCM node has two certs folder, one for the root CA and other for the intermediate CA that the node holds. Rest of the SCMs have just one folder for the intermediate CA role that the node serves. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name certs; done`
3. Move these certs directories to a backup location
4. Locate the key material and move it to a backup folder. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name keys; done`
5. Move these keys directories to a backup location
6. The VERSION file of SCM has to be updated similarly to Ozone Manager's VERSION file. To locate both the SCM and OM VERSION files on the hosts, execute the following command: `find / -name om -o -name scm 2>/dev/null | while read line; do find $line -name VERSION; done | sort | uniq`
7. Backup the version file (just in case you need to restore for any reason)
8. In OM's VERSION file remove the line starting with omCertSerialId, in SCM's VERSION file remove the line starting with scmCertSerialId.
9. Start the stopped Ozone roles and certificates will be regenerated during startup.

CDPD-35632: The default block level checksum does not work when running distcp from HDFS to Ozone or the other way around, because the two file systems manage underlying blocks very differently.

Use a file level checksum instead. For example, append ``-Ddfs.checksum.combine.mode=COMPOSITE_CRC`` to the distcp command.

CDPD-43942: Requests to modify an Ozone S3 tenant may fail with the error "Timed out acquiring authorizer write lock. Another multi-tenancy request is in-progress." even if another request is not in progress.

Retry the request.

CDPD-36389: The configurations `datanodes.involved.max.percentage.per.iteration` and `size.moved.max.per.iteration` are meant to limit the max number of DataNodes that is involved and maximum size that can move in an iteration. This bug causes balancer to stop an iteration when it is two DataNodes or 1 Container size (5GB) away from hitting these limits. However, these DataNodes can again be considered for balancing in the next iteration. This means the cluster is balanced after enough iterations, albeit a bit slowly. This bug is apparent in small clusters of around four DataNodes where the DataNodes can be either the source or target for a lot of moves but the iteration gets stopped when three DataNodes have been involved. It takes a higher number of iterations to eventually balance this cluster. While this is a performance issue, it does not prevent balancer from ultimately balancing the cluster.

Increase the speed for balancing by decreasing the interval between each iteration using the configuration `balancing.iteration.interval`. The value of this configuration must be greater than `hdds.datanode.du.refresh.period`. `size.moved.max.per.iteration` can be increased to allow more data to move in one iteration.

CDPD-22519: HDFS user is unable to run Ozone SCM client CLI.

SCM client CLIs are run using SCM user.

CDPD-34187: This is an usability issue where warnings are displayed on the console while running Ozone fs/CLI commands, which restricts user experience. .

Instead of logging into the user console, you redirect these log messages to a file called ozone-shell-log4j.properties which should avoid warnings to the user. Ozone-shell commands used a similar method of directing messages to the LogFile.

CDPD-35141: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive.ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2> (state=08S01,code=40000) java.sql.SQLException: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive.ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2>. This issue does not occur if the source and target buckets are different in Hive queries. Currently, copying across the same bucket is only supported.

Avoid different buckets in source and target path. Ensure that hive.exec.stagingdir is unset or set to the same bucket as the warehouse so that staging directories are created in the same bucket as the warehouse.

CDPD-40594: Ozone admin container create command does not work. The command fails at getCAList for the SCM Client to create a container.

Avoid using the create container command

CDPD-40966: df command on Ozone returns incorrect result.

None

CDPD-41184: With Legacy buckets, FileSystem Optimised is not interoperating with the Ozone shell command. The cause is that the directory key entry in the DB KeyTable is stored as "dir1/" with trailing slash. But while performing the described operation, Ozone shell (o3://) is normalizing the given path and removing the trailing slash "/" from it. That results in KEY_NOT_FOUND exception.

There are three workarounds:

- Use FileSystem API to Delete the Directories rather than Shell-Command API.
- Use FSO buckets instead of Legacy Buckets. As in FSO, you can create Intermediate Directories and Delete Directories using the Ozone shell commands.
- Disable and set the configuration ozone.om.enable.filesystem.pathsflag to false in order to delete the directories. This is generally not a preferred workaround because the cluster must be restarted to pick up the new changes.

CDPD-34867: Container Balancer might not balance if only Over-Utilized or only Under-Utilized DataNodes are reported. The log line displays the "Container Balancer has identified x Over-Utilized and y Under-Utilized DataNodes that need to be balanced" message where one of x or y will be 0.

Decrease the threshold using "utilization.threshold". This allows the balancer to find non zero number of both over and under utilized nodes.

CDPD-12966: Ozone du -s -h should report correct values with replication information.

None

CDPD-12542: Mount of Ozone filesystem with the help of FUSE fails.

None

CDPD-31910: In a non-Ranger deployment, the owner/group are shown based on Kerberos user or sudo user.

For correct owner/group, user needs a Ranger deployment.

CDPD-42691: During the upgrade - all pipelines will be closed when the upgrade is finalized on SCM, temporarily bringing the cluster to a read-only state.

When you execute the finalize command, the cluster will temporarily go into a read-only state.

CDPD-42945: When many EC buckets are created with different EC chunk sizes, it creates pipeline for each chunk size. As a result, large number of pipelines are created in the system.

None

OPSAPS-60721: Ozone SCM Primordial Node ID is a required field which needs to be specified with one of the SCM hostnames during Ozone HA installation. In Cloudera Manager this field is not mandatory during Ozone deployment. This can cause end users to continue further with installation which causes startup to fail in Ozone services.

During Ozone HA installation make sure that Ozone SCM Primordial Node ID is specified with one of the SCM hostname.

HDDS-4209: S3A Filesystem does not work with Ozone S3 in file system compact mode. When you create a directory, the S3A filesystem creates an empty file. When the ozone.om.enable.filesystem.paths parameter is enabled, the `hdfs dfs -mkdir -p s3a://b12345/d11/d12` command runs successfully. However, running the `hdfs dfs -put /tmp/file1 s3a://b12345/d11/d12/file1` command fails with an error: `ERROR org.apache.hadoop.ozone.om.request.key.OMKeyCreateRequest: Key creation failed.`

The HDDS-4209 Jira fixes the file system semantics and management in Ozone. On top of the flat name structure, which is Pure Object store, as a workaround the Hierarchical namespace structure is added. This ensures S3A compatibility with Ozone.

CDPD-42897: EC writes are failing with "No enough datanodes to choose" after EC replication config is set globally.

EC writes start failing when large number of pipelines are created as a result of multiple EC configs with different chunk sizes used to write keys.

If standard EC configs (that is, rs-3-2-1024k) are used to write keys, number of pipelines created per DataNode is limited to five and this issue is not seen with standard EC configs.

The recommendation is not to create too many random chunk sizes. It is configurable because, users can decide based on their workload. But do not to have separate chunk sizes for each file.

CDPD-41539: The "No such file or directory" imessage is displayed when EC file is read using older of client.

You must upgrade the client before trying to read the key: `vol1/ecbuck1/1GB_ec`.

CDPD-40560: Filesystem Operations using Hadoop S3a connector on a FILE_SYSTEM_OPTIMIZED bucket fails. `org.apache.hadoop.ozone.om.exceptions.OMException: Unable to get file status: volume: s3v bucket: fso key: test/`

Do not run Hadoop S3a commands on a FILE_SYSTEM_OPTIMIZED bucket. Use OBJECT_STORE bucket layouts.

CDPD-42832: With this issue, any long running setup or a production server results in data corruption due to inconsistency issues. This may result in major issues with the existing Legacy layout type.

FSO provides atomicity and consistency guarantees for the path (dir or file) rename/delete operations irrespective of the large sub-dirs/files contained in it. These capabilities help to make the long running test more consistent without any failures so far. Recommendation is to run bigdata HCFS workloads using the FSO bucket layout types.

CDPD-43432: Ozone Service in fault state in DataNode - Long Running setup.

Upgrade RocksDB to the latest version.

OPSAPS-63999: In the newly installed cluster, the Finish upgrade option is clickable.

None

OPSAPS-64648: Failed to start Ozone node using Cloudera Manager if default log path `/var/log/hadoop-ozone` does not exist. If this path does not exist, any Ozone nodes (for example SCM or DataNode) restart will fail.

Run the following command `sudo -u hdfs mkdir -p /var/log/hadoop-ozone` or replace hdfs with the user Ozone roles that are running.

CDPD-45932: Investigate impersonation with "is admin" in Ozone WebUIs /logLevel servlet endpoint

In a secure Kerberized cluster, due to an impersonation issue, changing log levels using Knox on the corresponding endpoint of the WebUI does not work. Note that this is only true, when the WebUI is accessed using Knox. Other means of changing log levels in Ozone services are not affected by this problem.

None.

Technical Service Bulletins**TSB 2025-820: Potential Data Integrity Issues Found in Ozone**

The Cloudera Engineering team has identified the following data integrity issues with Apache Ozone (Ozone):

1. In certain situations, handling of failure paths when recovering from disk hardware failures, disk full situations, or over-replication can result in the incorrect deletion of some storage containers on those disk(s). In rare cases, all replicas of the container can be affected, leading to the data within that container becoming unavailable. Under certain extreme conditions, permanent data loss could occur.

Reference: CDPD-83416

2. A bug in the snapshot deep cleaning service and the object deletion path can lead to potential missing blocks of a snapshot key. This can happen only for the keys that were deleted from the active object store after the snapshot was created.

Reference: CDPD-83417

Knowledge article

For the latest update on this issue see the corresponding Knowledge article: [TSB 2025-820: Potential Data Integrity Issues Found in Ozone](#)

TSB 2025-835: Dry run of incremental Ozone replication can cause failure to replicate some changes in Cloudera Replication Manager

Executing the "Dry Run" action for Ozone replication schedules with a "Listing type" of "Incremental only" or "Incremental with fallback to full file listing" will result in a run where the changes are not replicated and also omitted from the subsequent replication runs.

Unless a "Full file listing" replication run is executed, the changes made between the dry run and the previous run are not replicated to the target. Such a scenario may occur when, during the dry run action of an Ozone replication policy with INCREMENTAL_ONLY and INCREMENTAL_WITH_FALLBACK_TO_FULL_FILE_LISTING replication type, generates a temporary snapshot on the source, which doesn't get deleted. On the next incremental run, all changes that occurred on the source Ozone bucket between the last successful run and the last dry run operation, will go unnoticed by the Replication Manager. This situation results in the failure to replicate such changes, to the destination Ozone bucket.

Knowledge article

For the latest update on this issue see the corresponding Knowledge article: [TSB 2025-835: Dry run of incremental Ozone replication can cause failure to replicate some changes in Cloudera Replication Manager](#)

Known Issues in Parquet

There are no known issues for Parquet in Cloudera Runtime 7.1.9 SP1.

Known Issues in Phoenix

There are no known issues for Phoenix in Cloudera Runtime 7.1.9 SP1.

Known Issues in Queue Manager

Learn about the known issues in Queue Manager, the impact or changes to the functionality, and the workaround.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

Known Issues in Ranger

Learn about the known issues in Ranger, the impact or changes to the functionality, and the workaround.

OPSAPS-75673: Wrong enablement of Ranger RMS Database Full Sync command

The Ranger RMS Database Full Sync command should be enabled only when all RMS server instances are stopped. This is required to ensure that the RMS database synchronizes correctly without introducing conflicts or data corruption. However, when HA (High Availability) is enabled on the cluster, the command becomes available from Cloudera Manager Ranger RMS Actions drop-down, even though only one Ranger RMS instance is stopped while the others are still running.

None.

UnsupportedClassVersionError

JDK 8 deployments support Nashorn JavaScript engine, which is built-in and fully compatible, whereas JDK 17 deployments support GraalJS script engine due to unavailability of Nashorn.

When your cluster supports both JDK 8 and JDK 17, then while a Java application, running on JDK 8, uses generic interfaces like ScriptEngine (from the javax.script package), the ScriptEngineManager class scans the classpath for available script engine implementations through the service provider mechanism, and detects the GraalJS as a provider for JavaScript, because in this case the GraalJS library (version 22.3.0) is also included on the classpath. The ScriptEngineManager then attempts to instantiate it, when requesting a "js" or "javascript" engine, and triggers an UnsupportedClassVersionError.

Remove the GraalJS library from the classpath.

CDPD-66092: Upgrade from CDP-7.1.8 to 7.1.9 fails, Ranger shows no policies at all, due to Java patches not being applied during upgrade. This causes rolling restart of services to fail.

Skip applying any of the following java patches NOT applicable to the underlying environment. In other words, do not apply patches for a service definition that does not appear in ranger database.

Table 1: Java Patches and Related Service Definitions

Java patch	Service-definition
PatchForHiveServiceDefUpdate_J10027.java	Hive
PatchForTagServiceDefUpdate_J10028.java	Tag
PatchForHBaseServiceDefUpdate_J10035.java	HBase

Method) ~[?:?]
    at jdk.internal.reflect.NativeMethodAccessorImpl.invoke(NativeMe
thodAccessorImp

```

This exception is logged, since mandatory JWT auth filter configs are not provided (expected for some environments like y-cloud) Even though JWT auth filter is failed to initialised, it falls back to kerberos auth, hence no impact from auth perspective

NA

CDPD-56738: Ranger RMS showing FileNotFoundException: /usr/share/java/oraclepki.jar in Oracle 19 setup

This is a warning log printed in catalina.out file when Ranger RMS server is initialised. Following exception is observed only in Oracle 19 setup. FileNotFoundException: /usr/share/java/oraclepki.jar

NA

CDPD-55107: Not able to search using multiple user filter in access audit tab

If you were using multiple user search filters in Audit > Access Tab on Ranger Admin UI, after upgrading to CDP-7.1.9 that would not be supported. You can continue to search user with single search filter.

None

CDPD-48975: Ranger KMS KTS to KMS DB migration : keys with the same name but different case are not migrated

KMS keys are not case sensitive

No work arounds. Such keys combination are very rare and migration doc was updated to check such keys before starting the migration.

CDPD-58704: hadoop roll key / key delete command shows operation failed error when one KMS host is down, even when operation succeeds

In case of rollover/delete, client sends one more (last after delete request) request to KMS instances to clean their cache and that too to all registered kms instances. if one KMS instance is stopped (not deleted), client gets runtime exception.

This simply returns the runtime exception on client end for stopped instances but doesn't break any functionality.

CDPD-41582: Atlas Resource Lookup : Classification for "entity-type" lists only classification for the following payload:

```
{"resourceName": "classification", "userInput": "", "resources":  {"classification": []}}
```

expectation is to return all the classifications . But the response has only "classification" Happens similarly for entity-label , entity-business-metadata.

None.

CDPD-42598: Kafka policy creation allowed with incorrect permissions.

When creating a Kafka policy from the UI, the permissions "Idempotent write" and "Cluster action" are not displayed as they are not applicable for the "topic" resource, but when creating a policy for the "topic" resource with the permissions "Idempotent write" and "Cluster Action", the policy is created successfully when the expected behaviour is that the policy creation must fail as the permission is not applicable for the Kafka topic resource

None.

CDPD-40734: User allowed to insert data into a hive table when there is a deny policy on a table column.

A user is allowed to enter data into a table even if there is a deny policy present on one of the table columns.

Test scenario details:

```
Policy setup :-
policy 1 :- all access policy for hrt_qa, hive and impala users
resources - database - * , table - * , column - *
users : hrt_qa, hive, impala
access - all access allowed
policy 2 :- policy on test_1.table_1 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column - *
access :- all access allowed
policy 3 :- deny policy on test_1.table_1.c0 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column - c0
access - all access denied
data setup :-
```

```
database - test_1
table - table_1(c0 int, c1 int)
```

The user is able to insert data into the table.

None.

CDPD-58860: After upgrading CDP-7.1.8 to CDP-7.1.9, cdp-proxy token missing from Knox Ranger policy.

As part of [OPSAPS-67480](#) in 719 default ranger policy is added from cdp-proxy-token topology, so that after a new installation of CDP-7.1.9, the Knox Ranger policy includes cdp-proxy-token. However, upgrades do not add cdp-proxy-token to cm_knox policies automatically.

Manually add cdp-proxy-token to the Knox policy, using Ranger Admin Web UI.

1. Log in to Cloudera Manager Ranger Admin Web UI, as a Ranger administrator.
2. On Ranger Admin Web UI Service Manager Resource Knox, click cm_knox.
3. In Knox Policies, open the CDP Proxy UI, API and Token policy.
4. In Knox Topology*, add cdp-proxy-token.
5. Click Save.
6. Restart Ranger.

CDPD-68806: The Revoke operation for users belonging to a group or role permission does not function as expected.

List command is listing all the tables even when the user permission is revoked. And also the command does not add any deny policy to Ranger for that specific user.

For example:

user_1 is the part of group_1

user_2 is the part of role_1

Create a Ranger policy for group_1 and role_1 to access all the resources in HBase.

Try to revoke the permission for user_1 and user_2 using HBase shell global revoke command:

```
revoke 'user_1'
```

```
revoke 'user_2'
```

But there is no deny policy added for that user. And access is still granted to user_1 and user_2.

This behavior is currently not supported in HBase shell. Must be handled manually using the Ranger policy change.

CDPD-64939: Impala behavior differences across 717 SP3 and 719 SP1 releases.

Upgrading from Cloudera Runtime 7.1.7 Service Pack 3 to 7.1.9 Service Pack 1, for a GRANT statement involving multiple columns in a table, Impala service creates one Ranger policy for each column.

None

CDPD-68739: The revoke command does not work when using the HBase shell

While using the HBase shell, running the revoke command does not cancel the user permission. Users are able to perform actions even after running the revoke command.

For example:

When a user is granted permission to a particular table using the HBase grant command.

```
hbase:003:0> grant 'user_1', 'RWCA', 'some_abc_table'
```

And then execute the global revoke command for that user:

```
hbase:005:0> revoke 'user_1'
```

Permission for that user 'user_1' for the table 'some_abc_table' not got revoked.

None

CDPD-67238: Multiple Columns Revoke not generating policies with correct number of columns

As an example, when "revoke select(col1, col2,col3) on table demo.test from role Role3;" is done, the generated policy does not revoke the columns. Currently the revoke statement is only revoking if there is only one column.

None

CDPD-69412: revokeAccess() behaves differently from secureRevokeAccess() after RANGER-4638

In a non-Kerberized environment, you must use within revokeAccess(), "!isPolicyResourceSameAsRevokedResource" as the condition as it is used in secureRevokeAccess().

None

Known Issues in Ranger KMS

Learn about the known issues in Ranger, the impact or changes to the functionality, and the workaround.

CDPD-70115: Ranger KMS with Oracle DB not supported for Navigator Encrypt

Navigator Encrypt deposit registration is failing with Ranger KMS DB with Oracle DB setup with the following error:

```
java.sql.SQLException: ORA-02289: sequence does not exist
Error Code: 2289
```

None.

Known Issues in Schema Registry

Learn about the known issues in Schema Registry, the impact or changes to the functionality, and the workaround.

CDPD-40380: Authorization checking issue when Kerberos is disabled

Due to an issue in Ranger, when Kerberos is disabled then it is not possible to check authorization.

1. Open Schema Registry configuration in Cloudera Manager.
2. Find the ranger.plugin.schema-registry.service.name field.
3. Replace GENERATED_RANGER_SERVICE_NAME with the actual name of the service.
4. Restart the Schema Registry service.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

CDPD-60160: Schema Registry Atlas integration does not work with Oracle databases

Schema Registry is unable to create entities in Atlas if Schema Registry uses an Oracle database. The following will be present in the Schema Registry log if you are affected by this issue:

```
ERROR com.cloudera.dim.atlas.events.AtlasEventsProcessor: An error occurred while processing Atlas events.
java.lang.IllegalArgumentException: Cannot invoke com.hortonworks.registries.schemaregistry.AtlasEventStorable.setType on bean class 'class com.hortonworks.registries.schemaregistry.AtlasEventStorable' - argument type mismatch - had objects of type "java.lang.Long" but expected signature "java.lang.Integer"
```

This issue causes the loss of audit data on Oracle environments.

None.

CDPD-59015: Schema Registry does not create new versions of schemas even if the schema is changed

Schema Registry uses a schema fingerprinting mechanism to differentiate between schemas. However, fingerprinting does not take into consideration the schema attributes of the field type. As a result, if you have two schemas where the only difference is that one has type attributes defined and the other does not, they will be considered identical by Schema Registry. For example, the following schemas are considered identical:

```
#Schema V1
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":"long"}]}

#Schema V2
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":{"type":"long","logicalType":"local-timestamp-micros"}}]}
```

Notice that the only difference is that in the second schema, the `local_timestamp_micros_long` field has a logical type specified. In cases like this, the new version of the schema is not created, the initial version is used. This is true even if the data that is being produced has a new schema version. The ID of the first schema version is used and is put in the serialized record. The new schema version is not created.

This issue is common when using change data capture (CDC) connectors like the Debezium connectors. This is because CDC connectors create schemas with the logical type decimal based on the column type in the database schema. For example:

```
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"database_column","type":{"type":"bytes","logicalType":"decimal","precision":64,"scale":0}}]}
```

If the database schema changes (for example, the column type), it is possible that only scale changes, which is a schema attribute.

```
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"database_column","type":{"type":"bytes","logicalType":"decimal","precision":64,"scale":1}}]}
```

In this case, even though scale changed to 1, the first version of the schema is used where scale is 0. As a result, the data is consumed with the wrong scale.

Avoid using logical types or other attributes. Alternatively, ensure that there are no changes in the logical types or other attributes between schema versions.

OPSAPS-68708: Schema Registry might fail to start if a load balancer address is specified in Ranger

Schema Registry does not start if the address specified in the Load Balancer Address Ranger property does not end with a trailing slash (/).

Set the value of the `RANGER_REST_URL` Schema Registry environment variable to an address that includes a trailing slash.

1. In Cloudera Manager, select the Schema Registry service.
2. Go to Configuration.
3. Find the Schema Registry Server Environment Advanced Configuration Snippet (Safety Valve) property and add the following:

```
Key: RANGER_REST_URL
```

```
Value: [***RANGER REST API URL***]
```

Replace [***RANGER REST API URL***] with an address that can be used by Schema Registry to access Ranger. Ensure that the address ends with a trailing slash. For example: `https://ranger-1.cloudera.com:6182/`

4. Restart the Schema Registry service.

OPSAPS-70971: Schema Registry does not have permissions to use Atlas after an upgrade

Following an upgrade, Schema Registry might not have the required permissions in Ranger to access Atlas. As a result, Schema Registry's integration with Atlas might not function in secure clusters where Ranger authorization is enabled.

1. Access the Ranger Console (Ranger Admin web UI).
2. Click the `cm_atlas` resource-based service.
3. Add the `schemaregistry` user to the `all - *` policies.
4. Click `Manage Service Edit Service`.
5. Add the `schemaregistry` user to the `default.policy.users` property.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to `required`. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to `requested` instead of `required` and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Known Issues in Search Client

Learn about the known issues in Search Client, the impact or changes to the functionality, and the workaround.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

Known Issues in Solr

Learn about the known issues in Apache Solr, the impact or changes to the functionality, and the workaround.

HBase Indexer does not work with JDK 17

Depending on the Cloudera Manager version used with CDP, HBase Indexer (KS Indexer) may have compatibility issues with JDK 17.

You have the following options to fix this issue:

- Upgrade Cloudera Manager to version 7.11.3 or higher.
- If upgrading Cloudera Manager is not an option, you can manually add the following to HBase Indexer Java options in Cloudera Manager:

```
--add-opens java.base/java.nio=ALL-UNNAMED --add-opens java.base/java.util.concurrent.atomic=ALL-UNNAMED --add-opens java.base/java.lang=ALL-UNNAMED --add-opens java.base/java.lang.reflect=ALL-UNNAMED
```

Splitshard operation fails after CDH 6 to CDP upgrade

Collections are not reindexed during an upgrade from CDH 6 to CDP 7 because Lucene 8 (CDP) can read Lucene 7 (CDH 6) indexes.

If you try to execute a SPLITSHARD operation against such a collection, it fails with a similar error message:

```
o.a.s.h.a.SplitOp ERROR executing split: => java.lang.IllegalArg

Solr does not support rolling upgrade to release 7.1.9 or lower

Solr supports rolling upgrades from release 7.1.9 and higher. Upgrading from a lower version means that all the Solr Server instances are shut down, parcels upgraded and activated and then the Solr Servers are started again. This causes a service interruption of several minutes, the actual value depending on cluster size.

Services like Atlas and Ranger that depend on Solr, may face issues because of this service interruption.

None.

Unable to see single valued and multivalued empty string values when querying collections after upgrade to CDP

After upgrading from CDH or HDP to CDP, you are not able to see single valued and multi Valued empty string values in CDP.

This behavior in CDP is due to the remove-blank processor present in solrconfig.xml in Solr 8.

Remove the remove-blank processor from solrconfig.xml.

Cannot create multiple heap dump files because of file name error

Heap dump generation fails with a similar error message:

```
java.lang.OutOfMemoryError: Java heap space
Dumping heap to /data/tmp/solr_solr-SOLR_SERVER-fc9dacc265fabfc5
00b92112712505e3_pid{{PID}}.hprof ...
Unable to create /data/tmp/solr_solr-SOLR_SERVER-fc9dacc265fab
fc500b92112712505e3_pid{{PID}}.hprof: File exists
```

The cause of the problem is that {{PID}} does not get substituted during dump file creation with an actual process ID and because of that, a generic file name is generated. This causes the next dump file creation to fail, as the existing file with the same name cannot be overwritten.

You need to manually delete the existing dump file.

Solr coreAdmin status throws Null Pointer Exception

You get a Null Pointer Exception with a similar stacktrace:

```
Caused by: java.lang.NullPointerException
    at org.apache.solr.core.SolrCore.getInstancePath(SolrCore.
java:333)
    at org.apache.solr.handler.admin.CoreAdminOperation.getCor
eStatus(CoreAdminOperation.java:324)
    at org.apache.solr.handler.admin.StatusOp.execute(StatusOp.
java:46)
    at org.apache.solr.handler.admin.CoreAdminOperation.execute
(CoreAdminOperation.java:362)
```

This is caused by an error in handling solr admin core STATUS after collections are rebuilt.

Restart the Solr server.

Applications fail because of mixed authentication methods within dependency chain of services

Using different types of authentication methods within a dependency chain, for example, configuring your indexer tool to authenticate using Kerberos and configuring your Solr Server to use LDAP for authentication may cause your application to time out and eventually fail.

Make sure that all services in a dependency chain use the same type of authentication.

API calls fail with error when used with alias, but work with collection name

API calls fail with a similar error message when used with an alias, but they work when made using the collection name:

```
[ ] o.a.h.s.t.d.w.DelegationTokenAuthenticationFilter Authenti
cation exception: User: xyz@something.example.com is not allowed
to impersonate xyz@something.example.com
[c:RTOTagMetaOdd s:shard3 r:core_node11 x:RTOTagMetaOdd_shar
d3_replica_n8] o.a.h.s.t.d.w.DelegationTokenAuthenticationFilter
Authentication exception: User: xyz@something.example.com is not
allowed to impersonate xyz@something.example.com
```

Make sure there is a replica of the collection on every host.

CrunchIndexerTool does not work out of the box if /tmp is mounted noexec mode

When you try to run CrunchIndexerTool with the /tmp directory mounted in noexec mode, It throws a snappy-related error.

Create a separate directory for snappy temp files which is mounted with EXEC privileges and set this directory as the value of the org.xerial.snappy.tmpdir java property as a driver java option.

For example:

```
export myDriverJarDir=/opt/cloudera/parcels/CDH//lib/solr/contri
b/crunch;export myDependencyJarDir=/opt/cloudera/parcels/CDH//
```

```
lib/search/lib/search-crunch;export myDriverJar=$(find $myDriverJarDir -maxdepth 1 -name 'search-crunch-*.jar' ! -name '*-job.jar' ! -name '*-sources.jar');export myDependencyJarFiles=$(find $myDependencyJarDir -name '*.jar' | sort | tr '\n' ',' | head -c -1);export myDependencyJarPaths=$(find $myDependencyJarDir -name '*.jar' | sort | tr '\n' ':' | head -c -1);export HADOOP_CONF_DIR=;spark-submit --master local --deploy-mode client --driver-library-path /opt/cloudera/parcels/CDH//lib/hadoop/lib/native/ --jars $myDependencyJarFiles --driver-java-options ' -Dorg.xerial.snappy.tmpdir=/home/systest/tmp ' --class org.apache.solr.crunch.CrunchIndexerTool $myDriverJar --input-file-format=avroParquet --input-file-reader-schema search-parquetfile/parquet-schema.avsc --morphline-file /tmp/mrTestBase.conf --pipeline-type spark --chatty hdfs://[***HOSTNAME***]:8020/tmp/parquetfileparsertest-input
```

Mergeindex operation with --go-live fails after CDH 6 to CDP upgrade

During an upgrade from CDH6 to CDP, collections are not reindexed because Lucene 8 (CDP) can read Lucene 7 (CDH6) indexes.

If you try to execute MapReduceIndexerTool (MRIT) or HBase Indexer MRIT with --go-live against such a collection, you get a similar error message:

```
Caused by: java.lang.IllegalArgumentException: Cannot merge a segment that has been created with major version 8 into this index which has been created by major version 7
    at org.apache.lucene.index.IndexWriter.validateMergeReader(IndexWriter.java:2894)
    at org.apache.lucene.index.IndexWriter.addIndexes(IndexWriter.java:2960)
    at org.apache.solr.update.DirectUpdateHandler2.mergeIndexes(DirectUpdateHandler2.java:570)
    at org.apache.solr.update.processor.RunUpdateProcessor.processMergeIndexes(RunUpdateProcessorFactory.java:95)
    at org.apache.solr.update.processor.UpdateRequestProcessor.processMergeIndexes(UpdateRequestProcessor.java:63)
```

This happens because CDP MRIT and HBase indexer use Solr 8 as embedded Solr, which creates a Lucene 8 index. It cannot be merged (using MERGEINDEXES) into an older Lucene 7 index.

In the case of MRIT the only way to move past this issue is to drop the entire collection, delete the data in HDFS and recreate the collection with Solr 8 configs.

For HBase Indexer MRIT an alternative workaround is setting the number of reducers to 0 (--reducers 0) because in this case documents are sent directly from the mapper tasks to live Solr servers instead of using MERGEINDEXES.

Apache Tika upgrade may break morphlines indexing

The upgrade of Apache Tika from 1.27 to 2.3.0 brought potentially breaking changes for morphlines indexing. Duplicate/triplicate keys names were removed and certain parser class names were changed (For example, org.apache.tika.parser.jpeg.JpegParser changed to org.apache.tika.parser.image.JpegParser).

To avoid morphline commands failing after the upgrade, do the following:

- Check if key name changes affect your morphlines. For more information, see *Removed duplicate/triplicate keys* in [Migrating to Tika 2.0.0](#).
- Check if the name of any parser you use has changed. For more information, see the Apache Tika [API documentation](#).

Update your morphlines if necessary.

CDPD-28006: Solr access via Knox fails with impersonation error though auth_to_local and proxy user configs are set

Currently the names of system users which are impersonating users with Solr should match with the names of their respective Kerberos principals.

If, for some reason, this is not feasible, you must add the user name you want to associate with the custom Kerberos principal to Solr configuration via the Solr Service Environment Advanced Configuration Snippet (Safety Valve) environment variable in Cloudera Manager.

For more information, see [Configuring custom Kerberos principals and custom system users](#).

CDH-77598: Indexing fails with socketTimeout

Starting from CDH 6.0, the HTTP client library used by Solr has a default socket timeout of 10 minutes. Because of this, if a single request sent from an indexer executor to Solr takes more than 10 minutes to be serviced, the indexing process fails with a timeout error.

This timeout has been raised to 24 hours. Nevertheless, there still may be use cases where even this extended timeout period proves insufficient.

If your MapreduceIndexerTool or HBaseMapreduceIndexerTool batch indexing jobs fail with a timeout error during the go-live (Live merge, MERGEINDEXES) phase (This means the merge takes longer than 24 hours).

Use the --go-live-timeout option where the timeout can be specified in milliseconds.

CDPD-12450: CrunchIndexerTool Indexing fails with socketTimeout

The http client library uses a socket timeout of 10 minutes. The Spark Crunch Indexer does not override this value, and in case a single batch takes more than 10 minutes, the entire indexing job fails. This can happen especially if the morphlines contain DeleteByQuery requests.

Try the following workarounds:

- Check the batch size of your indexing job. Sending too large batches to Solr might increase the time needed on the Solr server to process the incoming batch.
- If your indexing job uses deleteByQuery requests, consider using deleteById wherever possible as deleteByQuery involves a complex locking mechanism on the Solr side which makes processing the requests slower.
- Check the number of executors for your Spark Crunch Indexer job. Too many executors can overload the Solr service. You can configure the number of executors by using the --mappers parameter
- Check that your Solr installation is correctly sized to accommodate the indexing load, making sure that the number of Solr servers and the number of shards in your target collection are adequate.
- The socket timeout for the connection can be configured in the morphline file. Add the solrClientSocketTimeout parameter to the solrLocator command

Example

```
SOLR_LOCATOR :
{
  collection : test_collection
  zkHost : "zookeeper1.example.corp:2181/solr"
  # 10 minutes in milliseconds
  solrClientSocketTimeout: 600000
  # Max number of documents to pass per RPC from morphline to
  Solr Server
  # batchSize : 10000
}
```

CDPD-29289: HBaseMapReduceIndexerTool fails with socketTimeout

The http client library uses a socket timeout of 10 minutes. The HBase Indexer does not override this value, and in case a single batch takes more than 10 minutes, the entire indexing job fails.

You can overwrite the default 600000 millisecond (10 minute) socket timeout in HBase indexer using the `--solr-client-socket-timeout` optional argument for the direct writing mode (when the value of the `--reducers` optional argument is set to 0 and mappers directly send the data to the live Solr).

CDPD-20577: Splitshard operation on HDFS index checks local filesystem and fails

When performing a shard split on an index that is stored on HDFS, `SplitShardCmd` still evaluates free disk space on the local file system of the server where Solr is installed. This may cause the command to fail, perceiving that there is no adequate disk space to perform the shard split.

Run the following command to skip the check for sufficient disk space altogether:

- On nonsecure clusters:

```
curl 'http://[${**SOLR_SERVER_HOSTNAME**}]:8983/solr/admin/collections?action=SPLITSHARD&collection=[**COLLECTION_NAME**]&shard=[**SHARD_TO_SPLIT**]&skipFreeSpaceCheck=true'
```

- On secure clusters:

```
curl -k -u : --negotiate 'http://[${**SOLR_SERVER_HOSTNAME**}]:8985/solr/admin/collections?action=SPLITSHARD&collection=[**COLLECTION_NAME**]&shard=[**SHARD_TO_SPLIT**]&skipFreeSpaceCheck=true'
```

Replace `[**SOLR_SERVER_HOSTNAME**]` with a valid Solr server hostname, `[**COLLECTION_NAME**]` with the collection name, and `[**SHARD_TO_SPLIT**]` with the ID of the to split.

To verify that the command executed successfully, check overseer logs for a similar entry:

```
2021-02-02 12:43:23.743 INFO (OverseerThreadFactory-9-thread-5-processing-n:myhost.example.com:8983_solr) [c:example s:shard1] o.a.s.c.a.c.SplitShardCmd Skipping check for sufficient disk space
```

DOCS-5717: Lucene index handling limitation

The Lucene index can only be upgraded by one major version. Solr 8 will not open an index that was created with Solr 6 or earlier.

None, you need to reindex collections.

CDH-22190: CrunchIndexerTool which includes Spark indexer requires specific input file format specifications

If the `--input-file-format` option is specified with `CrunchIndexerTool`, then its argument must be text, avro, or avroParquet, rather than a fully qualified class name.

None

CDH-26856: Field value class guessing and Automatic schema field addition are not supported with the MapReduceIndexerTool nor with the HBaseMapReduceIndexerTool

The `MapReduceIndexerTool` and the `HBaseMapReduceIndexerTool` can be used with a Managed Schema created via NRT indexing of documents or via the Solr Schema API. However, neither tool supports adding fields automatically to the schema during ingest.

Define the schema before running the `MapReduceIndexerTool` or `HBaseMapReduceIndexerTool`. In non-schemaless mode, define in the schema using the `schema.xml` file. In schemaless mode, either define the schema using the Solr Schema API or index sample documents using NRT indexing

before invoking the tools. In either case, Cloudera recommends that you verify that the schema is what you expect, using the List Fields API command.

CDH-19407: The Browse and Spell Request Handlers are not enabled in schemaless mode

The Browse and Spell Request Handlers require certain fields to be present in the schema. Since those fields cannot be guaranteed to exist in a Schemaless setup, the Browse and Spell Request Handlers are not enabled by default.

If you require the Browse and Spell Request Handlers, add them to the solrconfig.xml configuration file. Generate a non-schemaless configuration to see the usual settings and modify the required fields to fit your schema.

CDH-17978: Enabling blockcache writing may result in unusable indexes

It is possible to create indexes with solr.hdfs.blockcache.write.enabled set to true. Such indexes may appear corrupt to readers, and reading these indexes may irrecoverably corrupt indexes. Blockcache writing is disabled by default.

None

CDH-58276: Users with insufficient Solr permissions may receive a "Page Loading" message from the Solr Web Admin UI

Users who are not authorized to use the Solr Admin UI are not given a page explaining that access is denied to them, instead receive a web page that never finishes loading.

None

CDH-15441: Using MapReduceIndexerTool or HBaseMapReduceIndexerTool multiple times may produce duplicate entries in a collection

Repeatedly running the MapReduceIndexerTool on the same set of input files can result in duplicate entries in the Solr collection. This occurs because the tool can only insert documents and cannot update or delete existing Solr documents. This issue does not apply to the HBaseMapReduceIndexerTool unless it is run with more than zero reducers.

To avoid this issue, use HBaseMapReduceIndexerTool with zero reducers.

Note: This workaround is only valid for HBaseMapReduceIndexerTool. There is no workaround for MapReduceIndexerTool

CDH-58694: Deleting collections might fail if hosts are unavailable

It is possible to delete a collection when hosts that host some of the collection are unavailable. After such a deletion, if the previously unavailable hosts are brought back online, the deleted collection may be restored.

Ensure all hosts are online before deleting collections.

CDPD-13923: Every Configset is Untrusted Without Kerberos

Solr 8 introduces the concept of ‘[untrusted configset](#)’, denoting configsets that were uploaded without authentication. Collections created with an untrusted configset will not initialize if <lib> directives are used in the configset.

Select one of the following options if you would like to use untrusted configsets with <lib> directives:

- If the configset contains external libraries, but you do not want to use them, simply upload the configsets after deleting the <lib> directives.
- If the configset contains external libraries, and you want to use them, choose one from the following options:
 - Secure your cluster before reuploading the configset.
 - Add the libraries to Solr’s classpath, then reupload the configset without the <lib> directives.

Unsupported features

The following Solr features are currently not supported in Cloudera Data Platform:

- Panel with security info in admin UI's dashboard
- Incremental backup mode
- Schema Designer UI
- Package Management System
- HTTP/2
- Solr SQL/JDBC
- Graph Traversal
- Cross Data Center Replication (CDCR)
- SolrCloud Autoscaling
- HDFS Federation
- Saving search results
- Solr contrib modules (Spark, MapReduce and Lily HBase indexers are not contrib modules but part of the Cloudera Search product itself, therefore they are supported).

Limitations

Default Solr core names cannot be changed

Although it is technically possible to give user-defined Solr core names during core creation, it is to be avoided in the context of Cloudera's distribution of Apache Solr. Cloudera Manager expects core names in the default "collection_shardX_replicaY" format. Altering core names results in Cloudera Manager being unable to fetch Solr metrics for the given core and this may corrupt data collection for co-located core, or even shard, and server level charts.

Known Issues in Spark

Learn about the known issues in Spark, the impact or changes to the functionality, and the workaround.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94393: RuntimeWarning Failed to add file" message appears even when Spark successfully loads files

In both Spark 2 and 3, due to an exception when attempting to add files to the Python path, the RuntimeWarning: Failed to add file message appears even when the Python JAR file is successfully loaded.

None. You can safely ignore the message as the file is loaded successfully and the message does not affect job completion.

CDPD-67517: Spark3 tests are failing if /tmp is mounted as NOEXEC.

Map the tmpdir to a writable path in spark3-conf/spark-defaults.conf using the following steps:

1. Go to the Cloudera Manager.
2. Go to the Spark service.
3. Click the Configuration tab.
4. Select Scope Gateway .
5. Select Category Advanced .
6. Locate the Spark Client Advanced Configuration Snippet (Safety Valve) for spark3-conf/spark-defaults.conf_client_config_safety_valve property.
7. Map the tmpdir to a writable path:

```
spark.driver.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
spark.executor.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
```

8. Enter a Reason for change, and then click Save Changes to commit the changes.
9. Deploy the client configuration.

CDPD-23817: In the upgraded Cluster, the permission of /tmp/spark is restricted due to the HDP configuration hive.exec.scratchdir=/tmp/spark.

If you are using the /tmp/spark directory in the CDP cluster, you must provide the required additional Policies/ACL permissions.

CDPD-22670 and CDPD-23103: There are two configurations in Spark, "Atlas dependency" and "spark_lineage_enabled", which are conflicted. The issue is when Atlas dependency is turned off but spark_lineage_enabled is turned on.

Run Spark application, Spark will log some error message and cannot continue. That can be restored by correcting the configurations and restarting Spark component with distributing client configurations.

CDPD-23007: Mismatch in the Spark Default DB Location. In HDP 3.1.5, hive_db entities have one attribute - 'location' which is configured to the '/managed' path. In fresh install of CDP 7.1.7, hive_db entities now have 2 attributes 'location' configured to '/external' path and 'managedLocation' configured to '/managed' path. In the AM2CM migration (HDP 3.1.5 -> CDP 7.1.7), the 'location' attribute from hive_db entities in HDP 3.1.5 comes unaltered to CDP 7.1.7 and hence maps to '/managed' path.

This issue arises only if you are upgrading from HDP 3.1.5 to CDP 7.1.7. If you are performing a fresh install of CDP 7.1.7, you can ignore this issue.

None

CDPD-217: The Apache Spark connector is not supported

The old *Apache Spark - Apache HBase Connector* (shc) is not supported in CDP releases.

Use the new HBase-Spark connector shipped in CDP release.

CDPD-3038: Launching pyspark displays several HiveConf warning messages

When pyspark starts, several Hive configuration warning messages are displayed, similar to the following:

```
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of name hive.meta
store.runworker.in does not exist
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of
name hive.masking.algo does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of
name hive.metastore.runworker.in does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of na
me hive.masking.algo does not exist
```

These errors can be safely ignored.

Known Issues in Streams Replication Manager

Learn about the known issues in Streams Replication Manager, the impact or changes to the functionality, and the workaround.

Known Issues

CDPD-22089: SRM does not sync re-created source topics until the offsets have caught up with target topic

Messages written to topics that were deleted and re-created are not replicated until the source topic reaches the same offset as the target topic. For example, if at the time of deletion and re-creation there are a 100 messages on the source and target clusters, new messages will only get replicated once the re-created source topic has 100 messages. This leads to messages being lost.

None

CDPD-11079: Blacklisted topics appear in the list of replicated topics

If a topic was originally replicated but was later excluded for replication, it will still appear as a replicated topic under the /remote-topics REST API endpoint. As a result, if a call is made to this endpoint, this topic will be included in the response. Additionally, the excluded topic will also be visible in the SMM UI. However, its Partitions and Consumer Groups will be 0, its Throughput, Replication Latency and Checkpoint Latency will show N/A.

None

CDPD-30275: SRM may automatically re-create deleted topics on target clusters

If `auto.create.topics.enable` is enabled, deleted topics might get automatically re-created on target clusters. This is a timing issue. It only occurs if remote topics are deleted while the replication of the topic is still ongoing.

1. Remove the topic from the topic allowlist with `srm-control`. For example:

```
srm-control topics --source [SOURCE_CLUSTER] --target [TARGET_CLUSTER] --remove [TOPIC1]
```

2. Wait until SRM is no longer replicating the topic.
3. Delete the remote topic in the target cluster.

Limitations

SRM cannot replicate Ranger authorization policies to or from Kafka clusters

Due to a limitation in the Kafka-Ranger plugin, SRM cannot replicate Ranger policies to or from clusters that are configured to use Ranger for authorization. If you are using SRM to replicate data to or from a cluster that uses Ranger, disable authorization policy synchronization in SRM. This can be achieved by clearing the Sync Topic Acls Enabled (`sync.topic.acls.enabled`) checkbox.

SRM cannot ensure the exactly-once semantics of transactional source topics

SRM data replication uses at-least-once guarantees, and as a result cannot ensure the exactly-once semantics (EOS) of transactional topics in the backup/target cluster.

Note: Even though EOS is not guaranteed, you can still replicate the data of a transactional source, but you must set `isolation.level` to `read_committed` for SRM's internal consumers. This can be done by adding `[***SOURCE CLUSTER ALIAS***]->[***TARGET CLUSTER ALIAS***].consumer.isolation.level=read_committed` to the Streams Replication Manager's Replication Configs SRM service property in Cloudera Manager. The `isolation.level` property can be set on a global connector or replication level. For example:

```
#Global connector level
connectors.consumer.isolation.level
=read_committed
#Replication level
uswest->useast.consumer.isolation.l
evel=read_committed
```

SRM checkpointing is not supported for transactional source topics

SRM does not correctly translate checkpoints (committed consumer group offsets) for transactional topics. Checkpointing assumes that the offset mapping function is always increasing, but with transactional source topics this is violated. Transactional topics have control messages in them, which take up an offset in the log, but they are never returned on the consumer API. This causes the mappings to decrease, causing issues in the checkpointing feature. As a result of this limitation, failover operations for transactional topics is not possible.

Known Issues for Sqoop

Learn about the known issues in Sqoop, the impact or changes to the functionality, and the workaround.

CDPD-54770: Unable to read Sqoop metastore created by an older HSQLDB version

If you have upgraded to CDP PvC Base 7.1.8 Cumulative hotfix 4 or higher versions, you may encounter issues in reading the Sqoop metastore that was created using an older version of HyperSQL Database (HSQLDB).

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

After upgrading to CDP PvC Base 7.1.8 Cumulative hotfix 4, you must upgrade the Sqoop metastore and convert the database files to a format that can easily be read by HSQLDB 2.7.1. For more information, see [Troubleshooting Apache Sqoop issues](#).

CDPD-44431: Using direct mode causes problems

Using direct mode has several drawbacks:

- Imports can cause an intermittent and overlapping input split.
- Imports can generate duplicate data.
- Many problems, such as intermittent failures, can occur.
- Additional configuration is required.

Stop using direct mode. Do not use the `--direct` option in Sqoop import or export commands.

Sqoop direct mode is disabled by default. However, if you still want to use it, enable it by either setting the `sqoop.enable.deprecated.direct` property globally in Cloudera Manager for Sqoop or by specifying it in the command-line through `-Dsqoop.enable.deprecated.direct=true`.

CDPD-3089: Avro, S3, and HCat do not work together properly

Importing an Avro file into S3 with HCat fails with Delegation Token not available.

Parquet columns inadvertently renamed

Column names that start with a number are renamed when you use the `--as-parquetfile` option to import data.

Prepend column names in Parquet tables with one or more letters or underscore characters.

PARQUET-99: Importing Parquet files might cause out-of-memory (OOM) errors

Importing multiple megabytes per row before initial-page-run check (ColumnWriter) can cause OOM. Also, rows that vary significantly by size so that the next-page-size check is based on small rows, and is set very high, followed by many large rows can also cause OOM.

Known issues in Streams Messaging Manager

Learn about the known issues in Streams Messaging Manager, the impact or changes to the functionality, and the workaround.

OPSAPS-59597: SMM UI logs are not supported by Cloudera Manager

Cloudera Manager does not display a Log Files menu for SMM UI role (and SMM UI logs cannot be displayed in the Cloudera Manager UI) because the logging type used by SMM UI is not supported by Cloudera Manager.

View the SMM UI logs on the host.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker). Add the bootstrap server details in SMM safety valve in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Add the following value for bootstrap servers>Save Changes > Restart SMM.

```
streams.messaging.manager.kafka.bootstrap.servers=<comma-separated list of brokers>
```

CDPD-46728: SMM UI shows the consumerGroup instead of the instances on the Profile page's right hand side

On the ConsumerGroupDetail page, SMM UI shows the group instead of its instances on the right hand side table.

None.

CDPD-47836: The FROM OFFSET field of the offset slider in Data Explorer does not update on partition change

When changing the partition on the **Data Explorer** tab of a topic, the **FROM OFFSET** field of the offset slider is not updated to reflect the first offset of the newly selected partition. If the first offset of the newly selected partition differs from the previous one, the application throws an error. This issue only affects the **Data Explorer** tab, which is accessed from the topic details page of a topic.

This issue does not affect the **Data Explorer** modal window, which is accessed by clicking  next to the name of a topic.

After selecting a new partition, refresh the page. Alternatively, use the **Data Explorer** modal window.

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the hadoop.auth cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the www-authenticate: Negotiate header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at Clusters SMM Streams Messaging Manager Web UI and log in using the Kerberos username and password.

CDPD-82560: Streams Messaging Manager known unprotected endpoint

The Streams Messaging Manager Frontend exposes the /cm-configs and /configs public endpoints without requiring authentication. These endpoints do not share any sensitive information.

None.

CDPD-88488: The Streams Messaging Manager server fails to start if its keystore password starts with a special character or includes quotation marks

Ensure that the Streams Messaging Manager server keystore password meets the following requirements:

- It does not start with a special character. Special characters are permitted in other positions.
- It does not contain quotation marks (single or double) anywhere.

CDPD-76375: Topic column name is incorrect in the replications table

On the **Cluster Replications** page, in the replications table, the topic column name is incorrectly named **Source Topic Name** instead of Target Topic Name. This means that the **Source Topic Name** column currently shows the topic name on the target cluster, instead of the topic name on the source cluster.

Limitations**CDPD-36422: 1MB flow.snapshot freezes Safari**

While importing large connector configurations, flow.snapshots reduces the usability of the Streams Messaging Manager when using Safari browser.

Use a different browser (Chrome/Firefox/Edge).

Known Issues in MapReduce, YARN and YARN Queue Manager

Learn about the known issues in MapReduce and YARN, the impact or changes to the functionality, and the workaround.

Known Issues**COMPX-14820: Delete Queue and its Children throws "Queue capacity was reduced to zero, but failed to delete queue."**

When trying to perform the operation "Delete Queue and its Children" on a queue that has one or more siblings, the operation fails as YARN has some constraints. If the queue performing the operation "Delete Queue and its Children" is a leaf node, then the operations succeeds.

None.

COMPX-13177: QueueManager webapp requests fail with 'HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA'

Products:

- Cloudera Manager for CDP Private
- Cloud Base Cloudera Manager for CDP Public Cloud

Context:

- Centos 7.8 and Redhat 7.8 operating systems, when FIPS support is enabled.

Problem:

- When attempting to display the Yarn Queue Manager interface, Cloudera Manager displays an error: "HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA".

1. Edit the file [/etc/default/cloudera-scm-server]

2. Around line 28, modify the line that starts with

```
#export CMF_OVERRIDE_TLS_CIPHERS=...
```

3. Remove the comment mark #.
4. Remove all ciphers with "3DES" in the name.
5. Save the file.
6. Restart the Cloudera Manager Server service.

COMPX-4644: Queue capacity rounding problem when configuration is initially set via YARN

When setting the capacity scheduler configuration through the YARN/Cloudera Manager configuration, there may be capacity values that use multiple decimal places. This results in rounding/floating point precision discrepancies in the UI when trying to validate that all sibling capacities equal 100%. The UI looks like all the numbers add up to 100, but the validation still displays an error and does not allow to save the capacities. It is also observed that the capacity is being calculated as, for example, 99.9999999991 in the backend.

- Create queues within the UI, or
- Ensure that capacities configured through the Capacity Scheduler safety valve do not have more than one decimal place.

20202 Database migration after enabling opt-in migration

When migrating from an H2 database to a PostgreSQL database in YARN Queue Manager after installation or upgrade, you might encounter an issue only when you have followed the following specific scenario:

- New install or upgrade to CDP 7.1.9, forcing migration from H2 to PostgreSQL database.
- Upgrade to CDP 7.1.9 CHF2, moving back to H2 database.
- Upgrade to CDP 7.1.9 SP1 with valid PostgreSQL connection details in Queue Manager configurations.

To avoid any issues during the upgrade to version CDP 7.1.9 SP1, ensure that PostgreSQL connection details are removed from the YARN database configuration if you prefer to continue using the H2 database.

CDPD-56559: MapReduce jobs can intermittently fail during a rolling upgrade.

During a rolling upgrade between CDP versions 7.1.8 and 7.1.9, MapReduce jobs may fail with message, `RuntimeException: native snappy library not available`. Although the native Snappy compression library is not loaded, a checkmark displays to indicate that the Snappy compression library is loading for NodeManagers that are pending upgrades. This causes the MapReduce jobs that are associated with the NodeManagers to fail. After the upgrade, the jobs work as expected. This issue only impacts rolling upgrades from before CDP 7.1.9 to a higher version.

None.

COMPX-12021 Queue Manager configurations on Scheduler Configuration page are not working

When setting the following properties on the YARN Queue Manager UI, the properties are set in the `capacity-scheduler.xml` file which does not have any effect on YARN. The properties need to be set in the `yarn-site.xml` file, which does not happen when you set them through YARN Queue Manager.

- "Maximum Application Priority" – "yarn.cluster.max-application-priority"
- "Enable Monitoring Policies" – "yarn.resourcemanager.scheduler.monitor.enable"
- "Monitoring Policies" – "yarn.resourcemanager.scheduler.monitor.policies"

Note: You can also set this property on the YARN configuration page in Cloudera Manager as "Capacity Scheduler Preemption".

- "Preemption: Observe Only" – "yarn.resourcemanager.monitor.capacity.preemption.observe_only"

- "Preemption: Monitoring Interval (ms)" – `yarn.resourcemanager.monitor.capacity.preemption.monitoring_interval`
 - "Preemption: Maximum Wait Before Kill (ms)" – `yarn.resourcemanager.monitor.capacity.preemption.max_wait_before_kill`
 - "Preemption: Total Resources Per Round" – `yarn.resourcemanager.monitor.capacity.preemption.total_preemption_per_round`
 - "Preemption: Over Capacity Tolerance" – `yarn.resourcemanager.monitor.capacity.preemption.max_ignored_over_capacity`
 - "Preemption: Maximum Termination Factor" – `yarn.resourcemanager.monitor.capacity.preemption.natural_termination_factor`
 - "Enable Intra Queue Preemption" – `yarn.resourcemanager.monitor.capacity.preemption.intra-queue-preemption.enabled`
1. In Cloudera Manager, select the YARN service.
 2. Click the Configuration tab.
 3. Search for `yarn-site.xml`.
 4. Under YARN Service Advanced Configuration Snippet (Safety Valve) for `yarn-site.xml`, add the corresponding parameter and value you need.
 5. Click Save Changes.
 6. Restart the YARN services.

COMPX-11380 YARN Queue Manager displays an error stating that it is unable to complete a request

If YARN Queue Manager incorrectly detects an inactive Resource Manager, it displays an error stating that it is unable to complete a request.

Refresh the browser and reload the YARN Queue Manager UI.

COMPX-6214: When there are more than 600 queues in a cluster, potential timeouts occur due to performance reasons that are visible in the Configuration Service.

The Cloudera Manager proxy timeout configuration field is added now. This issue is tracked in OPSAPS-60554. For this release, the timeout is increased from 20 seconds to 5 minutes. However, if this problem occurs, Cloudera recommends you to increase the proxy timeout value.

COMPX-5817: YARN Queue Manager UI is not able to present a view of pre-upgrade queue structure. Cloudera Manager Store is not supported and therefore YARN does not have any of the pre-upgrade queue structure preserved.

When a Data Hub cluster is deleted, all saved configurations are also deleted. All YARN configurations are saved in Cloudera Manager Store and this is yet to be supported in Data Hub and Cloudera Manager. Hence, the YARN queue structure is also lost when a Data Hub cluster is deleted or upgraded or restored.

COMPX-6628: Unable to delete single leaf queue assigned to a partition.

In the current implementation, you cannot delete a single leaf queue assigned to a partition.

For each non-default partition, perform the following for the single child leaf queue and its parent queues:

1. In Cloudera Manager, click Cluster YARN .
2. Click the **Configuration** tab.
3. Search for ResourceManager. In the Filters pane, under Scope, select ResourceManager.
4. Add the following in Capacity Scheduler Configuration Advanced Configuration Snippet (Safety Valve):

```
Name: yarn.scheduler.capacity.<queuePath>.accessible-node-labels.<partition>.capacity
```

Value: 0

Set the value to 0 in Percentage mode, and 0w in Weight mode, and [memory=0,vcores=0] in Absolute mode.

Name: yarn.scheduler.capacity.<queuePath>.accessible-node-labels.<partition>.maximum-capacity
Value: 100

Set the value to 100 in Percentage and Weight mode and [memory=0,vcores=0] in Absolute mode.

5. Adjust the capacities of the siblings of the parent queue for the same partition.
6. Click Save Changes.
7. Restart the active **ResourceManager** service for the changes to apply.
8. In **Cloudera Manager**, click Cluster YARN Queue Manager UI .
9. Delete the desired single child leaf queue.

COMPX-5240: Restarting parent queue does not restart child queues in weight mode

When a dynamic auto child creation enabled parent queue is stopped in weight mode, its static and dynamically created child queues are also stopped. However, when the dynamic auto child creation enabled parent queue is restarted, its child queues remain stopped. In addition, the dynamically created child queues cannot be restarted manually through the YARN Queue Manager UI either.

Delete the dynamic auto child creation enabled parent queue. This action also deletes all its child queues, both static and dynamically created child queues, including the stopped dynamic queues. Then recreate the parent queue, enable the dynamic auto child creation feature for it and add the required static child queues.

COMPX-5589: Unable to add new queue to leaf queue with partition capacity in Weight/Absolute mode

Scenario

1. You create one or more partitions.
2. Assign a partition to a parent with children
3. Switch to the partition to distribute the capacities
4. Create a new child queue under one of the leaf queues but the following error is displayed:

```
Error :
2021-03-05 17:21:26,734 ERROR
com.cloudera.cpx.server.api.repositories.SchedulerRepository:
Validation failed for Add queue
operation. Error message: CapacityScheduler configuration
validation failed:java.io.IOException:
Failed to re-init queues : Parent queue 'root.test2' have
children queue used mixed of weight
mode, percentage and absolute mode, it is not allowed, please
double check, details:
{Queue=root.test2.test2childNew, label= uses weight mode}.
{Queue=root.test2.test2childNew,
label=partition uses percentage mode}
```

To create new queues under leaf queues successfully, perform the following:

1. Switch to Relative mode
2. Create the required queues
3. Create the required partitions
4. Assign partitions and set capacities
5. Switch back to Weight mode
1. Create the entire queue structure

2. Create the required partitions
3. Assign partition to queues
4. Set partition capacities

COMPX-5264: Unable to switch to Weight mode on creating a managed parent queue in Relative mode

In the current implementation, if there is an existing managed queue in Relative mode, then conversion to Weight mode is not allowed.

To proceed with the conversion from Relative mode to Weight mode, there should not be any managed queues. You must first delete the managed queues before conversion. In Weight mode, a parent queue can be converted into managed parent queue.

COMPX-5549: Queue Manager UI sets maximum-capacity to null when you switch mode with multiple partitions

If you associate a partition with one or more queues and then switch the allocation mode before assigning capacities to the queues, an Operation Failed error is displayed because `max-capacity` is set to null.

After you associate a partition with one or more queues, in the YARN Queue Manager UI, click Overview [***PARTITION NAME***] from the drop-down list and distribute capacity to the queues before switching allocation mode or creating placement rules.

COMPX-4992: Unable to switch to absolute mode after deleting a partition using YARN Queue Manager

If you delete a partition (node label) which has been associated with queues and those queues have capacities configured for that partition (node label), the `CS.xml` still contains the partition (node label) information. Hence, you cannot switch to absolute mode after deleting the partition (node label).

It is recommended not to delete a partition (node label) which has been associated with queues and those queues have capacities configured for that partition (node label).

COMPX-1445: YARN Queue Manager operations are failing when Queue Manager is installed separately from YARN

If Queue Manager is not selected during YARN installation, Queue Manager operations are failing. Queue Manager says 0 queues are configured and several failures are present. That is because ZooKeeper configuration store is not enabled.

1. In Cloudera Manager, select the YARN service.
2. Click the Configuration tab.
3. Find the Queue Manager Service property.
4. Select the Queue Manager service that the YARN service instance depends on.
5. Click Save Changes.
6. Restart all services that are marked stale in Cloudera Manager.

COMPX-1451: Queue Manager does not support multiple ResourceManagers

When YARN High Availability is enabled there are multiple ResourceManagers. Queue Manager receives multiple ResourceManager URLs for a High Availability cluster. It picks the active ResourceManager URL only when Queue Manager page is loaded. Queue Manager cannot handle it gracefully when the currently active ResourceManager goes down while the user is still using the Queue Manager UI.

Reload the Queue Manager page manually.

COMPX-3329: Autorestart is not enabled for Queue Manager in Data Hub

In a Data Hub cluster, Queue Manager is installed with autorestart disabled. Hence, if Queue Manager goes down, It does not restart automatically.

If Queue Manager goes down in a Data Hub cluster, you must go to the Cloudera Manager Dashboard and restart the Queue Manager service.

Third-party applications do not launch if MapReduce framework path is not included in the client configuration

MapReduce application framework is loaded from HDFS instead of being present on the NodeManagers. By default the `mapreduce.application.framework.path` property is set to the appropriate value, but third-party applications with their own configurations does not launch.

Set the `mapreduce.application.framework.path` property to the appropriate configuration for third-party applications.

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated the `mapred-site.xml` file that references the correct JobHistory Server.

CDH-49165: History link in ResourceManager web UI broken for killed Spark applications

When a Spark application is killed, the history link in the ResourceManager web UI does not work.

To view the history for a killed Spark application, see the Spark HistoryServer web UI instead.

CDH-6808: Routable IP address required by ResourceManager

ResourceManager requires routable host:port addresses for `yarn.resourcemanager.scheduler.address`, and does not support using the wildcard `0.0.0.0` address.

Set the address, in the form `host:port`, either in the client-side configuration, or on the command line when you submit the job.

YARN cannot start if Kerberos principal name is changed

If the Kerberos principal name is changed in Cloudera Manager after launch, YARN does not start. In such cases, the keytabs can be correctly generated but YARN cannot access ZooKeeper with the new Kerberos principal name and old ACLs.

There are two possible workarounds:

- Delete the `znode` and restart the YARN service.
- Use the `reset ZK ACLs` command. This also sets the `znodes` below `/rmstore/ZKRMStateRoot` to `world:anyone:cdw` which is less secure.

Queue Manager does not open on using a custom user with a default Kerberos principal

If a custom user is used with the default Kerberos principal, the Queue Manager web UI displays an HTTP ERROR 400 error.

Ensure that the Queue Manager `process_username` property matches the YARN `process_username` property.

COMPX-8687: Missing access check for getAppAttempts

When the Job ACL feature is enabled using Cloudera Manager (YARN Configuration Enable JOB ACL property), the `mapreduce.cluster.acls.enabled` property is not generated to all configuration files, including the `yarn-site.xml` configuration file. As a result, the ResourceManager process uses the default value of this property. The default property of `mapreduce.cluster.acls.enabled` is `false`.

Enable the Job ACL feature using the Advanced Configuration Snippet:

1. In Cloudera Manager select the YARN service.
2. Click Configuration.
3. Find the YARN Service MapReduce Advanced Configuration Snippet (Safety Valve) property.

4. Click the plus icon and add the following:
 - Name: mapreduce.cluster.acls.enabled
 - Value: true
5. Click Save Changes.

COMPX-7493: YARN Tracking URL that is shown in the command line does not work when Knox is enabled

When Knox is configured for YARN, the Tracking URL printed in the command line of an YARN application such as spark-submit shows the direct URL instead of the Knox Gateway URL.

Upgrade CDP Runtime to CDP 7.1.9 CHF 2, and perform the following steps:

1. Open the Cloudera Manager Admin Console and go to the Knox service.
2. Click on the Knox Gateway Home URL.
3. Copy the YARN Resource Manager Web UI V2 URL from the Knox Gateway Home page.

For example, `https://knox-gateway.example.com:8443/gateway/cdp-proxy/yarnuiv2/`

4. Open the Cloudera Manager Admin Console and go to the YARN service.
5. Click the Configuration tab and search for `resourcemanager_config_safety_valve`.
6. Add the Resource Manager Advanced Configuration Snippet (Safety Valve) for `yarn-site.xml` property, and specify its value by using the YARN Resource Manager Web UI V2 URL, copied earlier, as follows:

```
Name: yarn.web-proxy.gateway.url
Value:[***YARN Resource Manager Web UI V2 URL***]
```

7. Enter a Reason for Change and then click Save Changes.
8. Restart YARN.

Unsupported Features

The following YARN features are currently not supported in Cloudera Data Platform:

- Application Timeline Server v2 (ATSV2)
- Auxiliary Services
- Container Resizing
- Distributed or Centralized Allocation of Opportunistic Containers
- Distributed Scheduling
- Docker on YARN (DockerContainerExecutor)
- Fair Scheduler
- GPU support for Docker
- Hadoop Pipes
- Moving jobs between queues
- Native Services
- Pluggable Scheduler Configuration
- Queue Priority Support
- Reservation REST APIs
- Resource Estimator Service
- Resource Profiles
- (non-ZooKeeper) ResourceManager State Store
- Rolling Log Aggregation
- Shared Cache
- YARN Federation

Known Issues in Zeppelin

Learn about the known issues in Zeppelin, the impact or changes to the functionality, and the workaround.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

BUG-125263: Zeppelin service move fails on clusters upgraded from HDP3.1.5

Resolve the circular symlink issue on the Zeppelin node by linking the conf directory to a new directory under /etc/zeppelin:

- # mkdir -p /etc/zeppelin/<version>/0
- # rm /usr/hdp/<version>/zeppelin/conf
- # ln -s /etc/zeppelin/<version>/0 /usr/hdp/<version>/zeppelin/conf

Where version is the HDP version. For example, 7.1.x-yyy. Restart the Zeppelin server in Ambari.

CDPD-3090: Due to a configuration typo, functionality involving notebook repositories does not work

Due to a missing closing brace, access to the notebook repositories API is blocked by default.

From the CDP Management Console, go to Cloudera Manager for the cluster running Zeppelin. On the Zeppelin configuration page (Zeppelin serviceConfiguration), enter shiro urls in the Search field, and then add the missing closing brace to the notebook-repositories URL, as follows:

```
/api/notebook-repositories/** = authc, roles[{{zeppelin_admin_group}}]
```

Click Save Changes, and restart the Zeppelin service.

CDPD-2406: Logout button does not work

Clicking the Logout button in the Zeppelin UI logs you out, but then immediately logs you back in using SSO.

Close the browser.

OPSAPS-59802: Zeppelin and Livy roles should be co-located on the same host.

When installing or upgrading to CDP Private Cloud Base, you must co-locate all Zeppelin and Livy roles on the same cluster host due to an issue with certificate generation.

Known Issues in ZooKeeper

Learn about the known issues in ZooKeeper, the impact or changes to the functionality, and the workaround.

Zookeeper-client does not use ZooKeeper TLS/SSL automatically

The command-line tool 'zookeeper-client' is installed on all Cloudera nodes and it can be used to start the default Java command line ZooKeeper client. However even when ZooKeeper TLS/SSL is enabled, the zookeeper-client command connects to localhost:2181, without using TLS/SSL.

Manually configure the 2182 port, when zookeeper-client connects to a ZooKeeper cluster. The following is an example of connecting to a specific three-node ZooKeeper cluster using TLS/SSL:

```
CLIENT_JVMFLAGS="-Dzookeeper.clientCnxnSocket=org.apache
.zookeeper.ClientCnxnSocketNetty -Dzookeeper.ssl.keyStore
e.location=[***PATH TO YOUR CONFIGURED KEYSTORE***] -Dz
ookeeper.ssl.keyStore.password=[***PASSWORD YOU CONFIGURED
FOR KEYSTORE***] -Dzookeeper.ssl.trustStore.location
n=[***PATH TO YOUR CONFIGURED TRUSTSTORE***] -Dzookeeper
.ssl.trustStore.password=[***THE PASSWORD YOU CONFIGURED
FOR THE TRUSTSTORE***] -Dzookeeper.client.secure=true" zoo
keeper-client -server [***YOUR.ZOOKEEPER.SERVER-1***]:218
2,[***YOUR.ZOOKEEPER.SERVER-2***]:218
2,[***YOUR.ZOOKEEPER.SERVER-3***]:2182
```

TLS v1.3 Support for CDP in Zookeeper

ZooKeeper does not support TLS v1.3.

To configure TLS v1.3, add the following properties in the Server Advanced Configuration Snippet (Safety Valve) for zoo.cfg file.

```
ssl.protocol=TLSv1.3
ssl.enabledProtocols=TLSv1.3,TLSv1.2
ssl.ciphersuites=TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256,TLS_E
CDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_ECDSA_WITH_AES_256_GC
M_SHA384,TLS_E
CDHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_ECDSA_WITH_CHACHA20_PO
LY1305_SHA256,TLS_ECDHE_RSA_WITH_CHACHA20_POLY1305_SHA256,TLS_DH
E_RSA_WITH_
AES_128_GCM_SHA256,TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,TLS_AES_1
28_GCM_SHA256,TLS_AES_256_GCM_SHA384,TLS_CHACHA20_POLY1305_SHA256
```

Behavioral changes in Cloudera Runtime 7.1.9 SP1

You can review the changes in certain features or functionalities of components that have resulted in a change in behavior from the previously released version to this version of Cloudera Runtime 7.1.9 SP1.

Behavioral Changes in Ozone

Learn about the change in certain functionality of Ozone that has resulted in a change in behavior from the previously released version to this version of Cloudera Runtime.

Change in the behaviour of the Ozone admin pipeline list command.

In the CDP Private Cloud Base 7.1.9, running the Ozone admin pipeline list command displays the following output: Pipeline[Id: pipeline_id, Nodes: UUID1(hostname1/ip1)UUID2(hostname2/ip2)UUID3(hostname3/ip3), ReplicationConfig: RATIS/THREE, State:OPEN, leaderId:id, CreationTimestamp].

In the CDP Private Cloud Base 7.1.9 SP1, running the Ozone admin pipeline list command displays the following output: Pipeline[Id: pipeline_id, Nodes: UUID1(hostname1/ip1) ReplicaIndex: UUID2(hostname2/ip2) ReplicaIndex: UUID3(hostname3/ip3) ReplicaIndex: 0, ReplicationConfig: RATIS/THREE, State:OPEN, leaderId:id, CreationTimestamp].

CDP Private Cloud Base API Modifications and Removals

All the APIs that have either been modified or removed for this release of CDP Private Cloud Base.

CDP 7.1.9 SP1 and 7.1.9 SP1 Cumulative Hotfix 1 Components with API differences

The following is a list of all the APIs that have been modified or removed in this release of CDP Private Cloud Base. The APIs listed here are on a component by component basis and may include recommendations for how to manage the change.

API Compatibility changes in 7.1.9 SP1 Cumulative Hotfix 1 for HBase

Removed or Modified APIs in CDP 7.1.9 SP1 Cumulative Hotfix 1 for HBase and recommendations for how to handle them.

Apache Version of HBase in 7.1.9 was 1.0.0 and Apache Version of HBase in 7.1.9 SP1 Cumulative Hotfix 1 is 1.0.0

Removed APIs in 7.1.9 SP1 Cumulative Hotfix 1

The following APIs are no longer available for HBase in CDP 7.1.9 SP1 Cumulative Hotfix 1.

OAuthBearerSignedJwt.<init>

Method Removed

Package Name

```
com.cloudera.hbase.security.oauthbearer.internals.knox
```

Effect

A client program may be interrupted by NoSuchMethodError exception.

Reason for change

Backport fix for CDPD-67520: JWT authentication expects [sub] claim in the payload. Initially introduced by 7.1.9 CHF6

Recommendation

N/A

Recompilation Required?

Yes

CDP 7.1.9 GA and 7.1.9 SP1 Components with API differences

The following is a list of all the APIs that have been modified or removed in this release of CDP Private Cloud Base. The APIs listed here are on a component by component basis and may include recommendations for how to manage the change.

API Compatibility changes in 7.1.9 SP1 for Hadoop

Removed or Modified APIs in CDP 7.1.9 SP1 for Hadoop and recommendations for how to handle them.

Apache Version of Hadoop in 7.1.9 was 3.1.1 and Apache Version of Hadoop in 7.1.9 SP1 is 3.1.1

Modified APIs in 7.1.9 SP1

The following APIs have been modified for Hadoop and include a description of the impact of the modification on their use.

YarnConfiguration

Field NM_LINUX_CONTAINER_GROUP of type java.lang.String with the compile-time constant value "yarn.nodemanager.linux-container-executor.group" has been removed from this class.

Package Name

```
org.apache.hadoop.yarn.conf
```

Effect

Recompilation of a client program may be terminated with the message: cannot find variable NM_LINUX_CONTAINER_GROUP in org.apache.hadoop.yarn.conf.YarnConfiguration.

Reason for change

Unused constant ([YARN-4599](#))

Recommendation

N/A

Recompilation Required?

Yes

API Compatibility changes in 7.1.9 SP1 for Atlas

Removed or Modified APIs in CDP 7.1.9 SP1 for Atlas and recommendations for how to handle them.

Apache Version of Atlas in 7.1.9 was 3.0.0 and Apache Version of Atlas in 7.1.9 SP1 is 3.0.0

Removed APIs in 7.1.9 SP1

The following APIs are no longer available for Atlas in CDP 7.1.9 SP1

AtlasClientV2.<init>

The method isn't removed, but modified to include a different parameter. Change was done as part of Jersey Upgrade to 2.0, not yet merged in Apache

Package Name

```
org.apache.atlas
```

Effect

The method isn't removed

Reason for change

but modified to include a different parameter. Change was done as part of Jersey Upgrade to 2.0

Recommendation

not yet merged in Apache.

Recompilation Required?

The client application needs to pass WebTarget from jersey 2.0 object as argument instead from WebResource of jersey 1.0

Modified APIs in 7.1.9 SP1

The following APIs have been modified for Atlas and include a description of the impact of the modification on their use.

AdminResource.deleteRule

The method was not removed, rather modified to return the list of deleted rules and the API path was changed because it was conflicting with other API path, which was added in this release (ATLAS-4797)

Package Name

org.apache.atlas.web.resources

Effect

Any client application invoking this API needs to update the API path and if required, they can use the response object

Reason for change

Yes

Recommendation

The method was not removed

Recompilation Required?

rather modified to return the list of deleted rules and the API path was changed because it was conflicting with other API path

CDP 7.1.9 Cumulative hotfix 7 and 7.1.9 SP1 Components with API differences

The following is a list of all the APIs that have been modified or removed in this release of CDP Private Cloud Base. The APIs listed here are on a component by component basis and may include recommendations for how to manage the change.

API Compatibility changes in 7.1.9 SP1 for Hadoop

Removed or Modified APIs in CDP 7.1.9 SP1 for Hadoop and recommendations for how to handle them.

Apache Version of Hadoop in 7.1.9 was 3.1.1 and Apache Version of Hadoop in 7.1.9 SP1 is 3.1.1

Modified APIs in 7.1.9 SP1

The following APIs have been modified for Hadoop and include a description of the impact of the modification on their use.

YarnConfiguration

Field NM_LINUX_CONTAINER_GROUP of type java.lang.String with the compile-time constant value "yarn.nodemanager.linux-container-executor.group" has been removed from this class.

Package Name

org.apache.hadoop.yarn.conf

Effect

Recompilation of a client program may be terminated with the message: cannot find variable NM_LINUX_CONTAINER_GROUP in org.apache.hadoop.yarn.conf.YarnConfiguration.

Reason for change

[YARN-4599](#) removed this unused variable. It seems unrelated to the change itself.

Recommendation

Details about this config option: The UNIX group that the linux-container-executor should run as. This is intended to be set as part of container-executor.cfg. If a YARN client needs this variable it shall be created manually: public static final String NM_LINUX_CONTAINER_GROUP=""yarn.nodemanager.linux-container-executor.group"";

Recompilation Required?

Yes

API Compatibility changes in 7.1.9 SP1 for Atlas

Removed or Modified APIs in CDP 7.1.9 SP1 for Atlas and recommendations for how to handle them.

Apache Version of Atlas in 7.1.9 was 3.0.0 and Apache Version of Atlas in 7.1.9 SP1 is 3.0.0

Removed APIs in 7.1.9 SP1

The following APIs are no longer available for Atlas in CDP 7.1.9 SP1.

AtlasClientV2.<init>

Method Removed

Package Name

org.apache.atlas

Effect

A client program may be interrupted by NoSuchMethodError exception.

Reason for change

The method isn't removed, but modified to include a different parameter. The change was done as part of Jersey Upgrade to 2.0, which is not yet merged in Apache.

Recommendation

The client application needs to pass WebTarget from jersey 2.0 object as argument instead of WebResource of jersey 1.0.

Recompilation Required?

Yes

Modified APIs in 7.1.9 SP1

The following APIs have been modified for Atlas and include a description of the impact of the modification on their use.

AdminResource.deleteRule

Return value type has been changed from void to org.apache.atlas.model.instance.EntityMutationResponse.

Package Name

org.apache.atlas.web.resources

Effect

This method has been removed because the return type is part of the method signature. A client program may be interrupted by NoSuchMethodError exception.

Reason for change

The method was not removed, rather modified to return the list of deleted rules and the API path was changed because it was conflicting with other API path, which was added in this release ([ATLAS-4797](#))

Recommendation

Any client application invoking this API needs to update the API path and if required, they can use the response object.

Recompilation Required?

Yes

CDP 7.1.9 SP1 Components with API differences

The following is a list of all the APIs that have been modified or removed in this release of CDP Private Cloud Base. The APIs listed here are on a component by component basis and may include recommendations for how to manage the change.

API Compatibility changes in 7.1.9 SP1 for ZooKeeper

Removed or Modified APIs in CDP 7.1.9 SP1 for ZooKeeper and recommendations for how to handle them.

Apache Version of ZooKeeper in 7.1.9 SP1 was 3.8.1 and Apache Version of ZooKeeper in 7.1.9 SP1 is 3.8.1

Removed APIs in 7.1.9 SP1

The following APIs are no longer available for ZooKeeper in CDP 7.1.9 SP1

[*SecurityUtils.createSaslClient*](#)

Method Removed

Package Name

org.apache.zookeeper.util

Effect

A client program may be interrupted by NoSuchMethodError exception.

Reason for change

[ZOOKEEPER-4889](#) : ZooKeeper SecurityUtils has hard coded SASL DIGEST-MD5 - Fallback to DIGEST-MD5 auth mech should be disabled in Fips mode (branch-3.8)

Recommendation

Client code need to be adjusted to supply ZKConfig to the method.

Recompilation Required?

Yes

Deprecation notices in Cloudera Runtime 7.1.9 SP1

Certain features and functionalities have been removed or deprecated in Cloudera Runtime 7.1.9 SP1. You must review these items to understand whether you must modify your existing configuration. You can also learn about the features that will be removed or deprecated in the future release to plan for the required changes.

Terminology

Items in this section are designated as follows:

Deprecated

Technology that Cloudera is **removing in a future CDP release**. Marking an item as deprecated gives you time to plan for removal in a future CDP release.

Moving

Technology that Cloudera is moving from a future CDP release and is making available through an alternative Cloudera offering or subscription. Marking an item as moving gives you time to plan for removal in a future CDP release and plan for the alternative Cloudera offering or subscription for the technology.

Removed

Technology that Cloudera has removed from CDP and is no longer available or supported as of this release. Take note of technology marked as removed since it can potentially affect your upgrade plans.

You must contact Cloudera Support or your Cloudera Account Team if you have any questions.

Platform and OS

The listed Operating Systems and databases are deprecated or removed from the Cloudera Runtime 7.1.9 SP1 release.

Database Support:

The following databases are **removed** and no longer supported from the Cloudera Runtime 7.1.9 SP1 release:

- PostgreSQL 11

The following databases are **deprecated** from the Cloudera Runtime 7.1.9 SP1 release:

- PostgreSQL 12
- MariaDB 10.4
- MySQL 5.7

Operating System

The following operating systems are **deprecated** from the Cloudera Runtime 7.1.9 SP1 release:

- RHEL 8.6
- RHEL 7.9
- RHEL 7.9 (FIPS)
- CentOS 7.9
- SLES 12 SP5

Ozone

Certain features and functionality in Ozone are deprecated or removed in Cloudera Runtime 7.1.9 SP1 release.

Removed

Ordered deletion of snapshots

Starting from Cloudera Runtime 7.1.9 SP1 CHF12 onwards, ordered deletion is removed after significant fixes and improvements to Snapshot Garbage Collection. Configurations related to ordered deletion such as `ozone.snapshot.ordered.deletion.enabled` and `ozone.snapshot.deep.cleaning.enabled` might still be found in Cloudera Manager (CM) in order to ensure backward compatibility but they are ignored in versions from 7.1.9 SP1 CHF12 onwards.

Fixed Common Vulnerabilities and Exposures 7.1.9 SP1

Release Matrix

You must be familiar with the versions of all the cumulative hotfixes for CDP Private Cloud Base version 7.1.9 SP1.

The Runtime Release build number has two parts, the [**Runtime version number**] and the [**Runtime Build number**]. For example, in 7.1.9.1000-103, 7.1.9 is the version number and 103 is the build number.

Table 2: Table 1: Runtime Cumulative hotfixes

Cumulative Hotfix	Runtime Release Build Number	GBN	Release Date	Download URL
7.1.9 SP1 CHF 15	Runtime 7.1.9.1073-8	76451206	Mar 13, 2026	https://[USERNAME]:[PASSWORD]@archive.cloudera.com/p/cdh7/7.1.9.1073/parcels/
7.1.9 SP1 CHF 14	Runtime 7.1.9.1069-3	74330271	Jan 08, 2026	https://[USERNAME]:[PASSWORD]@archive.cloudera.com/p/cdh7/7.1.9.1069/parcels/

```

What's new in Cloudera Runtime 7.1.9 SP1 CHF 15

Understand the functionalities and improvements to features of components in Cloudera Runtime 7.1.9 SP1 CHF 15.

Apache Knox

Improved custom descriptor and shared provider configuration management in Knox

The users can now remove previously created custom descriptors, including their associated topologies, and shared provider configurations when they are no longer needed.

For more information, see [Remove a custom descriptor from Apache Knox](#) and [Remove a shared provider configuration](#).

Hue

Enhanced session security for Hue

Hue now includes security for the session ID (sessionid) cookie. This enhancement helps prevent unauthorized access results in data exposure, unauthorized query execution, and job submission across connected Hue services.

For more information, see [Securing Hue sessions](#).

Apache Ozone

New metrics added in the Grafana dashboard

The following metrics are added in the Grafana dashboard:

- Block count sent from Storage Container Manager to DataNode (Includes both overall and DataNode specific block count)
- Block count received from Ozone Manager
- Command timedout from Storage Container Manager to DataNode

Configuration Changes for the FIPS-compliant SASL Changes

Starting from Cloudera Runtime 7.1.9 SP1 CHF15 onwards, Cloudera supports DIGEST-SHA, a new SASL mechanism, to replace DIGEST-MD5. DIGEST-SHA is similar to DIGEST-MD5 except that DIGEST-SHA uses SHA256 and AES instead of MD5 and DES for message digest and encryption, respectively. As a result, DIGEST-SHA uses only FIPS-compliant algorithms. For more information, see [Step 1: Prepare hosts](#).

Yarn

A new security filtering mechanism introduced inside the Application Master

A new security filtering mechanism inside the Application Master prevents unauthorized mapper or reducer implementations from running within the cluster. This feature ensures that only approved classes or packages are executed inside containers, protecting the cluster from unwanted or unsafe task implementations that may introduce performance, stability, or security risks. For more information, see [Hadoop MapReduce Application Manager based security filter](#)

Fixed issues in 7.1.9 SP1 CHF 15

Know more about the list of fixes that are shipped for CDP Private Cloud Base version 7.1.9 SP1 CHF 15.

Note: Contact Cloudera Support for questions related to any specific hotfixes. The version and build identifier for this CDH Parcel is 7.1.9-1.cdh7.1.9.p1073.76451206.

CDPD-69213: Export/Import, Incremental Export: Tags fail to propagate to target child entities when the source entity is deleted

Previously, when creating tables with multiple levels of depth, a tag applied to the first table was propagated along the lineage. However, after dropping the first table and exporting the entire lineage, child tables did not have the propagated tag after import on the target cluster. This occurred because of a task ordering issue in the deferred actions flow: when deferred actions were enabled during import, the add-propagation task was created before the parent entity was deleted, but ran after the deletion. This caused the system to find the edge between the parent entity and the classification in a deleted state, preventing tag propagation to child entities.

The fix adds a check in the tag propagation logic to skip the edge-status validation when an import is in progress and deferred actions are enabled. This ensures that tags are now correctly propagated to child entities even when the source entity is deleted.

Apache Jira: [ATLAS-5055](#)

CDPD-96779: Spark ORC table column name does not support special characters

Spark threw an error when creating ORC tables with column names containing special characters, such as \$, which was compatible with Hive but not with Spark. This issue is now fixed. Special characters can now be used with Spark.

Apache Jira: [SPARK-32889](#)

CDPD-87921: Oozie SSH action port is not configurable

The Oozie SSH action port always uses the default port number 22. The default behaviour is still the same. But, you can change the port number using the following methods:

1. Use the new 0.4 schema version for your SSH action in your workflow.xml and add the port XML element with the new value.

Example

```
<port>11100</port>
```

2. Set the port number globally by adding the following oozie-site.xml safety-valve in Cloudera Manager with the new value.

Example,

```
"11100" : "oozie.action.ssh.action.port"
```

If you set both the options, then the value set in the workflow.xml takes precedence and the port with the new port number should open in the target host.

CDPD-93325: Hive2Main.java can print out passwords

Previously, Hive2Main was printing full Beeline command arguments to standard output, which might unintentionally expose LDAP credentials and the truststore password. This issue is now fixed.

CDPD-77768: Oozie log parameters are not substituted correctly

Previously, Oozie log parameters, for example, {0}, were not substituted when log messages contained apostrophes. The formatting engine treated the text following a single quote as a literal block, preventing parameter replacement. This issue is now fixed. Oozie now automatically escapes single quotes in log messages, ensuring that all parameters are substituted correctly.

CDPD-97100: Zeppelin fails after updating Zookeeper and Hadoop components

Previously, updating Zookeeper and Hadoop components caused Zeppelin to fail. This occurred because the updates introduced conflicting versions of the io.netty:netty-transport-native-epoll dependency. The issue is now resolved.

CDPD-94957: Broken lineage on Atlas when calling .cache() or .persist() method

Previously, lineage reporting issues occurred when using the .cache() or .persist() methods on Spark DataFrames, which caused lineage to not be correctly reported into Atlas. This issue is now fixed. The Atlas lineage is no longer wrong in case of cached Dataframes.

CDPD-96543: Missing timeline items for partition delta updaters

Previously, the Catalog Server Operation section in the DDL profile incorrectly displayed that delays in metadata loading were caused by fetching the latest Metastore event ID.

This issue is now fixed by adding the missing timeline items for loading partition names from Metastore to the catalog timeline. These external calls are now accurately tracked to help you find the cause of metadata loading delays.

Apache Jira: [IMPALA-14062](#)

CDPD-96540: Unnecessary metadata reloads for Metastore ALTER_TABLE events

Previously, the catalog service incorrectly triggered file metadata reloads for certain trivial Metastore ALTER_TABLE events.

This issue is now fixed by normalizing null and empty StorageDescriptor parameters to avoid unnecessary reloads. The logs are also improved, when non-trivial StorageDescriptor changes are detected, to display the actual changes.

Apache Jira: [IMPALA-14646](#)

CDPD-96529: Slow metadata operations for wide tables

Previously, when using Ranger authorization, Impala checked column masking policies using the column list. This required loading the table metadata, which triggered unnecessary loading delays, even when running the `INVALIDATE` or `REFRESH` command.

This issue is now fixed. Impala does not depend on the column list to check policies. This prevents unnecessary metadata loading and improves the performance of `INVALIDATE` and `REFRESH` commands on unloaded tables.

Apache Jira: [IMPALA-14703](#)

CDPD-92930: Impala daemon crashes with analytic functions and collections

Previously, running a query with an analytic function on unnested collection columns caused the Impala daemon to crash.

This issue is now fixed by ensuring that data is added to the sorting process only when it is fully available and required.

Apache Jira: [IMPALA-13272](#)

CDPD-91994: Stale query IDs in catalog logs

Previously, Catalog logs for `getPartialCatalogObject` requests displayed incorrect query IDs.

This issue is now fixed by ensuring that each request is associated with its correct query ID. The system automatically clears the identification after the request finishes to prevent stale information from appearing in later logs.

Apache Jira: [IMPALA-14494](#)

CDPD-93504: NullPointerException when hive.acid.key.index is missing in ORC files

Previously, a `NullPointerException` (NPE) error occurred when the `hive.acid.key.index` property was missing from an Optimized Row Columnar (ORC) file.

This issue is now resolved. The fix ensures that if the metadata is missing, the system sets the minimum and maximum keys to null and performs a full file scan instead of failing.

Apache Jira: [HIVE-26147](#)

CDPD-94206: Partition column statistics corruption during concurrent updates

Previously, a concurrency issue existed when multiple processes updated partition column statistics at the same time.

This issue is now resolved. The update process is now synchronized to ensure that statistics remain accurate during simultaneous access on the same partition.

Apache Jira: [HIVE-29316](#)

CDPD-94205: Database inconsistency during partition deletion failures

Previously, when a direct SQL processing failure occurred during operations such as dropping partitions, the partial changes made to the database were not reverted before the system attempted an alternative processing method.

This issue is now resolved. The system now sets a savepoint before starting direct SQL processing, ensuring that if a failure occurs, the transaction rolls back to the savepoint before retrying the operation.

Apache Jira: [HIVE-26976](#)

CDPD-93503: Incorrect row order after query-based minor compaction

Previously, query-based minor compaction used an incorrect sorting order for rows in its inner query. This resulted in duplicated rows when you ran the compaction after multiple MERGE statements.

This issue is now resolved. The fix aligns the query-based minor compaction sorting order with the MapReduce compaction order by using the transaction ID, bucket property, and row ID.

Apache Jira: [HIVE-25258](#)

CDPD-93502: Query-based major compaction failure after multiple merge statements

Previously, query-based major compaction failed with a Wrong sort order error when processing tables with multiple Atomicity, Consistency, Isolation, and Durability (ACID) delta directories, such as those created after multiple MERGE statements.

This issue is now resolved. The validation now correctly verifies the row order based on the original transaction ID, bucket property, and row ID, ensuring compatibility with data written by MapReduce and query-based processes. **Apache Jira:** [HIVE-25257](#)

CDPD-93427: Data loss in insert-only tables during query-based minor compaction

Previously, query-based minor compaction produced empty delta files when a table had both aborted and open transactions.

This issue is now resolved. The fix ensures that the compaction process correctly identifies the range of transactions to include, preventing the creation of empty delta files and subsequent data loss.

Apache Jira: [HIVE-29272](#)

CDPD-92365: Unsupported removal of SerDe properties

Previously, you could not remove specific serialization or deserialization (SerDe) properties from an existing Hive table because the UNSET SERDEPROPERTIES clause was not supported.

This issue is now resolved. Hive now supports the UNSET operation for SerDe properties, allowing you to delete specific properties by running the ALTER TABLE <table_name> UNSET SERDEPROPERTIES command.

Apache Jira: [HIVE-21952](#)

CDPD-93500: Multiple YARN UI navigation issues when accessed through Knox

Previously, several issues prevented users from properly accessing YARN-related pages through Knox. This issue is now fixed. The following UI elements and API functions now resolve correctly when proxied through Knox:

- Tracking URL link for running Flink jobs in the YARN UI and YARN UI v2.
- Query parameters in the YARN REST API, such as filtering applications by state.
- Spark History Server links on finished jobs page.

These improvements enhance the user experience when managing and monitoring YARN applications, Flink jobs, and Spark jobs through the Knox gateway.

CDPD-92941: Knox Gateway logging configuration cannot be customized through Cloudera Manager

The Knox Gateway Logging Configuration (Safety Valve) advanced configuration snippet did not apply properly to Knox Gateway. This issue is now resolved by allowing individual logger configurations to be set and modified through the Cloudera Manager UI.

COMPX-14637: Incorrect permissions on NodeManager local directories cause container failures

The NodeManager creates the configured local directories with 755 permissions on startup if the directories did not exist. However, if these permissions were changed after startup or if an administrator created the directories with incorrect permissions before starting YARN, the NodeManager would not reset the permissions, resulting in container failures. This issue is now resolved.

CDPD-89478: Oozie UI displays start and end times incorrectly after upgrade

Previously, the Oozie UI intermittently displayed the start time and end time fields in reverse order. Additionally, the Run button remained inactive until you clicked Save, even if you made no changes. This issue is resolved by correcting the field display order and ensuring that the Run button is active for schedules without requiring an unnecessary save action.

CDPD-92510: Inaccurate table update timestamps in Hue

Previously, the Data last updated on timestamp for Iceberg tables in Hue displayed incorrect information when tables were altered using Spark. This occurred because the timestamp was sourced from the `transient_lastDdlTime` table property, which does not update correctly during Spark operations. This issue is now fixed by updating the metadata source to use Iceberg snapshot timestamps.

CDPD-94739: Audit logging dependency on debug mode in Hue

Previously, audit logging in Hue only functioned when debug logging was enabled by setting the `DJANGO_DEBUG_MODE` property to true. This caused audit logging to be disabled by default. This issue is now resolved by ensuring audit events are always captured regardless of the debug mode settings. This change ensures Hue compliance and security requirements by maintaining audit logs in all environments.

CDPD-92857: Export All failures in secured multi-tenant clusters

Previously, the Export All feature in Hue failed in secured multi-tenant clusters that used tenant colocation policies. This resulted in access errors during the export process. This issue is now resolved. The Export All functionality now follows tenant boundaries and cluster security policies. However, other known limitations exist. For more information, see [Export All failure in secured multi-tenant clusters](#)

CDPD-95855: TLS truststore initialization with FIPS-compliant crypto providers

Previously, in some environments using FIPS-compliant crypto providers, TLS truststore initialization failed. This occurred because of incompatible handling of empty keystore initialization. This issue is now resolved by updating the truststore initialization logic to ensure compatibility with FIPS-compliant providers. This allows the TLS setup to complete successfully.

CDPD-96618: Race condition when registering or unregistering Exception Handling frames

A race condition in libgcc could occur during concurrent registration and EH frames by the memory manager, leading to instability during multi-threaded code generation. This issue is now resolved by ensuring proper padding so that a null-terminated list of FDEs is always provided, eliminating the race condition.

Apache Jira: [KUDU-3545](#)

CDPD-93290: Open Keys summary is not displaying proper data

Previously, the Open Keys summary response was not rendering properly and was not displaying proper data. This issue is now fixed.

CDPD-92660: Recon UI fails to load Disk Usage view with large number of nested directories and keys

Previously, with a large number of entries, the Recon UI **Disk Usage** page failed to load or took an excessive amount of time to populate the tree. This issue is now fixed now. The **Disk Usage** page no longer loads the root path by default. You also get a warning if you try to submit a root path DU request. The root path DU can only be fetched after an explicit submission.

CDPD-93580: Ozone Manager retains native ACL metadata for incoming keys

Previously, if the Ozone client was not updated to the latest version in the user's environment, it sent unwanted ACL metadata during key or file creation. This issue is now fixed. A new server-side configuration ensures that the Ozone Manager removes all native ACL information from the keys before persisting them.

CDPD-94895/CDPD-93951/CDPD-93469: Do not know how many DataNodes cannot accept new writes in a container

Previously, you did not know how many DataNodes were actually readable from the perspective of container allocation and metadata operations. This issue is now fixed and a new metric named

NonWritableNodes is added which shows the number of DataNodes that cannot accept new writes because they are either not in IN_SERVICE and HEALTHY state, cannot allocate new containers or cannot write to existing containers.

CDPD-93860: SpaceUsageSource implementation class Fixed is missing toString()

Previously, the toString() method was missing in SpaceUsageSource.Fixed implementation. The toString() method in SpaceUsageSource.Fixed implementation is used for logging and debugging purposes to display volume space usage information such as capacity, used and available space. This issue is now fixed.

CDPD-93609: Ozone Usage is going beyond 100 percentage

Previously, the Ozone Datanode was using more disk space than allowed for Ozone. This issue is now fixed.

CDPD-88335: DataNode decommissioning fails when other DataNodes are offline due to invalid affinity node in Ratis replication

Previously, DataNode decommissioning failed if one or more DataNodes holding Ratis replicas were already offline. During decommissioning, the Storage Container Manager (SCM) attempts to replicate Ratis container data to maintain redundancy. However, SCM's placement logic still references an affinity node that was previously part of the network topology but has since been removed due to the DataNode going offline. This resulted in repeated placement errors and prevented the decommissioning process from completing successfully. This issue is now fixed.

Apache Jira: [HDDS-13544](#)

CDPD-93901: Not able to track Ozone Storage Container Manager (SCM) safemode rules and exit

In large clusters, the Ozone SCM safemode might take a lot of time to exit. Previously, the you were not able to track the Ozone SCM Manager safemode rules and exit. This issue is not fixed and a new dashboard named "SCM Safemode" is introduced in Grafana which contains a chart for each safemode rule displaying its target and actual value. It also displays if the SCM is in safemode or not by showing "In Safemode" in red and "Exited safemode" in green respectively.

Apache Jira: [HDDS-14039](#)

CDPD-93793: Storage Container Manager (SCM) does not log safemode exit rules at regular intervals

Previously, SCM logged rule statuses at arbitrary time intervals instead of logging them at regular intervals. This issue is now fixed and SCM logs safemode exit rule status at regular intervals while in safemode. The logging interval is configurable through `hdds.scm.safemode.log.interval`. Default value is 1 minute. Each log entry includes overall safemode state, precheck completion status, and current progress of each exit rule.

Apache Jira: [HDDS-14012](#)

Common Vulnerabilities and Exposures (CVE) that is fixed in this CHF:

- [CVE-2023-33202](#) - Bouncy Castle

Behavioral changes in Cloudera Runtime 7.1.9 SP1 CHF 15

Behavioral changes for Cloudera Runtime 7.1.9 SP1 cumulative hotfix (CHF) 15 introduce functional adjustments to Cloudera Runtime components.

Hive**HIVE-26976, HIVE-28578, HIVE-29316, HIVE-29030, CDPD-75871: Performance-related issues for HMS**

Previous behavior:

Several performance-related issues for HMS occurred, including stale entries or inconsistent metadata in the database and exceptions during the update operation for multiple table column statistics or for multiple partition-level column statistics.

New behavior:

To resolve these issues, a backend database exclusive row lock is now introduced. The statistics importer tasks are coordinated so that only one importer task that obtains the lock runs at a time. The other tasks to import or update the statistics for the same table or partition continue to be in the pending queue until the current importer task completes and then releases the lock. By default, a blocked or pending importer task retries the lock 100 times in the 3 secs ~ 33 secs duration until a failure occurs.

You can now configure the number of retries and the interval between retries using the following parameters that you can set on the Cloudera Manager Clusters Hive service Configuration tab:

- The `hive.metastore.s4u.nowait.max.retries` parameter allows you to set the number of retries to acquire the row lock immediately without waiting. The default value is 100.
- The `hive.metastore.s4u.nowait.retry.sleep.interval` parameter allows you to set the interval between the retries to acquire a row lock immediately. The default value is 300ms.

Known issues in 7.1.9 SP1 CHF 15

The following section lists the known issues and limitations, the areas of impact, and workaround for each Runtime component.

Known Issues in Atlas

Learn about the known issues in Atlas the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15**CDPD-93307: Hive import logs are truncated during bulk import**

When running the `import-hive.sh` script to perform bulk Hive metadata imports, the logging process fails to retain the expected history. The `import-hive.log` file rotates prematurely when it reaches 10 MB and retains only one backup file (`import-hive.log.1`), instead of the expected 100 MB file size and 20 backup files.

Supply a custom `log4j` configuration file with the correct structure by using the `ATLAS_OPTS` environment variable before running the import script:

```
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE log4j:configuration SYSTEM "log4j.dtd">
<log4j:configuration xmlns:log4j="http://jakarta.apache.org/log4j/">
  <appender name="console" class="org.apache.log4j.ConsoleAppender">
    <param name="Target" value="System.out"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t: %x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <appender name="FILE" class="org.apache.log4j.RollingFileAppender">
```

```

    <param name="File" value="${atlas.log.dir}/${atlas.log.f
ile}"/>
    <param name="Append" value="true"/>
    <param name="maxFileSize" value="100MB"/>
    <param name="maxBackupIndex" value="20"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <logger name="org.apache.atlas" additivity="false">
    <level value="info"/>
    <appender-ref ref="FILE"/>
  </logger>
  <logger name="org.apache.kafka.common.config.AbstractConfig"
additivity="false">
    <level value="error"/>
    <appender-ref ref="FILE"/>
  </logger>
</root>
<priority value="warn"/>
<appender-ref ref="FILE"/>
</root>
</log4j:configuration>

```

Export the ATLAS_OPTS variable to point to your custom file before running the import script:

```

export ATLAS_OPTS="-Dlog4j.configuration=file:/path/to/custom-hi
ve-import-log4j.xml"
./import-hive.sh

```

CDPD-87670: [Atlas UI] Apache Atlas Glossary becomes unresponsive when the page size is set to 50

When the page limit is set to 50 in **Glossary**, the user interface becomes unresponsive due to an incorrect API call with the error message, when trying to show more than 25 associated entities for a glossary item: "expected type AtlasGlossaryCategory; found AtlasGlossaryTerm".

Apache Jira: [ATLAS-5067](#)

CDPD-70450: Impala SQL queries that include the “WITH” clause should populate lineage in Atlas

Impala SQL queries that do not use the WITH clause can show lineage in Atlas, but queries that do use the WITH clause cannot show lineage in Apache Atlas. Impala SQL queries using the WITH clause are not supported.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-6565: Issue with ddlQueries in Atlas for Hive/Impala tables created in default/non-default db using DAS/HUE respectively

ddlQueries are not created for Impala origin table. ddlQueries created for Impala/Hive CTAS tables have difference in names as compared to same operation for Hive table. The Impala table has the query in the ddlQueries entity name.

None

CDPD-55301: ddlQueries and ALTERNATE_* lineage missing for Spark tables created through spark3-shell

The ddlQueries and ALTERNATE_* lineage missing for Spark tables created using spark3-shell.

None

CDPD-56085: LOAD DATA INPATH to iceberg_table creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas

Running a query like LOAD DATA INPATH to iceberg_table, creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas. So in Atlas, a deleted entity is created corresponding to the temporary table <iceberg_table_name>_tmp*.

None

CDPD-58554: Discard audits of specific classification, label, and business metadata

Support to control audits for specific classification, label, and business metadata is not present in the Custom Audit Filters feature.

None

CDPD-40346: The ddlQueries and ALTERNATIVE_ADDCOLS lineage missing for Impala tables.

The ALTERNATIVE_ADDCOLS lineage has some issue when an Impala table is altered and the corresponding lineage is not created.

CDPD-67112: Import transforms do not work as expected when replacing a string which already has ":"

The character ":" is not supported in path replacements. The import succeeds but location remains unchanged. The character ":" must be avoided.

None

CDPD-69150: Unable to add labels or user defined properties in Japanese

Adding Japanese labels or user defined properties results in the error message: "Invalid label: ###, label should contain alphanumeric characters, _ or -"

None

CDPD-69279: Quick search does not return entities when using Japanese or Chinese characters to search properties

Entities, such as hdfs_path, are not returned by the search when their indexable properties are searched using partial search terms made of Japanese or Chinese characters. Only exact matches return results when searching the indexed properties made of Japanese or Chinese characters.

None

CDPD-68191: Suggestions do not return the correct results when searching multiple Chinese characters

Free text search does not return results when searching Chinese phrases made of multiple characters. Partial searches return the correct results.

None.

CDPD-71219: Regression : Suggestions don't work for single character words on indexable attributes

When searching for entities whose name (entity names are indexable) is a single character, search results are returned but suggestions are not. When searching for entities whose description (entity descriptions are not indexable) is a single character, both search results and suggestions are returned.

None.

CDPD-67450: Table name renaming operation is not updating or creating iceberg_table entity

Renaming an Iceberg table does not update the corresponding Atlas entity.

None.

CDPD-67089: Export/Import: When a table with Ozone path is exported as "connected", only the Ozone key is exported.

When table with Ozone path is exported as "connected", only Ozone key is exported. Other Ozone entities, such as Ozone volume, Ozone bucket are not exported.

None.

CDPD-43772: Performance issues with Atlas service

If there are lot of update operations and the compression type of column families of atlas_janus table is SNAPPY, then the Kafka message processing might become slower.

- Consider setting compression type of column families of atlas_janus table as GZ.

OPSAPS-67783: During rolling upgrade one among two Atlas server failed to start but Cloudera Manager considered as success

Cloudera Manager marks the Execute command Start on service Atlas-1 as a success even when Atlas service had failed to start successfully. In such cases, Atlas logs give the exact reason for Atlas start-up failure.

None

CDPD-19358: "IsIndexable" and "isOptional" value of a typedef's attribute is modified post migration.

In HDP-265, falcon_feed_creation has "stored-in" attribute which has IsIndexable value set to True.

Post migration, "stored-in" is moved to relationshipAttributeDefs and has IsIndexable value set to False.

Similarly, in HDP-265 the table attribute of hive_storage_desc isOptional is set to true. Post migration, isOptional set to False.

None.

CDPD-11941: Table creation events missed when multiple tables are created in the same Hive command

When multiple Hive tables are created in the same database in a single command, the Atlas audit log for the database may not capture all the table creation events. When there is a delay between creation commands, audits are created as expected.

None.

CDPD-11940: Database audit record misses table delete

When a hive_table entity is created, the Atlas audit list for the parent database includes an update audit. However, at this time, the database does not show an audit when the table is deleted.

None.

CDPD-11692: Navigator table creation time not converted to Atlas

In converting content from Navigator to Atlas, the create time for Hive tables is not moved to Atlas.

None

CDPD-10574: Suggestion order doesn't match search weights

At this time, the order of search suggestions does not honor the search weight for attributes.

None.

CDPD-7982: HBase bridge stops at HBase table with deleted column family

Bridge importing metadata from HBase fails when it encounters an HBase table for which a column family was previously dropped. The error indicates:

```
Metadata service API org.apache.atlas.AtlasClientV2$API_V2@58112bc4 failed with status 404 (Not Found) Response Body
({ "errorCode": "ATLAS-404-00-007", "errorMessage": "Invalid instance creation/updation parameters passed : hbase_column_family.table: mandatory attribute value missing in type hbase_column_family" })
```

None.

CDPD-6675: Irregular qualifiedName format for Azure storage

The qualifiedName for hdfs_path entities created from Azure blob locations (ABFS) does not have the clusterName appended to it as do hdfs_path entities in other location types.

None.

CDPD-4762: Spark metadata order may affect lineage

Atlas may record unexpected lineage relationships when metadata collection from the Spark Atlas Connector occurs out of sequence from the metadata collection from HMS. For example, if an ALTER TABLE operation in Spark that is changing a table name and is reporting to Atlas before HMS has processed the change, Atlas may not show the correct lineage relationships to the altered table.

None.

CDPD-4545: Searches for Qualified Names with "@" does not fetch the correct results

When searching Atlas qualifiedName values that include an "@" character (@), Atlas does not return the expected results or generate appropriate search suggestions.

Consider leaving out the portion of the search string that includes the @ sign, and use the wildcard character * instead.

CDPD-3208: Table alias values are not found in search

When table names are changed, Atlas keeps the old name of the table in a list of aliases. These values are not included in the search index in this release, so after a table name is changed, searching on the old table name does not return the entity for the table.

None.

CDPD-3160: Hive lineage missing for INSERT OVERWRITE queries

Lineage is not generated for Hive INSERT OVERWRITE queries on partitioned tables. Lineage is generated as expected for CTAS queries from partitioned tables.

None.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a logout event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent access to Atlas after logging out, close all browser windows and exit the browser.

CDPD-1892: Ranking of top results in free-text search not intuitive

The Free-text search feature ranks results based on which attributes match the search criteria. The attribute ranking is evolving and therefore the choice of top results may not be intuitive in this release.

If you don't find what you need in the top 5 results, use the full results or refine the search.

CDPD-1884: Free text search in Atlas is case sensitive

The free text search bar in the top of the screen allows you to search across entity types and through all text attributes for all entities. The search shows the top 5 results that match the search terms at any place in the text (*term* logic). It also shows suggestions that match the search terms that begin with the term (term* logic). However, in this release, the search results are case-sensitive.

If you don't see the results you expect, repeat the search changing the case of the search terms.

CDPD-1823: Queries with ? wildcard return unexpected results

DSL queries in Advanced Search return incorrect results when the query text includes a question mark (?) wildcard character. This problem occurs in environments where trusted proxy for Knox is enabled, which is always the case for CDP.

None.

CDPD-1664: Guest users are redirected incorrectly

Authenticated users logging in to Atlas are redirected to the CDP Knox-based login page. However, if a guest user (without Atlas privileges) attempts to log in to Atlas, the user is redirected instead to the Atlas login page.

To avoid this problem, open the Atlas Dashboard in a private or incognito browser window.

CDPD-922: The IsUnique relationship attribute not honored

The Atlas model includes the ability to ensure that an attribute can be set to a specific value in only one relationship entity across the cluster metadata. For example, to add metadata tags to relationships that you wanted to make sure were unique in the system, you can design the relationship attribute with the property IsUnique equal true. However, in this release, the IsUnique attribute is not enforced.

None.

DOCS-13759: Tag Propagation stops after a certain depth while the lineage is being extended

When a tag is added to an entity at timestamp T1, the entities along the lineage to which the tag must be propagated is calculated at T1. Before tag propagation completes, if the lineage is extended, tag does not propagate to the entities in the extended lineage.

CDPD-41142: When a Kafka console consumer group is run, more than one update audits are seen

After running the console consumer with a consumer group, verify the consumer group entity created, along with the metrics and notifications for the consumer group and topic. The expected result can be: one ENTITY_CREATE audit and one ENTITY_UPDATE audit. But more than one ENTITY_UPDATE audits are seen.

CDPD-40165: Two audits are created for SPARK CTAS table

When following Spark queries are fired:

```
spark.sql("create table table1(id int)")
spark.sql("create table table2 as select * from table1")
```

HMS sends "ENTITY_CREATE" and "ENTITY_FULL_UPDATE_V2".

The extra ENTITY_FULL_UPDATE_V2 message received from HMS is sent as a part of ALTER_TABLE_ADDCOLS event from the HMS Hook side. This behaviour is observed only when the queries are run from Spark SQL and not when the same queries are run from Beeline.

CDPD-39197: Debug metrics returns empty data

When debug metrics is enabled and some operations are performed, the response is empty

CDPD-36495: Updating legacyAttribute from False to True resets the initially created relationshipAttributes values

Creating types, entities, and to start, you must set the relationship with is_legacy_attribute value as **False**.

Later, update the value relationshipDef is_legacy_attribute to True.

For the entities that were created before updating the is_legacy_attribute to True, the relationship Attributes value is reset.

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-29409: Hive import: Suggestion suggests entity which is deleted.

Suggestions suggests tables of a database, which is a deleted entity.

CDPD-25152: Tag propagation through deferred actions consumes additional time as compared to default flow

The additional time might be due to the small overhead added to create / update task vertex and which is run in the background. This also depends on number of tasks queued to be executed.

CDPD-42954: Zeppelin notebook fails after enabling Atlas-HDFS hook

The Zeppelin notebooks are failing with errors after enabling Atlas-HDFS hook in the CDP cluster.

When the below properties are set for atlas-client.properties in Cloudera Manager:

- atlas.jaas.KafkaClient.option.keyTab
- atlas.jaas.KafkaClient.option.principal

Along with adding the properties in /etc/atlas/conf/atlas-application.properties, Cloudera Manager also adds these properties to atlas-application.properties for other services (like Spark).

Adding these properties interferes with the normal flow of the services (like Spark)

To enable HDFS lineage feature, instead of setting these properties through Cloudera Manager, users can manually add the properties directly in /etc/atlas/conf/atlas-application.properties

CDPD-10576: Deleted Business Metadata attributes appear in Search Suggestions

Atlas search suggestions continue to show Business Metadata attributes even if the attributes have been deleted.

None.

CDPD-39427: [HDFS Lineage]: When the input is a directory in case of put/copyfromLocal/cp/mv commands, lineage is not created even though the script succeeds.

When Source is a directory and target is a directory which is already present in Atlas, the command succeeds and inserts the data in the desired location, but lineage is not created.

DOCS-13760: System Attributes search, __classificationNames: Search with parent tag does not return entities associated to its children tags

System attribute search with __classificationNames = parent_tag returns entities associated to parent_tag only and not entities associated to its children tag.

Workaround: Instead of using system attribute, employ the basic search attribute "classification" which lists entities associated with inherited classifications.

CDPD-35818: Basic search with tag filter provides approximateCount as -1 when there is no match and is 0 otherwise

When the following search operations are performed:

- Faceted search with both tag filter and entity filter

The observed approximateCount is -1.

Here both entity filter and tag filter are present and when there is no match the response received is -1.

- Faceted search with only entity filter

Performing a basic search provides an approximate value of 0 when there is no match.

- Faceted search with only tag filter

Whenever there is tag filter in the query and there is no entity match, the approximateCount is -1 and if the tag filter is not available, the response approximateCount is 0

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-76035: Resource lookup for Atlas service is failing

Once the Atlas configuration snippet `atlas.authentication.method.file` is enabled and a classification is created, these do not synchronize correctly to the **Type Category** resource field setting of Apache Ranger. The newly created classification won't be able to be selected as the **Type Name**.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-69140: Incremental export: When an entity has tag propagated and is exported, the tag is not propagated to it in the export

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After exporting the last table, it will not have the propagated tag.

Apache JIRA: [ATLAS-4889](#)

CDPD-69213: Export/Import, Incremental Export: When entity exported has a tag propagated from entity which is deleted, tag is not propagated to it at target

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After dropping the first table and exporting the entire lineage, the child tables will not have the propagated tag.

Apache JIRA: [ATLAS-5055](#)

CDPD-76789: Creating tag with name description throws java.lang.ClassCastException

Creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options" can lead to HTTP 500 error in Apache Atlas.

Avoid creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options".

CDPD-77435: RAZ: Import-hive on Cloudera Data Engineering cluster fails

Running import-hive command on RAZ enabled Cloudera Data Engineering cluster fails with error "NoClassDefFoundError: com/sun/jersey/core/spi/factory/ResponseBuilderImpl".

CDPD-70321: Atlas Parallel import is failing with various errors

During a parallel import-export activity with six iceberg table policies with exportOption as db1.* for all six exports, all import fail after the exports.

CDPD-75994: Post DL regular upgrade (non ZDU) to 7.3.1, "Exception in getKafkaConsumer ,WakeUpException: null" is seen

After the data lake is upgraded to 7.3.1, sometimes Atlas Hook does not function when Apache Atlas and Apache Kafka are started at the same time, thus Atlas is unable to connect to Kafka while Kafka is still being set up. Atlas performs only three attempts.

Restart the cluster, after the upgrade to trigger to reconnect to Apache Kafka. The Kafka consumer creation should be retried if the Kafka service is unavailable during Atlas startup.

DOCS-26821: Iceberg entities created in 7.2.17 Atlas-Hook (Hive,Impala,Spark) is not ingested by 7.2.18/7.3.1 Atlas Server

When using an Atlas hook from 7.3.1 with an earlier version of Atlas server (7.1.9 SP1 CHF5 or earlier) to create an Iceberg table, the older data model of Iceberg cannot process the features of the new data models. For example, when encountering relationships or attributes in queries which do not have a definition in the earlier model, Iceberg fails to create new tables with an error message. The data model of the Iceberg in Cloudera Runtime 7.1.9 SP1 CHF5 or later is not backward compatible with earlier data models.

It is recommended to upgrade your Atlas server version to at least 7.1.9 SP1 CHF5 or later.

CDPD-28741: Atlas node start failure : PermanentLockingException: Expected value mismatch for KeyColumn

In an Atlas High Availability (HA) enabled environment, starting both Atlas hosts at the same time can result in both trying to access or modify the same graph database resulting in a race condition. One instance successfully modifies the patch vertex, while the other instance triggers a Locking Exception (Concurrent modification exception).

Start Atlas instances in sequence and not in parallel to avoid the potential race condition. If the exception is already present, restart the second Atlas instance after triggering the PermanentLockingException.

CDPD-79099: Unable to import hive tables using import script in Public Cloud

The validation of import .zip files can cause the org.apache.atlas.AtlasServiceException error if the .zip file contains Atlas shell entities missing mandatory attributes such as a name. Therefore, the import of shell entities fails.

CDPD-88230: Bulk import operations currently do not construct lineage as expected

Bulk import operations do not create lineage consistently, even when the entities are imported successfully.

CDPD-88302: Bulk import operations currently do not create audits for the imported entities

Bulk import operations do not create audits for the imported entities.

Known Issues in Cruise Control

Learn about the known issues in Cruise Control, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15**Rebalancing with Cruise Control does not work due to the metric reporter failing to report the CPU usage metric**

On the Kafka broker, the Cruise control metric reporter plugin may fail to report the CPU usage metric.

If the CPU usage metric is not reported, the numValidWindows in Cruise Control will be 0 and proposal generation as well as partition rebalancing will not work. If this issue is present, the following message will be included in the Kafka logs:

```
WARN com.linkedin.kafka.cruisecontrol.metricsreporter.CruiseControlMetricsReporter:
[CruiseControlMetricsReporterRunner]: Failed reporting CPU
util.
```

```
java.io.IOException: Java Virtual Machine recent CPU usage is not
available.
```

This issue is only known to affect Kafka broker hosts that have the following specifications:

- CPU: Intel(R) Xeon(R) CPU E5-2699 v4 @ 2.20GHz
- OS: Linux 4.18.5-1.el7.elrepo.x86_64 #1 SMP Fri Aug 24 11:35:05 EDT 2018 x86_64
- Java version: 8-18

Move the broker to a different machine where the CPU is different. This can be done by moving the host to a different cluster. For more information, see the [Moving a Host Between Clusters](#).

Note: Cluster nodes affected by this issue are not displayed as unhealthy.

Known Issues in HDFS

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60770: Beeline Authentication Issue with Special Characters in Passwords

When LDAP is enabled, users cannot authenticate with Beeline if the password contains a special character. For example, the following string fails:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>;user=user@XXX;password='R3G#xpXyoy1M0Jb1'
```

Use the -p parameter to execute the Beeline command:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>; -n user@XXX -p 'R3G#xpXyoy1M0Jb1'
```

CDPD-43769: Inconsistent behavior with CHAR comparisons and string literals

In Hive, 'char' data to 'string' data comparison is considered as equal, but 'char' data to 'varchar' data comparison is considered as not equal if the data has trailing spaces. For example,

```
create table test(colchar char(10), colvarchar varchar(20), colstring string);
insert into test values ('a ', 'a ', 'a ');

select count(*) from test where colchar = colstring;
Output returns 1 because char and string data is considered as equal

select count(*) from test where colchar = colvarchar;
Output returns 0 because char and varchar data is considered as not equal
```

It is recommended that you use 'varchar or string' data type instead of 'char' data type for any character or string representation.

CDPD-42726: Wrong results for agg queries from stats after running multi-insert query on managed table

Multiple inserts at the same time into the same partition results in invalid stats. For example:

```
create table source(p int, key int, value string);
insert into source(p, key, value) values (101,42,'string42');

create table stats_part(key int,value string) partitioned by (p int);
from source
insert into stats_part select key, value, p
insert into stats_part select key, value, p;

select count(*) from stats_part;
-- In this scenario, StatsOptimizer helps serving this query because the result should be rowNum of the partition p=101.
-- The result is 1, however, the result should be 2.
```

Rewrite the multi-insert statement by merging the branches inserting into the same partition to one branch.

CDPD-57574: Query execution fails due to NullPointerException in DagUtils.setupQuickStart

Hive queries may fail at runtime with a NullPointerException while executing the Tez graph at DagUtils.setupQuickStart method. A part of the stack trace from the error is shown below:

```
ERROR : Failed to execute tez graph.
java.lang.NullPointerException: null at org.apache.hadoop.hive.ql.exec.tez.DagUtils.setupQuickStart(DagUtils.java:1724)
```

The error usually occurs from an invalid plan that has cycles created by semi-join or map-join edges.

Disable some of the optimizations in order to remove the cycles from the plan. It is sufficient to set one of the following properties:

- set hive.tez.dynamic.partition.pruning=false;
- set hive.tez.dynamic.semijoin.reduction=false;
- set hive.auto.convert.join=false;

To avoid any undesired performance regressions, disable the optimization(s) only for specific queries and not globally (through Cloudera Manager) for the whole workload or cluster.

CDPD-45370: Cartesian join fails with an empty table

When the configuration `hive.tez.cartesian-product.enabled` is set to `true`, query fails if one of the tables involved in a Cartesian join has zero rows. This results in an `IllegalArgumentException` with the message `Number of items is 0. Should be positive`.

To address this issue, set `hive.tez.cartesian-product.enabled` to `false` before running the query.

Apache Jira: [\[HIVE-26582\]](#)

CDPD-43107: SemanticException for INSERT INTO statement when Hive Cost-based Optimizer (CBO) is disabled

If you are running the `INSERT INTO` query and `hive.cbo.enable` is set to `"false"`, the query fails with a `SemanticException`. For example,

```
set hive.cbo.enable=false;

CREATE TABLE mytable (
  id INT,
  str STRING
);

INSERT INTO mytable (id, str) VALUES (1, 'a');
```

```
Output:
org.apache.hadoop.hive.ql.parse.SemanticException: 0:0 Expected
2 columns for insclause-0/default@mytable; select produces 1 col
umns. Error encountered near token ''a''
```

This issue occurs only when columns are specified for the target table in the query. `INSERT INTO mytable values (1, 'a');` does not result in an exception.

Enable CBO and run the query.

CDPD-43957: HiveServer shuts down during replication due to high resource usage

During Hive replication (both bootstrap and incremental), you may notice that the `HiveServer` (HS2) shuts down periodically with the following error:

```
java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientE
xception: Unable to read HiveServer2 configs from ZooKeeper

... 8 mor
```

This issue occurs when you replicate at scale with an unbalanced cluster setup that has all the roles running on the Cloudera Manager host. As a result, Cloudera Manager ends up in a bottleneck situation because HS2 crashes, preventing further replication. The logs (/var/log/messages) indicate that there were a large number of Java processes running on the host, which exhausted the host's memory and triggered an Out Of Memory Killer process to stop HS2.

You can restart HS2 and reinitiate replication. However, the replication process may take a longer time to complete.

- Follow these recommendations when setting up your source and target clusters:
 - Ensure that no HS2, Hive metastore (HMS), DataNode, or NameNode roles are running on the Cloudera Manager host.
 - Ensure that you have multiple instances of HS2 and HMS roles on different nodes.
 - It is recommended that you have the HS2 and HMS roles on different nodes than the DataNodes or NameNodes.

These practices increase the possibility of Hive replication at scale completing successfully.

- Limit the scale of Hive replication by temporarily disabling replication policies.

CDPD-40730: Parquet change can cause incompatibility

Parquet files written by the parquet-mr library in CDP 7.1.9, where the schema contains a timestamp with no UTC conversion will not be compatible with older versions of Parquet readers. The effect is that the older versions will still consider these timestamps as they would require UTC conversions and will thus end up with a wrong result. You can encounter this problem only when you write Parquet-based tables using Hive, and tables have the non-default configuration `hive.parquet.write.int64.timestamp=true`.

None.

CDPD-41274: HWC + Oozie issue: Could not open client transport with JDBC Uri

Currently only Spark cluster mode is supported in the Oozie Spark Action with Hive Warehouse Connector (HWC).

Use Spark action in cluster mode.

```
<spark xmlns="uri:oozie:spark-action:1.0">
  ...
  <mode>cluster</mode>
  ...
</spark>
```

CDPD-23506: OutOfMemoryError in LLAP

Long running spark-shell applications can leave sessions in interactive Hiveserver2 until the Spark application finishes (user exists from spark-shell), causing memory pressure in case of a high number of queries in the same shell (1000+).

You must close spark-shell so that sessions are closed. Add the owner of the database or the tables as a user with read or read/write access to the tables directly.

CDPD-23041: DROP TABLE on a table having an index does not work

If you migrate a Hive table to CDP having an index, DROP TABLE does not drop the table. Hive no longer supports indexes ([HIVE-18448](#)). A foreign key constraint on the indexed table prevents dropping the table. Attempting to drop such a table results in the following error:

```
java.sql.BatchUpdateException: Cannot delete or update a parent
row: a foreign key constraint fails ("hive"."IDXS", CONSTRAINT "
```

```
IDXS_FK1" FOREIGN KEY ("ORIG_TBL_ID") REFERENCES "TBLS ("TBL_ID"
))
```

There are two workarounds:

- Drop the foreign key "IDXS_FK1" on the "IDXS" table within the metastore. You can also manually drop indexes, but do not cascade any drops because the IDXS table includes references to "TBLS".
- Launch an older version of Hive, such as Hive 2.3 that includes IDXS in the DDL, and then drop the indexes as described in [Language Manual Indexing](#).

Apache Issue: [Hive-24815](#)

CDPD-13636: Hive job fails with OutOfMemory exception in the Azure DE cluster

Set the parameter `hive.optimize.sort.dynamic.partition.threshold=0`. Add this parameter in Cloudera Manager (Hive Service Advanced Configuration Snippet (Safety Valve) for `hive-site.xml`)

CDPD-10848: HiveServer Web UI displays incorrect data

If you enabled auto-TLS for TLS encryption, the HiveServer2 Web UI does not display the correct data in the following tables: Active Sessions, Open Queries, Last Max n Closed Queries

Known Issues in Hue

Learn about the known issues in Hue, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-94739: Hue audit logging requires debug mode

In Hue, audit logging is only active when debug logging is enabled by setting `DJANGO_DEBUG_MODE = true`. By default, audit logging is disabled.

Update to the upcoming release to restore audit logging functionality.

CDPD-58978: Batch query execution using Hue fails with Kerberos error

When you run Impala queries in a batch mode, you encounter failures with a Kerberos error even if the keytab is configured correctly. This is because submitting Impala, Sqoop, Pig, or pyspark queries in a batch mode launches a shell script Oozie job from Hue and this is not supported on a secure cluster.

There is no workaround. You can submit the queries individually.

OPSAPS-69659: Hue service fails on restart with "Unable to find pycpg2 2.5.4" error

Hue service fails to restart and you see the following error: Unable to find pycpg2 2.5.4. This could be because you have installed Python in a non-default location and Hue is unable to locate the pycpg2 PostgreSQL database adapter.

You must specify the path where you have installed Python in the `PYTHONPATH` property in the Hue Advanced Configuration Snippet using Cloudera Manager.

1. Log in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue Configurations and add the following key and value in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

Key: `PYTHONPATH`

Value: `[***PYTHON-PATH***]`

Replace `[***PYTHON-PATH***]` with the actual location where you have installed Python. For example, `/opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python3.8/site-packages`

3. Click Save Changes.
4. Restart the Hue service.

CDPD-59677: Unable to view Phoenix tables on the left assist in Hue

On clusters secured with Knox, you may not be able to see Phoenix tables on the left assist that are present under the default database (that is, an empty("") database).

None.

CDPD-58142: A query is not pre-populated in the Hue editor after clicking on the “Re Execute” button

When you click Re Execute to rerun a query from the Job Browser Queries Query Details page, the query does not get populated on the Hue editor, as expected.

None.

CDPD-54376: Clicking the home button on the File Browser page redirects to HDFS user directory

When you are previewing a file on any supported filesystem, such as S3 or ABFS, and you click on the Home button, you are redirected to the HDFS user home directory instead of the user home directory on the said filesystem.

None.

CDPD-41306: pip3.8 freeze command does not work and results into an error

You see the /usr/lib/hue/build/env/bin/python: No such file or directory error when you run the following command:

```
build/env/bin/pip3.8 freeze
```

Run the freeze command as follows by specifying the paths of python3.8 and pip3.8:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/python3.8 /opt/cloudera/parcels/CDH/lib/hue/build/env/bin/pip3.8 freeze
```

CDPD-43293: Unable to import Impala table using Importer

Creating Impala tables using the Hue Importer may fail.

If you have both Hive and Impala services installed on your cluster, then you can import the table using by selecting the Hive dialect from Tables Sources .

If only Impala service is installed on your cluster, then go to Cloudera Manager Clusters Hue Configurations and add the following line in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[beeswax]
max_number_of_sessions=1
```

DWX-8602: Unable to import a large CSV file from the local workstation

You may see an error message while importing a CSV file into Hue from your workstation, stating that you cannot import files of size more than 200 KB.

Upload the file to S3 or ABFS and then import them into Hue using the Importer.

CDPD-39330: Unable to use the pip command in CDP

You may not be able to use the pip command in CDP 7.1.7 or higher and may see the following error when using pip in a command: “ImportError: cannot import name chardet”.

Follow the steps listed on [Unable to use pip command in CDP](#).

CDPD-24294: Hue uses the unsafe-inline directive in its Content Security Policy (CSP) header

Hue 4 web interface uses the unsafe-inline directive in its CSP header. As a result, the application server does not set the CSP header in its HTTP responses, and therefore does not benefit from the additional protection against potential cross-site scripting issues and other modern application

vulnerabilities which a properly configured CSP may provide. This could lead to application vulnerability.

Cloudera recommends deploying additional security measures such as a firewall within the Hue server to control allowed connections, and SSO-based authentications mechanisms such as LDAP or SAML.

OPSAPS-58927: Connection failed error when accessing the Search app (Solr) from Hue

If you are using Solr with Hue to generate interactive dashboards and for indexing data, and if you have deployed two Solr services on your cluster and selected the second one as a dependency for Hue, then Cloudera Manager assigns the hostname of the first Solr service and the port number of the second Solr service generating an incorrect Solr URL in the search section of the hue.ini file. As a result, you may see a “Connection failed” error when you try to access the Search app from the Hue web UI.

1. Log into Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[search]
# URL of the Solr Server
solr_url=http://[***HOSTNAME***]:[***PORT***]/solr/
```

For example:

```
solr_url=http://solr2:4567/solr/
```

3. Click Save Changes.
4. Restart the Hue service.

CDPD-41136: Importing files from the local workstation is disabled by default

Cloudera has disabled the functionality to import files from your local workstation into Hue because it may cause errors. You may not see the Local File option in the Type drop-down menu on the **Importer** page by default.

You can enable the functionality to import files from your local workstation by specifying the following parameter in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field in Hue configurations in Cloudera Manager:

```
[indexer]
enable_direct_upload=true
```

Invalid S3 URI error while accessing S3 bucket

The Hue Load Balancer merges the double slashes (//) in the S3 URI into a single slash (/) so that the URI prefix "/filebrowser/view=S3A:/" is changed to "/filebrowser/view=S3A:". This results in an error when you try to access the S3 buckets from the Hue File Browser through the port 8889.

The Hue web UI displays the following error: “Unknown error occurred”.

The Hue server logs record the “ValueError: Invalid S3 URI: S3A” error.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.

5. Restart the Hue Load Balancer.

You should be able to load the S3 browser from both 8888 and 8889 ports.

Alternatively, you can use the Hue server port 8888 instead of the load balancer port 8889 to resolve this issue.

Error while rerunning Oozie workflow

You may see an error such as the following while rerunning an already executed and finished Oozie workflow through the Hue web interface: E0504: App directory [hdfs://cdh/user/hue/oozie/workspaces/hue-oozie-1571929263.84] does not exist.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

CDPD-17956, CDPD-14167: Setting idle session timeout for Hue does not work when the cluster is secured using Knox SSO

If Hue is configured with desktop.auth.backend.KnoxSpnegoDjangoBackend as the Authentication Backend, then the automatic idle session logout that is set by configuring the `idle_session_timeout` property does not take effect. You may also see 404 error while accessing Hue from the Knox UI when the `idle_session_timeout` property is not set to -1.

None

Query history displays "Result Expired" message

You see the "Result Expired" message under the Query History column on the **Queries** tab for queries which were run back to back. This is a known behaviour.

None.

CDPD-43956: Manually replace UUID when importing Oozie workflows containing sub-workflows

When importing Oozie workflows that contain sub-workflows, you must replace all the UUID entries with unique new entries. If you change the UUID of a sub-workflow, you must update that reference in the parent workflow to avoid circular dependencies.

Hue limitation after upgrading from CDH to CDP Private Cloud Base

The `hive.server2.parallel.ops.in.session` configuration property changes from TRUE to FALSE after upgrading from CDH to CDP Private Cloud Base. Current versions of Hue are compatible with this property change; however, if you still would like to use an earlier version of Hue that was not compatible with this property being FALSE and shared a single JDBC connection to issue queries concurrently, the connection will no longer work after upgrading.

Hue UI is blank upon login after upgrading to CDP 7.1.7 from CDH 6

If your cluster was secured using Knox, and if you have upgraded from CDH 6 to CDP 7.1.7, then you may see a blank Hue screen. This could happen because the `knox_proxyhosts` parameter is newly introduced in CDP, and it is possible that this parameter is not configured in Cloudera Manager under Hue configuration.

Specify the host on which you have installed Knox in the Hue Knox Proxy Hosts configuration as follows:

1. Log in to Cloudera Manager as an Administrator.
2. Obtain the host name of the Knox Gateway by going to Clusters Knox service Instances .

3. Go to Clusters Hue service Configuration and search for the Knox Proxy Hosts field.

Note: Cloudera Manager displays the following warning if the Knox Proxy Hosts field is empty when Knox Gateway is enabled on the CDP cluster: The parameter `knox_proxyhosts` cannot be empty. This can happen if there are no Knox Gateways. Please set the `knox_proxyhosts` to the list of hosts that have Knox Gateways.

4. Specify the Knox Gateway hostname in the Knox Proxy Hosts field.
5. Click Save Changes and restart the Hue service.

Unsupported features

CDPD-59595: Spark SQL does not work with all Livy servers that are configured for High Availability

SparkSQL support in Hue with Livy servers in HA mode is not supported. Hue does not automatically connect to one of the Livy servers. You must specify the Livy server in the Hue Advanced Configuration Snippet as follows:

```
[desktop]
[spark]
livy_server_url=http(s)://[***LIVY-FOR-SPARK3-SERVER-HOST***]:
[***LIVY-FOR-SPARK3-SERVER-PORT***]
```

Moreover, you may see the following error in Hue when you submit a SparkSQL query: Expecting value: line 2 column 1 (char 1). This happens when the Livy server does not respond to the request from Hue.

Specify all different Livy servers in the `livy_server_url` property one at a time and use the one which does not cause the issue.

CDPD-18491: PySpark and SparkSQL are not supported with Livy in Hue

Hue does not support configuring and using PySpark and SparkSQL with Livy in CDP Private Cloud Base.

Importing and exporting Oozie workflows across clusters and between different CDH versions is not supported

You can export Oozie workflows, schedules, and bundles from Hue and import them only within the same cluster if the cluster is unchanged. You can migrate bundle and coordinator jobs with their workflows only if their arguments have not changed between the old and the new cluster. For example, hostnames, NameNode, Resource Manager names, YARN queue names, and all the other parameters defined in the `workflow.xml` and `job.properties` files.

Using the import-export feature to migrate data between clusters is not recommended. To migrate data between different versions of CDH, for example, from CDH 5 to CDP 7, you must take the dump of the Hue database on the old cluster, restore it on the new cluster, and set up the database in the new environment. Also, the authentication method on the old and the new cluster should be the same because the Oozie workflows are tied to a user ID, and the exact user ID needs to be present in the new environment so that when a user logs into Hue, they can access their respective workflows.

Note: Migrating Oozie workflows from HDP clusters is not supported.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94720: Impala startup failure due to invalid TLS v1.3 ciphers

When running Impala on a machine with OpenSSL 1.1.1, providing an invalid or TLS v1.2 ciphersuite in the `--tls_ciphersuites` startup flag causes the process to fail during startup. While OpenSSL 3.x ignores invalid ciphers, OpenSSL 1.1.1 returns an error if any ciphersuite in the list is invalid, even if other valid TLS v1.3 ciphers are present.

Ensure that the list in the `--tls_ciphersuites` startup flag contains only valid TLS v1.3 ciphersuites and does not contain any TLS v1.2 ciphersuites.

Apache Jira: [IMPALA-14625](#)

CDPD-59625: Impala shell in RHEL 9 with Python 2 as default does not work

If you try to run `impala-shell` on RHEL 9 by setting the default python executable available in `PATH` to Python 2, it will fail since RHEL 9 is compatible only with Python 3.

If you run into such issues, set this parameter pointing to Python 3, `IMPALA_PYTHON_EXECUTABLE=python3`.

CDPD-81980: Impala query may fail due to backpressure

Impala queries could fail with a dropped due to backpressure error, even when service queue and memory usage appear normal.

Increase the value of the `--mem_limit` startup option.

CDPD-42958: After upgrading the CDH 7.1.9 from CDH 6.x, under certain conditions you cannot insert data into a table

Under the following conditions, after upgrading from CDH 6.x to CDH 7.1.9 you cannot insert data into a table from Impala:

- On CDH 6.x, you created a database with Impala in a user specified HDFS location.
- Using Hive, you then created a table in the database.

Under these conditions, the database and table are stored in the user-specified HDFS directory. After upgrading, the HDFS directory of the table is read-only for Impala. Consequently, from Impala you cannot insert new data into the table because Impala does not have write permission on the HDFS directory.

Workaround: To resolve this issue, use either one of the following workarounds:

- Using the Ranger Web UI, in the policy repository `cm_hdfs`, grant the user 'impala' write permission on the directory where the table resides.
- Enter the following command to grant write permission to user 'impala' on the HDFS directory where the table resides.

```
hdfs dfs -setfacl -m default:user:impala:rwX <HDFS directory>
```

Impala cannot update table if the 'external.table.purge' property is not set to true

Impala cannot update a table using DDL statements if the 'external.table.purge' property is FALSE. ALTER TABLE statements return success with no changes to the table.

ALTER TABLE statements should be issued twice if "external.table.purge" was FALSE initially.

Note: For Iceberg tables, Impala users should always use CREATE TABLE since the Impala CREATE TABLE statement sets the flag to TRUE. However, Impala CREATE EXTERNAL TABLE sets the flag to FALSE.

Impala's known limitation when querying compacted tables

When the compaction process deletes the files for a table from the underlying HDFS location, the Impala service does not detect the changes as the compactions does not allocate new write ids. When the same table is queried from Impala it throws a 'File does not exist' exception that looks something like this:

```
Query Status: Disk I/O error on <node>:22000: Failed to open HDFS file hdfs://nameservice1/warehouse/tablespace/managed/hive/<database>/<table>/xxxxx
Error(2): No such file or directory Root cause: RemoteException: File does not exist: /warehouse/tablespace/managed/hive/<database>/<table>/xxxx
```

Use the [REFRESH/INVALIDATE](#) statements on the affected table to overcome the 'File does not exist' exception.

CDPD-28431: Intermittent errors could be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

Impala api calls via kinox require configuration if the kinox customized kerberos principal name is a default service user name

To access impala api calls via kinox, if the kinox customized kerberos principal name is a default service user name, then configure "authorized_proxy_user_config" by clicking Clusters->impala->configuration. Include the kinox customized kerberos principal name in the comma separated list of values `<knox_custom_kerberos_principal_name>=*` where `<knox_custom_kerberos_principal_name>` is the value of the Kerberos Principal in the Knox service. Select Clusters>Knox>Configuration and search for Kerberos Principal to display this value.

CDPD-21828: Multiple permission assignment through grant is not working

None

Problem configuring masking on tables using Ranger

The following Knowledge Base article describes the behavior when we configure masking on tables using Ranger. This configuration works for Hive, but breaks queries in some scenarios for Impala.

For a workaround, see the following Knowledge Base article: [ERROR: "AnalysisException: No matching function with signature: mask\(FLOAT\)" when Impala jobs fail with the following error with signature: mask\(FLOAT\)](#)

IMPALA-11871: INSERT statement does not respect Ranger policies for HDFS

In a cluster with Ranger auth (and with legacy catalog mode), even if you provide RWX to cm_hdfs -> all-path for the user impala, inserting into a table whose HDFS POSIX permissions happen to exclude impala access will result in "AnalysisException: Unable to INSERT into target table (default.t1) because Impala does not have WRITE access to HDFS location: hdfs://XXXXXXXXXXXXX"

IMPALA-532: Impala should tolerate bad locale settings

If the LC_* environment variables specify an unsupported locale, Impala does not start.

Add LC_ALL="C" to the environment settings for both the Impala daemon and the Statestore daemon.

Avro Scanner fails to parse some schemas

The default value in Avro schema must match type of first union type, e.g. if the default value is null, then the first type in the UNION must be "null".

Swap the order of the fields in the schema specification. For example, use ["null", "string"] instead of ["string", "null"]. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

IMPALA-691: Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the impalad daemon.

To monitor overall memory usage, use the top command, or add the memory figures in the Impala web UI /memz tab to JVM memory usage shown on the /metrics tab.

IMPALA-1024: Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Remove trailing semicolon from the Avro schema.

IMPALA-1652: Incorrect results with basic predicate on CHAR typed column

When comparing a CHAR column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Use the RPAD() function to blank-pad literals compared with CHAR columns to the expected length.

IMPALA-1821: Casting scenarios with invalid/inconsistent results

Using a CAST() function to convert large literal values to smaller types, or to convert special values such as NaN or Inf, produces values not consistent with other database systems. This could lead to unexpected results from queries.

None

IMPALA-2005: A failed CTAS does not drop the table if the insert fails

If a CREATE TABLE AS SELECT operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Metadata operations that change the state of a table, like COMPUTE STATS or ALTER RECOVER PARTITIONS, may delay metadata propagation of unrelated unloaded tables triggered by statements like DESCRIBE or SELECT queries.

None

IMPALA-7072: Impala does not support Heimdal Kerberos

None

OPSAPS-46641: A single parameter exists in Cloudera Manager for specifying the Impala Daemon Load Balancer. Because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

The workaround is to use the load balancer configuration either without a port specification, or with the Beeswax port: this will configure BDR. To configure Hue use the "Hue Server Advanced Configuration Snippet (Safety Valve) for impalad_flags" to specify the the load balancer address with the HiveServer2 port.

CDPD-28139: Set spark.hadoop.hive.stats.autogather to false by default

As an Impala user, if you submit a query against a table containing data ingested using Spark and you are concerned about the quality of the query plan, you must run COMPUTE STATS against such a table in any case after an ETL operation because numRows created by Spark could be incorrect. Also, use other stats computed by COMPUTE STATS, e.g., Number of Distinct Values (NDV) and NULL count for good selectivity estimates.

For example, when a user ingests data from a file into a partition of an existing table using Spark, if spark.hadoop.hive.stats.autogather is not set to false explicitly, numRows associated with this partition would be 0 even though there is at least one row in the file. To avoid this, the workaround is to set "spark.hadoop.hive.stats.autogather=false" in the "Spark Client Advanced Configuration Snippet (Safety Valve) for spark-conf/spark-defaults.conf" in Spark's CM Configuration section.

Known Issues in Kafka

Learn about the known issues in Kafka, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker) in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Save Changes > Restart SMM.

The offsets.topic.replication.factor property must be less than or equal to the number of live brokers

The offsets.topic.replication.factor broker configuration is now enforced upon auto topic creation. Internal auto topic creation will fail with a GROUP_COORDINATOR_NOT_AVAILABLE error until the cluster size meets this replication factor requirement.

None

Requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true

The first few produce requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true.

Increase the number of retries in the producer configuration setting retries.

Performance degradation when SSL Is enabled

In some configuration scenarios, significant performance degradation can occur when SSL is enabled. The impact varies depending on your CPU, JVM version, Kafka configuration, and message size. Consumers are typically more affected than producers.

Configure brokers and clients with ssl.secure.random.implementation = SHA1PRNG. It often reduces this degradation drastically, but its effect is CPU and JVM dependent.

OPSAPS-43236: Kafka garbage collection logs are written to the process directory

By default Kafka garbage collection logs are written to the agent process directory. Changing the default path for these log files is currently unsupported.

None

RANGER-3809: Idempotent Kafka producer fails to initialize due to an authorization failure

Kafka producers that have idempotence enabled require the Idempotent Write permission to be set on the cluster resource in Ranger. If permission is not given, the client fails to initialize and an error similar to the following is thrown:

```
org.apache.kafka.common.KafkaException: Cannot execute transactional method because we are in an error state
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeFailWithError(TransactionManager.java:1125)
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeAddPartition(TransactionManager.java:442)
    at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:1000)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:914)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:800)
    :
    :
    :
    Caused by: org.apache.kafka.common.errors.ClusterAuthorizationException: Cluster authorization failed.
```

Idempotence is enabled by default for clients in Kafka 3.0.1, 3.1.1, and any version after 3.1.1. This means that any client updated to 3.0.1, 3.1.1, or any version after 3.1.1 is affected by this issue.

This issue has two workarounds, do either of the following:

- Explicitly disable idempotence for the producers. This can be done by setting `enable.idempotence` to `false`.
- Update your policies in Ranger and ensure that producers have Idempotent Write permission on the cluster resource.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

DBZ-4990: The Debezium Db2 Source connector does not support schema evolution

The Debezium Db2 Source connector does not support the evolution (updates) of schemas. In addition, schema change events are not emitted to the schema change topic if there is a change in the schema of a table that is in capture mode. For more information, see [DBZ-4990](#).

None.

CFM-3532: The Stateless NiFi Source, Stateless NiFi Sink, and HDFS Stateless Sink connectors cannot use Snappy compression

This issue only affects Stateless NiFi Source and Sink connectors if the connector is running a dataflow that uses a processor that uses Hadoop libraries and is configured to use Snappy compression. The HDFS Stateless Sink connector is only affected if the `Compression Codec` or `Compression Codec` for Parquet properties are set to `SNAPPY`.

If you are affected by this issue, errors similar to the following will be present in the logs.

```
Failed to write to HDFS due to java.lang.UnsatisfiedLinkError: org.apache.hadoop.util.NativeCodeLoader.buildSupportsSnappy()
```

```
Failed to write to HDFS due to java.lang.RuntimeException: native snappy library not available: this version of libhadoop was built without snappy support.
```

Download and deploy missing libraries.

Important: Ensure that you complete steps 1-11 on all Kafka Connect hosts. Additionally, ensure that the advanced configuration snippet in step 12 is configured for all Kafka Connect role instances.

1. Create the `/opt/nativelibs` directory.

```
mkdir /opt/nativelibs
```

2. Change the owner to kafka.

```
chown kafka:kafka /opt/nativelibs
```

3. Locate the directory containing the Hadoop native libraries and copy its contents to the directory you created.

```
cp /opt/cloudera/parcels/CDH/lib/hadoop/lib/native/* /opt/nativelibs
```

4. Verify that `libsnapy.so` was copied to the directory you created.
5. Remove the following from `/opt/nativelibs`.

```
libhadoop.a
```

```
libhadoop.so
libhadoop.so.1.0.0
```

6. Run the following command.

```
hadoop version
```

The command returns the Hadoop version running in the cluster. Note down the first three digits in the version.

7. Go to <https://archive.apache.org/dist/hadoop/common/> and download the Hadoop version that matches the first three digits of the version running in the cluster.

For example, if your Hadoop version is 3.1.1.7.1.9.0-296, then you need to download Hadoop 3.1.1.

8. Extract the downloaded archive.
9. Copy the following libraries from the downloaded archive to /opt/nativelibs on the cluster host.

```
libhadoop.a
libhadoop.so.1.0.0
```

The libraries are located in `hadoop-[***VERSION***]/lib/native`.

10. Create a symlink named `libhadoop.so` and point it to `/opt/nativelibs/libhadoop.so.1.0.0`.

```
ln -s /opt/nativelibs/libhadoop.so.1.0.0 /opt/nativelibs/libhadoop.so
```

11. Change the owner of every entry within `/opt/nativelibs` to `kafka`.

```
chown -h kafka:kafka /opt/nativelibs/*
```

12. In Cloudera Manager, go to `Kafka service Configuration`.
13. Add the following key-value pair to `Kafka Connect Environment Advanced Configuration Snippet (Safety Valve)`.
 - Key: `LD_LIBRARY_PATH`
 - Value: `/opt/nativelibs`
14. Click `Save Changes`.
15. Restart the `Kafka` service.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to `requested` instead of `required` and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Unsupported Features

The following Kafka features are not supported in Cloudera Data Platform:

- Only Java and .Net based clients are supported. Clients developed with C, C++, Python, and other languages are currently not supported.
- The Kafka default authorizer is not supported. This includes setting ACLs and all related APIs, broker functionality, and command-line tools.
- SASL/SCRAM is only supported for delegation token based authentication. It is not supported as a standalone authentication mechanism.

- Kafka KRaft in this release of Cloudera Runtime is in technical preview and does not support the following:
 - Deployments with multiple log directories. This includes deployments that use JBOD for storage.
 - Delegation token based authentication.
 - Migrating an already running Kafka service from ZooKeeper to KRaft.
 - Atlas Integration.

Limitations

Collection of Partition Level Metrics May Cause Cloudera Manager's Performance to Degrade

If the Kafka service operates with a large number of partitions, collection of partition level metrics may cause Cloudera Manager's performance to degrade.

If you are observing performance degradation and your cluster is operating with a high number of partitions, you can choose to disable the collection of partition level metrics.

Important: If you are using SMM to monitor Kafka or Cruise Control for rebalancing Kafka partitions, be aware that both SMM and Cruise Control rely on partition level metrics. If partition level metric collection is disabled, SMM will not be able to display information about partitions. In addition, Cruise Control will not operate properly.

Complete the following steps to turn off the collection of partition level metrics:

1. Obtain the Kafka service name:
 - a. In Cloudera Manager, Select the Kafka service.
 - b. Select any available chart, and select Open in Chart Builder from the configuration icon drop-down.
 - c. Find \$SERVICENAME= near the top of the display.
The Kafka service name is the value of \$SERVICENAME.
2. Turn off the collection of partition level metrics:
 - a. Go to Hosts Hosts Configuration .
 - b. Find and configure the Cloudera Manager Agent Monitoring Advanced Configuration Snippet (Safety Valve) configuration property.

Enter the following to turn off the collection of partition level metrics:

```
[KAFKA_SERVICE_NAME]_feature_send_broker_topic_partition_entity_update_enabled=false
```

Replace [KAFKA_SERVICE_NAME] with the service name of Kafka obtained in step 1. The service name should always be in lower case.

- c. Click Save Changes.

Known Issues in Knox

Learn about the known issues in Knox that impact or change functionality, and the workarounds in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15**CDPD-76435: Default HTTP client timeout for Streams Messaging Manager requests may cause connection timeouts**

Some Streams Messaging Manager requests, particularly those retrieving topic data, may take up to 30 seconds to complete, even when there are no connectivity issues. Since the default gateway timeout is set to 20 seconds, this can result in connection timeouts despite the system functioning as expected.

Increase the HTTP client and socket timeouts for Streams Messaging Manager services to 60 seconds. This prevents connection timeouts when the requests take longer than the default gateway timeout.

Follow these steps to configure the required properties for the SMM API and SMM UI services:

1. In Cloudera Manager, select the Knox service.
2. Go to Configuration.
3. Find the Knox Simplified Topology Management - cdp-proxy property, and click **+** to add the following lines:

```
SMM-UI:replayBufferSize=512
SMM-UI:httpclient.connectionTimeout=1m
SMM-UI:client.socketTimeout=1m
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

4. Find the Knox Simplified Topology Management - cdp-proxy-api property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

5. Find the Knox Simplified Topology Management - cdp-proxy-token property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

6. Save your changes.
7. Refresh the cluster.

Known Issues in Kudu

Learn about the known issues in Kudu, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15**CDPD-94474: Kudu Tablet Server Crash on RHEL9**

Kudu tablet servers kudu-tserver crash on Red Hat Enterprise Linux 9 (RHEL9) x86_64 platforms when the libgcc package is updated to version 11.5.0-11 or newer. This crash manifests as a Segmentation Fault (SIGSEGV) or an Abort (SIGABRT) error under certain workloads.

1. Log in to Cloudera Manager as an Administrator.
2. Navigate to Cloudera Manager Clusters Kudu Configuration .
3. Navigate to the Configuration tab, and add the following value in the Tablet Server Advanced Configuration Snippet (Safety Valve) for gflagfile for the Tablet Server Default Group field:

```
--mrs_use_codegen=false
```

4. Click Save Changes.
5. Restart the Kudu Service.

You get "The user 'kudu' is not part of group 'hive' on the following hosts:" warning by the Host Inspector.

If you are using fine-grained authorization for Kudu, and you are also using Kudu-HMS integration with HDFS-Sentry sync, then you may get the "The user 'kudu' is not part of group 'hive' on the following hosts:" warning while upgrading.

Workaround: Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Unsupported features

Kudu HMS Sync is disabled and is not yet supported

Known Issues in Livy

Known Issues in Ozone

Learn about the known issues in Ozone, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-96710: Non-recursive directory deletion fails with the **Directory is not empty** error

S3 clients might display **Directory is not empty** error unexpectedly when recursively deleting a directory through S3 Gateway on Ozone. This is a timing issue. This occurs when the Ozone Manager's internal double buffer has not flushed the child delete transactions to the DB yet.

It typically takes a few seconds for the double buffer to flush under load. So, wait for some time, and then try the recursive delete operation again.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-88335: Datanode decommission fails when other datanodes are offline due to invalid affinity node in Ratis replication

Datanode decommissioning fails if one or more datanodes holding Ratis replicas are offline. During decommission, the Storage Container Manager (SCM) tries to replicate Ratis container data to maintain redundancy. However, SCM's placement logic still references an affinity node that was previously part of the network topology but has since been removed due to the datanode going offline. This causes repeated placement errors and prevents the decommission process from completing successfully.

Apache Issue: [HDDS-13544](#)

CDPD-87429: Unexpected log lines in Ozone snapshot diff output

``ozone.client.server-defaults.validity.period.ms`` configuration introduced to get server default configurations causes Replication Manager to fail when replicating data between Ozone buckets with the following error when the config value does not specify a timeunit.

```

...
java.lang.IllegalStateException: Invalid first line in diff: "25
/07/02 05:58:44 INFO Configuration.deprecation: No unit for ozon
e.client.server-defaults.validity.period.ms(3600000) assuming MI
LLISECONDS"
at com.cloudera.enterprise.distcp.OzoneCopyListingUtils.parseOz
oneDiff(OzoneCopyListingUtils.java:397)
...

```

Overwrite the ``ozone.client.server-defaults.validity.period.ms`` to configure the value to have time unit (ns, ms, s, m, h). For example, 3600000ms.

CDPD-71648: Snapshot creation failing with "PERMISSION_DENIED" error on a bucket created during pre-upgrade in 7.1.7 SP3

On upgrade of cluster from 7.1.7 SP3 to 7.1.9 SP1, we are not able to create snapshots on a pre-upgrade volume or bucket with "PERMISSION_DENIED" error, since in 7.1.7SP3, we were using full KRB owner name with domain but currently, we only use and search for user shortname.

Update the owner of the bucket with the user shortname and then create snapshot by running the commands:

```

ozone sh bucket update --user=[***USER_SHORT_NAME***] {volume}/{
bucket}
ozone sh snapshot create {volume}/{bucket}
[***SNAPSHOT_NAME***]

```

OPSAPS-74668: `ozone.snapshot.deep.cleaning.enabled` and `ozone.snapshot.ordered.deletion.enabled` configurations are missing with CDP 7.1.9 SP1 CHF and Cloudera Manager 7.13.1

Two Ozone Manager configurations are missing while using CDP 7.1.9 SP1 CHF after upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400.

If you are using CDP 7.1.9 SP1 CHF, before upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400, add the following configs to Ozone Manager Advanced Configuration Snippet (Safety Valve) for ozone-conf/ozone-site.xml so that Ozone Manager does not miss important config after the Cloudera Manager upgrade:

```
<property>
<name>ozone.snapshot.deep.cleaning.enabled</name>
<value>false</value>
</property>

<property>
<name>ozone.snapshot.ordered.deletion.enabled</name>
<value>true</value>
</property>
```

CDPD-64865: Intermittent timeout in TestBlockDeletion.testBlockDeletion (BlockDeletionService stuck)

If the event of SCM exiting safe mode was triggered multiple times, this might eventually cause the SCMBlockDeletingService to transition into the PAUSING state.

Check the SCM logs and ensure that the SCMBlockDeletingService is not running, and then restart the SCM.

CDPD-81569: Recon is not reflecting correct metrics for Volumes, Buckets, Keys, and Pending Key Deletions

Recon is displaying data for container and space utilisation only. The metrics for Volumes, Buckets, Keys, and Pending Key Deletions are not being updated and displayed correctly.

Apache Jira: [HDDS-12607](#)

CDPD-54885: Ozone Prometheus does not work with TLS

The Prometheus service shipped by Ozone does not support TLS mode. So, Prometheus is not able to gather metrics from Ozone endpoints when TLS is enabled.

Go to Ozone Configuration Ozone Prometheus Endpoint Token and update the Ozone Prometheus Endpoint Token with any random string. This makes a token available in the process directory of the Ozone endpoint in plaintext, which Prometheus can use to get around the TLS limitation.

CDPD-69681: Ozone Ranger plugin does recursive listing for ACL checks

Ozone Ranger plugin does recursive listing in unoptimized path for performing ACL check on a directory. Recursive rename and delete operations on directories with layers of subdirectories causes a performance problem.

[Enable Ranger subaccess optimization for rename and delete operations in Ozone.](#)

Apache Issue: [HDDS-10823](#)

CDPD-51490: Installing HDFS and Ozone datanode instances on the same server (in case of a small test or development platform), can cause the Ozone UI to fail as it attempts to use the same default port 9864 already taken by HDFS.

On the Ozone configuration, overwrite the hdds.datanode.client.port value = 19864 and restart the Ozone service. This will allow Ozone UI to load without colliding with the HDFS service.

The Prometheus binary is not available in CDP Private Cloud Base 7.1.9 for the Ubuntu operating system.

You can install Prometheus separately and specify the path to the parent directory, for example /usr/bin, in the prometheus.location parameter in Ozone.

After upgrading the cluster from CDP Private Cloud Base 7.1.8 to CDP Private Cloud Base 7.1.9 and if Ozone is in the Non-HA environment, an exception message is observed during the finalization of the Ozone upgrade.

During the finalization of the upgrade, a `ClassNotFoundException` message for `org.cloudera.log4j.redactor.RedactorAppender` class may be displayed. The error message can be ignored because the upgrade is successful. The error existed previously and does not affect the Ozone service and its operation.

None.

CDPD-68951: In CDP Private Cloud Base 7.1.9 CHF2 version and lower, the command `ozone sh key list <bucket_path>` displays the `isFile` flag in a key's metadata as `false` even when the key is a file. This issue is rectified in CDP Private Cloud Base 7.1.9 CHF3. However, the pre-existing (pre-upgrade) key's metadata cannot be changed.

None

CDPD-67771: When using S3A committer `fs.s3a.committer.name=directory` with `fs.s3a.committer.staging.conflict-mode=replace` to write to FSO buckets, the client fails with the following error.

```
DIRECTORY_NOT_FOUND
org.apache.hadoop.ozone.om.exceptions.OMException:
Failed to find parent directory of xxxxxxxx at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentId(OMFileRequest
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteRequest
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteRequest
at
org.apache.hadoop.ozone.protocolPB.OzoneManagerRequestHandler.handleWriteRequest
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.runCommand(OzoneManag
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.lambda
$1(OzoneManagerStateMachine.java:363) at
java.base/java.util.concurrent.CompletableFuture
$AsyncSupply.run(CompletableFuture.java:1700) at java.base/
java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1128)
at java.base/java.util.concurrent.ThreadPoolExecutor
$Worker.run(ThreadPoolExecutor.java:628) at java.base/
java.lang.Thread.run(Thread.java:834)
```

This occurs because S3A uses multipart upload to commit job results in a batch. The staging committer's replace mode deletes the target directory before completing Memory Protection Unit (MPU). The problem is that File System Optimization (FSO) does not create intermediate directories during MPU, it does only for regular file/dir/key requests.

Use `fs.s3a.committer.name=magic` for affected versions.

CDPD-64398: In SCM with non-HA configuration, Secret key manager does not initialise. Hence, the startup of OM and DataNode fails because it cannot get a secret key. This key is used when security is enabled and used in Block token and container token verification while communicating between the Ozone client, OM, and Datanode.

This issue does not occur in SCM with HA configuration.

You must force exit from the safe mode for SCM. This triggers the initialization of the Secret key manager. Below are the options:

- exit safe mode manually whenever SCM is started
- disable safe mode by setting `hdds.scm.safemode.enabled=false` in safety valve for SCM configuration

Impact of disabling safe mode and the purpose of safe mode:

- Write should not fail once the cluster is out of safe mode
- Read of existing data should not fail after the cluster is out of safe mode
- Unnecessary re-replication should be avoided during cluster restart

So disabling safe mode does not have any major impact on Ozone.

HDDS-9512: Ozone DataNode's new client port conflicts with HDFS DataNode's web port if both Ozone and HDFS DataNode roles are placed on the same host.

You must set `hdds.datanode.client.port` to any unused port. For example, 19864, through the Ozone DataNode safety valve.

CDPD-52412: keyManagerImpl#listStatus exceeds the maximum RPC length.

To reduce the payload, you must increase the part size.

OPSAPS-68159: If you did not deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Error when distributing parcel to host, Ignoring non-compliant parcel manifest error is displayed after Cloudera Manager is upgraded to 7.11.3.

If you encounter the error, perform the following steps:

1. Deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.11.3.
2. Restart the cluster with a delay of 10 minutes.
3. Continue to upgrade CDH 7.1.8 to CDH 7.1.9.

OPSAPS-68159: If you did not deactivate the Ozone parcel 718.2.x on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Ozone roles during the CDH 7.1.8 upgrade to CDH 7.1.9.

If you encounter the error, perform the following steps:

1. Deactivate the Ozone parcel 718.2.x.
2. Restart the Ozone service.
3. Perform Finalize Upgrade for the Ozone service.

Step result: The Ozone roles will be displayed in green.

CDPD-60989: The packaging version for Apache Ozone points to the 1.2.0 older version. This is a version string problem and not a packaging issue. The version of the Apache Ozone binary is closest to 1.4.0.

None. This only affects the JAR versioning.

CDPD-60366: Native library loader fails when system property `native.lib.tmp.dir` is not set. It fails because the library is copied to / instead of the cwd.

Setting `native.lib.tmp.dir` to a certain path like `/tmp` should solve the issue. To set this system property, you must add `-Dnative.lib.tmp.dir=/tmp` to `ozone_java_opts` in Cloudera Manager configuration of the Ozone cluster.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-60598: DataNode can consume up to the JVM heap size worth of direct memory buffers under specific failure scenarios. This can lead to a DataNode crash. This is due to Netty allocating and not freeing the direct memory buffers.

Restarting DataNode will resolve this issue.

CDPD-60466: The Ozone client is missing in the Cloudera Manager's Service Monitor node. This causes Ozone Canary's health check to fail.

Ensure you install Ozone CLI on the same node as Cloudera Manager's Service Monitor.

CDPD-60012: The Ozone SCM may be stuck in safe mode after upgrade to 7.1.9. This is due to a bug in how the SCM accounts for open storage containers.

The workaround is to temporarily set the Ozone configuration `hdds.scm.safemode.threshold.pct` to a lower value like 0.90 and restart the SCM.

CDPD-59679: In some scenarios, excess UNHEALTHY replicas of EC containers may not be removed from the cluster.

None

CDPD-50116: Topology-aware reads can provide better performance by routing applications to the closest replica of a file, if available, on the same physical node or same rack. However this feature is disabled by default in CDP 7.1.9.

This feature can be enabled by setting `ozone.network.topology.aware.read` to true using Cloudera Manager safety valve.

CDPD-57165: The DataNode disk usage thread may abort due to Ratis log tailing.

Use `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory` to calculate disk usage. Configure in the `ozone-site.xml` property: `hdds.datanode.du.factory` value: `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory`

OPSAPS-63510: When Ozone Container Balancer is started using Activate Container Balancer from Cloudera Manager, it runs on the Storage Container Manager (SCM) host which is the Ratis leader. However, the link to the Full Log File under Role Log in the Cloudera Manager command window for the Activate Container Balancer command may not link to the leader SCM's logs.

1. Find the leader SCM. Using Cloudera Manager and SCM Web UI: Go to Clusters Ozone **Web UI**. Open any of the Storage Container Manager web UI. In the UI, search for SCM Roles (HA) in the Status section. The leader SCM's hostname is mentioned. Or using Terminal: Log in to any Ozone host and run `ozone admin scm roles`. Note the leader.
2. After finding the leader SCM, search in this leader host's logs for ContainerBalancer related logs.

OPSAPS-67373: Toggling the Enable Ozone S3 Multi-Tenancy feature configuration in the Cloudera Manager Ozone service configuration page affects more service roles than actually needed.

Enabling multi-tenancy only requires restarting the Ozone Managers.

CDPD-55513: Hive external table replication policy does not migrate Hive tables in HDFS storage to Ozone.

To replicate data from HDFS to Ozone, see [Migrating your data from HDFS to Ozone](#). You can use HMS Mirror to replicate the metadata.

OPSAPS-67757: Hive external tables in Ozone storage cannot be replicated using Hive external table replication policies.

To replicate the Hive external tables' data, consider using DistCp. To replicate the metadata of Hive external tables, consider using HMS Mirror.

Remove bucket recursively using `rb -f -force` command from AWS S3 cannot work for FSO buckets.

Use the Ozone shell command `ozone sh bucket delete -r [***BUCKET ADDRESS***]`

CDPD-59126: Info log displays "noexec permission on /tmp/liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86" on client while executing command with noexec on /tmp.

To suppress Info log related to `liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86` library: Export `OZONE_OPTS` environment variable on the client terminal by running the command `export OZONE_OPTS="-Dorg.apache.ratis.thirdparty.io.netty.native.workdir=/var/tmp $OZONE_OPTS"`

OPSAPS-67650: Ozone uses RocksDB as a library to persist metadata locally.

By default, RocksDB places certain executables in /tmp, and thus encounters errors when /tmp is mounted with noexec.

The workaround is to configure RocksDB to put executables at another location. On a PhatCat node, the steps are:

1. Go to Cloudera Manager UI OZONE Configuration .
2. Find Ozone Service Environment Advanced Configuration Snippet (Safety Valve) and set the following environment variable: `ROCKSDB_SHAREDLIB_DIR=/VAR/TMP`
3. Restart Ozone.

CDPD-49137: Ozone Manager Kerberos token expires for SCM communication and OM does not log in again.

Sometimes, OM's Kerberos token is not updated and it stops to communicate with SCM. When this occurs, writes start failing.

Restart OM or set the safety valve `hadoop.kerberos.keytab.login.autorenewal.enabled = true`

CDPD-56684: Keys get deleted when you do not have permission on volume

When a volume is deleted, it recursively deletes the buckets and keys inside it and only then deletes the volume. The volume delete ACL check is done only in the end, due to which you may end up deleting all the data inside the volume without having delete permission on the volume.

Note: There was no bucket/key permission available which allowed the user to delete them recursively.

CDPD-50610: Large file uploads are slow with OPEN and stream data approach

Hue file browser uses the append operation for large files. This API is not supported by Ozone in 7.1.9 and therefore large file uploads can be slow or timeout from the browser.

Use native Ozone client to upload large files instead of the Hue file browser.

OPSAPS-64097: Ozone service restart failed at SCM

Stopping SCM service using Cloudera Manager can sometimes timeout and need a retry. The Cloudera Manager API waits for 90 seconds which is not sufficient under certain circumstances.

Retry the shutdown using Cloudera Manager if the SCM still shows as running after a refresh of the service status.

OPSAPS-66469: Ozone-site.xml is missing if the host does not contain HDFS roles

The client side `ozone-site.xml` (/etc/hadoop/conf/ozone-site.xml) is not generated by Cloudera Manager if the host does not have any HDFS role. Because of this, issuing Ozone commands from that host fails because it cannot find the service name to host name mapping. The error message is similar to this: `# ozone sh volume list o3://ozoneabc 23/03/06 18:46:15 WARN ha.OMProxyInfo: OzoneManager address ozoneabc:9862 for serviceID null remains unresolved for node ID null` Check your `ozone-site.xml` file to ensure ozone manager addresses are configured properly.

Add the HDFS gateway role on that host.

OPSAPS-67607: Cloudera Manager FirstRun failure at the “Upload YARN MapReduce Framework JARs” step.

If this failure is attributed to the broken symbolic link, `/var/lib/hadoop-hdfs/ozone-file-system-hadoop3.jar`, it is likely due to the presence of the user `hdfs` on the node prior to CDP parcel activation. As a result, the Cloudera Manager agent skips the initialization related to HDFS, leading to the non-creation of the `/var/lib/hadoop-hdfs` directory.

Create the directory `“/var/lib/hadoop-hdfs”` on all nodes followed by the deactivation and activation of the CDP parcel (deactivate and activate the Ozone parcel instead, in case Ozone parcel is used).

CDPD-50447: When SCM High Availability is enabled, each of the SCM web UIs report the host of the web UI as the leader of HA, and the other two as followers. This gives wrong information

Correct output is available by running the `ozone admin scm roles --service-id=<ID>` command.

OPSAPS-66501: Currently it is not possible to configure High Availability for SCM roles in Ozone post deployment. You should be able to change the HA configuration through Cloudera Manager, bringing it in line with other services.

At present it requires deleting Ozone and then adding it back with the SCM HA configuration in place and manually cleaning up the Ozone data in between. For more information, read the [KB article](#).

OPSAPS-66500: Currently, it is not possible to enable Kerberos in Ozone after it has been deployed, despite all the required configuration changes being created when the box is checked in the Ozone configurations in Cloudera Manager.

Ozone must be deleted and redeployed with Kerberos enabled. Due to OPSAPS-66499, this requires manual data cleanup in between. For more information, read the [KB article](#).

OPSAPS-66499: When you delete Ozone from a cluster using Cloudera Manager, Ozone data is not cleaned up. This may cause issues when Ozone is redeployed.

You must clean up the data manually. For more information, read the [KB article](#).

OPSAPS-62327: In an Ozone cluster without any gateway roles, Ozone is unable to deploy client configurations and displays the ConfigGenException error.

You must add the Ozone gateway roles to the cluster.

CDPD-49027: SCM certificates are not renewed automatically

The certificates that are there to ensure encrypted communication and authentication between Ozone internal services are not renewed automatically for Storage Container Managers.

Certificate revocation

Once these certificates expire, a manual re-bootstrap of the internal Ozone certificates is necessary.

To revoke a certificate, remove the full trust chain to stop trusting a compromised certificate. For this, remove the SCM certificates or any other certificates from the system. During the startup of the system, new certificates are created and distributed. The old certificates are not trusted anymore as the root CA certificate changes as well.

Procedure to force revoke internal certificates:

1. Stop Ozone service and all of its roles including SCMs
2. Include SCM's certs folders. Note that the Primordial SCM node has two certs folder, one for the root CA and other for the intermediate CA that the node holds. Rest of the SCMs have just one folder for the intermediate CA role that the node serves. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name certs; done`
3. Move these certs directories to a backup location
4. Locate the key material and move it to a backup folder. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name keys; done`
5. Move these keys directories to a backup location
6. The VERSION file of SCM has to be updated similarly to Ozone Manager's VERSION file. To locate both the SCM and OM VERSION files on the hosts, execute the following command: `find / -name om -o -name scm 2>/dev/null | while read line; do find $line -name VERSION; done | sort | uniq`
7. Backup the version file (just in case you need to restore for any reason)
8. In OM's VERSION file remove the line starting with `omCertSerialId`, in SCM's VERSION file remove the line starting with `scmCertSerialId`.
9. Start the stopped Ozone roles and certificates will be regenerated during startup.

CDPD-35632: The default block level checksum does not work when running distcp from HDFS to Ozone or the other way around, because the two file systems manage underlying blocks very differently.

Use a file level checksum instead. For example, append ``-Ddfs.checksum.combine.mode=COMPOSITE_CRC`` to the distcp command.

CDPD-43942: Requests to modify an Ozone S3 tenant may fail with the error "Timed out acquiring authorizer write lock. Another multi-tenancy request is in-progress." even if another request is not in progress.

Retry the request.

CDPD-36389: The configurations `datanodes.involved.max.percentage.per.iteration` and `size.moved.max.per.iteration` are meant to limit the max number of DataNodes that is involved and maximum size that can move in an iteration. This bug causes balancer to stop an iteration when it is two DataNodes or 1 Container size (5GB) away from hitting these limits. However, these DataNodes can again be considered for balancing in the next iteration. This means the cluster is balanced after enough iterations, albeit a bit slowly. This bug is apparent in small clusters of around four DataNodes where the DataNodes can be either the source or target for a lot of moves but the iteration gets stopped when three DataNodes have been involved. It takes a higher number of iterations to eventually balance this cluster. While this is a performance issue, it does not prevent balancer from ultimately balancing the cluster.

Increase the speed for balancing by decreasing the interval between each iteration using the configuration `balancing.iteration.interval`. The value of this configuration must be greater than `hdds.datanode.du.refresh.period`. `size.moved.max.per.iteration` can be increased to allow more data to move in one iteration.

CDPD-22519: HDFS user is unable to run Ozone SCM client CLI.

SCM client CLIs are run using SCM user.

CDPD-34187: This is an usability issue where warnings are displayed on the console while running Ozone fs/CLI commands, which restricts user experience. .

Instead of logging into the user console, you redirect these log messages to a file called `ozone-shell-log4j.properties` which should avoid warnings to the user. Ozone-shell commands used a similar method of directing messages to the LogFile.

CDPD-35141: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2> (state=08S01,code=40000) java.sql.SQLException: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2>. This issue does not occur if the source and target buckets are different in Hive queries. Currently, copying across the same bucket is only supported.

Avoid different buckets in source and target path. Ensure that `hive.exec.stagingdir` is unset or set to the same bucket as the warehouse so that staging directories are created in the same bucket as the warehouse.

CDPD-40594: Ozone admin container create command does not work. The command fails at getCAList for the SCM Client to create a container.

Avoid using the create container command

CDPD-40966: df command on Ozone returns incorrect result.

None

CDPD-41184: With Legacy buckets, FileSystem Optimised is not interoperating with the Ozone shell command. The cause is that the directory key entry in the DB KeyTable is stored as "dir1/" with trailing slash. But while performing the described operation, Ozone shell (o3://) is normalizing the given path and removing the trailing slash "/" from it. That results in KEY_NOT_FOUND exception.

There are three workarounds:

- Use FileSystem API to Delete the Directories rather than Shell-Command API.
- Use FSO buckets instead of Legacy Buckets. As in FSO, you can create Intermediate Directories and Delete Directories using the Ozone shell commands.

- Disable and set the configuration `ozone.om.enable.filesystem.pathsflag` to false in order to delete the directories. This is generally not a preferred workaround because the cluster must be restarted to pick up the new changes.

CDPD-34867: Container Balancer might not balance if only Over-Utilized or only Under-Utilized DataNodes are reported. The log line displays the "Container Balancer has identified x Over-Utilized and y Under-Utilized DataNodes that need to be balanced" message where one of x or y will be 0.

Decrease the threshold using "utilization.threshold". This allows the balancer to find non zero number of both over and under utilized nodes.

CDPD-12966: Ozone du -s -h should report correct values with replication information.

None

CDPD-12542: Mount of Ozone filesystem with the help of FUSE fails.

None

CDPD-31910: In a non-Ranger deployment, the owner/group are shown based on Kerberos user or sudo user.

For correct owner/group, user needs a Ranger deployment.

CDPD-42691: During the upgrade - all pipelines will be closed when the upgrade is finalized on SCM, temporarily bringing the cluster to a read-only state.

When you execute the finalize command, the cluster will temporarily go into a read-only state.

CDPD-42945: When many EC buckets are created with different EC chunk sizes, it creates pipeline for each chunk size. As a result, large number of pipelines are created in the system.

None

OPSAPS-60721: Ozone SCM Primordial Node ID is a required field which needs to be specified with one of the SCM hostnames during Ozone HA installation. In Cloudera Manager this field is not mandatory during Ozone deployment. This can cause end users to continue further with installation which causes startup to fail in Ozone services.

During Ozone HA installation make sure that Ozone SCM Primordial Node ID is specified with one of the SCM hostname.

HDDS-4209: S3A Filesystem does not work with Ozone S3 in file system compact mode. When you create a directory, the S3A filesystem creates an empty file. When the `ozone.om.enable.filesystem.paths` parameter is enabled, the `hdfs dfs -mkdir -p s3a://b12345/d11/d12` command runs successfully. However, running the `hdfs dfs -put /tmp/file1 s3a://b12345/d11/d12/file1` command fails with an error: `ERROR org.apache.hadoop.ozone.om.request.key.OMKeyCreateRequest: Key creation failed`.

The HDDS-4209 Jira fixes the file system semantics and management in Ozone. On top of the flat name structure, which is Pure Object store, as a workaround the Hierarchical namespace structure is added. This ensures S3A compatibility with Ozone.

CDPD-42897: EC writes are failing with "No enough datanodes to choose" after EC replication config is set globally.

EC writes start failing when large number of pipelines are created as a result of multiple EC configs with different chunk sizes used to write keys.

If standard EC configs (that is, rs-3-2-1024k) are used to write keys, number of pipelines created per DataNode is limited to five and this issue is not seen with standard EC configs.

The recommendation is not to create too many random chunk sizes. It is configurable because, users can decide based on their workload. But do not to have separate chunk sizes for each file.

CDPD-41539: The "No such file or directory" message is displayed when EC file is read using older ofs client.

You must upgrade the client before trying to read the key: `vol1/ecbuck1/1GB_ec`.

CDPD-40560: Filesystem Operations using Hadoop S3a connector on a FILE_SYSTEM_OPTIMIZED bucket fails. org.apache.hadoop.ozone.om.exceptions.OMException: Unable to get file status: volume: s3v bucket: fso key: test/

Do not run Hadoop S3a commands on a FILE_SYSTEM_OPTIMIZED bucket. Use OBJECT_STORE bucket layouts.

CDPD-42832: With this issue, any long running setup or a production server results in data corruption due to inconsistency issues. This may result in major issues with the existing Legacy layout type.

FSO provides atomicity and consistency guarantees for the path (dir or file) rename/delete operations irrespective of the large sub-dirs/files contained in it. These capabilities help to make the long running test more consistent without any failures so far. Recommendation is to run bigdata HCFS workloads using the FSO bucket layout types.

CDPD-43432: Ozone Service in fault state in DataNode - Long Running setup.

Upgrade RocksDB to the latest version.

OPSAPS-63999: In the newly installed cluster, the Finish upgrade option is clickable.

None

OPSAPS-64648: Failed to start Ozone node using Cloudera Manager if default log path /var/log/hadoop-ozone does not exist. If this path does not exist, any Ozone nodes (for example SCM or DataNode) restart will fail.

Run the following command `sudo -u hdfs mkdir -p /var/log/hadoop-ozone` or replace hdfs with the user Ozone roles that are running.

CDPD-45932: Investigate impersonation with "is admin" in Ozone WebUIs /logLevel servlet endpoint

In a secure Kerberized cluster, due to an impersonation issue, changing log levels using Knox on the corresponding endpoint of the WebUI does not work. Note that this is only true, when the WebUI is accessed using Knox. Other means of changing log levels in Ozone services are not affected by this problem.

None.

Known Issues in Streams Messaging Manager

Learn about the known issues in Streams Messaging Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

OPSAPS-59597: SMM UI logs are not supported by Cloudera Manager

Cloudera Manager does not display a Log Files menu for SMM UI role (and SMM UI logs cannot be displayed in the Cloudera Manager UI) because the logging type used by SMM UI is not supported by Cloudera Manager.

View the SMM UI logs on the host.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker). Add the bootstrap server details in SMM safety valve in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server
Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Add the
following value for bootstrap servers>Save Changes > Restart SMM.

```
streams.messaging.manager.kafka.bootstrap.servers=<comma-separated list of brokers>
```

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the hadoop.auth cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the www-authenticate: Negotiate header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at Clusters SMM Streams Messaging Manager Web UI and log in using the Kerberos username and password.

CDPD-82560: Streams Messaging Manager known unprotected endpoint

The Streams Messaging Manager Frontend exposes the /cm-configs and /configs public endpoints without requiring authentication. These endpoints do not share any sensitive information.

None.

CDPD-88488: The Streams Messaging Manager server fails to start if its keystore password starts with a special character or includes quotation marks

Ensure that the Streams Messaging Manager server keystore password meets the following requirements:

- It does not start with a special character. Special characters are permitted in other positions.
- It does not contain quotation marks (single or double) anywhere.

CDPD-76375: Topic column name is incorrect in the replications table

On the **Cluster Replications** page, in the replications table, the topic column name is incorrectly named **Source Topic Name** instead of Target Topic Name. This means that the **Source Topic Name** column currently shows the topic name on the target cluster, instead of the topic name on the source cluster.

Limitations

CDPD-36422: 1MB flow.snapshot freezes Safari

While importing large connector configurations, flow.snapshots reduces the usability of the Streams Messaging Manager when using Safari browser.

Use a different browser (Chrome/Firefox/Edge).

Known Issues in Spark

Learn about the known issues in Spark the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-94393: RuntimeWarning Failed to add file" message appears even when Spark successfully loads files

In both Spark 2 and 3, due to an exception when attempting to add files to the Python path, the RuntimeWarning: Failed to add file message appears even when the Python JAR file is successfully loaded.

None. You can safely ignore the message as the file is loaded successfully and the message does not affect job completion.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-67517: Spark3 tests are failing if /tmp is mounted as NOEXEC.

Map the tmpdir to a writable path in spark3-conf/spark-defaults.conf using the following steps:

1. Go to the Cloudera Manager.
2. Go to the Spark service.
3. Click the Configuration tab.
4. Select Scope Gateway .
5. Select Category Advanced .
6. Locate the Spark Client Advanced Configuration Snippet (Safety Valve) for spark3-conf/spark-defaults.conf_client_config_safety_valve property.
7. Map the tmpdir to a writable path:

```
spark.driver.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
spark.executor.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
```

8. Enter a Reason for change, and then click Save Changes to commit the changes.
9. Deploy the client configuration.

CDPD-23817: In the upgraded Cluster, the permission of /tmp/spark is restricted due to the HDP configuration hive.exec.scratchdir=/tmp/spark.

If you are using the /tmp/spark directory in the CDP cluster, you must provide the required additional Policies/ACL permissions.

CDPD-22670 and CDPD-23103: There are two configurations in Spark, "Atlas dependency" and "spark_lineage_enabled", which are conflicted. The issue is when Atlas dependency is turned off but spark_lineage_enabled is turned on.

Run Spark application, Spark will log some error message and cannot continue. That can be restored by correcting the configurations and restarting Spark component with distributing client configurations.

CDPD-23007: Mismatch in the Spark Default DB Location. In HDP 3.1.5, hive_db entities have one attribute - 'location' which is configured to the '/managed' path. In fresh install of CDP 7.1.7, hive_db entities now have 2 attributes 'location' configured to '/external' path and 'managedLocation' configured

to `/managed` path. In the AM2CM migration (HDP 3.1.5 -> CDP 7.1.7), the `'location'` attribute from `hive_db` entities in HDP 3.1.5 comes unaltered to CDP 7.1.7 and hence maps to `/managed` path.

This issue arises only if you are upgrading from HDP 3.1.5 to CDP 7.1.7. If you are performing a fresh install of CDP 7.1.7, you can ignore this issue.

None

CDPD-217: The Apache Spark connector is not supported

The old *Apache Spark - Apache HBase Connector* (shc) is not supported in CDP releases.

Use the new HBase-Spark connector shipped in CDP release.

CDPD-3038: Launching pyspark displays several HiveConf warning messages

When pyspark starts, several Hive configuration warning messages are displayed, similar to the following:

```
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of name hive.meta
store.runworker.in does not exist
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of
name hive.masking.algo does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of
name hive.metastore.runworker.in does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of na
me hive.masking.algo does not exist
```

These errors can be safely ignored.

Known Issues in Sqoop

Learn about the known issues in Sqoop, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-54770: Unable to read Sqoop metastore created by an older HSQLDB version

If you have upgraded to CDP PvC Base 7.1.8 Cumulative hotfix 4 or higher versions, you may encounter issues in reading the Sqoop metastore that was created using an older version of HyperSQL Database (HSQLDB).

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

After upgrading to CDP PvC Base 7.1.8 Cumulative hotfix 4, you must upgrade the Sqoop metastore and convert the database files to a format that can easily be read by HSQLDB 2.7.1. For more information, see [Troubleshooting Apache Sqoop issues](#).

CDPD-44431: Using direct mode causes problems

Using direct mode has several drawbacks:

- Imports can cause an intermittent and overlapping input split.
- Imports can generate duplicate data.
- Many problems, such as intermittent failures, can occur.
- Additional configuration is required.

Stop using direct mode. Do not use the `--direct` option in Sqoop import or export commands.

Sqoop direct mode is disabled by default. However, if you still want to use it, enable it by either setting the `sqoop.enable.deprecated.direct` property globally in Cloudera Manager for Sqoop or by specifying it in the command-line through `-Dsqoop.enable.deprecated.direct=true`.

CDPD-3089: Avro, S3, and HCat do not work together properly

Importing an Avro file into S3 with HCat fails with Delegation Token not available.

Parquet columns inadvertently renamed

Column names that start with a number are renamed when you use the `--as-parquetfile` option to import data.

Prepend column names in Parquet tables with one or more letters or underscore characters.

PARQUET-99: Importing Parquet files might cause out-of-memory (OOM) errors

Importing multiple megabytes per row before initial-page-run check (ColumnWriter) can cause OOM. Also, rows that vary significantly by size so that the next-page-size check is based on small rows, and is set very high, followed by many large rows can also cause OOM.

Known Issues in Schema Registry

Learn about the known issues in Schema Registry, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15**CDPD-40380: Authorization checking issue when Kerberos is disabled**

Due to an issue in Ranger, when Kerberos is disabled then it is not possible to check authorization.

1. Open Schema Registry configuration in Cloudera Manager.
2. Find the `ranger.plugin.schema-registry.service.name` field.
3. Replace `GENERATED_RANGER_SERVICE_NAME` with the actual name of the service.
4. Restart the Schema Registry service.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

CDPD-59015: Schema Registry does not create new versions of schemas even if the schema is changed

Schema Registry uses a schema fingerprinting mechanism to differentiate between schemas. However, fingerprinting does not take into consideration the schema attributes of the field type. As a result, if you have two schemas where the only difference is that one has type attributes defined and the other does not, they will be considered identical by Schema Registry. For example, the following schemas are considered identical:

```
#Schema V1
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":"long"}]}

#Schema V2
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":{"type":"long","logicalType":"local-timestamp-micros"}}]}
```

Notice that the only difference is that in the second schema, the `local_timestamp_micros_long` field has a logical type specified. In cases like this, the new version of the schema is not created, the initial version is used. This is true even if the data that is being produced has a new schema version. The ID of the first schema version is used and is put in the serialized record. The new schema version is not created.

This issue is common when using change data capture (CDC) connectors like the Debezium connectors. This is because CDC connectors create schemas with the logical type decimal based on the column type in the database schema. For example:

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 0}}]}
```

If the database schema changes (for example, the column type), it is possible that only scale changes, which is a schema attribute.

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 1}}]}
```

In this case, even though scale changed to 1, the first version of the schema is used where scale is 0. As a result, the data is consumed with the wrong scale.

Avoid using logical types or other attributes. Alternatively, ensure that there are no changes in the logical types or other attributes between schema versions.

OPSAPS-68708: Schema Registry might fail to start if a load balancer address is specified in Ranger

Schema Registry does not start if the address specified in the Load Balancer Address Ranger property does not end with a trailing slash (/).

Set the value of the RANGER_REST_URL Schema Registry environment variable to an address that includes a trailing slash.

1. In Cloudera Manager, select the Schema Registry service.
2. Go to Configuration.
3. Find the Schema Registry Server Environment Advanced Configuration Snippet (Safety Valve) property and add the following:

```
Key: RANGER_REST_URL
Value: [***RANGER REST API URL***]
```

Replace [***RANGER REST API URL***] with an address that can be used by Schema Registry to access Ranger. Ensure that the address ends with a trailing slash. For example: `http s://ranger-1.cloudera.com:6182/`

4. Restart the Schema Registry service.

OPSAPS-70971: Schema Registry does not have permissions to use Atlas after an upgrade

Following an upgrade, Schema Registry might not have the required permissions in Ranger to access Atlas. As a result, Schema Registry's integration with Atlas might not function in secure clusters where Ranger authorization is enabled.

1. Access the Ranger Console (Ranger Admin web UI).
2. Click the `cm_atlas` resource-based service.
3. Add the `schemaregistry` user to the `all - *` policies.
4. Click `Manage Service Edit Service`.
5. Add the `schemaregistry` user to the `default.policy.users` property.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect

instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Known Issues in Streams Replication Manager

Learn about the known issues in Streams Replication Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

CDPD-22089: SRM does not sync re-created source topics until the offsets have caught up with target topic

Messages written to topics that were deleted and re-created are not replicated until the source topic reaches the same offset as the target topic. For example, if at the time of deletion and re-creation there are a 100 messages on the source and target clusters, new messages will only get replicated once the re-created source topic has 100 messages. This leads to messages being lost.

None

CDPD-11079: Blacklisted topics appear in the list of replicated topics

If a topic was originally replicated but was later excluded for replication, it will still appear as a replicated topic under the /remote-topics REST API endpoint. As a result, if a call is made to this endpoint, this topic will be included in the response. Additionally, the excluded topic will also be visible in the SMM UI. However, its Partitions and Consumer Groups will be 0, its Throughput, Replication Latency and Checkpoint Latency will show N/A.

None

CDPD-30275: SRM may automatically re-create deleted topics on target clusters

If `auto.create.topics.enable` is enabled, deleted topics might get automatically re-created on target clusters. This is a timing issue. It only occurs if remote topics are deleted while the replication of the topic is still ongoing.

1. Remove the topic from the topic allowlist with `srm-control`. For example:

```
srm-control topics --source [SOURCE_CLUSTER] --target [TARGET_CLUSTER] --remove [TOPIC1]
```

2. Wait until SRM is no longer replicating the topic.
3. Delete the remote topic in the target cluster.

Limitations

SRM cannot replicate Ranger authorization policies to or from Kafka clusters

Due to a limitation in the Kafka-Ranger plugin, SRM cannot replicate Ranger policies to or from clusters that are configured to use Ranger for authorization. If you are using SRM to replicate data to or from a cluster that uses Ranger, disable authorization policy synchronization in SRM. This can be achieved by clearing the Sync Topic Acls Enabled (`sync.topic.acls.enabled`) checkbox.

SRM cannot ensure the exactly-once semantics of transactional source topics

SRM data replication uses at-least-once guarantees, and as a result cannot ensure the exactly-once semantics (EOS) of transactional topics in the backup/target cluster.

Note: Even though EOS is not guaranteed, you can still replicate the data of a transactional source, but you must set `isolation.level` to `read_committed` for SRM's internal consumers. This can be done by adding `[***SOURCE CLUSTER ALIAS***]->[***TARGET CLUSTER ALIAS***].consumer.isolation.level=read_committed` to the Streams Replication Manager's Replication Configs SRM service property in Cloudera Manager. The `isolation.level` property can be set on a global connector or replication level. For example:

```
#Global connector level
connectors.consumer.isolation.level
=read_committed
#Replication level
uswest->useast.consumer.isolation.level
evel=read_committed
```

SRM checkpointing is not supported for transactional source topics

SRM does not correctly translate checkpoints (committed consumer group offsets) for transactional topics. Checkpointing assumes that the offset mapping function is always increasing, but with transactional source topics this is violated. Transactional topics have control messages in them, which take up an offset in the log, but they are never returned on the consumer API. This causes the mappings to decrease, causing issues in the checkpointing feature. As a result of this limitation, failover operations for transactional topics is not possible.

Known Issues in YARN and YARN Queue Manager

Learn about the known issues in YARN and YARN Queue Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 15

COMPX-14820: Delete Queue and its Children throws "Queue capacity was reduced to zero, but failed to delete queue."

When trying to perform the operation "Delete Queue and its Children" on a queue that has one or more siblings, the operation fails as YARN has some constraints. If the queue performing the operation "Delete Queue and its Children" is a leaf node, then the operations succeeds.

None.

COMPX-4644: Queue capacity rounding problem when configuration is initially set via YARN

When setting the capacity scheduler configuration through the YARN/Cloudera Manager configuration, there may be capacity values that use multiple decimal places. This results in rounding/floating point precision discrepancies in the UI when trying to validate that all sibling capacities equal 100%. The UI looks like all the numbers add up to 100, but the validation still displays an error and does not allow to save the capacities. It is also observed that the capacity is being calculated as, for example, 99.9999999991 in the backend.

- Create queues within the UI, or
- Ensure that capacities configured through the Capacity Scheduler safety valve do not have more than one decimal place.

20202 Database migration after enabling opt-in migration

When migrating from an H2 database to a PostgreSQL database in YARN Queue Manager after installation or upgrade, you might encounter an issue only when you have followed the following specific scenario:

- New install or upgrade to CDP 7.1.9, forcing migration from H2 to PostgreSQL database.

- Upgrade to CDP 7.1.9 CHF2, moving back to H2 database.
- Upgrade to CDP 7.1.9 SP1 with valid PostgreSQL connection details in Queue Manager configurations.

To avoid any issues during the upgrade to version CDP 7.1.9 SP1, ensure that PostgreSQL connection details are removed from the YARN database configuration if you prefer to continue using the H2 database.

CDPD-56559: MapReduce jobs can intermittently fail during a rolling upgrade.

During a rolling upgrade between CDP versions 7.1.8 and 7.1.9, MapReduce jobs may fail with message, `RuntimeException: native snappy library not available`. Although the native Snappy compression library is not loaded, a checkmark displays to indicate that the Snappy compression library is loading for NodeManagers that are pending upgrades. This causes the MapReduce jobs that are associated with the NodeManagers to fail. After the upgrade, the jobs work as expected. This issue only impacts rolling upgrades from before CDP 7.1.9 to a higher version.

None.

COMPX-12021 Queue Manager configurations on Scheduler Configuration page are not working

When setting the following properties on the YARN Queue Manager UI, the properties are set in the `capacity-scheduler.xml` file which does not have any effect on YARN. The properties need to be set in the `yarn-site.xml` file, which does not happen when you set them through YARN Queue Manager.

- "Maximum Application Priority" – `"yarn.cluster.max-application-priority"`
- "Enable Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.enable"`
- "Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.policies"`

Note: You can also set this property on the YARN configuration page in Cloudera Manager as "Capacity Scheduler Preemption".

- "Preemption: Observe Only" – `"yarn.resourcemanager.monitor.capacity.preemption.observe_only"`
- "Preemption: Monitoring Interval (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.monitoring_interval"`
- "Preemption: Maximum Wait Before Kill (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.max_wait_before_kill"`
- "Preemption: Total Resources Per Round" – `"yarn.resourcemanager.monitor.capacity.preemption.total_preemption_per_round"`
- "Preemption: Over Capacity Tolerance" – `"yarn.resourcemanager.monitor.capacity.preemption.max_ignored_over_capacity"`
- "Preemption: Maximum Termination Factor" – `"yarn.resourcemanager.monitor.capacity.preemption.natural_termination_factor"`
- "Enable Intra Queue Preemption" – `"yarn.resourcemanager.monitor.capacity.preemption.intra-queue-preemption.enabled"`

1. In Cloudera Manager, select the YARN service.
2. Click the Configuration tab.
3. Search for `yarn-site.xml`.
4. Under YARN Service Advanced Configuration Snippet (Safety Valve) for `yarn-site.xml`, add the corresponding parameter and value you need.
5. Click Save Changes.
6. Restart the YARN services.

COMPX-13177: QueueManager webapp requests fail with 'HTTP ERROR 400

`java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA'`

Products:

- Cloudera Manager for CDP Private
- Cloud Base Cloudera Manager for CDP Public Cloud

Context:

- Centos 7.8 and Redhat 7.8 operating systems, when FIPS support is enabled.

Problem:

- When attempting to display the Yarn Queue Manager interface, Cloudera Manager displays an error: "HTTP ERROR 400 java.net.ConnectException: Unsupported cipher suite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA".

1. Edit the file [/etc/default/cloudera-scm-server]
2. Around line 28, modify the line that starts with

```
#export CMF_OVERRIDE_TLS_CIPHERS=...
```

3. Remove the comment mark #.
4. Remove all ciphers with "3DES" in the name.
5. Save the file.
6. Restart the Cloudera Manager Server service.

Third-party applications do not launch if MapReduce framework path is not included in the client configuration

MapReduce application framework is loaded from HDFS instead of being present on the NodeManagers. By default the `mapreduce.application.framework.path` property is set to the appropriate value, but third-party applications with their own configurations does not launch.

Set the `mapreduce.application.framework.path` property to the appropriate configuration for third-party applications.

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated the `mapred-site.xml` file that references the correct JobHistory Server.

YARN cannot start if Kerberos principal name is changed

If the Kerberos principal name is changed in Cloudera Manager after launch, YARN does not start. In such cases, the keytabs can be correctly generated but YARN cannot access ZooKeeper with the new Kerberos principal name and old ACLs.

There are two possible workarounds:

- Delete the `znode` and restart the YARN service.
- Use the `reset ZK ACLs` command. This also sets the `znodes` below `/rmstore/ZKRMStateRoot` to `world:anyone:cdwra` which is less secure.

Queue Manager does not open on using a custom user with a default Kerberos principal

If a custom user is used with the default Kerberos principal, the Queue Manager web UI displays an HTTP ERROR 400 error.

Ensure that the Queue Manager `process_username` property matches the YARN `process_username` property.

Known Issues in Zeppelin

Learn about the known issues in Zeppelin the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF15

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF15**CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.**

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

BUG-125263: Zeppelin service move fails on clusters upgraded from HDP3.1.5

Resolve the circular symlink issue on the Zeppelin node by linking the conf directory to a new directory under /etc/zeppelin:

- # mkdir -p /etc/zeppelin/<version>/0
- # rm /usr/hdp/<version>/zeppelin/conf
- # ln -s /etc/zeppelin/<version>/0 /usr/hdp/<version>/zeppelin/conf

Where version is the HDP version. For example, 7.1.x-yyy. Restart the Zeppelin server in Ambari.

CDPD-3090: Due to a configuration typo, functionality involving notebook repositories does not work

Due to a missing closing brace, access to the notebook repositories API is blocked by default.

From the CDP Management Console, go to Cloudera Manager for the cluster running Zeppelin. On the Zeppelin configuration page (Zeppelin serviceConfiguration), enter shiro urls in the Search field, and then add the missing closing brace to the notebook-repositories URL, as follows:

```
/api/notebook-repositories/** = authc, roles[{{zeppelin_admin_group}}]
```

Click Save Changes, and restart the Zeppelin service.

CDPD-2406: Logout button does not work

Clicking the Logout button in the Zeppelin UI logs you out, but then immediately logs you back in using SSO.

Close the browser.

OPSAPS-59802: Zeppelin and Livy roles should be co-located on the same host.

When installing or upgrading to CDP Private Cloud Base, you must co-locate all Zeppelin and Livy roles on the same cluster host due to an issue with certificate generation.

Known Issues in ZooKeeper

Learn about the known issues in ZooKeeper the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 15.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 15

Cumulative hotfix 14

Know more about the cumulative hotfix 14 for CDP 7.1.9 SP1. This cumulative hotfix was released on January 08, 2026.

Cloudera Runtime 7.1.9.1069-3 (Cumulative Hotfix 14) download URL:**Parcel Repository Location**

```
https://[USERNAME]:[PASSWORD]@archive.cloudera.com/p/cdh7/7.1.9.1069/parcels/
```

Fixed issues in 7.1.9 SP1 CHF 14

Know more about the list of fixes that are shipped for CDP Private Cloud Base version 7.1.9 SP1 CHF 14.

Note: Contact Cloudera Support for questions related to any specific hotfixes. The version and build identifier for this CDH Parcel is 7.1.9-1.cdh7.1.9.p1069.74330271.

CDPD-94496: Security vulnerability related to Apache Tika

This fix addresses a critical XML External Entity (XXE) vulnerability, as described in [CVE-2025-66516](#), in the Apache Tika core and parser modules. This vulnerability could be exploited by using a crafted XFA file within a PDF document.

Backport of Apache Tika version

Apache Tika 2.9.4 is now forked, patched and built internally into 2.9.4.cldr-b21. This applies for NiFi and CFM as well.

Cloudera Search uses the downstream version of Tika 2.4.1 (2.4.1.cldr-b12) as well which is essentially patched with the CVE fix.

HIVE-26456: Duplicate rows after query-based minor compaction

Previously, duplicate rows appeared in table results after you ran a minor compaction.

This issue is resolved by updating the sorting process to match standard compaction methods, ensuring data is processed in the correct order.

Apache Jira: [HIVE-26456](#)

HIVE-26147: Null pointer exception when ACID key index is missing

Previously, queries failed with a null pointer error when reading ACID-compliant ORC files that were missing specific index metadata.

This issue is resolved by allowing the system to perform a full file scan when the index metadata is missing instead of failing.

Apache Jira: [HIVE-26147](#)

HIVE-21052: Cleanup failure for aborted transactions

Previously, if a transaction aborted before partition registration, the system flagged it as empty.

This issue is resolved by using a marker in the transaction components to track early-stage writes, ensuring the cleaner identifies and removes aborted data directories.

Apache Jira: [HIVE-21052](#)

HIVE-24374: Metadata removal for aborted writes in batched delta files

This issue is now fixed.

Apache Jira: [HIVE-24374](#)

HIVE-25502: Data loss when cleaning aborted transactions with dynamic partitions

Previously, running the cleaner after an aborted streaming transaction could cause data loss in unrelated partitions.

This issue is now fixed.

Apache Jira: [HIVE-25502](#)

HIVE-25257: Incorrect row order validation for query-based major compaction

Previously, query-based major compaction failed when processing tables with multiple transaction statements, such as consecutive MERGE operations.

This issue is now fixed.

Apache Jira: [HIVE-25257](#)

Common Vulnerabilities and Exposures (CVE) that is fixed in this CHF:

- [CVE-2025-66516](#) - Apache Tika

Known issues in 7.1.9 SP1 CHF 14

The following section lists the known issues and limitations, the areas of impact, and workaround for each Runtime component.

Known Issues in Atlas

Learn about the known issues in Atlas the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-93307: Hive import logs are truncated during bulk import

When running the import-hive.sh script to perform bulk Hive metadata imports, the logging process fails to retain the expected history. The import-hive.log file rotates prematurely when it reaches 10 MB and retains only one backup file (import-hive.log.1), instead of the expected 100 MB file size and 20 backup files.

Supply a custom log4j configuration file with the correct structure by using the ATLAS_OPTS environment variable before running the import script:

```
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE log4j:configuration SYSTEM "log4j.dtd">
<log4j:configuration xmlns:log4j="http://jakarta.apache.org/log4j/">
  <appender name="console" class="org.apache.log4j.ConsoleAppender">
    <param name="Target" value="System.out"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <appender name="FILE" class="org.apache.log4j.RollingFileAppender">
    <param name="File" value="${atlas.log.dir}/${atlas.log.file}"/>
    <param name="Append" value="true"/>
    <param name="maxFileSize" value="100MB"/>
    <param name="maxBackupIndex" value="20"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <logger name="org.apache.atlas" additivity="false">
    <level value="info"/>
    <appender-ref ref="FILE"/>
  </logger>
</log4j:configuration>
```

```

    </logger>
    <logger name="org.apache.kafka.common.config.AbstractConfig"
    additivity="false">
      <level value="error"/>
      <appender-ref ref="FILE"/>
    </logger>
  </root>
  <priority value="warn"/>
  <appender-ref ref="FILE"/>
</root>
</log4j:configuration>

```

Export the ATLAS_OPTS variable to point to your custom file before running the import script:

```

export ATLAS_OPTS="-Dlog4j.configuration=file:/path/to/custom-hi
ve-import-log4j.xml"
./import-hive.sh

```

CDPD-87670: [Atlas UI] Apache Atlas Glossary becomes unresponsive when the page size is set to 50

When the page limit is set to 50 in **Glossary**, the user interface becomes unresponsive due to an incorrect API call with the error message, when trying to show more than 25 associated entities for a glossary item: "expected type AtlasGlossaryCategory; found AtlasGlossaryTerm".

Apache Jira: [ATLAS-5067](#)

CDPD-70450: Impala SQL queries that include the “WITH” clause should populate lineage in Atlas

Impala SQL queries that do not use the WITH clause can show lineage in Atlas, but queries that do use the WITH clause cannot show lineage in Apache Atlas. Impala SQL queries using the WITH clause are not supported.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-6565: Issue with ddlQueries in Atlas for Hive/Impala tables created in default/non-default db using DAS/HUE respectively

ddlQueries are not created for Impala origin table. ddlQueries created for Impala/Hive CTAS tables have difference in names as compared to same operation for Hive table. The Impala table has the query in the ddlQueries entity name.

None

CDPD-55301: ddlQueries and ALTERNATE_* lineage missing for Spark tables created through spark3-shell

The ddlQueries and ALTERNATE_* lineage missing for Spark tables created using spark3-shell.

None

CDPD-56085: LOAD DATA INPATH to iceberg_table creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas

Running a query like LOAD DATA INPATH to iceberg_table, creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas. So in Atlas, a deleted entity is created corresponding to the temporary table <iceberg_table_name>_tmp*.

None

CDPD-58554: Discard audits of specific classification, label, and business metadata

Support to control audits for specific classification, label, and business metadata is not present in the Custom Audit Filters feature.

None

CDPD-40346: The ddlQueries and ALTERNATIVE_ADDCOLS lineage missing for Impala tables.

The ALTERNATIVE_ADDCOLS lineage has some issue when an Impala table is altered and the corresponding lineage is not created.

CDPD-67112: Import transforms do not work as expected when replacing a string which already has ":"

The character ":" is not supported in path replacements. The import succeeds but location remains unchanged. The character ":" must be avoided.

None

CDPD-69150: Unable to add labels or user defined properties in Japanese

Adding Japanese labels or user defined properties results in the error message: "Invalid label: ###, label should contain alphanumeric characters, _ or -"

None

CDPD-69279: Quick search does not return entities when using Japanese or Chinese characters to search properties

Entities, such as hdfs_path, are not returned by the search when their indexable properties are searched using partial search terms made of Japanese or Chinese characters. Only exact matches return results when searching the indexed properties made of Japanese or Chinese characters.

None

CDPD-68191: Suggestions do not return the correct results when searching multiple Chinese characters

Free text search does not return results when searching Chinese phrases made of multiple characters. Partial searches return the correct results.

None.

CDPD-71219: Regression : Suggestions don't work for single character words on indexable attributes

When searching for entities whose name (entity names are indexable) is a single character, search results are returned but suggestions are not. When searching for entities whose description (entity descriptions are not indexable) is a single character, both search results and suggestions are returned.

None.

CDPD-67450: Table name renaming operation is not updating or creating iceberg_table entity

Renaming an Iceberg table does not update the corresponding Atlas entity.

None.

CDPD-67089: Export/Import: When a table with Ozone path is exported as "connected", only the Ozone key is exported.

When table with Ozone path is exported as "connected", only Ozone key is exported. Other Ozone entities, such as Ozone volume, Ozone bucket are not exported.

None.

CDPD-43772: Performance issues with Atlas service

If there are lot of update operations and the compression type of column families of atlas_janus table is SNAPPY, then the Kafka message processing might become slower.

- Consider setting compression type of column families of atlas_janus table as GZ.

OPSAPS-67783: During rolling upgrade one among two Atlas server failed to start but Cloudera Manager considered as success

Cloudera Manager marks the Execute command Start on service Atlas-1 as a success even when Atlas service had failed to start successfully. In such cases, Atlas logs give the exact reason for Atlas start-up failure.

None

CDPD-19358: "IsIndexable" and "isOptional" value of a typedef's attribute is modified post migration.

In HDP-265, falcon_feed_creation has "stored-in" attribute which has IsIndexable value set to True.

Post migration, "stored-in" is moved to relationshipAttributeDefs and has IsIndexable value set to False.

Similarly, in HDP-265 the table attribute of hive_storage_desc isOptional is set to true. Post migration, isOptional set to False.

None.

CDPD-11941: Table creation events missed when multiple tables are created in the same Hive command

When multiple Hive tables are created in the same database in a single command, the Atlas audit log for the database may not capture all the table creation events. When there is a delay between creation commands, audits are created as expected.

None.

CDPD-11940: Database audit record misses table delete

When a hive_table entity is created, the Atlas audit list for the parent database includes an update audit. However, at this time, the database does not show an audit when the table is deleted.

None.

CDPD-11692: Navigator table creation time not converted to Atlas

In converting content from Navigator to Atlas, the create time for Hive tables is not moved to Atlas.

None

CDPD-10574: Suggestion order doesn't match search weights

At this time, the order of search suggestions does not honor the search weight for attributes.

None.

CDPD-7982: HBase bridge stops at HBase table with deleted column family

Bridge importing metadata from HBase fails when it encounters an HBase table for which a column family was previously dropped. The error indicates:

```
Metadata service API org.apache.atlas.AtlasClientV2$API_V2@58112bc4 failed with status 404 (Not Found) Response Body
({ "errorCode": "ATLAS-404-00-007", "errorMessage": "Invalid instance creation/updation parameters passed : hbase_column_family.table: mandatory attribute value missing in type hbase_column_family" })
```

None.

CDPD-6675: Irregular qualifiedName format for Azure storage

The qualifiedName for hdfs_path entities created from Azure blob locations (ABFS) does not have the clusterName appended to it as do hdfs_path entities in other location types.

None.

CDPD-4762: Spark metadata order may affect lineage

Atlas may record unexpected lineage relationships when metadata collection from the Spark Atlas Connector occurs out of sequence from the metadata collection from HMS. For example, if an ALTER TABLE operation in Spark that is changing a table name and is reporting to Atlas before HMS has processed the change, Atlas may not show the correct lineage relationships to the altered table.

None.

CDPD-4545: Searches for Qualified Names with "@" does not fetch the correct results

When searching Atlas qualifiedName values that include an "@" character (@), Atlas does not return the expected results or generate appropriate search suggestions.

Consider leaving out the portion of the search string that includes the @ sign, and use the wildcard character * instead.

CDPD-3208: Table alias values are not found in search

When table names are changed, Atlas keeps the old name of the table in a list of aliases. These values are not included in the search index in this release, so after a table name is changed, searching on the old table name does not return the entity for the table.

None.

CDPD-3160: Hive lineage missing for INSERT OVERWRITE queries

Lineage is not generated for Hive INSERT OVERWRITE queries on partitioned tables. Lineage is generated as expected for CTAS queries from partitioned tables.

None.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a logout event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent access to Atlas after logging out, close all browser windows and exit the browser.

CDPD-1892: Ranking of top results in free-text search not intuitive

The Free-text search feature ranks results based on which attributes match the search criteria. The attribute ranking is evolving and therefore the choice of top results may not be intuitive in this release.

If you don't find what you need in the top 5 results, use the full results or refine the search.

CDPD-1884: Free text search in Atlas is case sensitive

The free text search bar in the top of the screen allows you to search across entity types and through all text attributes for all entities. The search shows the top 5 results that match the search terms at any place in the text (*term* logic). It also shows suggestions that match the search terms that begin with the term (term* logic). However, in this release, the search results are case-sensitive.

If you don't see the results you expect, repeat the search changing the case of the search terms.

CDPD-1823: Queries with ? wildcard return unexpected results

DSL queries in Advanced Search return incorrect results when the query text includes a question mark (?) wildcard character. This problem occurs in environments where trusted proxy for Knox is enabled, which is always the case for CDP.

None.

CDPD-1664: Guest users are redirected incorrectly

Authenticated users logging in to Atlas are redirected to the CDP Knox-based login page. However, if a guest user (without Atlas privileges) attempts to log in to Atlas, the user is redirected instead to the Atlas login page.

To avoid this problem, open the Atlas Dashboard in a private or incognito browser window.

CDPD-922: The IsUnique relationship attribute not honored

The Atlas model includes the ability to ensure that an attribute can be set to a specific value in only one relationship entity across the cluster metadata. For example, to add metadata tags to relationships that you wanted to make sure were unique in the system, you can design the relationship attribute with the property IsUnique equal true. However, in this release, the IsUnique attribute is not enforced.

None.

DOCS-13759: Tag Propagation stops after a certain depth while the lineage is being extended

When a tag is added to an entity at timestamp T1, the entities along the lineage to which the tag must be propagated is calculated at T1. Before tag propagation completes, if the lineage is extended, tag does not propagate to the entities in the extended lineage.

CDPD-41142: When a Kafka console consumer group is run, more than one update audits are seen

After running the console consumer with a consumer group, verify the consumer group entity created, along with the metrics and notifications for the consumer group and topic. The expected result can be: one ENTITY_CREATE audit and one ENTITY_UPDATE audit. But more than one ENTITY_UPDATE audits are seen.

CDPD-40165: Two audits are created for SPARK CTAS table

When following Spark queries are fired:

```
spark.sql("create table table1(id int)")
spark.sql("create table table2 as select * from table1")
```

HMS sends "ENTITY_CREATE" and "ENTITY_FULL_UPDATE_V2".

The extra ENTITY_FULL_UPDATE_V2 message received from HMS is sent as a part of ALTER_TABLE_ADDCOLS event from the HMS Hook side. This behaviour is observed only when the queries are run from Spark SQL and not when run the same queries are run from Beeline.

CDPD-39197: Debug metrics returns empty data

When debug metrics is enabled and some operations are performed, the response is empty

CDPD-36495: Updating legacyAttribute from False to True resets the initially created relationshipAttributes values

Creating types, entities, and to start, you must set the relationship with is_legacy_attribute value as **False**.

Later, update the value relationshipDef is_legacy_attribute to True.

For the entities that were created before updating the is_legacy_attribute to True, the relationship Attributes value is reset.

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-29409: Hive import: Suggestion suggests entity which is deleted.

Suggestions suggests tables of a database, which is a deleted entity.

CDPD-25152: Tag propagation through deferred actions consumes additional time as compared to default flow

The additional time might be due to the small overhead added to create / update task vertex and which is run in the background. This also depends on number of tasks queued to be executed.

CDPD-42954: Zeppelin notebook fails after enabling Atlas-HDFS hook

The Zeppelin notebooks are failing with errors after enabling Atlas-HDFS hook in the CDP cluster.

When the below properties are set for atlas-client.properties in Cloudera Manager:

- atlas.jaas.KafkaClient.option.keyTab
- atlas.jaas.KafkaClient.option.principal

Along with adding the properties in /etc/atlas/conf/atlas-application.properties, Cloudera Manager also adds these properties to atlas-application.properties for other services (like Spark).

Adding these properties interferes with the normal flow of the services (like Spark)

To enable HDFS lineage feature, instead of setting these properties through Cloudera Manager, users can manually add the properties directly in `/etc/atlas/conf/atlas-application.properties`

CDPD-10576: Deleted Business Metadata attributes appear in Search Suggestions

Atlas search suggestions continue to show Business Metadata attributes even if the attributes have been deleted.

None.

CDPD-39427: [HDFS Lineage]: When the input is a directory in case of `put/copyfromLocal/cp/mv` commands, lineage is not created even though the script succeeds.

When Source is a directory and target is a directory which is already present in Atlas, the command succeeds and inserts the data in the desired location, but lineage is not created.

DOCS-13760: System Attributes search, `__classificationNames`: Search with parent tag does not return entities associated to its children tags

System attribute search with `__classificationNames = parent_tag` returns entities associated to `parent_tag` only and not entities associated to its children tag.

Workaround: Instead of using system attribute, employ the basic search attribute "classification" which lists entities associated with inherited classifications.

CDPD-35818: Basic search with tag filter provides approximateCount as -1 when there is no match and is 0 otherwise

When the following search operations are performed:

- Faceted search with both tag filter and entity filter

The observed approximateCount is -1.

Here both entity filter and tag filter are present and when there is no match the response received is -1.

- Faceted search with only entity filter

Performing a basic search provides an approximate value of 0 when there is no match.

- Faceted search with only tag filter

Whenever there is tag filter in the query and there is no entity match, the approximateCount is -1 and if the tag filter is not available, the response approximateCount is 0

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-76035: Resource lookup for Atlas service is failing

Once the Atlas configuration snippet `atlas.authentication.method.file` is enabled and a classification is created, these do not synchronize correctly to the **Type Category** resource field setting of Apache Ranger. The newly created classification won't be able to be selected as the **Type Name**.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-69140: Incremental export: When an entity has tag propagated and is exported, the tag is not propagated to it in the export

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After exporting the last table, it will not have the propagated tag.

Apache JIRA: [ATLAS-4889](#)

CDPD-69213: Export/Import, Incremental Export: When entity exported has a tag propagated from entity which is deleted, tag is not propagated to it at target

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After dropping the first table and exporting the entire lineage, the child tables will not have the propagated tag.

Apache JIRA: [ATLAS-5055](#)

CDPD-76789: Creating tag with name description throws java.lang.ClassCastException

Creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options" can lead to HTTP 500 error in Apache Atlas.

Avoid creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options".

CDPD-77435: RAZ: Import-hive on Cloudera Data Engineering cluster fails

Running import-hive command on RAZ enabled Cloudera Data Engineering cluster fails with error "NoClassDefFoundError: com/sun/jersey/core/spi/factory/ResponseBuilderImpl".

CDPD-70321: Atlas Parallel import is failing with various errors

During a parallel import-export activity with six iceberg table policies with exportOption as db1.* for all six exports, all import fail after the exports.

CDPD-75994: Post DL regular upgrade (non ZDU) to 7.3.1, "Exception in getKafkaConsumer ,WakeUpException: null" is seen

After the data lake is upgraded to 7.3.1, sometimes Atlas Hook does not function when Apache Atlas and Apache Kafka are started at the same time, thus Atlas is unable to connect to Kafka while Kafka is still being set up. Atlas performs only three attempts.

Restart the cluster, after the upgrade to trigger to reconnect to Apache Kafka. The Kafka consumer creation should be retried if the Kafka service is unavailable during Atlas startup.

DOCS-26821: Iceberg entities created in 7.2.17 Atlas-Hook (Hive,Impala,Spark) is not ingested by 7.2.18/7.3.1 Atlas Server

When using an Atlas hook from 7.3.1 with an earlier version of Atlas server (7.1.9 SP1 CHF5 or earlier) to create an Iceberg table, the older data model of Iceberg cannot process the features of the new data models. For example, when encountering relationships or attributes in queries which do not have a definition in the earlier model, Iceberg fails to create new tables with an error message. The data model of the Iceberg in Cloudera Runtime 7.1.9 SP1 CHF5 or later is not backward compatible with earlier data models.

It is recommended to upgrade your Atlas server version to at least 7.1.9 SP1 CHF5 or later.

CDPD-28741: Atlas node start failure : PermanentLockingException: Expected value mismatch for KeyColumn

In an Atlas High Availability (HA) enabled environment, starting both Atlas hosts at the same time can result in both trying to access or modify the same graph database resulting in a race condition. One instance successfully modifies the patch vertex, while the other instance triggers a Locking Exception (Concurrent modification exception).

Start Atlas instances in sequence and not in parallel to avoid the potential race condition. If the exception is already present, restart the second Atlas instance after triggering the PermanentLockingException.

CDPD-79099: Unable to import hive tables using import script in Public Cloud

The validation of import .zip files can cause the `org.apache.atlas.AtlasServiceException` error if the .zip file contains Atlas shell entities missing mandatory attributes such as a name. Therefore, the import of shell entities fails.

CDPD-88230: Bulk import operations currently do not construct lineage as expected

Bulk import operations do not create lineage consistently, even when the entities are imported successfully.

CDPD-88302: Bulk import operations currently do not create audits for the imported entities

Bulk import operations do not create audits for the imported entities.

Known Issues in Cruise Control

Learn about the known issues in Cruise Control, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14**Rebalancing with Cruise Control does not work due to the metric reporter failing to report the CPU usage metric**

On the Kafka broker, the Cruise control metric reporter plugin may fail to report the CPU usage metric.

If the CPU usage metric is not reported, the `numValidWindows` in Cruise Control will be 0 and proposal generation as well as partition rebalancing will not work. If this issue is present, the following message will be included in the Kafka logs:

```
WARN com.linkedin.kafka.cruisecontrol.metricsreporter.CruiseControlMetricsReporter:
    [CruiseControlMetricsReporterRunner]: Failed reporting CPU
    util.
```

```
java.io.IOException: Java Virtual Machine recent CPU usage is not
    available.
```

This issue is only known to affect Kafka broker hosts that have the following specifications:

- CPU: Intel(R) Xeon(R) CPU E5-2699 v4 @ 2.20GHz
- OS: Linux 4.18.5-1.el7.elrepo.x86_64 #1 SMP Fri Aug 24 11:35:05 EDT 2018 x86_64
- Java version: 8-18

Move the broker to a different machine where the CPU is different. This can be done by moving the host to a different cluster. For more information, see the [Moving a Host Between Clusters](#).

Note: Cluster nodes affected by this issue are not displayed as unhealthy.

Known Issues in Hive

Learn about the known issues in Hive, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14**CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress**

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60770: Beeline Authentication Issue with Special Characters in Passwords

When LDAP is enabled, users cannot authenticate with Beeline if the password contains a special character. For example, the following string fails:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>;user=user@XXX;password='R3G#xpXyoy1M0Jb1'
```

Use the `-p` parameter to execute the Beeline command:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>; -n user@XXX -p 'R3G#xpXyoy1M0Jb1'
```

CDPD-43769: Inconsistent behavior with CHAR comparisons and string literals

In Hive, 'char' data to 'string' data comparison is considered as equal, but 'char' data to 'varchar' data comparison is considered as not equal if the data has trailing spaces. For example,

```
create table test(colchar char(10), colvarchar varchar(20), colstring string);
insert into test values ('a ', 'a ', 'a ');

select count(*) from test where colchar = colstring;
Output returns 1 because char and string data is considered as equal

select count(*) from test where colchar = colvarchar;
Output returns 0 because char and varchar data is considered as not equal
```

It is recommended that you use 'varchar or string' data type instead of 'char' data type for any character or string representation.

CDPD-42726: Wrong results for agg queries from stats after running multi-insert query on managed table

Multiple inserts at the same time into the same partition results in invalid stats. For example:

```
create table source(p int, key int, value string);
insert into source(p, key, value) values (101,42,'string42');

create table stats_part(key int,value string) partitioned by (p int);
```

```

from source
insert into stats_part select key, value, p
insert into stats_part select key, value, p;

select count(*) from stats_part;
-- In this scenario, StatsOptimizer helps serving this query be
cause the result should be rowNum of the partition p=101.
-- The result is 1, however, the result should be 2.

```

Rewrite the multi-insert statement by merging the branches inserting into the same partition to one branch.

CDPD-57574: Query execution fails due to NullPointerException in DagUtils.setupQuickStart

Hive queries may fail at runtime with a NullPointerException while executing the Tez graph at DagUtils.setupQuickStart method. A part of the stack trace from the error is shown below:

```

ERROR : Failed to execute tez graph.
java.lang.NullPointerException: null at org.apache.hadoop.hive.
ql.exec.tez.DagUtils.setupQuickStart(DagUtils.java:1724)

```

The error usually occurs from an invalid plan that has cycles created by semi-join or map-join edges.

Disable some of the optimizations in order to remove the cycles from the plan. It is sufficient to set one of the following properties:

- set hive.tez.dynamic.partition.pruning=false;
- set hive.tez.dynamic.semijoin.reduction=false;
- set hive.auto.convert.join=false;

To avoid any undesired performance regressions, disable the optimization(s) only for specific queries and not globally (through Cloudera Manager) for the whole workload or cluster.

CDPD-45370: Cartesian join fails with an empty table

When the configuration hive.tez.cartesian-product.enabled is set to true, query fails if one of the tables involved in a Cartesian join has zero rows. This results in an IllegalArgumentException with the message Number of items is 0. Should be positive.

To address this issue, set hive.tez.cartesian-product.enabled to false before running the query.

Apache Jira: [\[HIVE-26582\]](#)

CDPD-43107: SemanticException for INSERT INTO statement when Hive Cost-based Optimizer (CBO) is disabled

If you are running the INSERT INTO query and hive.cbo.enable is set to "false", the query fails with a SemanticException. For example,

```

set hive.cbo.enable=false;

CREATE TABLE mytable (
  id INT,
  str STRING
);

INSERT INTO mytable (id, str) VALUES (1, 'a');

```

```

Output:
org.apache.hadoop.hive.ql.parse.SemanticException: 0:0 Expected
2 columns for insclause-0/default@mytable; select produces 1 col
umns. Error encountered near token 'a'

```

This issue occurs only when columns are specified for the target table in the query. INSERT INTO mytable values (1, 'a'); does not result in an exception.

Enable CBO and run the query.

CDPD-43957: HiveServer shuts down during replication due to high resource usage

During Hive replication (both bootstrap and incremental), you may notice that the HiveServer (HS2) shuts down periodically with the following error:

```
java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper
    at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:265)
    at org.apache.hive.jdbc.HiveDriver.connect(HiveDriver.java:107)
    at java.sql.DriverManager.getConnection(DriverManager.java:664)
    at java.sql.DriverManager.getConnection(DriverManager.java:247)
    at com.cloudera.enterprise.hive3qt.Hive3QueryTool$HiveOperation.execute(Hive3QueryTool.java:682)
    at com.cloudera.enterprise.hive3qt.Hive3QueryTool.main(Hive3QueryTool.java:935)
Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.configureConnParams(ZooKeeperHiveClientHelper.java:177)
    at org.apache.hive.jdbc.Utills.configureConnParamsFromZooKeeper(Utills.java:580)
    at org.apache.hive.jdbc.Utills.parseURL(Utills.java:391)
    at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:263)
    ... 5 more
Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Tried all existing HiveServer2 uris from ZooKeeper.
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.getServerHosts(ZooKeeperHiveClientHelper.java:132)
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.configureConnParams(ZooKeeperHiveClientHelper.java:172)
    ... 8 mor
```

This issue occurs when you replicate at scale with an unbalanced cluster setup that has all the roles running on the Cloudera Manager host. As a result, Cloudera Manager ends up in a bottleneck situation because HS2 crashes, preventing further replication. The logs (/var/log/messages) indicate that there were a large number of Java processes running on the host, which exhausted the host's memory and triggered an Out Of Memory Killer process to stop HS2.

You can restart HS2 and reinitiate replication. However, the replication process may take a longer time to complete.

- Follow these recommendations when setting up your source and target clusters:
 - Ensure that no HS2, Hive metastore (HMS), DataNode, or NameNode roles are running on the Cloudera Manager host.
 - Ensure that you have multiple instances of HS2 and HMS roles on different nodes.
 - It is recommended that you have the HS2 and HMS roles on different nodes than the DataNodes or NameNodes.

These practices increase the possibility of Hive replication at scale completing successfully.

- Limit the scale of Hive replication by temporarily disabling replication policies.

CDPD-40730: Parquet change can cause incompatibility

Parquet files written by the parquet-mr library in CDP 7.1.9, where the schema contains a timestamp with no UTC conversion will not be compatible with older versions of Parquet readers. The effect is that the older versions will still consider these timestamps as they would require UTC

conversions and will thus end up with a wrong result. You can encounter this problem only when you write Parquet-based tables using Hive, and tables have the non-default configuration `hive.parquet.write.int64.timestamp=true`.

None.

CDPD-41274: HWC + Oozie issue: Could not open client transport with JDBC Uri

Currently only Spark cluster mode is supported in the Oozie Spark Action with Hive Warehouse Connector (HWC).

Use Spark action in cluster mode.

```
<spark xmlns="uri:oozie:spark-action:1.0">
  ...
  <mode>cluster</mode>
  ...
</spark>
```

CDPD-26556 After an upgrade, querying a CTAS table under certain conditions might throw an exception

If you upgrade your Hive cluster from CDH 6 to CDP 7, create a CTAS table in the CDP cluster from a table you upgraded from CDH, you might see the following exception when you query the new table:

```
class org.apache.hadoop.io.IntWritable cannot be cast to class o
rg.apache.hadoop.hive.serde2.objectinspector.StandardUnionObject
Inspector$StandardUnion
```

This issue involves CDH-based tables having columns of complex types ARRAY, MAP, and STRUCT.

CDPD-23506: OutOfMemoryError in LLAP

Long running spark-shell applications can leave sessions in interactive Hiveserver2 until the Spark application finishes (user exists from spark-shell), causing memory pressure in case of a high number of queries in the same shell (1000+).

You must close spark-shell so that sessions are closed. Add the owner of the database or the tables as a user with read or read/write access to the tables directly.

CDPD-23041: DROP TABLE on a table having an index does not work

If you migrate a Hive table to CDP having an index, DROP TABLE does not drop the table. Hive no longer supports indexes ([HIVE-18448](#)). A foreign key constraint on the indexed table prevents dropping the table. Attempting to drop such a table results in the following error:

```
java.sql.BatchUpdateException: Cannot delete or update a parent
row: a foreign key constraint fails ("hive"."IDXS", CONSTRAINT "
IDXS_FK1" FOREIGN KEY ("ORIG_TBL_ID") REFERENCES "TBLS" ("TBL_ID"
))
```

There are two workarounds:

- Drop the foreign key "IDXS_FK1" on the "IDXS" table within the metastore. You can also manually drop indexes, but do not cascade any drops because the IDXS table includes references to "TBLS".
- Launch an older version of Hive, such as Hive 2.3 that includes IDXS in the DDL, and then drop the indexes as described in [Language Manual Indexing](#).

Apache Issue: [Hive-24815](#)

CDPD-17766: Queries fail when using spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive.

Do not specify `spark.sql.hive.hiveserver2.jdbc.url.principal` in the JDBC URL to invoke Hive remotely.

Workaround: specify `principal=hive.server2.authentication.kerberos.principal` as shown in the following syntax:

```
jdbc:hive://<host>:<port>/<dbName>;principal=hive.server2.authentication.kerberos.principal;<otherSessionConfs>?<hiveConfs>#<hiveVars>
```

CDPD-13636: Hive job fails with OutOfMemory exception in the Azure DE cluster

Set the parameter `hive.optimize.sort.dynamic.partition.threshold=0`. Add this parameter in Cloudera Manager (Hive Service Advanced Configuration Snippet (Safety Valve) for `hive-site.xml`)

CDPD-10848: HiveServer Web UI displays incorrect data

If you enabled auto-TLS for TLS encryption, the HiveServer2 Web UI does not display the correct data in the following tables: Active Sessions, Open Queries, Last Max n Closed Queries

Known Issues in HDFS

Learn about the known issues in HDFS, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

Known Issues in Hue

Learn about the known issues in Hue, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14**CDPD-94739: Hue audit logging requires debug mode**

In Hue, audit logging is only active when debug logging is enabled by setting `DJANGO_DEBUG_MODE = true`. By default, audit logging is disabled.

Update to the upcoming release to restore audit logging functionality.

CDPD-58978: Batch query execution using Hue fails with Kerberos error

When you run Impala queries in a batch mode, you encounter failures with a Kerberos error even if the keytab is configured correctly. This is because submitting Impala, Sqoop, Pig, or pyspark queries in a batch mode launches a shell script Oozie job from Hue and this is not supported on a secure cluster.

There is no workaround. You can submit the queries individually.

OPSAPS-69659: Hue service fails on restart with "Unable to find pycpg2 2.5.4" error

Hue service fails to restart and you see the following error: Unable to find pycpg2 2.5.4. This could be because you have installed Python in a non-default location and Hue is unable to locate the pycpg2 PostgreSQL database adapter.

You must specify the path where you have installed Python in the `PYTHONPATH` property in the Hue Advanced Configuration Snippet using Cloudera Manager.

1. Log in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue Configurations and add the following key and value in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

Key: PYTHONPATH

Value: `[***PYTHON-PATH***]`

Replace `[***PYTHON-PATH***]` with the actual location where you have installed Python. For example, `/opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python3.8/site-packages`

3. Click Save Changes.
4. Restart the Hue service.

CDPD-59677: Unable to view Phoenix tables on the left assist in Hue

On clusters secured with Knox, you may not be able to see Phoenix tables on the left assist that are present under the default database (that is, an empty("") database).

None.

CDPD-58142: A query is not pre-populated in the Hue editor after clicking on the “Re Execute” button

When you click Re Execute to rerun a query from the Job Browser Queries Query Details page, the query does not get populated on the Hue editor, as expected.

None.

CDPD-54376: Clicking the home button on the File Browser page redirects to HDFS user directory

When you are previewing a file on any supported filesystem, such as S3 or ABFS, and you click on the Home button, you are redirected to the HDFS user home directory instead of the user home directory on the said filesystem.

None.

CDPD-41306: pip3.8 freeze command does not work and results into an error

You see the `/usr/lib/hue/build/env/bin/python: No such file or directory` error when you run the following command:

```
build/env/bin/pip3.8 freeze
```

Run the freeze command as follows by specifying the paths of python3.8 and pip3.8:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/python3.8 /opt/c  
loudera/parcels/CDH/lib/hue/build/env/bin/pip3.8 freeze
```

CDPD-43293: Unable to import Impala table using Importer

Creating Impala tables using the Hue Importer may fail.

If you have both Hive and Impala services installed on your cluster, then you can import the table using by selecting the Hive dialect from Tables Sources .

If only Impala service is installed on your cluster, then go to Cloudera Manager Clusters Hue Configurations and add the following line in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[beeswax]  
max_number_of_sessions=1
```

DWX-8602: Unable to import a large CSV file from the local workstation

You may see an error message while importing a CSV file into Hue from your workstation, stating that you cannot import files of size more than 200 KB.

Upload the file to S3 or ABFS and then import them into Hue using the Importer.

CDPD-39330: Unable to use the pip command in CDP

You may not be able to use the pip command in CDP 7.1.7 or higher and may see the following error when using pip in a command: “ImportError: cannot import name chardet”.

Follow the steps listed on [Unable to use pip command in CDP](#).

CDPD-24294: Hue uses the unsafe-inline directive in its Content Security Policy (CSP) header

Hue 4 web interface uses the unsafe-inline directive in its CSP header. As a result, the application server does not set the CSP header in its HTTP responses, and therefore does not benefit from the additional protection against potential cross-site scripting issues and other modern application vulnerabilities which a properly configured CSP may provide. This could lead to application vulnerability.

Cloudera recommends deploying additional security measures such as a firewall within the Hue server to control allowed connections, and SSO-based authentications mechanisms such as LDAP or SAML.

OPSAPS-58927: Connection failed error when accessing the Search app (Solr) from Hue

If you are using Solr with Hue to generate interactive dashboards and for indexing data, and if you have deployed two Solr services on your cluster and selected the second one as a dependency for Hue, then Cloudera Manager assigns the hostname of the first Solr service and the port number of the second Solr service generating an incorrect Solr URL in the search section of the hue.ini file. As a result, you may see a “Connection failed” error when you try to access the Search app from the Hue web UI.

1. Log into Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[search]
# URL of the Solr Server
solr_url=http://[***HOSTNAME***]:[***PORT***]/solr/
```

For example:

```
solr_url=http://solr2:4567/solr/
```

3. Click Save Changes.
4. Restart the Hue service.

CDPD-41136: Importing files from the local workstation is disabled by default

Cloudera has disabled the functionality to import files from your local workstation into Hue because it may cause errors. You may not see the Local File option in the Type drop-down menu on the **Importer** page by default.

You can enable the functionality to import files from your local workstation by specifying the following parameter in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field in Hue configurations in Cloudera Manager:

```
[indexer]
enable_direct_upload=true
```

Invalid S3 URI error while accessing S3 bucket

The Hue Load Balancer merges the double slashes (//) in the S3 URI into a single slash (/) so that the URI prefix "/filebrowser/view=S3A:/" is changed to "/filebrowser/view=S3A:". This results in an error when you try to access the S3 buckets from the Hue File Browser through the port 8889.

The Hue web UI displays the following error: “Unknown error occurred”.

The Hue server logs record the “ValueError: Invalid S3 URI: S3A” error.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

You should be able to load the S3 browser from both 8888 and 8889 ports.

Alternatively, you can use the Hue server port 8888 instead of the load balancer port 8889 to resolve this issue.

Error while rerunning Oozie workflow

You may see an error such as the following while rerunning an already executed and finished Oozie workflow through the Hue web interface: E0504: App directory [hdfs://cdh/user/hue/oozie/workspaces/hue-oozie-1571929263.84] does not exist.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

CDPD-17956, CDPD-14167: Setting idle session timeout for Hue does not work when the cluster is secured using Knox SSO

If Hue is configured with desktop.auth.backend.KnoxSpnegoDjangoBackend as the Authentication Backend, then the automatic idle session logout that is set by configuring the `idle_session_timeout` property does not take effect. You may also see 404 error while accessing Hue from the Knox UI when the `idle_session_timeout` property is not set to -1.

None

Query history displays "Result Expired" message

You see the "Result Expired" message under the Query History column on the **Queries** tab for queries which were run back to back. This is a known behaviour.

None.

CDPD-43956: Manually replace UUID when importing Oozie workflows containing sub-workflows

When importing Oozie workflows that contain sub-workflows, you must replace all the UUID entries with unique new entries. If you change the UUID of a sub-workflow, you must update that reference in the parent workflow to avoid circular dependencies.

Hue limitation after upgrading from CDH to CDP Private Cloud Base

The `hive.server2.parallel.ops.in.session` configuration property changes from TRUE to FALSE after upgrading from CDH to CDP Private Cloud Base. Current versions of Hue are compatible with this property change; however, if you still would like to use an earlier version of Hue that was not compatible with this property being FALSE and shared a single JDBC connection to issue queries concurrently, the connection will no longer work after upgrading.

Hue UI is blank upon login after upgrading to CDP 7.1.7 from CDH 6

If your cluster was secured using Knox, and if you have upgraded from CDH 6 to CDP 7.1.7, then you may see a blank Hue screen. This could happen because the `knox_proxyhosts` parameter is newly introduced in CDP, and it is possible that this parameter is not configured in Cloudera Manager under Hue configuration.

Specify the host on which you have installed Knox in the Hue Knox Proxy Hosts configuration as follows:

1. Log in to Cloudera Manager as an Administrator.
2. Obtain the host name of the Knox Gateway by going to Clusters Knox service Instances .
3. Go to Clusters Hue service Configuration and search for the Knox Proxy Hosts field.

Note: Cloudera Manager displays the following warning if the Knox Proxy Hosts field is empty when Knox Gateway is enabled on the CDP cluster: The parameter `knox_proxyhosts` cannot be empty. This can happen if there are no Knox Gateways. Please set the `knox_proxyhosts` to the list of hosts that have Knox Gateways.

4. Specify the Knox Gateway hostname in the Knox Proxy Hosts field.
5. Click Save Changes and restart the Hue service.

Unsupported features

CDPD-59595: Spark SQL does not work with all Livy servers that are configured for High Availability

SparkSQL support in Hue with Livy servers in HA mode is not supported. Hue does not automatically connect to one of the Livy servers. You must specify the Livy server in the Hue Advanced Configuration Snippet as follows:

```
[desktop]
[spark]
livy_server_url=http(s)://[***LIVY-FOR-SPARK3-SERVER-HOST***]:
[***LIVY-FOR-SPARK3-SERVER-PORT***]
```

Moreover, you may see the following error in Hue when you submit a SparkSQL query: Expecting value: line 2 column 1 (char 1). This happens when the Livy server does not respond to the request from Hue.

Specify all different Livy servers in the `livy_server_url` property one at a time and use the one which does not cause the issue.

CDPD-18491: PySpark and SparkSQL are not supported with Livy in Hue

Hue does not support configuring and using PySpark and SparkSQL with Livy in CDP Private Cloud Base.

Importing and exporting Oozie workflows across clusters and between different CDH versions is not supported

You can export Oozie workflows, schedules, and bundles from Hue and import them only within the same cluster if the cluster is unchanged. You can migrate bundle and coordinator jobs with their workflows only if their arguments have not changed between the old and the new cluster. For example, hostnames, NameNode, Resource Manager names, YARN queue names, and all the other parameters defined in the `workflow.xml` and `job.properties` files.

Using the import-export feature to migrate data between clusters is not recommended. To migrate data between different versions of CDH, for example, from CDH 5 to CDP 7, you must take the dump of the Hue database on the old cluster, restore it on the new cluster, and set up the database in the new environment. Also, the authentication method on the old and the new cluster should be the same because the Oozie workflows are tied to a user ID, and the exact user ID needs to be present in the new environment so that when a user logs into Hue, they can access their respective workflows.

Note: Migrating Oozie workflows from HDP clusters is not supported.

Known Issues in Impala

Learn about the known issues in Impala, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94720: Impala startup failure due to invalid TLS v1.3 ciphers

When running Impala on a machine with OpenSSL 1.1.1, providing an invalid or TLS v1.2 ciphersuite in the `--tls_ciphersuites` startup flag causes the process to fail during startup. While OpenSSL 3.x ignores invalid ciphers, OpenSSL 1.1.1 returns an error if any ciphersuite in the list is invalid, even if other valid TLS v1.3 ciphers are present.

Ensure that the list in the `--tls_ciphersuites` startup flag contains only valid TLS v1.3 ciphersuites and does not contain any TLS v1.2 ciphersuites.

Apache Jira: [IMPALA-14625](#)

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-59625: Impala shell in RHEL 9 with Python 2 as default does not work

If you try to run `impala-shell` on RHEL 9 by setting the default python executable available in `PATH` to Python 2, it will fail since RHEL 9 is compatible only with Python 3.

If you run into such issues, set this parameter pointing to Python 3, `IMPALA_PYTHON_EXECUTABLE=python3`.

CDPD-81980: Impala query may fail due to backpressure

Impala queries could fail with a dropped due to backpressure error, even when service queue and memory usage appear normal.

Increase the value of the `--mem_limit` startup option.

CDPD-42958: After upgrading the CDH 7.1.9 from CDH 6.x, under certain conditions you cannot insert data into a table

Under the following conditions, after upgrading from CDH 6.x to CDH 7.1.9 you cannot insert data into a table from Impala:

- On CDH 6.x, you created a database with Impala in a user specified HDFS location.
- Using Hive, you then created a table in the database.

Under these conditions, the database and table are stored in the user-specified HDFS directory. After upgrading, the HDFS directory of the table is read-only for Impala. Consequently, from Impala you cannot insert new data into the table because Impala does not have write permission on the HDFS directory.

Workaround: To resolve this issue, use either one of the following workarounds:

- Using the Ranger Web UI, in the policy repository `cm_hdfs`, grant the user 'impala' write permission on the directory where the table resides.
- Enter the following command to grant write permission to user 'impala' on the HDFS directory where the table resides.

```
hdfs dfs -setfacl -m default:user:impala:rwX <HDFS directory>
```

CDPD-80019: Impala fails to start due to large catalog-update topic

Impala coordinators fail to start if the catalog-update statestore topic exceeds 2GB, hitting the Thrift 0.16.0 message size limit (`thrift_rpc_max_message_size`). This prevents the coordinator from processing the update.

- Enable local catalog mode: `--use_local_catalog=true`
- In Cloudera Manager, go to Impala Configuration search for "Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)" and click 
- Add property name and value:

```
Name : --catalog_topic_mode
Value: minimal
```

- Save changes.

Apache Jira: [IMPALA-12350](#)

Impala cannot update table if the 'external.table.purge' property is not set to true

Impala cannot update a table using DDL statements if the 'external.table.purge' property is FALSE. ALTER TABLE statements return success with no changes to the table.

ALTER TABLE statements should be issued twice if "external.table.purge" was FALSE initially.

Note: For Iceberg tables, Impala users should always use CREATE TABLE since the Impala CREATE TABLE statement sets the flag to TRUE. However, Impala CREATE EXTERNAL TABLE sets the flag to FALSE.

Impala's known limitation when querying compacted tables

When the compaction process deletes the files for a table from the underlying HDFS location, the Impala service does not detect the changes as the compactions does not allocate new write ids. When the same table is queried from Impala it throws a 'File does not exist' exception that looks something like this:

```
Query Status: Disk I/O error on <node>:22000: Failed to open HDFS
file hdfs://nameservice1/warehouse/tablespace/managed/hive/<database>/<table>/xxxxx
Error(2): No such file or directory Root cause: RemoteException:
File does not exist: /warehouse/tablespace/managed/hive/<data
base>/<table>/xxxx
```

Use the [REFRESH/INVALIDATE](#) statements on the affected table to overcome the 'File does not exist' exception.

CDPD-28431: Intermittent errors could be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

Impala api calls via knox require configuration if the knox customized kerberos principal name is a default service user name

To access impala api calls via knox, if the knox customized kerberos principal name is a default service user name, then configure "authorized_proxy_user_config" by clicking Clusters->impala->configuration. Include the knox customized kerberos principal name in the comma separated list of values <knox_custom_kerberos_principal_name>="*" where <knox_custom_kerberos_principal_name> is the value of the Kerberos Principal in the Knox service. Select Clusters>Knox>Configuration and search for Kerberos Principal to display this value.

CDPD-21828: Multiple permission assignment through grant is not working

None

Problem configuring masking on tables using Ranger

The following Knowledge Base article describes the behavior when we configure masking on tables using Ranger. This configuration works for Hive, but breaks queries in some scenarios for Impala.

For a workaround, see the following Knowledge Base article: [ERROR: "AnalysisException: No matching function with signature: mask\(FLOAT\)" when Impala jobs fail with the following error with signature: mask\(FLOAT\)](#)

IMPALA-11871: INSERT statement does not respect Ranger policies for HDFS

In a cluster with Ranger auth (and with legacy catalog mode), even if you provide RWX to cm_hdfs -> all-path for the user impala, inserting into a table whose HDFS POSIX permissions happen to exclude impala access will result in "AnalysisException: Unable to INSERT into target table (default.t1) because Impala does not have WRITE access to HDFS location: hdfs://XXXXXXXXXXXXX"

IMPALA-532: Impala should tolerate bad locale settings

If the LC_* environment variables specify an unsupported locale, Impala does not start.

Add LC_ALL="C" to the environment settings for both the Impala daemon and the Statestore daemon.

Avro Scanner fails to parse some schemas

The default value in Avro schema must match type of first union type, e.g. if the default value is null, then the first type in the UNION must be "null".

Swap the order of the fields in the schema specification. For example, use ["null", "string"] instead of ["string", "null"]. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

IMPALA-691: Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the impalad daemon.

To monitor overall memory usage, use the top command, or add the memory figures in the Impala web UI /memz tab to JVM memory usage shown on the /metrics tab.

IMPALA-1024: Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Remove trailing semicolon from the Avro schema.

IMPALA-1652: Incorrect results with basic predicate on CHAR typed column

When comparing a CHAR column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Use the RPAD() function to blank-pad literals compared with CHAR columns to the expected length.

IMPALA-1821: Casting scenarios with invalid/inconsistent results

Using a CAST() function to convert large literal values to smaller types, or to convert special values such as NaN or Inf, produces values not consistent with other database systems. This could lead to unexpected results from queries.

None

IMPALA-2005: A failed CTAS does not drop the table if the insert fails

If a CREATE TABLE AS SELECT operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Drop the new table manually after a failed CREATE TABLE AS SELECT

IMPALA-2422: % escaping does not work correctly when occurs at the end in a LIKE clause

If the final character in the RHS argument of a LIKE operator is an escaped \% character, it does not match a % final character of the LHS argument.

None

IMPALA-2603: Crash: impala::Coordinator::ValidateCollectionSlots

A query could encounter a serious error if includes multiple nested levels of INNER JOIN clauses involving subqueries.

None

IMPALA-3094: Incorrect result due to constant evaluation in query with outer join

An OUTER JOIN query could omit some expected result rows due to a constant such as FALSE in another join clause. For example:

```
explain SELECT 1 FROM alltypestiny a1
  INNER JOIN alltypesagg a2 ON a1.smallint_col = a2.year AND fals
e
  RIGHT JOIN alltypes a3 ON a1.year = a1.bigint_col;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| Explain String
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| Estimated Per-Host Requirements: Memory=1.00KB VCores=1 |
|
| 00:EMPTYSET
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

IMPALA-3509: Breakpad minidumps can be very large when the thread count is high

The size of the breakpad minidump files grows linearly with the number of threads. By default, each thread adds 8 KB to the minidump size. Minidump files could consume significant disk space when the daemons have a high number of threads.

Add `-\-minidump_size_limit_hint_kb=size` to set a soft upper limit on the size of each minidump file. If the minidump file would exceed that limit, Impala reduces the amount of information for each thread from 8 KB to 2 KB. (Full thread information is captured for the first 20 threads, then

2 KB per thread after that.) The minidump file can still grow larger than the "hinted" size. For example, if you have 10,000 threads, the minidump file can be more than 20 MB.

IMPALA-4978: Impala requires FQDN from hostname command on Kerberized clusters

The method Impala uses to retrieve the host name while constructing the Kerberos principal is the `gethostname()` system call. This function might not always return the fully qualified domain name, depending on the network configuration. If the daemons cannot determine the FQDN, Impala does not start on a Kerberized cluster.

Test if a host is affected by checking whether the output of the `hostname` command includes the FQDN. On hosts where `hostname` only returns the short name, pass the command-line flag `##hostname=FULLY_QUALIFIED_DOMAIN_NAME` in the startup options of all Impala-related daemons.

IMPALA-6671: Metadata operations block read-only operations on unrelated tables

Metadata operations that change the state of a table, like `COMPUTE STATS` or `ALTER RECOVER PARTITIONS`, may delay metadata propagation of unrelated unloaded tables triggered by statements like `DESCRIBE` or `SELECT` queries.

None

IMPALA-7072: Impala does not support Heimdal Kerberos

None

OPSAPS-46641: A single parameter exists in Cloudera Manager for specifying the Impala Daemon Load Balancer. Because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

The workaround is to use the load balancer configuration either without a port specification, or with the Beeswax port: this will configure BDR. To configure Hue use the "Hue Server Advanced Configuration Snippet (Safety Valve) for `impalad_flags`" to specify the the load balancer address with the `HiveServer2` port.

CDPD-28139: Set `spark.hadoop.hive.stats.autogather` to false by default

As an Impala user, if you submit a query against a table containing data ingested using Spark and you are concerned about the quality of the query plan, you must run `COMPUTE STATS` against such a table in any case after an ETL operation because `numRows` created by Spark could be incorrect. Also, use other stats computed by `COMPUTE STATS`, e.g., Number of Distinct Values (NDV) and NULL count for good selectivity estimates.

For example, when a user ingests data from a file into a partition of an existing table using Spark, if `spark.hadoop.hive.stats.autogather` is not set to false explicitly, `numRows` associated with this partition would be 0 even though there is at least one row in the file. To avoid this, the workaround is to set `"spark.hadoop.hive.stats.autogather=false"` in the "Spark Client Advanced Configuration Snippet (Safety Valve) for `spark-conf/spark-defaults.conf`" in Spark's CM Configuration section.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker) in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Save Changes > Restart SMM.

The offsets.topic.replication.factor property must be less than or equal to the number of live brokers

The offsets.topic.replication.factor broker configuration is now enforced upon auto topic creation. Internal auto topic creation will fail with a GROUP_COORDINATOR_NOT_AVAILABLE error until the cluster size meets this replication factor requirement.

None

Requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true

The first few produce requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true.

Increase the number of retries in the producer configuration setting retries.

Performance degradation when SSL Is enabled

In some configuration scenarios, significant performance degradation can occur when SSL is enabled. The impact varies depending on your CPU, JVM version, Kafka configuration, and message size. Consumers are typically more affected than producers.

Configure brokers and clients with ssl.secure.random.implementation = SHA1PRNG. It often reduces this degradation drastically, but its effect is CPU and JVM dependent.

OPSAPS-43236: Kafka garbage collection logs are written to the process directory

By default Kafka garbage collection logs are written to the agent process directory. Changing the default path for these log files is currently unsupported.

None

RANGER-3809: Idempotent Kafka producer fails to initialize due to an authorization failure

Kafka producers that have idempotence enabled require the Idempotent Write permission to be set on the cluster resource in Ranger. If permission is not given, the client fails to initialize and an error similar to the following is thrown:

```
org.apache.kafka.common.KafkaException: Cannot execute transactional method because we are in an error state
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeFailWithError(TransactionManager.java:1125)
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeAddPartition(TransactionManager.java:442)
    at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:1000)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:914)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:800)
    .
    .
    .
    Caused by: org.apache.kafka.common.errors.ClusterAuthorizationException: Cluster authorization failed.
```

Idempotence is enabled by default for clients in Kafka 3.0.1, 3.1.1, and any version after 3.1.1. This means that any client updated to 3.0.1, 3.1.1, or any version after 3.1.1 is affected by this issue.

This issue has two workarounds, do either of the following:

- Explicitly disable idempotence for the producers. This can be done by setting `enable.idempotence` to `false`.
- Update your policies in Ranger and ensure that producers have Idempotent Write permission on the cluster resource.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

DBZ-4990: The Debezium Db2 Source connector does not support schema evolution

The Debezium Db2 Source connector does not support the evolution (updates) of schemas. In addition, schema change events are not emitted to the schema change topic if there is a change in the schema of a table that is in capture mode. For more information, see [DBZ-4990](#).

None.

CFM-3532: The Stateless NiFi Source, Stateless NiFi Sink, and HDFS Stateless Sink connectors cannot use Snappy compression

This issue only affects Stateless NiFi Source and Sink connectors if the connector is running a dataflow that uses a processor that uses Hadoop libraries and is configured to use Snappy compression. The HDFS Stateless Sink connector is only affected if the Compression Codec or Compression Codec for Parquet properties are set to SNAPPY.

If you are affected by this issue, errors similar to the following will be present in the logs.

```
Failed to write to HDFS due to java.lang.UnsatisfiedLinkError: org.apache.hadoop.util.NativeCodeLoader.buildSupportsSnappy()
```

```
Failed to write to HDFS due to java.lang.RuntimeException: native snappy library not available: this version of libhadoop was built without snappy support.
```

Download and deploy missing libraries.

Important: Ensure that you complete steps 1-11 on all Kafka Connect hosts. Additionally, ensure that the advanced configuration snippet in step 12 is configured for all Kafka Connect role instances.

1. Create the `/opt/nativelibs` directory.

```
mkdir /opt/nativelibs
```

2. Change the owner to kafka.

```
chown kafka:kafka /opt/nativelibs
```

3. Locate the directory containing the Hadoop native libraries and copy its contents to the directory you created.

```
cp /opt/cloudera/parcels/CDH/lib/hadoop/lib/native/* /opt/nativelibs
```

4. Verify that `libsnapy.so` was copied to the directory you created.
5. Remove the following from `/opt/nativelibs`.

```
libhadoop.a
libhadoop.so
libhadoop.so.1.0.0
```

6. Run the following command.

```
hadoop version
```

The command returns the Hadoop version running in the cluster. Note down the first three digits in the version.

7. Go to <https://archive.apache.org/dist/hadoop/common/> and download the Hadoop version that matches the first three digits of the version running in the cluster.

For example, if your Hadoop version is 3.1.1.7.1.9.0-296, then you need to download Hadoop 3.1.1.

8. Extract the downloaded archive.
9. Copy the following libraries from the downloaded archive to `/opt/nativelibs` on the cluster host.

```
libhadoop.a
libhadoop.so.1.0.0
```

The libraries are located in `hadoop-[*VERSION*]/lib/native`.

10. Create a symlink named `libhadoop.so` and point it to `/opt/nativelibs/libhadoop.so.1.0.0`.

```
ln -s /opt/nativelibs/libhadoop.so.1.0.0 /opt/nativelibs/libhadoop.so
```

11. Change the owner of every entry within /opt/nativelibs to kafka.

```
chown -h kafka:kafka /opt/nativelibs/*
```

12. In Cloudera Manager, go to Kafka service Configuration .
13. Add the following key-value pair to Kafka Connect Environment Advanced Configuration Snippet (Safety Valve).
 - Key: LD_LIBRARY_PATH
 - Value: /opt/nativelibs
14. Click Save Changes.
15. Restart the Kafka service.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Unsupported Features

The following Kafka features are not supported in Cloudera Data Platform:

- Only Java and .Net based clients are supported. Clients developed with C, C++, Python, and other languages are currently not supported.
- The Kafka default authorizer is not supported. This includes setting ACLs and all related APIs, broker functionality, and command-line tools.
- SASL/SCRAM is only supported for delegation token based authentication. It is not supported as a standalone authentication mechanism.
- Kafka KRaft in this release of Cloudera Runtime is in technical preview and does not support the following:
 - Deployments with multiple log directories. This includes deployments that use JBOD for storage.
 - Delegation token based authentication.
 - Migrating an already running Kafka service from ZooKeeper to KRaft.
 - Atlas Integration.

Limitations

Collection of Partition Level Metrics May Cause Cloudera Manager's Performance to Degrade

If the Kafka service operates with a large number of partitions, collection of partition level metrics may cause Cloudera Manager's performance to degrade.

If you are observing performance degradation and your cluster is operating with a high number of partitions, you can choose to disable the collection of partition level metrics.

Important: If you are using SMM to monitor Kafka or Cruise Control for rebalancing Kafka partitions, be aware that both SMM and Cruise Control rely on partition level metrics. If partition level metric collection is disabled, SMM will not be able to display information about partitions. In addition, Cruise Control will not operate properly.

Complete the following steps to turn off the collection of partition level metrics:

1. Obtain the Kafka service name:
 - a. In Cloudera Manager, Select the Kafka service.
 - b. Select any available chart, and select Open in Chart Builder from the configuration icon drop-down.
 - c. Find \$SERVICENAME= near the top of the display.

The Kafka service name is the value of \$SERVICENAME.

2. Turn off the collection of partition level metrics:
 - a. Go to Hosts Hosts Configuration .
 - b. Find and configure the Cloudera Manager Agent Monitoring Advanced Configuration Snippet (Safety Valve) configuration property.

Enter the following to turn off the collection of partition level metrics:

```
[KAFKA_SERVICE_NAME]_feature_send_broker_topic_partition_entity_update_enabled=false
```

Replace [KAFKA_SERVICE_NAME] with the service name of Kafka obtained in step 1. The service name should always be in lower case.

- c. Click Save Changes.

Known Issues in Knox

Learn about the known issues in Knox, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-92941: Knox Gateway logging configuration cannot be customized through Cloudera Manager

The Knox Gateway Logging Configuration (Safety Valve) in Cloudera Manager is not applied to Knox Gateway. Individual logger configurations cannot be set or modified through the Cloudera Manager UI.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-76435: Default HTTP client timeout for Streams Messaging Manager requests may cause connection timeouts

Some Streams Messaging Manager requests, particularly those retrieving topic data, may take up to 30 seconds to complete, even when there are no connectivity issues. Since the default gateway timeout is set to 20 seconds, this can result in connection timeouts despite the system functioning as expected.

Increase the HTTP client and socket timeouts for Streams Messaging Manager services to 60 seconds. This prevents connection timeouts when the requests take longer than the default gateway timeout.

Follow these steps to configure the required properties for the SMM API and SMM UI services:

1. In Cloudera Manager, select the Knox service.
2. Go to Configuration.
3. Find the Knox Simplified Topology Management - cdp-proxy property, and click  to add the following lines:

```
SMM-UI:replayBufferSize=512
SMM-UI:httpclient.connectionTimeout=1m
SMM-UI:client.socketTimeout=1m
SMM-API:replayBufferSize=512
```

```
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

4. Find the Knox Simplified Topology Management - cdp-proxy-api property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

5. Find the Knox Simplified Topology Management - cdp-proxy-token property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

6. Save your changes.
7. Refresh the cluster.

Known Issues in Kudu

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-94474: Kudu Tablet Server Crash on RHEL9

Kudu tablet servers kudu-tserver crash on Red Hat Enterprise Linux 9 (RHEL9) x86_64 platforms when the libgcc package is updated to version 11.5.0-11 or newer. This crash manifests as a Segmentation Fault (SIGSEGV) or an Abort (SIGABRT) error under certain workloads.

1. Log in to Cloudera Manager as an Administrator.
2. Navigate to Cloudera Manager Clusters Kudu Configuration .
3. Navigate to the Configuration tab, and add the following value in the Tablet Server Advanced Configuration Snippet (Safety Valve) for gflagfile for the Tablet Server Default Group field:

```
--mrs_use_codegen=false
```

4. Click Save Changes.
5. Restart the Kudu Service.

You get "The user 'kudu' is not part of group 'hive' on the following hosts:" warning by the Host Inspector.

If you are using fine-grained authorization for Kudu, and you are also using Kudu-HMS integration with HDFS-Sentry sync, then you may get the "The user 'kudu' is not part of group 'hive' on the following hosts:" warning while upgrading.

Workaround: Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Unsupported features

Kudu HMS Sync is disabled and is not yet supported

CDPD-88335: Datanode decommission fails when other datanodes are offline due to invalid affinity node in Ratis replication

Datanode decommissioning fails if one or more datanodes holding Ratis replicas are offline. During decommission, the Storage Container Manager (SCM) tries to replicate Ratis container data to maintain redundancy. However, SCM's placement logic still references an affinity node that was previously part of the network topology but has since been removed due to the datanode going offline. This causes repeated placement errors and prevents the decommission process from completing successfully.

Apache Issue: [HDDS-13544](#)

CDPD-87429: Unexpected log lines in Ozone snapshot diff output

`ozone.client.server-defaults.validity.period.ms` configuration introduced to get server default configurations causes Replication Manager to fail when replicating data between Ozone buckets with the following error when the config value does not specify a timeunit.

```
...
java.lang.IllegalStateException: Invalid first line in diff: "25
/07/02 05:58:44 INFO Configuration.deprecation: No unit for ozon
e.client.server-defaults.validity.period.ms(3600000) assuming MI
LLISECONDS"
    at com.cloudera.enterprise.distcp.OzoneCopyListingUtils.parseOz
oneDiff(OzoneCopyListingUtils.java:397)
...
```

Overwrite the `ozone.client.server-defaults.validity.period.ms` to configure the value to have time unit (ns, ms, s, m, h). For example, 3600000ms.

CDPD-71648: Snapshot creation failing with "PERMISSION_DENIED" error on a bucket created during pre-upgrade in 7.1.7 SP3

On upgrade of cluster from 7.1.7 SP3 to 7.1.9 SP1, we are not able to create snapshots on a pre-upgrade volume or bucket with "PERMISSION_DENIED" error, since in 7.1.7SP3, we were using full KRB owner name with domain but currently, we only use and search for user shortname.

Update the owner of the bucket with the user shortname and then create snapshot by running the commands:

```
ozone sh bucket update --user=[{***USER_SHORT_NAME***}] {volume}/
{bucket}
ozone sh snapshot create {volume}/{bucket}
[{***SNAPSHOT_NAME***}]
```

OPSAPS-74668: ozone.snapshot.deep.cleaning.enabled and ozone.snapshot.ordered.deletion.enabled configurations are missing with CDP 7.1.9 SP1 CHF and Cloudera Manager 7.13.1

Two Ozone Manager configurations are missing while using CDP 7.1.9 SP1 CHF after upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400.

If you are using CDP 7.1.9 SP1 CHF, before upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400, add the following configs to Ozone Manager Advanced Configuration Snippet (Safety Valve) for ozone-conf/ozone-site.xml so that Ozone Manager does not miss important config after the Cloudera Manager upgrade:

```
<property>
<name>ozone.snapshot.deep.cleaning.enabled</name>
<value>>false</value>
```

```

</property>

<property>
<name>ozone.snapshot.ordered.deletion.enabled</name>
<value>true</value>
</property>

```

CDPD-64865: Intermittent timeout in TestBlockDeletion.testBlockDeletion (BlockDeletionService stuck)

If the event of SCM exiting safe mode was triggered multiple times, this might eventually cause the SCMBlockDeletingService to transition into the PAUSING state.

Check the SCM logs and ensure that the SCMBlockDeletingService is not running, and then restart the SCM.

CDPD-81569: Recon is not reflecting correct metrics for Volumes, Buckets, Keys, and Pending Key Deletions

Recon is displaying data for container and space utilisation only. The metrics for Volumes, Buckets, Keys, and Pending Key Deletions are not being updated and displayed correctly.

Apache Jira: [HDDS-12607](#)

CDPD-54885: Ozone Prometheus does not work with TLS

The Prometheus service shipped by Ozone does not support TLS mode. So, Prometheus is not able to gather metrics from Ozone endpoints when TLS is enabled.

Go to Ozone Configuration Ozone Prometheus Endpoint Token and update the Ozone Prometheus Endpoint Token with any random string. This makes a token available in the process directory of the Ozone endpoint in plaintext, which Prometheus can use to get around the TLS limitation.

CDPD-69681: Ozone Ranger plugin does recursive listing for ACL checks

Ozone Ranger plugin does recursive listing in unoptimized path for performing ACL check on a directory. Recursive rename and delete operations on directories with layers of subdirectories causes a performance problem.

[Enable Ranger subaccess optimization for rename and delete operations in Ozone.](#)

Apache Issue: [HDDS-10823](#)

CDPD-51490: Installing HDFS and Ozone datanode instances on the same server (in case of a small test or development platform), can cause the Ozone UI to fail as it attempts to use the same default port 9864 already taken by HDFS.

On the Ozone configuration, overwrite the hdds.datanode.client.port value = 19864 and restart the Ozone service. This will allow Ozone UI to load without colliding with the HDFS service.

The Prometheus binary is not available in CDP Private Cloud Base 7.1.9 for the Ubuntu operating system.

You can install Prometheus separately and specify the path to the parent directory, for example /usr/bin, in the prometheus.location parameter in Ozone.

After upgrading the cluster from CDP Private Cloud Base 7.1.8 to CDP Private Cloud Base 7.1.9 and if Ozone is in the Non-HA environment, an exception message is observed during the finalization of the Ozone upgrade.

During the finalization of the upgrade, a ClassNotFoundException message for org.cloudera.log4j.redactor.RedactorAppender class may be displayed. The error message can be ignored because the upgrade is successful. The error existed previously and does not affect the Ozone service and its operation.

None.

CDPD-68951: In CDP Private Cloud Base 7.1.9 CHF2 version and lower, the command `ozone sh key list <bucket_path>` displays the isFile flag in a key's metadata as false even when the key is a file.

This issue is rectified in CDP Private Cloud Base 7.1.9 CHF3. However, the pre-existing (pre-upgrade) key's metadata cannot be changed.

None

CDPD-67771: When using S3A committer `fs.s3a.committer.name=directory` with `fs.s3a.committer.staging.conflict-mode=replace` to write to FSO buckets, the client fails with the following error.

```
DIRECTORY_NOT_FOUND
org.apache.hadoop.ozone.om.exceptions.OMException:
Failed to find parent directory of xxxxxxxx at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentId(OMFileRequest
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteReques
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteReques
at
org.apache.hadoop.ozone.protocolPB.OzoneManagerRequestHandler.handleWriteReques
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.runCommand(OzoneManag
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.lambda
$1(OzoneManagerStateMachine.java:363) at
java.base/java.util.concurrent.CompletableFuture
$AsyncSupply.run(CompletableFuture.java:1700) at java.base/
java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1128)
at java.base/java.util.concurrent.ThreadPoolExecutor
$Worker.run(ThreadPoolExecutor.java:628) at java.base/
java.lang.Thread.run(Thread.java:834)
```

This occurs because S3A uses multipart upload to commit job results in a batch. The staging committer's replace mode deletes the target directory before completing Memory Protection Unit (MPU). The problem is that File System Optimization (FSO) does not create intermediate directories during MPU, it does only for regular file/dir/key requests.

Use `fs.s3a.committer.name=magic` for affected versions.

CDPD-64398: In SCM with non-HA configuration, Secret key manager does not initialise. Hence, the startup of OM and DataNode fails because it cannot get a secret key. This key is used when security is enabled and used in Block token and container token verification while communicating between the Ozone client, OM, and Datanode.

This issue does not occur in SCM with HA configuration.

You must force exit from the safe mode for SCM. This triggers the initialization of the Secret key manager. Below are the options:

- exit safe mode manually whenever SCM is started
- disable safe mode by setting `hdds.scm.safemode.enabled=false` in safety valve for SCM configuration

Impact of disabling safe mode and the purpose of safe mode:

- Write should not fail once the cluster is out of safe mode
- Read of existing data should not fail after the cluster is out of safe mode
- Unnecessary re-replication should be avoided during cluster restart

So disabling safe mode does not have any major impact on Ozone.

HDDS-9512: Ozone DataNode's new client port conflicts with HDFS DataNode's web port if both Ozone and HDFS DataNode roles are placed on the same host.

You must set `hdds.datanode.client.port` to any unused port. For example, 19864, through the Ozone DataNode safety valve.

CDPD-52412: keyManagerImpl#listStatus exceeds the maximum RPC length.

To reduce the payload, you must increase the part size.

OPSAPS-68159: If you did not deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Error when distributing parcel to host, Ignoring non-compliant parcel manifest error is displayed after Cloudera Manager is upgraded to 7.11.3.

If you encounter the error, perform the following steps:

1. Deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.11.3.
2. Restart the cluster with a delay of 10 minutes.
3. Continue to upgrade CDH 7.1.8 to CDH 7.1.9.

OPSAPS-68159: If you did not deactivate the Ozone parcel 718.2.x on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Ozone roles during the CDH 7.1.8 upgrade to CDH 7.1.9.

If you encounter the error, perform the following steps:

1. Deactivate the Ozone parcel 718.2.x.
2. Restart the Ozone service.
3. Perform Finalize Upgrade for the Ozone service.

Step result: The Ozone roles will be displayed in green.

CDPD-60989: The packaging version for Apache Ozone points to the 1.2.0 older version. This is a version string problem and not a packaging issue. The version of the Apache Ozone binary is closest to 1.4.0.

None. This only affects the JAR versioning.

CDPD-60366: Native library loader fails when system property `native.lib.tmp.dir` is not set. It fails because the library is copied to `/` instead of the `cwd`.

Setting `native.lib.tmp.dir` to a certain path like `/tmp` should solve the issue. To set this system property, you must add `-Dnative.lib.tmp.dir=/tmp` to `ozone_java_opts` in Cloudera Manager configuration of the Ozone cluster.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-60598: DataNode can consume up to the JVM heap size worth of direct memory buffers under specific failure scenarios. This can lead to a DataNode crash. This is due to Netty allocating and not freeing the direct memory buffers.

Restarting DataNode will resolve this issue.

CDPD-60466: The Ozone client is missing in the Cloudera Manager's Service Monitor node. This causes Ozone Canary's health check to fail.

Ensure you install Ozone CLI on the same node as Cloudera Manager's Service Monitor.

CDPD-60012: The Ozone SCM may be stuck in safe mode after upgrade to 7.1.9. This is due to a bug in how the SCM accounts for open storage containers.

The workaround is to temporarily set the Ozone configuration `hdds.scm.safemode.threshold.pct` to a lower value like 0.90 and restart the SCM.

CDPD-59679: In some scenarios, excess UNHEALTHY replicas of EC containers may not be removed from the cluster.

None

CDPD-50116: Topology-aware reads can provide better performance by routing applications to the closest replica of a file, if available, on the same physical node or same rack. However this feature is disabled by default in CDP 7.1.9.

This feature can be enabled by setting `ozone.network.topology.aware.read` to true using Cloudera Manager safety valve.

CDPD-57165: The DataNode disk usage thread may abort due to Ratis log tailing.

Use `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory` to calculate disk usage. Configure in the `ozone-site.xml` property: `hdds.datanode.du.factory` value: `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory`

OPSAPS-63510: When Ozone Container Balancer is started using Activate Container Balancer from Cloudera Manager, it runs on the Storage Container Manager (SCM) host which is the Ratis leader. However, the link to the Full Log File under Role Log in the Cloudera Manager command window for the Activate Container Balancer command may not link to the leader SCM's logs.

1. Find the leader SCM. Using Cloudera Manager and SCM Web UI: Go to Clusters Ozone **Web UI** . Open any of the Storage Container Manager web UI. In the UI, search for SCM Roles (HA) in the Status section. The leader SCM's hostname is mentioned. Or using Terminal: Log in to any Ozone host and run `ozone admin scm roles`. Note the leader.
2. After finding the leader SCM, search in this leader host's logs for ContainerBalancer related logs.

OPSAPS-67373: Toggling the Enable Ozone S3 Multi-Tenancy feature configuration in the Cloudera Manager Ozone service configuration page affects more service roles than actually needed.

Enabling multi-tenancy only requires restarting the Ozone Managers.

CDPD-55513: Hive external table replication policy does not migrate Hive tables in HDFS storage to Ozone.

To replicate data from HDFS to Ozone, see [Migrating your data from HDFS to Ozone](#). You can use HMS Mirror to replicate the metadata.

OPSAPS-67757: Hive external tables in Ozone storage cannot be replicated using Hive external table replication policies.

To replicate the Hive external tables' data, consider using DistCp. To replicate the metadata of Hive external tables, consider using HMS Mirror.

Remove bucket recursively using `rb -f force` command from AWS S3 cannot work for FSO buckets.

Use the Ozone shell command `ozone sh bucket delete -r [***BUCKET ADDRESS***]`

CDPD-59126: Info log displays "noexec permission on /tmp/liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86" on client while executing command with noexec on /tmp.

To suppress Info log related to `liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86` library: Export `OZONE_OPTS` environment variable on the client terminal by running the command `export OZONE_OPTS="-Dorg.apache.ratis.thirdparty.io.netty.native.workdir=/var/tmp $OZONE_OPTS"`

OPSAPS-67650: Ozone uses RocksDB as a library to persist metadata locally.

By default, RocksDB places certain executables in `/tmp`, and thus encounters errors when `/tmp` is mounted with `noexec`.

The workaround is to configure RocksDB to put executables at another location. On a PhatCat node, the steps are:

1. Go to Cloudera Manager UI OZONE Configuration .
2. Find Ozone Service Environment Advanced Configuration Snippet (Safety Valve) and set the following environment variable: `ROCKSDB_SHARED_LIB_DIR=/VAR/TMP`

3. Restart Ozone.

CDPD-49137: Ozone Manager Kerberos token expires for SCM communication and OM does not log in again.

Sometimes, OM's Kerberos token is not updated and it stops to communicate with SCM. When this occurs, writes start failing.

Restart OM or set the safety valve `hadoop.kerberos.keytab.login.autorenewal.enabled = true`

CDPD-56684: Keys get deleted when you do not have permission on volume

When a volume is deleted, it recursively deletes the buckets and keys inside it and only then deletes the volume. The volume delete ACL check is done only in the end, due to which you may end up deleting all the data inside the volume without having delete permission on the volume.

Note: There was no bucket/key permission available which allowed the user to delete them recursively.

CDPD-50610: Large file uploads are slow with OPEN and stream data approach

Hue file browser uses the append operation for large files. This API is not supported by Ozone in 7.1.9 and therefore large file uploads can be slow or timeout from the browser.

Use native Ozone client to upload large files instead of the Hue file browser.

OPSAPS-64097: Ozone service restart failed at SCM

Stopping SCM service using Cloudera Manager can sometimes timeout and need a retry. The Cloudera Manager API waits for 90 seconds which is not sufficient under certain circumstances.

Retry the shutdown using Cloudera Manager if the SCM still shows as running after a refresh of the service status.

OPSAPS-66469: Ozone-site.xml is missing if the host does not contain HDFS roles

The client side `ozone-site.xml` (`/etc/hadoop/conf/ozone-site.xml`) is not generated by Cloudera Manager if the host does not have any HDFS role. Because of this, issuing Ozone commands from that host fails because it cannot find the service name to host name mapping. The error message is similar to this: `# ozone sh volume list o3://ozoneabc 23/03/06 18:46:15 WARN ha.OMProxyInfo: OzoneManager address ozoneabc:9862 for serviceID null remains unresolved for node ID null`. Check your `ozone-site.xml` file to ensure ozone manager addresses are configured properly.

Add the HDFS gateway role on that host.

OPSAPS-67607: Cloudera Manager FirstRun failure at the “Upload YARN MapReduce Framework JARs” step.

If this failure is attributed to the broken symbolic link, `/var/lib/hadoop-hdfs/ozone-filesystem-hadoop3.jar`, it is likely due to the presence of the user `hdfs` on the node prior to CDP parcel activation. As a result, the Cloudera Manager agent skips the initialization related to HDFS, leading to the non-creation of the `/var/lib/hadoop-hdfs` directory.

Create the directory `“/var/lib/hadoop-hdfs”` on all nodes followed by the deactivation and activation of the CDP parcel (deactivate and activate the Ozone parcel instead, in case Ozone parcel is used).

CDPD-50447: When SCM High Availability is enabled, each of the SCM web UIs report the host of the web UI as the leader of HA, and the other two as followers. This gives wrong information

Correct output is available by running the `ozone admin scm roles --service-id=<ID>` command.

OPSAPS-66501: Currently it is not possible to configure High Availability for SCM roles in Ozone post deployment. You should be able to change the HA configuration through Cloudera Manager, bringing it in line with other services.

At present it requires deleting Ozone and then adding it back with the SCM HA configuration in place and manually cleaning up the Ozone data in between. For more information, read the [KB article](#).

OPSAPS-66500: Currently, it is not possible to enable Kerberos in Ozone after it has been deployed, despite all the required configuration changes being created when the box is checked in the Ozone configurations in Cloudera Manager.

Ozone must be deleted and redeployed with Kerberos enabled. Due to OPSAPS-66499, this requires manual data cleanup in between. For more information, read the [KB article](#).

OPSAPS-66499: When you delete Ozone from a cluster using Cloudera Manager, Ozone data is not cleaned up. This may cause issues when Ozone is redeployed.

You must clean up the data manually. For more information, read the [KB article](#).

OPSAPS-62327: In an Ozone cluster without any gateway roles, Ozone is unable to deploy client configurations and displays the ConfigGenException error.

You must add the Ozone gateway roles to the cluster.

CDPD-49027: SCM certificates are not renewed automatically

The certificates that are there to ensure encrypted communication and authentication between Ozone internal services are not renewed automatically for Storage Container Managers.

Certificate revocation

Once these certificates expire, a manual re-bootstrap of the internal Ozone certificates is necessary.

To revoke a certificate, remove the full trust chain to stop trusting a compromised certificate. For this, remove the SCM certificates or any other certificates from the system. During the startup of the system, new certificates are created and distributed. The old certificates are not trusted anymore as the root CA certificate changes as well.

Procedure to force revoke internal certificates:

1. Stop Ozone service and all of its roles including SCMs
2. Include SCM's certs folders. Note that the Primordial SCM node has two certs folder, one for the root CA and other for the intermediate CA that the node holds. Rest of the SCMs have just one folder for the intermediate CA role that the node serves. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name certs; done`
3. Move these certs directories to a backup location
4. Locate the key material and move it to a backup folder. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name keys; done`
5. Move these keys directories to a backup location
6. The VERSION file of SCM has to be updated similarly to Ozone Manager's VERSION file. To locate both the SCM and OM VERSION files on the hosts, execute the following command: `find / -name om -o -name scm 2>/dev/null | while read line; do find $line -name VERSION; done | sort | uniq`
7. Backup the version file (just in case you need to restore for any reason)
8. In OM's VERSION file remove the line starting with omCertSerialId, in SCM's VERSION file remove the line starting with scmCertSerialId.
9. Start the stopped Ozone roles and certificates will be regenerated during startup.

CDPD-35632: The default block level checksum does not work when running distcp from HDFS to Ozone or the other way around, because the two file systems manage underlying blocks very differently.

Use a file level checksum instead. For example, append ``-Ddfs.checksum.combine.mode=COMPOSITE_CRC`` to the distcp command.

CDPD-43942: Requests to modify an Ozone S3 tenant may fail with the error "Timed out acquiring authorizer write lock. Another multi-tenancy request is in-progress." even if another request is not in progress.

Retry the request.

CDPD-36389: The configurations `datanodes.involved.max.percentage.per.iteration` and `size.moved.max.per.iteration` are meant to limit the max number of DataNodes that is involved and maximum size that can move in an iteration. This bug causes balancer to stop an iteration when it is two DataNodes or 1 Container size (5GB) away from hitting these limits. However, these DataNodes can again be considered for balancing in the next iteration. This means the cluster is balanced after enough iterations, albeit a bit slowly. This bug is apparent in small clusters of around four DataNodes where the DataNodes can be either the source or target for a lot of moves but the iteration gets stopped when three DataNodes have been involved. It takes a higher number of iterations to eventually balance this cluster. While this is a performance issue, it does not prevent balancer from ultimately balancing the cluster.

Increase the speed for balancing by decreasing the interval between each iteration using the configuration `balancing.iteration.interval`. The value of this configuration must be greater than `hdds.datanode.du.refresh.period`. `size.moved.max.per.iteration` can be increased to allow more data to move in one iteration.

CDPD-22519: HDFS user is unable to run Ozone SCM client CLI.

SCM client CLIs are run using SCM user.

CDPD-34187: This is an usability issue where warnings are displayed on the console while running Ozone fs/CLI commands, which restricts user experience. .

Instead of logging into the user console, you redirect these log messages to a file called `ozone-shell-log4j.properties` which should avoid warnings to the user. Ozone-shell commands used a similar method of directing messages to the LogFile.

CDPD-35141: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2> (state=08S01,code=40000) java.sql.SQLException: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2>. This issue does not occur if the source and target buckets are different in Hive queries. Currently, copying across the same bucket is only supported.

Avoid different buckets in source and target path. Ensure that `hive.exec.stagingdir` is unset or set to the same bucket as the warehouse so that staging directories are created in the same bucket as the warehouse.

CDPD-40594: Ozone admin container create command does not work. The command fails at getCAList for the SCM Client to create a container.

Avoid using the create container command

CDPD-40966: df command on Ozone returns incorrect result.

None

CDPD-41184: With Legacy buckets, FileSystem Optimised is not interoperating with the Ozone shell command. The cause is that the directory key entry in the DB KeyTable is stored as "dir1/" with trailing slash. But while performing the described operation, Ozone shell (o3://) is normalizing the given path and removing the trailing slash "/" from it. That results in KEY_NOT_FOUND exception.

There are three workarounds:

- Use FileSystem API to Delete the Directories rather than Shell-Command API.
- Use FSO buckets instead of Legacy Buckets. As in FSO, you can create Intermediate Directories and Delete Directories using the Ozone shell commands.
- Disable and set the configuration `ozone.om.enable.filesystem.pathsflag` to false in order to delete the directories. This is generally not a preferred workaround because the cluster must be restarted to pick up the new changes.

CDPD-34867: Container Balancer might not balance if only Over-Utilized or only Under-Utilized DataNodes are reported. The log line displays the "Container Balancer has identified x Over-Utilized and y Under-Utilized DataNodes that need to be balanced" message where one of x or y will be 0.

Decrease the threshold using "utilization.threshold". This allows the balancer to find non zero number of both over and under utilized nodes.

CDPD-12966: Ozone du -s -h should report correct values with replication information.

None

CDPD-12542: Mount of Ozone filesystem with the help of FUSE fails.

None

CDPD-31910: In a non-Ranger deployment, the owner/group are shown based on Kerberos user or sudo user.

For correct owner/group, user needs a Ranger deployment.

CDPD-42691: During the upgrade - all pipelines will be closed when the upgrade is finalized on SCM, temporarily bringing the cluster to a read-only state.

When you execute the finalize command, the cluster will temporarily go into a read-only state.

CDPD-42945: When many EC buckets are created with different EC chunk sizes, it creates pipeline for each chunk size. As a result, large number of pipelines are created in the system.

None

OPSAPS-60721: Ozone SCM Primordial Node ID is a required field which needs to be specified with one of the SCM hostnames during Ozone HA installation. In Cloudera Manager this field is not mandatory during Ozone deployment. This can cause end users to continue further with installation which causes startup to fail in Ozone services.

During Ozone HA installation make sure that Ozone SCM Primordial Node ID is specified with one of the SCM hostname.

HDDS-4209: S3A Filesystem does not work with Ozone S3 in file system compact mode. When you create a directory, the S3A filesystem creates an empty file. When the ozone.om.enable.filesystem.paths parameter is enabled, the `hdfs dfs -mkdir -p s3a://b12345/d11/d12` command runs successfully. However, running the `hdfs dfs -put /tmp/file1 s3a://b12345/d11/d12/file1` command fails with an error: `ERROR org.apache.hadoop.ozone.om.request.key.OMKeyCreateRequest: Key creation failed`.

The HDDS-4209 Jira fixes the file system semantics and management in Ozone. On top of the flat name structure, which is Pure Object store, as a workaround the Hierarchical namespace structure is added. This ensures S3A compatibility with Ozone.

CDPD-42897: EC writes are failing with "No enough datanodes to choose" after EC replication config is set globally.

EC writes start failing when large number of pipelines are created as a result of multiple EC configs with different chunk sizes used to write keys.

If standard EC configs (that is., rs-3-2-1024k) are used to write keys, number of pipelines created per DataNode is limited to five and this issue is not seen with standard EC configs.

The recommendation is not to create too many random chunk sizes. It is configurable because, users can decide based on their workload. But do not to have separate chunk sizes for each file.

CDPD-41539: The "No such file or directory" message is displayed when EC file is read using older ofs client.

You must upgrade the client before trying to read the key: `vol1/ecbuck1/1GB_ec`.

CDPD-40560: Filesystem Operations using Hadoop S3a connector on a FILE_SYSTEM_OPTIMIZED bucket fails. `org.apache.hadoop.ozone.om.exceptions.OMException: Unable to get file status: volume: s3v bucket: fso key: test/`

Do not run Hadoop S3a commands on a FILE_SYSTEM_OPTIMIZED bucket. Use OBJECT_STORE bucket layouts.

CDPD-42832: With this issue, any long running setup or a production server results in data corruption due to inconsistency issues. This may result in major issues with the existing Legacy layout type.

FSO provides atomicity and consistency guarantees for the path (dir or file) rename/delete operations irrespective of the large sub-dirs/files contained in it. These capabilities help to make

the long running test more consistent without any failures so far. Recommendation is to run bigdata HCFS workloads using the FSO bucket layout types.

CDPD-43432: Ozone Service in fault state in DataNode - Long Running setup.

Upgrade RocksDB to the latest version.

OPSAPS-63999: In the newly installed cluster, the Finish upgrade option is clickable.

None

OPSAPS-64648: Failed to start Ozone node using Cloudera Manager if default log path /var/log/hadoop-ozone does not exist. If this path does not exist, any Ozone nodes(for example SCM or DataNode) restart will fail.

Run the following command `sudo -u hdfs mkdir -p /var/log/hadoop-ozone` or replace hdfs with the user Ozone roles that are running.

CDPD-45932: Investigate impersonation with "is admin" in Ozone WebUIs /logLevel servlet endpoint

In a secure Kerberized cluster, due to an impersonation issue, changing log levels using Knox on the corresponding endpoint of the WebUI does not work. Note that this is only true, when the WebUI is accessed using Knox. Other means of changing log levels in Ozone services are not affected by this problem.

None.

Known Issues in Ranger

Learn about the known issues in Ranger, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

Access issues with users having similar name as admin or keyadmin users

Users with USER role that have a similar name as admin or keyadmin users are able to query those admin and keyadmin users.

None.

UnsupportedClassVersionError

JDK 8 deployments support Nashorn JavaScript engine, which is built-in and fully compatible, whereas JDK 17 deployments support GraalJS script engine due to unavailability of Nashorn.

When your cluster supports both JDK 8 and JDK 17, then while a Java application, running on JDK 8, uses generic interfaces like ScriptEngine (from the javax.script package), the ScriptEngineManager class scans the classpath for available script engine implementations through the service provider mechanism, and detects the GraalJS as a provider for JavaScript, because in this case the GraalJS library (version 22.3.0) is also included on the classpath. The ScriptEngineManager then attempts to instantiate it, when requesting a "js" or "javascript" engine, and triggers an UnsupportedClassVersionError.

Remove the GraalJS library from the classpath.

CDPD-68806: The Revoke operation for users belonging to a group or role permission does not function as expected.

List command is listing all the tables even when the user permission is revoked. And also the command does not add any deny policy to Ranger for that specific user.

For example:

user_1 is the part of group_1

user_2 is the part of role_1

Create a Ranger policy for group_1 and role_1 to access all the resources in HBase.

Try to revoke the permission for user_1 and user_2 using HBase shell global revoke command:

```
revoke 'user_1'
```

```
revoke 'user_2'
```

But there is no deny policy added for that user. And access is still granted to user_1 and user_2.

This behavior is currently not supported in HBase shell. Must be handled manually using the Ranger policy change.

CDPD-68739: The revoke command does not work when using the HBase shell

While using the HBase shell, running the revoke command does not cancel the user permission. Users are able to perform actions even after running the revoke command.

For example:

When a user is granted permission to a particular table using the HBase grant command.

```
hbase:003:0> grant 'user_1', 'RWCA', 'some_abc_table'
```

And then execute the global revoke command for that user:

```
hbase:005:0> revoke 'user_1'
```

Permission for that user 'user_1' for the table 'some_abc_table' not got revoked.

None.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-58860: After upgrading CDP-7.1.8 to CDP-7.1.9, cdp-proxy token missing from Knox-Ranger policy.

As part of [OPSAPS-67480](#) in 719 default ranger policy is added from cdp-proxy-token topology, so that after a new installation of CDP-7.1.9, the Knox-Ranger policy includes cdp-proxy-token. However, upgrades do not add cdp-proxy-token to cm_knox policies automatically.

Manually add cdp-proxy-token to the Knox policy, using Ranger Admin Web UI.

1. Log in to Cloudera Manager Ranger Admin Web UI, as a Ranger administrator.
2. On Ranger Admin Web UI Service Manager Resource Knox, click cm_knox.
3. In Knox Policies, open the CDP Proxy UI, API and Token policy.
4. In Knox Topology*, add cdp-proxy-token.
5. Click Save.
6. Restart Ranger.

CDPD-58704: Hadoop roll key / key delete command shows operation failed error when one KMS host is down, even when operation succeeds

In case of rollover/delete, client sends one more (last after delete request) request to KMS instances to clean their cache and that too to all registered KMS instances. If one KMS instance is stopped (not deleted), client gets runtime exception.

This simply returns the runtime exception on client end for stopped instances but doesn't break any functionality.

CDPD-56803: When there is no existing policy for user and a revoke request comes from HBase, then will get this error.

```
hbase:001:0> revoke 'hrt_11'
ERROR: org.apache.hadoop.hbase.coprocessor.CoprocessorException: HTTP 400 Error: processSecureRevokeRequest processing failed
```

```

ativeMethodAccessorImp

```

This exception is logged, since mandatory JWT auth filter configs are not provided (expected for some environments like y-cloud) Even though JWT auth filter is failed to initialised, it falls back to kerberos auth, hence no impact from auth perspective

NA

CDPD-56738: Ranger RMS showing FileNotFoundException: /usr/share/java/oraclepki.jar in Oracle 19 setup

This is a warning log printed in catalina.out file when Ranger RMS server is initialised. Following exception is observed only in Oracle 19 setup. FileNotFoundException: /usr/share/java/oraclepki.jar
NA

CDPD-48975: Ranger KMS KTS to KMS DB migration : keys with the same name but different case are not migrated

KMS keys are not case sensitive

No workarounds. Such keys combination are very rare and migration doc was updated to check such keys before starting the migration.

CDPD-42598: Kafka policy creation allowed with incorrect permissions.

When creating a Kafka policy from the UI, the permissions "Idempotent write" and "Cluster action" are not displayed as they are not applicable for the "topic" resource, but when creating a policy for the "topic" resource with the permissions "Idempotent write" and "Cluster Action", the policy is created successfully when the expected behaviour is that the policy creation must fail as the permission is not applicable for the Kafka topic resource

None.

CDPD-41582: Atlas Resource Lookup : Classification for "entity-type" lists only classification for the following payload:

```
{"resourceName": "classification", "userInput": "", "resources":  {"classification": []}}
```

expectation is to return all the classifications . But the response has only "classification" Happens similarly for entity-label , entity-business-metadata.

None.

CDPD-40734: User allowed to insert data into a hive table when there is a deny policy on a table column.

A user is allowed to enter data into a table even if there is a deny policy present on one of the table columns.

Test scenario details:

```
Policy setup :-
  policy 1 :- all access policy for hrt_qa, hive and impala
  users
    resources - database - * , table - *, column - *
    users : hrt_qa, hive, impala
    access - all access allowed
  policy 2 :- policy on test_1.table_1 for hrt_5
  users : hrt_5
    resources : database - test_1, table - table_1, column - *
    access :- all access allowed
  policy 3 :- deny policy on test_1.table_1.c0 for hrt_5
  users : hrt_5
    resources : database - test_1, table - table_1, column -
c0
    access - all access denied
  data setup :-
    database - test_1
    table - table_1(c0 int, c1 int)
```

The user is able to insert data into the table.

None.

Known Issues in Schema Registry

Learn about the known issues in Schema Registry, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-40380: Authorization checking issue when Kerberos is disabled

Due to an issue in Ranger, when Kerberos is disabled then it is not possible to check authorization.

1. Open Schema Registry configuration in Cloudera Manager.
2. Find the `ranger.plugin.schema-registry.service.name` field.
3. Replace `GENERATED_RANGER_SERVICE_NAME` with the actual name of the service.
4. Restart the Schema Registry service.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

CDPD-59015: Schema Registry does not create new versions of schemas even if the schema is changed

Schema Registry uses a schema fingerprinting mechanism to differentiate between schemas. However, fingerprinting does not take into consideration the schema attributes of the field type. As a result, if you have two schemas where the only difference is that one has type attributes defined and the other does not, they will be considered identical by Schema Registry. For example, the following schemas are considered identical:

```
#Schema V1
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "local_timestamp_micros_long", "type": "long"}]}

#Schema V2
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "local_timestamp_micros_long", "type": {"type": "long", "logicalType": "local-timestamp-micros"}}]}
```

Notice that the only difference is that in the second schema, the `local_timestamp_micros_long` field has a logical type specified. In cases like this, the new version of the schema is not created, the initial version is used. This is true even if the data that is being produced has a new schema version. The ID of the first schema version is used and is put in the serialized record. The new schema version is not created.

This issue is common when using change data capture (CDC) connectors like the Debezium connectors. This is because CDC connectors create schemas with the logical type decimal based on the column type in the database schema. For example:

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 0}}]}
```

If the database schema changes (for example, the column type), it is possible that only scale changes, which is a schema attribute.

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 1}}]}
```

In this case, even though scale changed to 1, the first version of the schema is used where scale is 0. As a result, the data is consumed with the wrong scale.

Avoid using logical types or other attributes. Alternatively, ensure that there are no changes in the logical types or other attributes between schema versions.

OPSAPS-68708: Schema Registry might fail to start if a load balancer address is specified in Ranger

Schema Registry does not start if the address specified in the Load Balancer Address Ranger property does not end with a trailing slash (/).

Set the value of the RANGER_REST_URL Schema Registry environment variable to an address that includes a trailing slash.

1. In Cloudera Manager, select the Schema Registry service.
2. Go to Configuration.
3. Find the Schema Registry Server Environment Advanced Configuration Snippet (Safety Valve) property and add the following:

```
Key: RANGER_REST_URL
Value: [***RANGER REST API URL***]
```

Replace [***RANGER REST API URL***] with an address that can be used by Schema Registry to access Ranger. Ensure that the address ends with a trailing slash. For example: `https://ranger-1.cloudera.com:6182/`

4. Restart the Schema Registry service.

OPSAPS-70971: Schema Registry does not have permissions to use Atlas after an upgrade

Following an upgrade, Schema Registry might not have the required permissions in Ranger to access Atlas. As a result, Schema Registry's integration with Atlas might not function in secure clusters where Ranger authorization is enabled.

1. Access the Ranger Console (Ranger Admin web UI).
2. Click the cm_atlas resource-based service.
3. Add the schemaregistry user to the all - * policies.
4. Click Manage Service Edit Service .
5. Add the schemaregistry user to the default.policy.users property.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Known Issues in Spark

Learn about the known issues in Spark the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14**CDPD-94393: RuntimeWarning Failed to add file" message appears even when Spark successfully loads files**

In both Spark 2 and 3, due to an exception when attempting to add files to the Python path, the RuntimeWarning: Failed to add file message appears even when the Python JAR file is successfully loaded.

None. You can safely ignore the message as the file is loaded successfully and the message does not affect job completion.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-67517: Spark3 tests are failing if /tmp is mounted as NOEXEC.

Map the tmpdir to a writable path in spark3-conf/spark-defaults.conf using the following steps:

1. Go to the Cloudera Manager.
2. Go to the Spark service.
3. Click the Configuration tab.
4. Select Scope Gateway .
5. Select Category Advanced .
6. Locate the Spark Client Advanced Configuration Snippet (Safety Valve) for spark3-conf/spark-defaults.conf_client_config_safety_valve property.
7. Map the tmpdir to a writable path:

```
spark.driver.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
spark.executor.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
```

8. Enter a Reason for change, and then click Save Changes to commit the changes.
9. Deploy the client configuration.

CDPD-23817: In the upgraded Cluster, the permission of /tmp/spark is restricted due to the HDP configuration hive.exec.scratchdir=/tmp/spark.

If you are using the /tmp/spark directory in the CDP cluster, you must provide the required additional Policies/ACL permissions.

CDPD-22670 and CDPD-23103: There are two configurations in Spark, "Atlas dependency" and "spark_lineage_enabled", which are conflicted. The issue is when Atlas dependency is turned off but spark_lineage_enabled is turned on.

Run Spark application, Spark will log some error message and cannot continue. That can be restored by correcting the configurations and restarting Spark component with distributing client configurations.

CDPD-23007: Mismatch in the Spark Default DB Location. In HDP 3.1.5, hive_db entities have one attribute - 'location' which is configured to the '/managed' path. In fresh install of CDP 7.1.7, hive_db entities now have 2 attributes 'location' configured to '/external' path and 'managedLocation' configured to '/managed' path. In the AM2CM migration (HDP 3.1.5 -> CDP 7.1.7), the 'location' attribute from hive_db entities in HDP 3.1.5 comes unaltered to CDP 7.1.7 and hence maps to '/managed' path.

This issue arises only if you are upgrading from HDP 3.1.5 to CDP 7.1.7. If you are performing a fresh install of CDP 7.1.7, you can ignore this issue.

None

CDPD-217: The Apache Spark connector is not supported

The old *Apache Spark - Apache HBase Connector* (shc) is not supported in CDP releases.

Use the new HBase-Spark connector shipped in CDP release.

CDPD-3038: Launching pyspark displays several HiveConf warning messages

When pyspark starts, several Hive configuration warning messages are displayed, similar to the following:

```
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of name hive.meta
store.runworker.in does not exist
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of
name hive.masking.algo does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of
name hive.metastore.runworker.in does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of na
me hive.masking.algo does not exist
```

These errors can be safely ignored.

Known Issues in Sqoop

Learn about the known issues in Sqoop, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-54770: Unable to read Sqoop metastore created by an older HSQLDB version

If you have upgraded to CDP PvC Base 7.1.8 Cumulative hotfix 4 or higher versions, you may encounter issues in reading the Sqoop metastore that was created using an older version of HyperSQL Database (HSQLDB).

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

After upgrading to CDP PvC Base 7.1.8 Cumulative hotfix 4, you must upgrade the Sqoop metastore and convert the database files to a format that can easily be read by HSQLDB 2.7.1. For more information, see [Troubleshooting Apache Sqoop issues](#).

CDPD-44431: Using direct mode causes problems

Using direct mode has several drawbacks:

- Imports can cause an intermittent and overlapping input split.
- Imports can generate duplicate data.
- Many problems, such as intermittent failures, can occur.
- Additional configuration is required.

Stop using direct mode. Do not use the `--direct` option in Sqoop import or export commands.

Sqoop direct mode is disabled by default. However, if you still want to use it, enable it by either setting the `sqoop.enable.deprecated.direct` property globally in Cloudera Manager for Sqoop or by specifying it in the command-line through `-Dsqoop.enable.deprecated.direct=true`.

CDPD-3089: Avro, S3, and HCat do not work together properly

Importing an Avro file into S3 with HCat fails with Delegation Token not available.

Parquet columns inadvertently renamed

Column names that start with a number are renamed when you use the `--as-parquetfile` option to import data.

Prepend column names in Parquet tables with one or more letters or underscore characters.

PARQUET-99: Importing Parquet files might cause out-of-memory (OOM) errors

Importing multiple megabytes per row before initial-page-run check (ColumnWriter) can cause OOM. Also, rows that vary significantly by size so that the next-page-size check is based on small rows, and is set very high, followed by many large rows can also cause OOM.

Known Issues in Streams Messaging Manager

Learn about the known issues in Streams Messaging Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

OPSAPS-59597: SMM UI logs are not supported by Cloudera Manager

Cloudera Manager does not display a Log Files menu for SMM UI role (and SMM UI logs cannot be displayed in the Cloudera Manager UI) because the logging type used by SMM UI is not supported by Cloudera Manager.

View the SMM UI logs on the host.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker). Add the bootstrap server details in SMM safety valve in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Add the following value for bootstrap servers>Save Changes > Restart SMM.

```
streams.messaging.manager.kafka.bootstrap.servers=<comma-separated list of brokers>
```

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the `hadoop.auth` cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the `www-authenticate: Negotiate` header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at `Clusters SMM Streams Messaging Manager Web UI` and log in using the Kerberos username and password.

CDPD-82560: Streams Messaging Manager known unprotected endpoint

The Streams Messaging Manager Frontend exposes the `/cm-configs` and `/configs` public endpoints without requiring authentication. These endpoints do not share any sensitive information.

None.

CDPD-88488: The Streams Messaging Manager server fails to start if its keystore password starts with a special character or includes quotation marks

Ensure that the Streams Messaging Manager server keystore password meets the following requirements:

- It does not start with a special character. Special characters are permitted in other positions.
- It does not contain quotation marks (single or double) anywhere.

CDPD-76375: Topic column name is incorrect in the replications table

On the **Cluster Replications** page, in the replications table, the topic column name is incorrectly named **Source Topic Name** instead of Target Topic Name. This means that the **Source Topic Name** column currently shows the topic name on the target cluster, instead of the topic name on the source cluster.

Limitations

CDPD-36422: 1MB flow.snapshot freezes Safari

While importing large connector configurations, flow.snapshots reduces the usability of the Streams Messaging Manager when using Safari browser.

Use a different browser (Chrome/Firefox/Edge).

Known Issues in Streams Replication Manager

Learn about the known issues in Streams Replication Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-22089: SRM does not sync re-created source topics until the offsets have caught up with target topic

Messages written to topics that were deleted and re-created are not replicated until the source topic reaches the same offset as the target topic. For example, if at the time of deletion and re-creation there are a 100 messages on the source and target clusters, new messages will only get replicated once the re-created source topic has 100 messages. This leads to messages being lost.

None

CDPD-11079: Blacklisted topics appear in the list of replicated topics

If a topic was originally replicated but was later excluded for replication, it will still appear as a replicated topic under the /remote-topics REST API endpoint. As a result, if a call is made to this endpoint, this topic will be included in the response. Additionally, the excluded topic will also be visible in the SMM UI. However, its Partitions and Consumer Groups will be 0, its Throughput, Replication Latency and Checkpoint Latency will show N/A.

None

CDPD-30275: SRM may automatically re-create deleted topics on target clusters

If auto.create.topics.enable is enabled, deleted topics might get automatically re-created on target clusters. This is a timing issue. It only occurs if remote topics are deleted while the replication of the topic is still ongoing.

1. Remove the topic from the topic allowlist with srm-control. For example:

```
srm-control topics --source [SOURCE_CLUSTER] --target [TARGET_CLUSTER] --remove [TOPIC1]
```

2. Wait until SRM is no longer replicating the topic.
3. Delete the remote topic in the target cluster.

Limitations

SRM cannot replicate Ranger authorization policies to or from Kafka clusters

Due to a limitation in the Kafka-Ranger plugin, SRM cannot replicate Ranger policies to or from clusters that are configured to use Ranger for authorization. If you are using SRM to replicate data to or from a cluster that uses Ranger, disable authorization policy synchronization in SRM. This can be achieved by clearing the Sync Topic Acls Enabled (sync.topic.acls.enabled) checkbox.

SRM cannot ensure the exactly-once semantics of transactional source topics

SRM data replication uses at-least-once guarantees, and as a result cannot ensure the exactly-once semantics (EOS) of transactional topics in the backup/target cluster.

Note: Even though EOS is not guaranteed, you can still replicate the data of a transactional source, but you must set isolation.level to read_committed for SRM's internal consumers. This can be done by adding `[***SOURCE CLUSTER ALIAS***]->[***TARGET CLUSTER ALIAS***].consumer.isolation.level=read_committed` to the Streams Replication Manager's Replication Configs SRM service property in Cloudera Manager. The isolation.level property can be set on a global connector or replication level. For example:

```
#Global connector level
connectors.consumer.isolation.level
=read_committed
#Replication level
uswest->useast.consumer.isolation.l
evel=read_committed
```

SRM checkpointing is not supported for transactional source topics

SRM does not correctly translate checkpoints (committed consumer group offsets) for transactional topics. Checkpointing assumes that the offset mapping function is always increasing, but with transactional source topics this is violated. Transactional topics have control messages in them, which take up an offset in the log, but they are never returned on the consumer API. This causes the mappings to decrease, causing issues in the checkpointing feature. As a result of this limitation, failover operations for transactional topics is not possible.

Known Issues in YARN and YARN Queue Manager

Learn about the known issues in YARN and YARN Queue Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

COMPX-14820: Delete Queue and its Children throws "Queue capacity was reduced to zero, but failed to delete queue."

When trying to perform the operation "Delete Queue and its Children" on a queue that has one or more siblings, the operation fails as YARN has some constraints. If the queue performing the operation "Delete Queue and its Children" is a leaf node, then the operations succeeds.

None.

COMPX-4644: Queue capacity rounding problem when configuration is initially set via YARN

When setting the capacity scheduler configuration through the YARN/Cloudera Manager configuration, there may be capacity values that use multiple decimal places. This results in rounding/floating point precision discrepancies in the UI when trying to validate that all sibling capacities equal 100%. The UI looks like all the numbers add up to 100, but the validation still displays an error and does not allow to save the capacities. It is also observed that the capacity is being calculated as, for example, 99.9999999991 in the backend.

- Create queues within the UI, or

- Ensure that capacities configured through the Capacity Scheduler safety valve do not have more than one decimal place.

20202 Database migration after enabling opt-in migration

When migrating from an H2 database to a PostgreSQL database in YARN Queue Manager after installation or upgrade, you might encounter an issue only when you have followed the following specific scenario:

- New install or upgrade to CDP 7.1.9, forcing migration from H2 to PostgreSQL database.
- Upgrade to CDP 7.1.9 CHF2, moving back to H2 database.
- Upgrade to CDP 7.1.9 SP1 with valid PostgreSQL connection details in Queue Manager configurations.

To avoid any issues during the upgrade to version CDP 7.1.9 SP1, ensure that PostgreSQL connection details are removed from the YARN database configuration if you prefer to continue using the H2 database.

CDPD-56559: MapReduce jobs can intermittently fail during a rolling upgrade.

During a rolling upgrade between CDP versions 7.1.8 and 7.1.9, MapReduce jobs may fail with message, `RuntimeException: native snappy library not available`. Although the native Snappy compression library is not loaded, a checkmark displays to indicate that the Snappy compression library is loading for NodeManagers that are pending upgrades. This causes the MapReduce jobs that are associated with the NodeManagers to fail. After the upgrade, the jobs work as expected. This issue only impacts rolling upgrades from before CDP 7.1.9 to a higher version.

None.

COMPX-12021 Queue Manager configurations on Scheduler Configuration page are not working

When setting the following properties on the YARN Queue Manager UI, the properties are set in the `capacity-scheduler.xml` file which does not have any effect on YARN. The properties need to be set in the `yarn-site.xml` file, which does not happen when you set them through YARN Queue Manager.

- "Maximum Application Priority" – `"yarn.cluster.max-application-priority"`
- "Enable Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.enable"`
- "Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.policies"`

Note: You can also set this property on the YARN configuration page in Cloudera Manager as "Capacity Scheduler Preemption".

- "Preemption: Observe Only" – `"yarn.resourcemanager.monitor.capacity.preemption.observe_only"`
- "Preemption: Monitoring Interval (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.monitoring_interval"`
- "Preemption: Maximum Wait Before Kill (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.max_wait_before_kill"`
- "Preemption: Total Resources Per Round" – `"yarn.resourcemanager.monitor.capacity.preemption.total_preemption_per_round"`
- "Preemption: Over Capacity Tolerance" – `"yarn.resourcemanager.monitor.capacity.preemption.max_ignored_over_capacity"`
- "Preemption: Maximum Termination Factor" – `"yarn.resourcemanager.monitor.capacity.preemption.natural_termination_factor"`
- "Enable Intra Queue Preemption" – `"yarn.resourcemanager.monitor.capacity.preemption.intra-queue-preemption.enabled"`

1. In Cloudera Manager, select the YARN service.
2. Click the Configuration tab.
3. Search for `yarn-site.xml`.
4. Under YARN Service Advanced Configuration Snippet (Safety Valve) for `yarn-site.xml`, add the corresponding parameter and value you need.

5. Click Save Changes.
6. Restart the YARN services.

COMPX-13177: QueueManager webapp requests fail with 'HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA'

Products:

- Cloudera Manager for CDP Private
- Cloud Base Cloudera Manager for CDP Public Cloud

Context:

- Centos 7.8 and Redhat 7.8 operating systems, when FIPS support is enabled.

Problem:

- When attempting to display the Yarn Queue Manager interface, Cloudera Manager displays an error: "HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA".
1. Edit the file [/etc/default/cloudera-scm-server]
 2. Around line 28, modify the line that starts with

```
#export CMF_OVERRIDE_TLS_CIPHERS=...
```

3. Remove the comment mark #.
4. Remove all ciphers with "3DES" in the name.
5. Save the file.
6. Restart the Cloudera Manager Server service.

Third-party applications do not launch if MapReduce framework path is not included in the client configuration

MapReduce application framework is loaded from HDFS instead of being present on the NodeManagers. By default the `mapreduce.application.framework.path` property is set to the appropriate value, but third-party applications with their own configurations does not launch.

Set the `mapreduce.application.framework.path` property to the appropriate configuration for third-party applications.

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated the `mapred-site.xml` file that references the correct JobHistory Server.

YARN cannot start if Kerberos principal name is changed

If the Kerberos principal name is changed in Cloudera Manager after launch, YARN does not start. In such cases, the keytabs can be correctly generated but YARN cannot access ZooKeeper with the new Kerberos principal name and old ACLs.

There are two possible workarounds:

- Delete the `znode` and restart the YARN service.
- Use the `reset ZK ACLs` command. This also sets the `znodes` below `/rmstore/ZKRMStateRoot` to `world:anyone:cdw` which is less secure.

Queue Manager does not open on using a custom user with a default Kerberos principal

If a custom user is used with the default Kerberos principal, the Queue Manager web UI displays an HTTP ERROR 400 error.

Ensure that the Queue Manager process_username property matches the YARN process_username property.

Known Issues in Zeppelin

Learn about the known issues in Zeppelin the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 14.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 14

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 14

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

BUG-125263: Zeppelin service move fails on clusters upgraded from HDP3.1.5

Resolve the circular symlink issue on the Zeppelin node by linking the conf directory to a new directory under /etc/zeppelin:

- # mkdir -p /etc/zeppelin/<version>/0
- # rm /usr/hdp/<version>/zeppelin/conf
- # ln -s /etc/zeppelin/<version>/0 /usr/hdp/<version>/zeppelin/conf

Where version is the HDP version. For example, 7.1.x-yyy. Restart the Zeppelin server in Ambari.

CDPD-3090: Due to a configuration typo, functionality involving notebook repositories does not work

Due to a missing closing brace, access to the notebook repositories API is blocked by default.

From the CDP Management Console, go to Cloudera Manager for the cluster running Zeppelin. On the Zeppelin configuration page (Zeppelin serviceConfiguration), enter shiro urls in the Search field, and then add the missing closing brace to the notebook-repositories URL, as follows:

```
/api/notebook-repositories/** = authc, roles[{{zeppelin_admin_group}}]
```

Click Save Changes, and restart the Zeppelin service.

CDPD-2406: Logout button does not work

Clicking the Logout button in the Zeppelin UI logs you out, but then immediately logs you back in using SSO.

Close the browser.

OPSAPS-59802: Zeppelin and Livy roles should be co-located on the same host.

When installing or upgrading to CDP Private Cloud Base, you must co-locate all Zeppelin and Livy roles on the same cluster host due to an issue with certificate generation.

Fixed issues in 7.1.9 SP1 CHF 13

Know more about the list of fixes that are shipped for CDP Private Cloud Base version 7.1.9 SP1 CHF 13.

Note: Contact Cloudera Support for questions related to any specific hotfixes. The version and build identifier for this CDH Parcel is 7.1.9-1.cdh7.1.9.p1066.73837803.

CDPD-64874: Intermittent failure in TestOzoneRpcClientAbstract.testListSnapshot

The `ListSnapshot` API uses the `org.apache.hadoop.ozone.om.ListIterator.MinHeapIterator` static class, which internally uses the `CacheIterator` and `DBIterator` objects. The `DBIterator` object checks if the rocks DB key is present in the cache in the `org.apache.hadoop.ozone.om.ListIterator.DbTableIter#getNextKey` method. Previously, this check accessed the cache from the table cache, which could be intermittently flushed, causing the addition of duplicate entries in the `org.apache.hadoop.ozone.om.ListIterator.MinHeapIterator` static class. This issue is now fixed and you must use the preloaded keys in the `org.apache.hadoop.ozone.om.ListIterator.CacheIter#cacheKeyMap` method within the `org.apache.hadoop.ozone.om.ListIterator.CacheIter` static class.

Apache Jira: [HDDS-9967](#)

CDPD-69064: DataNode volume DU reserved percentage should have a non-zero default value

Previously, the `hdds.datanode.dir.du.reserved.percent` `DataNode` configuration default value was zero. This issue is fixed now and the default value is 0.0001, which means that the reserved percentage is 0.01%. As a result, for each `DataNode` volume being used by Ozone, the available volume capacity for Ozone is calculated by `real capacity volume - (real capacity of the volume * 0.0001)`, ensuring that 0.01% of the volume is preserved for non-Ozone use.

Apache Jira: [HDDS-10720](#)

CDPD-90382: FSO to FSO replication failing for snapshot diff issue

Previously, FSO to FSO bucket replication using Replication Manager failed if the ozone sh snapshotdiff report between the current and previous snapshot contained more than 1000 entries. This was because Replication Manager could not parse the additional newline at the end of each page in the paginated response. This issue is now fixed by removing the additional newline at the end of every page in snapshotdiff output.

CDPD-92017: Set ozone.om.group.rights configuration default value to ALL

Previously, the `ozone.om.group.rights` configuration value `READ, LIST` could not be processed by lower version Ozone. This issue is now fixed by setting the default value of the `ozone.om.group.rights` configuration to `ALL`.

CDPD-87831: Avoid scheduling replications on full DataNodes by tracking pending operation size in SCM

Previously, Storage Container Manager (SCM) scheduled replication commands to fix under-replication or misreplication for container moves, decommissioning, and other operations for both Ratis and EC containers. SCM checked whether a target `DataNode` had space equal to twice the `containerSize` value before selecting it as the target node for container replication. However, SCM did not track pending operation size of scheduled. Consequently, SCM could over-schedule replications to a target `DataNode` that did not have enough space. This issue is now fixed.

Apache Jira: [HDDS-13437](#)

CDPD-80178: Missing check for space availability for all DNS while container creation is in pipeline

Previously, if the leader node in pipeline did not have capacity to create a new container, it might have returned a container creation failure. If the follower node did not have the capacity to create new container, it might have failed and kept trying for another follower node to be successful. This could cause the disk to fill up with parallel write blocks through a state machine, and slowed down the write capability and failure response. This issue is now fixed by checking whether a `DataNode` has enough space for a new container before allocating a new container to that `DataNode`. This improves write performance and reduces container creation failure in scenarios when `DataNodes` have less than 5GB disk space remaining.

Apache Jira: [HDDS-12468](#)

CDPD-80031: Missing latency metrics in Ozone Manager for deletion services

Previously, no metrics were available in Ozone Manager to measure how long each iteration of the deletion services were taking. This issue is now fixed and latency metrics for key deletion services of Ozone Manager are available now.

Apache Jira: [HDDS-12442](#)

CDPD-85199: Upgraded jackson-core to 2.15.0

The jackson-core version of the Jackson Data Processor for Phoenix Query Server (PQS) and OMID is upgraded to 2.15.0 due to CVE-2025-49128 and CVE-2025-52999.

CDPD-76594: Impala Iceberg table creation fails in Hue

Previously, creating Iceberg tables in Impala using the Hue importer failed. This issue is now resolved, by allowing seamless table creation.

CDPD-78292: Hue defunct gunicorn worker processes

On Ubuntu 22, when using Oracle Database, `rungunicornserver` worker processes might have accumulated due to incomplete process termination and stale database connections. This resulted in a cluttered process table but did not critically impact service functionality. This issue is now resolved.

CDPD-90930: Hue Metadata front end cache not functioning correctly

Previously, the metadata front end cache was not applied as expected, resulting in slower page load times and degraded responsiveness. This issue is now resolved, and metadata is properly cached, improving UI performance and overall user experience.

CDPD-89886: FileUtils.isOwnerOfFileHierarchy does not have the recurse parameter

This patch resolves performance degradation in `add_partition` API calls to the Hive Metastore (HMS). The latency of the `add_partition` calls increases significantly with the number of folders and files in HDFS. You can optimize performance by using the existing `xasecure.hive.ur i.permission.coarse.check` configuration parameter. Setting this value to true prevents recursive permission checks on the parent folder.

CDPD-89263: Enhanced file extension controls for Hue file management

Previously, Hue allowed only the control of allowed and restricted file type extensions for Hue file uploads.

This issue is now fixed by Hue allowing to control both allowed and restricted file type extensions for Hue file uploads and create and rename the file. This improves flexibility and enhances the overall user experience.

For more information, see [Managing file extensions for Hue uploads](#).

CDPD-87409: Duplicate compaction processing by multiple HiveServer2 threads

Multiple HiveServer2 Compactor Worker threads could process the same minor compaction simultaneously. This created duplicate delta directories in HDFS and caused subsequent table operations to fail with an `IllegalStateException` error.

This issue is now resolved by implementing a synchronization mechanism. The compaction worker now locks the compaction ID in the metadata store before starting, ensuring that only one thread processes a compaction at a time.

CDPD-91034: MariaDB falls back to MySQL in Hive

Hive downstream had errors in supporting MariaDB.

The issue is now fixed by making MariaDB automatically fall back to MySQL.

CDPD-92487: Impala compatibility with OpenSSL 3.2 on RHEL 9.5

Impala experienced widespread failures, including numerous test failures and cluster hangs, after RHEL/Rocky 9.5 updated its OpenSSL version from 3.0.2 to 3.2.x. This OpenSSL rebase broke two core areas in Impala, affecting both AES-GCM encryption and SSL connection handling.

The issue is now resolved by correcting the OpenSSL call sequence for AES-GCM encryption (IMPALA-13592). The Initialization Vector (IV) length is now set before the IV value, ensuring that encryption works properly with OpenSSL 3.2 and by avoiding the unnecessary flush() call when the TSSLSocket transport is closing after an SSL handshake error (IMPALA-13680). This prevents the indefinite hang and ensures that failed connections are correctly terminated.

Apache Jira: [IMPALA-13592](#),[IMPALA-13680](#)

CDPD-91626: Stable file system operations

Unreadable paths in Java CLASSPATH could lead to crashing during startup without an informative error message. This is now resolved by ignoring unreadable paths in CLASSPATH.

Apache Jira: [IMPALA-13371](#)

CDPD-81958: Improve cookie security in Knox-proxied web UIs with Secure and HttpOnly attributes

Previously, the pac4jCsrfToken cookie in Apache Knox-proxied applications did not contain the Secure and HttpOnly flags. This issue is now fixed by ensuring that the pac4jCsrfToken cookie has both the Secure and HttpOnly flags in Knox-proxied applications, improving the security provided by Knox.

Apache JIRA: [KNOX-3134](#)

Common Vulnerabilities and Exposures (CVE) that is fixed in this CHF:

CVE-2014-0114	commons-beanutils
CVE-2019-10086	commons-beanutils
CVE-2024-52046	mina-core
CVE-2025-59059	Apache Ranger
CVE-2025-59060	Apache Ranger

Behavioral changes in Cloudera Runtime 7.1.9 SP1 CHF 13

Know more about the behavioral changes in cumulative hotfix 13 for 7.1.9 SP1.

Hive

CDPD-92002: New configuration properties added for Hive metatool summary operation

A new configuration property is available to manage the performance and scope of the metatool summary operation, particularly when dealing with the task running indefinitely.

Previous behavior:

The Hive metatool summary operation executed without specific controls for resource usage, time limits.

New behavior:

A new configuration property is available to manage the performance and scope of the metatool summary operation, particularly when dealing with the task running indefinitely.

Property	Default Value	Description
hive.metatool.summary.timeout	20 min	The maximum time the summary operation will wait to complete before being automatically canceled.

Impala

CDPD-89269: Batched Insert events for Impala

Previous behavior:

Impala initiated insert statements using a single API call for each partition. This could become a performance bottleneck when inserting data into tables with a large number of partitions.

New behavior:

This change speeds up computing file checksums during **INSERT** operations, especially for tables with many files and partitions. This is achieved by leveraging a new batch insert API in the Hive Metastore to process events more efficiently.

Apache Jira: [IMPALA-14051](#)

CDPD-92378: Impala no longer allows unauthenticated user impersonation through Knox JDBC gateway

Previous behavior:

When connecting to Impala using the Knox JDBC gateway URL (e.g., jdbc:impala://[knoxhost]:[knoxport]/...), you could specify any Impala user through the `impala.doas.user` property and successfully impersonate them, regardless of whether your Knox user had explicit Impala proxy user permissions. This unintended behavior bypassed security checks and allowed for delegation to users who should not have been accessible.

New behavior:

Knox JDBC Gateway authenticates as itself and delegates to the logged in user, so it has already performed some delegation. If `impala.doas.user` is passed by the client through Knox JDBC Gateway, it will now result in an error as we don't support secondary delegation.

Known issues in 7.1.9 SP1 CHF 13

The following section lists the known issues and limitations, the areas of impact, and workaround for each Runtime component.

Known Issues in Atlas

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-93307: Hive import logs are truncated during bulk import

When running the `import-hive.sh` script to perform bulk Hive metadata imports, the logging process fails to retain the expected history. The `import-hive.log` file rotates prematurely when it reaches 10 MB and retains only one backup file (`import-hive.log.1`), instead of the expected 100 MB file size and 20 backup files.

Supply a custom `log4j` configuration file with the correct structure by using the `ATLAS_OPTS` environment variable before running the import script:

```
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE log4j:configuration SYSTEM "log4j.dtd">
<log4j:configuration xmlns:log4j="http://jakarta.apache.org/log4j/">
  <appender name="console" class="org.apache.log4j.ConsoleAppender">
    <param name="Target" value="System.out"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t: %x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <appender name="FILE" class="org.apache.log4j.RollingFileAppender">

```

Export the ATLAS_OPTS variable to point to your custom file before running the import script:

```

export ATLAS_OPTS="-Dlog4j.configuration=file:/path/to/custom-hi
ve-import-log4j.xml"
./import-hive.sh

```

CDPD-87670: [Atlas UI] Apache Atlas Glossary becomes unresponsive when the page size is set to 50

When the page limit is set to 50 in **Glossary**, the user interface becomes unresponsive due to an incorrect API call with the error message, when trying to show more than 25 associated entities for a glossary item: "expected type AtlasGlossaryCategory; found AtlasGlossaryTerm".

Apache Jira: [ATLAS-5067](#)

CDPD-70450: Impala SQL queries that include the “WITH” clause should populate lineage in Atlas

Impala SQL queries that do not use the WITH clause can show lineage in Atlas, but queries that do use the WITH clause cannot show lineage in Apache Atlas. Impala SQL queries using the WITH clause are not supported.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-6565: Issue with ddlQueries in Atlas for Hive/Impala tables created in default/non-default db using DAS/HUE respectively

ddlQueries are not created for Impala origin table. ddlQueries created for Impala/Hive CTAS tables have difference in names as compared to same operation for Hive table. The Impala table has the query in the ddlQueries entity name.

None

CDPD-55301: ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created through spark3-shell

The ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created using spark3-shell.

None

CDPD-56085: LOAD DATA INPATH to iceberg_table creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas

Running a query like `LOAD DATA INPATH` to `iceberg_table`, creates a temporary `hive_table` with name `<iceberg_table_name>_tmp*` and then marks it as `DELETED` in Atlas. So in Atlas, a deleted entity is created corresponding to the temporary table `<iceberg_table_name>_tmp*`.

None

CDPD-58554: Discard audits of specific classification, label, and business metadata

Support to control audits for specific classification, label, and business metadata is not present in the Custom Audit Filters feature.

None

CDPD-40346: The `ddlQueries` and `ALTERTABLE_ADDCOLS` lineage missing for Impala tables.

The `ALTERTABLE_ADDCOLS` lineage has some issue when an Impala table is altered and the corresponding lineage is not created.

CDPD-67112: Import transforms do not work as expected when replacing a string which already has ":"

The character ":" is not supported in path replacements. The import succeeds but location remains unchanged. The character ":" must be avoided.

None

CDPD-69150: Unable to add labels or user defined properties in Japanese

Adding Japanese labels or user defined properties results in the error message: "Invalid label: ###, label should contain alphanumeric characters, _ or -"

None

CDPD-69279: Quick search does not return entities when using Japanese or Chinese characters to search properties

Entities, such as `hdfs_path`, are not returned by the search when their indexable properties are searched using partial search terms made of Japanese or Chinese characters. Only exact matches return results when searching the indexed properties made of Japanese or Chinese characters.

None

CDPD-68191: Suggestions do not return the correct results when searching multiple Chinese characters

Free text search does not return results when searching Chinese phrases made of multiple characters. Partial searches return the correct results.

None.

CDPD-71219: Regression : Suggestions don't work for single character words on indexable attributes

When searching for entities whose name (entity names are indexable) is a single character, search results are returned but suggestions are not. When searching for entities whose description (entity descriptions are not indexable) is a single character, both search results and suggestions are returned.

None.

CDPD-67450: Table name renaming operation is not updating or creating `iceberg_table` entity

Renaming an Iceberg table does not update the corresponding Atlas entity.

None.

CDPD-67089: Export/Import: When a table with Ozone path is exported as "connected", only the Ozone key is exported.

When table with Ozone path is exported as "connected", only Ozone key is exported. Other Ozone entities, such as Ozone volume, Ozone bucket are not exported.

None.

CDPD-43772: Performance issues with Atlas service

If there are lot of update operations and the compression type of column families of atlas_janus table is SNAPPY, then the Kafka message processing might become slower.

- Consider setting compression type of column families of atlas_janus table as GZ.

OPSAPS-67783: During rolling upgrade one among two Atlas server failed to start but Cloudera Manager considered as success

Cloudera Manager marks the Execute command Start on service Atlas-1 as a success even when Atlas service had failed to start successfully. In such cases, Atlas logs give the exact reason for Atlas start-up failure.

None

CDPD-19358: "IsIndexable" and "isOptional" value of a typedef's attribute is modified post migration.

In HDP-265, falcon_feed_creation has "stored-in" attribute which has IsIndexable value set to True.

Post migration, "stored-in" is moved to relationshipAttributeDefs and has IsIndexable value set to False.

Similarly, in HDP-265 the table attribute of hive_storage_desc isOptional is set to true. Post migration, isOptional set to False.

None.

CDPD-11941: Table creation events missed when multiple tables are created in the same Hive command

When multiple Hive tables are created in the same database in a single command, the Atlas audit log for the database may not capture all the table creation events. When there is a delay between creation commands, audits are created as expected.

None.

CDPD-11940: Database audit record misses table delete

When a hive_table entity is created, the Atlas audit list for the parent database includes an update audit. However, at this time, the database does not show an audit when the table is deleted.

None.

CDPD-11692: Navigator table creation time not converted to Atlas

In converting content from Navigator to Atlas, the create time for Hive tables is not moved to Atlas.

None

CDPD-10574: Suggestion order doesn't match search weights

At this time, the order of search suggestions does not honor the search weight for attributes.

None.

CDPD-7982: HBase bridge stops at HBase table with deleted column family

Bridge importing metadata from HBase fails when it encounters an HBase table for which a column family was previously dropped. The error indicates:

```
Metadata service API org.apache.atlas.AtlasClientV2$API_V2@58112
bc4 failed with status 404 (Not Found) Response Body
({"errorCode":"ATLAS-404-00-007","errorMessage":"Invalid
instance creation/updation parameters passed :
hbase_column_family.table: mandatory attribute value missing in
type hbase_column_family"})
```

None.

CDPD-6675: Irregular qualifiedName format for Azure storage

The qualifiedName for hdfs_path entities created from Azure blob locations (ABFS) does not have the clusterName appended to it as do hdfs_path entities in other location types.

None.

CDPD-4762: Spark metadata order may affect lineage

Atlas may record unexpected lineage relationships when metadata collection from the Spark Atlas Connector occurs out of sequence from the metadata collection from HMS. For example, if an ALTER TABLE operation in Spark that is changing a table name and is reporting to Atlas before HMS has processed the change, Atlas may not show the correct lineage relationships to the altered table.

None.

CDPD-4545: Searches for Qualified Names with "@" does not fetch the correct results

When searching Atlas qualifiedName values that include an "@" character (@), Atlas does not return the expected results or generate appropriate search suggestions.

Consider leaving out the portion of the search string that includes the @ sign, and use the wildcard character * instead.

CDPD-3208: Table alias values are not found in search

When table names are changed, Atlas keeps the old name of the table in a list of aliases. These values are not included in the search index in this release, so after a table name is changed, searching on the old table name does not return the entity for the table.

None.

CDPD-3160: Hive lineage missing for INSERT OVERWRITE queries

Lineage is not generated for Hive INSERT OVERWRITE queries on partitioned tables. Lineage is generated as expected for CTAS queries from partitioned tables.

None.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a logout event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent access to Atlas after logging out, close all browser windows and exit the browser.

CDPD-1892: Ranking of top results in free-text search not intuitive

The Free-text search feature ranks results based on which attributes match the search criteria. The attribute ranking is evolving and therefore the choice of top results may not be intuitive in this release.

If you don't find what you need in the top 5 results, use the full results or refine the search.

CDPD-1884: Free text search in Atlas is case sensitive

The free text search bar in the top of the screen allows you to search across entity types and through all text attributes for all entities. The search shows the top 5 results that match the search terms at any place in the text (*term* logic). It also shows suggestions that match the search terms that begin with the term (term* logic). However, in this release, the search results are case-sensitive.

If you don't see the results you expect, repeat the search changing the case of the search terms.

CDPD-1823: Queries with ? wildcard return unexpected results

DSL queries in Advanced Search return incorrect results when the query text includes a question mark (?) wildcard character. This problem occurs in environments where trusted proxy for Knox is enabled, which is always the case for CDP.

None.

CDPD-1664: Guest users are redirected incorrectly

Authenticated users logging in to Atlas are redirected to the CDP Knox-based login page. However, if a guest user (without Atlas privileges) attempts to log in to Atlas, the user is redirected instead to the Atlas login page.

To avoid this problem, open the Atlas Dashboard in a private or incognito browser window.

CDPD-922: The IsUnique relationship attribute not honored

The Atlas model includes the ability to ensure that an attribute can be set to a specific value in only one relationship entity across the cluster metadata. For example, to add metadata tags to relationships that you wanted to make sure were unique in the system, you can design the relationship attribute with the property IsUnique equal true. However, in this release, the IsUnique attribute is not enforced.

None.

DOCS-13759: Tag Propagation stops after a certain depth while the lineage is being extended

When a tag is added to an entity at timestamp T1, the entities along the lineage to which the tag must be propagated is calculated at T1. Before tag propagation completes, if the lineage is extended, tag does not propagate to the entities in the extended lineage.

CDPD-41142: When a Kafka console consumer group is run, more than one update audits are seen

After running the console consumer with a consumer group, verify the consumer group entity created, along with the metrics and notifications for the consumer group and topic. The expected result can be: one ENTITY_CREATE audit and one ENTITY_UPDATE audit. But more than one ENTITY_UPDATE audits are seen.

CDPD-40165: Two audits are created for SPARK CTAS table

When following Spark queries are fired:

```
spark.sql("create table table1(id int)")
spark.sql("create table table2 as select * from table1")
```

HMS sends "ENTITY_CREATE" and "ENTITY_FULL_UPDATE_V2".

The extra ENTITY_FULL_UPDATE_V2 message received from HMS is sent as a part of ALTER_TABLE_ADDCOLS event from the HMS Hook side. This behaviour is observed only when the queries are run from Spark SQL and not when run the same queries are run from Beeline.

CDPD-39197: Debug metrics returns empty data

When debug metrics is enabled and some operations are performed, the response is empty

CDPD-36495: Updating legacyAttribute from False to True resets the initially created relationshipAttributes values

Creating types, entities, and to start, you must set the relationship with is_legacy_attribute value as False.

Later, update the value relationshipDef is_legacy_attribute to True.

For the entities that were created before updating the is_legacy_attribute to True, the relationship Attributes value is reset.

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-29409: Hive import: Suggestion suggests entity which is deleted.

Suggestions suggests tables of a database, which is a deleted entity.

CDPD-25152: Tag propagation through deferred actions consumes additional time as compared to default flow

The additional time might be due to the small overhead added to create / update task vertex and which is run in the background. This also depends on number of tasks queued to be executed.

CDPD-42954: Zeppelin notebook fails after enabling Atlas-HDFS hook

The Zeppelin notebooks are failing with errors after enabling Atlas-HDFS hook in the CDP cluster.

When the below properties are set for atlas-client.properties in Cloudera Manager:

- atlas.jaas.KafkaClient.option.keyTab
- atlas.jaas.KafkaClient.option.principal

Along with adding the properties in /etc/atlas/conf/atlas-application.properties, Cloudera Manager also adds these properties to atlas-application.properties for other services (like Spark).

Adding these properties interferes with the normal flow of the services (like Spark)

To enable HDFS lineage feature, instead of setting these properties through Cloudera Manager, users can manually add the properties directly in /etc/atlas/conf/atlas-application.properties

CDPD-10576: Deleted Business Metadata attributes appear in Search Suggestions

Atlas search suggestions continue to show Business Metadata attributes even if the attributes have been deleted.

None.

CDPD-39427: [HDFS Lineage]: When the input is a directory in case of put/copyfromLocal/cp/mv commands, lineage is not created even though the script succeeds.

When Source is a directory and target is a directory which is already present in Atlas, the command succeeds and inserts the data in the desired location, but lineage is not created.

DOCS-13760: System Attributes search, __classificationNames: Search with parent tag does not return entities associated to its children tags

System attribute search with __classificationNames = parent_tag returns entities associated to parent_tag only and not entities associated to its children tag.

Workaround: Instead of using system attribute, employ the basic search attribute "classification" which lists entities associated with inherited classifications.

CDPD-35818: Basic search with tag filter provides approximateCount as -1 when there is no match and is 0 otherwise

When the following search operations are performed:

- Faceted search with both tag filter and entity filter

The observed approximateCount is -1.

Here both entity filter and tag filter are present and when there is no match the response received is -1.

- Faceted search with only entity filter

Performing a basic search provides an approximate value of 0 when there is no match.

- Faceted search with only tag filter

Whenever there is tag filter in the query and there is no entity match, the approximateCount is -1 and if the tag filter is not available, the response approximateCount is 0

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-76035: Resource lookup for Atlas service is failing

Once the Atlas configuration snippet `atlas.authentication.method.file` is enabled and a classification is created, these do not synchronize correctly to the **Type Category** resource field setting of Apache Ranger. The newly created classification won't be able to be selected as the **Type Name**.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-69140: Incremental export: When an entity has tag propagated and is exported, the tag is not propagated to it in the export

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After exporting the last table, it will not have the propagated tag.

Apache JIRA: [ATLAS-4889](#)

CDPD-69213: Export/Import, Incremental Export: When entity exported has a tag propagated from entity which is deleted, tag is not propagated to it at target

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After dropping the first table and exporting the entire lineage, the child tables will not have the propagated tag.

Apache JIRA: [ATLAS-5055](#)

CDPD-76789: Creating tag with name description throws java.lang.ClassCastException

Creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options" can lead to HTTP 500 error in Apache Atlas.

Avoid creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options".

CDPD-77435: RAZ: Import-hive on Cloudera Data Engineering cluster fails

Running import-hive command on RAZ enabled Cloudera Data Engineering cluster fails with error "NoClassDefFoundError: com/sun/jersey/core/spi/factory/ResponseBuilderImpl".

CDPD-70321: Atlas Parallel import is failing with various errors

During a parallel import-export activity with six iceberg table policies with exportOption as db1.* for all six exports, all import fail after the exports.

CDPD-75994: Post DL regular upgrade (non ZDU) to 7.3.1, "Exception in getKafkaConsumer ,WakeUpException: null" is seen

After the data lake is upgraded to 7.3.1, sometimes Atlas Hook does not function when Apache Atlas and Apache Kafka are started at the same time, thus Atlas is unable to connect to Kafka while Kafka is still being set up. Atlas performs only three attempts.

Restart the cluster, after the upgrade to trigger to reconnect to Apache Kafka. The Kafka consumer creation should be retried if the Kafka service is unavailable during Atlas startup.

DOCS-26821: Iceberg entities created in 7.2.17 Atlas-Hook (Hive,Impala,Spark) is not ingested by 7.2.18/7.3.1 Atlas Server

When using an Atlas hook from 7.3.1 with an earlier version of Atlas server (7.1.9 SP1 CHF5 or earlier) to create an Iceberg table, the older data model of Iceberg cannot process the features of the new data models. For example, when encountering relationships or attributes in queries which do not have a definition in the earlier model, Iceberg fails to create new tables with an error message. The data model of the Iceberg in Cloudera Runtime 7.1.9 SP1 CHF5 or later is not backward compatible with earlier data models.

It is recommended to upgrade your Atlas server version to at least 7.1.9 SP1 CHF5 or later.

CDPD-28741: Atlas node start failure : PermanentLockingException: Expected value mismatch for KeyColumn

In an Atlas High Availability (HA) enabled environment, starting both Atlas hosts at the same time can result in both trying to access or modify the same graph database resulting in a race condition. One instance successfully modifies the patch vertex, while the other instance triggers a Locking Exception (Concurrent modification exception).

Start Atlas instances in sequence and not in parallel to avoid the potential race condition. If the exception is already present, restart the second Atlas instance after triggering the `PermanentLockingException`.

CDPD-79099: Unable to import hive tables using import script in Public Cloud

The validation of import .zip files can cause the `org.apache.atlas.AtlasServiceException` error if the .zip file contains Atlas shell entities missing mandatory attributes such as a name. Therefore, the import of shell entities fails.

CDPD-88230: Bulk import operations currently do not construct lineage as expected

Bulk import operations do not create lineage consistently, even when the entities are imported successfully.

CDPD-88302: Bulk import operations currently do not create audits for the imported entities

Bulk import operations do not create audits for the imported entities.

Known Issues in Cruise Control

Learn about the known issues in Cruise Control, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

Rebalancing with Cruise Control does not work due to the metric reporter failing to report the CPU usage metric

On the Kafka broker, the Cruise control metric reporter plugin may fail to report the CPU usage metric.

If the CPU usage metric is not reported, the `numValidWindows` in Cruise Control will be 0 and proposal generation as well as partition rebalancing will not work. If this issue is present, the following message will be included in the Kafka logs:

```
WARN com.linkedin.kafka.cruisecontrol.metricsreporter.CruiseControlMetricsReporter:
    [CruiseControlMetricsReporterRunner]: Failed reporting CPU
    util.
```

```
java.io.IOException: Java Virtual Machine recent CPU usage is not
    available.
```

This issue is only known to affect Kafka broker hosts that have the following specifications:

- CPU: Intel(R) Xeon(R) CPU E5-2699 v4 @ 2.20GHz
- OS: Linux 4.18.5-1.el7.elrepo.x86_64 #1 SMP Fri Aug 24 11:35:05 EDT 2018 x86_64
- Java version: 8-18

Move the broker to a different machine where the CPU is different. This can be done by moving the host to a different cluster. For more information, see the [Moving a Host Between Clusters](#).

Note: Cluster nodes affected by this issue are not displayed as unhealthy.

Known Issues in Hive

Learn about the known issues in Hive, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60770: Beeline Authentication Issue with Special Characters in Passwords

When LDAP is enabled, users cannot authenticate with Beeline if the password contains a special character. For example, the following string fails:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>;user=user@XXX;password='R3G#xpXyoy1M0Jb1'
```

Use the -p parameter to execute the Beeline command:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>; -n user@XXX -p 'R3G#xpXyoy1M0Jb1'
```

CDPD-43769: Inconsistent behavior with CHAR comparisons and string literals

In Hive, 'char' data to 'string' data comparison is considered as equal, but 'char' data to 'varchar' data comparison is considered as not equal if the data has trailing spaces. For example,

```
create table test(colchar char(10), colvarchar varchar(20), colstring string);
insert into test values ('a ', 'a ', 'a ');

select count(*) from test where colchar = colstring;
Output returns 1 because char and string data is considered as equal

select count(*) from test where colchar = colvarchar;
Output returns 0 because char and varchar data is considered as not equal
```

It is recommended that you use 'varchar or string' data type instead of 'char' data type for any character or string representation.

CDPD-42726: Wrong results for agg queries from stats after running multi-insert query on managed table

Multiple inserts at the same time into the same partition results in invalid stats. For example:

```
create table source(p int, key int, value string);
insert into source(p, key, value) values (101,42,'string42');

create table stats_part(key int,value string) partitioned by (p
int);
from source
insert into stats_part select key, value, p
insert into stats_part select key, value, p;

select count(*) from stats_part;
-- In this scenario, StatsOptimizer helps serving this query be
cause the result should be rowNum of the partition p=101.
-- The result is 1, however, the result should be 2.
```

Rewrite the multi-insert statement by merging the branches inserting into the same partition to one branch.

CDPD-57574: Query execution fails due to NullPointerException in DagUtils.setupQuickStart

Hive queries may fail at runtime with a NullPointerException while executing the Tez graph at DagUtils.setupQuickStart method. A part of the stack trace from the error is shown below:

```
ERROR : Failed to execute tez graph.
java.lang.NullPointerException: null at org.apache.hadoop.hive.ql.exec.tez.DagUtils.setupQuickStart(DagUtils.java:1724)
```

The error usually occurs from an invalid plan that has cycles created by semi-join or map-join edges.

Disable some of the optimizations in order to remove the cycles from the plan. It is sufficient to set one of the following properties:

- set hive.tez.dynamic.partition.pruning=false;
- set hive.tez.dynamic.semijoin.reduction=false;
- set hive.auto.convert.join=false;

To avoid any undesired performance regressions, disable the optimization(s) only for specific queries and not globally (through Cloudera Manager) for the whole workload or cluster.

CDPD-45370: Cartesian join fails with an empty table

When the configuration hive.tez.cartesian-product.enabled is set to true, query fails if one of the tables involved in a Cartesian join has zero rows. This results in an IllegalArgumentException with the message Number of items is 0. Should be positive.

To address this issue, set hive.tez.cartesian-product.enabled to false before running the query.

Apache Jira: [\[HIVE-26582\]](#)

CDPD-43107: SemanticException for INSERT INTO statement when Hive Cost-based Optimizer (CBO) is disabled

If you are running the INSERT INTO query and hive.cbo.enable is set to "false", the query fails with a SemanticException. For example,

```
set hive.cbo.enable=false;

CREATE TABLE mytable (
```

```
id INT,
str STRING
);

INSERT INTO mytable (id, str) VALUES (1, 'a');
```

Output:
 org.apache.hadoop.hive.ql.parse.SemanticException: 0:0 Expected 2 columns for insclause-0/default@mytable; select produces 1 columns. Error encountered near token 'a'

This issue occurs only when columns are specified for the target table in the query. INSERT INTO mytable values (1, 'a'); does not result in an exception.

Enable CBO and run the query.

CDPD-43957: HiveServer shuts down during replication due to high resource usage

During Hive replication (both bootstrap and incremental), you may notice that the HiveServer (HS2) shuts down periodically with the following error:

```
java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper
    at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:265)
    at org.apache.hive.jdbc.HiveDriver.connect(HiveDriver.java:107)
    at java.sql.DriverManager.getConnection(DriverManager.java:664)
    at java.sql.DriverManager.getConnection(DriverManager.java:247)
    at com.cloudera.enterprise.hive3qt.Hive3QueryTool$HiveOperation.execute(Hive3QueryTool.java:682)
    at com.cloudera.enterprise.hive3qt.Hive3QueryTool.main(Hive3QueryTool.java:935)
Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.configureConnParams(ZooKeeperHiveClientHelper.java:177)
    at org.apache.hive.jdbc.Utills.configureConnParamsFromZooKeeper(Utills.java:580)
    at org.apache.hive.jdbc.Utills.parseURL(Utills.java:391)
    at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:263)
    ... 5 more
Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Tried all existing HiveServer2 uris from ZooKeeper.
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.getServerHosts(ZooKeeperHiveClientHelper.java:132)
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.configureConnParams(ZooKeeperHiveClientHelper.java:172)
    ... 8 more
```

This issue occurs when you replicate at scale with an unbalanced cluster setup that has all the roles running on the Cloudera Manager host. As a result, Cloudera Manager ends up in a bottleneck situation because HS2 crashes, preventing further replication. The logs (/var/log/messages) indicate that there were a large number of Java processes running on the host, which exhausted the host's memory and triggered an Out Of Memory Killer process to stop HS2.

You can restart HS2 and reinitiate replication. However, the replication process may take a longer time to complete.

- Follow these recommendations when setting up your source and target clusters:
 - Ensure that no HS2, Hive metastore (HMS), DataNode, or NameNode roles are running on the Cloudera Manager host.
 - Ensure that you have multiple instances of HS2 and HMS roles on different nodes.
 - It is recommended that you have the HS2 and HMS roles on different nodes than the DataNodes or NameNodes.

These practices increase the possibility of Hive replication at scale completing successfully.

- Limit the scale of Hive replication by temporarily disabling replication policies.

CDPD-40730: Parquet change can cause incompatibility

Parquet files written by the parquet-mr library in CDP 7.1.9, where the schema contains a timestamp with no UTC conversion will not be compatible with older versions of Parquet readers. The effect is that the older versions will still consider these timestamps as they would require UTC conversions and will thus end up with a wrong result. You can encounter this problem only when you write Parquet-based tables using Hive, and tables have the non-default configuration `hive.parquet.write.int64.timestamp=true`.

None.

CDPD-41274: HWC + Oozie issue: Could not open client transport with JDBC Uri

Currently only Spark cluster mode is supported in the Oozie Spark Action with Hive Warehouse Connector (HWC).

Use Spark action in cluster mode.

```
<spark xmlns="uri:oozie:spark-action:1.0">
  ...
  <mode>cluster</mode>
  ...
</spark>
```

CDPD-26556 After an upgrade, querying a CTAS table under certain conditions might throw an exception

If you upgrade your Hive cluster from CDH 6 to CDP 7, create a CTAS table in the CDP cluster from a table you upgraded from CDH, you might see the following exception when you query the new table:

```
class org.apache.hadoop.io.IntWritable cannot be cast to class o
rg.apache.hadoop.hive.serde2.objectinspector.StandardUnionObject
Inspector$StandardUnion
```

This issue involves CDH-based tables having columns of complex types ARRAY, MAP, and STRUCT.

CDPD-23506: OutOfMemoryError in LLAP

Long running spark-shell applications can leave sessions in interactive Hiveserver2 until the Spark application finishes (user exists from spark-shell), causing memory pressure in case of a high number of queries in the same shell (1000+).

You must close spark-shell so that sessions are closed. Add the owner of the database or the tables as a user with read or read/write access to the tables directly.

CDPD-23041: DROP TABLE on a table having an index does not work

If you migrate a Hive table to CDP having an index, DROP TABLE does not drop the table. Hive no longer supports indexes ([HIVE-18448](#)). A foreign key constraint on the indexed table prevents dropping the table. Attempting to drop such a table results in the following error:

```
java.sql.BatchUpdateException: Cannot delete or update a parent
row: a foreign key constraint fails ("hive"."IDXS", CONSTRAINT "
```

```
IDXS_FK1" FOREIGN KEY ("ORIG_TBL_ID") REFERENCES "TBL" ("TBL_ID"
))
```

There are two workarounds:

- Drop the foreign key "IDXS_FK1" on the "IDXS" table within the metastore. You can also manually drop indexes, but do not cascade any drops because the IDXS table includes references to "TBL".
- Launch an older version of Hive, such as Hive 2.3 that includes IDXS in the DDL, and then drop the indexes as described in [Language Manual Indexing](#).

Apache Issue: [Hive-24815](#)

CDPD-17766: Queries fail when using spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive.

Do not specify spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive remotely.

Workaround: specify principal=hive.server2.authentication.kerberos.principal as shown in the following syntax:

```
jdbc:hive://<host>:<port>/<dbName>;principal=hive.server2.authentication.kerberos.principal;<otherSessionConfs>?<hiveConfs>#<hiveVars>
```

CDPD-13636: Hive job fails with OutOfMemory exception in the Azure DE cluster

Set the parameter hive.optimize.sort.dynamic.partition.threshold=0. Add this parameter in Cloudera Manager (Hive Service Advanced Configuration Snippet (Safety Valve) for hive-site.xml)

CDPD-10848: HiveServer Web UI displays incorrect data

If you enabled auto-TLS for TLS encryption, the HiveServer2 Web UI does not display the correct data in the following tables: Active Sessions, Open Queries, Last Max n Closed Queries

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-94739: Hue audit logging requires debug mode

In Hue, audit logging is only active when debug logging is enabled by setting DJANGO_DEBUG_MODE = true. By default, audit logging is disabled.

Update to the upcoming release to restore audit logging functionality.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-58978: Batch query execution using Hue fails with Kerberos error

When you run Impala queries in a batch mode, you encounter failures with a Kerberos error even if the keytab is configured correctly. This is because submitting Impala, Sqoop, Pig, or pyspark

queries in a batch mode launches a shell script Oozie job from Hue and this is not supported on a secure cluster.

There is no workaround. You can submit the queries individually.

OPSAPS-69659: Hue service fails on restart with "Unable to find psycopg2 2.5.4" error

Hue service fails to restart and you see the following error: Unable to find psycopg2 2.5.4. This could be because you have installed Python in a non-default location and Hue is unable to locate the psycopg2 PostgreSQL database adapter.

You must specify the path where you have installed Python in the PYTHONPATH property in the Hue Advanced Configuration Snippet using Cloudera Manager.

1. Log in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue Configurations and add the following key and value in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

Key: PYTHONPATH

Value: `[***PYTHON-PATH***]`

Replace `[***PYTHON-PATH***]` with the actual location where you have installed Python. For example, `/opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python3.8/site-packages`

3. Click Save Changes.
4. Restart the Hue service.

CDPD-59677: Unable to view Phoenix tables on the left assist in Hue

On clusters secured with Knox, you may not be able to see Phoenix tables on the left assist that are present under the default database (that is, an empty("") database).

None.

CDPD-58142: A query is not pre-populated in the Hue editor after clicking on the "Re Execute" button

When you click Re Execute to rerun a query from the Job Browser Queries Query Details page, the query does not get populated on the Hue editor, as expected.

None.

CDPD-54376: Clicking the home button on the File Browser page redirects to HDFS user directory

When you are previewing a file on any supported filesystem, such as S3 or ABFS, and you click on the Home button, you are redirected to the HDFS user home directory instead of the user home directory on the said filesystem.

None.

CDPD-41306: pip3.8 freeze command does not work and results into an error

You see the `/usr/lib/hue/build/env/bin/python: No such file or directory` error when you run the following command:

```
build/env/bin/pip3.8 freeze
```

Run the freeze command as follows by specifying the paths of python3.8 and pip3.8:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/python3.8 /opt/cloudera/parcels/CDH/lib/hue/build/env/bin/pip3.8 freeze
```

CDPD-43293: Unable to import Impala table using Importer

Creating Impala tables using the Hue Importer may fail.

If you have both Hive and Impala services installed on your cluster, then you can import the table using by selecting the Hive dialect from Tables Sources .

If only Impala service is installed on your cluster, then go to Cloudera Manager Clusters Hue Configurations and add the following line in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[beeswax]
max_number_of_sessions=1
```

DWX-8602: Unable to import a large CSV file from the local workstation

You may see an error message while importing a CSV file into Hue from your workstation, stating that you cannot import files of size more than 200 KB.

Upload the file to S3 or ABFS and then import them into Hue using the Importer.

CDPD-39330: Unable to use the pip command in CDP

You may not be able to use the pip command in CDP 7.1.7 or higher and may see the following error when using pip in a command: “ImportError: cannot import name chardet”.

Follow the steps listed on [Unable to use pip command in CDP](#).

CDPD-24294: Hue uses the unsafe-inline directive in its Content Security Policy (CSP) header

Hue 4 web interface uses the unsafe-inline directive in its CSP header. As a result, the application server does not set the CSP header in its HTTP responses, and therefore does not benefit from the additional protection against potential cross-site scripting issues and other modern application vulnerabilities which a properly configured CSP may provide. This could lead to application vulnerability.

Cloudera recommends deploying additional security measures such as a firewall within the Hue server to control allowed connections, and SSO-based authentications mechanisms such as LDAP or SAML.

OPSAPS-58927: Connection failed error when accessing the Search app (Solr) from Hue

If you are using Solr with Hue to generate interactive dashboards and for indexing data, and if you have deployed two Solr services on your cluster and selected the second one as a dependency for Hue, then Cloudera Manager assigns the hostname of the first Solr service and the port number of the second Solr service generating an incorrect Solr URL in the search section of the hue.ini file. As a result, you may see a “Connection failed” error when you try to access the Search app from the Hue web UI.

1. Log into Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[search]
# URL of the Solr Server
solr_url=http://[***HOSTNAME***]:[***PORT***]/solr/
```

For example:

```
solr_url=http://solr2:4567/solr/
```

3. Click Save Changes.
4. Restart the Hue service.

CDPD-41136: Importing files from the local workstation is disabled by default

Cloudera has disabled the functionality to import files from your local workstation into Hue because it may cause errors. You may not see the Local File option in the Type drop-down menu on the **Importer** page by default.

You can enable the functionality to import files from your local workstation by specifying the following parameter in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field in Hue configurations in Cloudera Manager:

```
[indexer]
enable_direct_upload=true
```

Invalid S3 URI error while accessing S3 bucket

The Hue Load Balancer merges the double slashes (//) in the S3 URI into a single slash (/) so that the URI prefix `"/filebrowser/view=S3A:/"` is changed to `"/filebrowser/view=S3A:/"`. This results in an error when you try to access the S3 buckets from the Hue File Browser through the port 8889.

The Hue web UI displays the following error: “Unknown error occurred”.

The Hue server logs record the “ValueError: Invalid S3 URI: S3A” error.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to **Clusters Hue service Configurations Load Balancer** and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
3. Specify `MergeSlashes OFF` in the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
4. Click **Save Changes**.
5. Restart the Hue Load Balancer.

You should be able to load the S3 browser from both 8888 and 8889 ports.

Alternatively, you can use the Hue server port 8888 instead of the load balancer port 8889 to resolve this issue.

Error while rerunning Oozie workflow

You may see an error such as the following while rerunning an already executed and finished Oozie workflow through the Hue web interface: `E0504: App directory [hdfs://cdh/user/hue/oozie/workspaces/hue-oozie-1571929263.84] does not exist`.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to **Clusters Hue service Configurations Load Balancer** and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
3. Specify `MergeSlashes OFF` in the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
4. Click **Save Changes**.
5. Restart the Hue Load Balancer.

CDPD-17956, CDPD-14167: Setting idle session timeout for Hue does not work when the cluster is secured using Knox SSO

If Hue is configured with `desktop.auth.backend.KnoxSpnegoDjangoBackend` as the Authentication Backend, then the automatic idle session logout that is set by configuring the `idle_session_timeout` property does not take effect. You may also see 404 error while accessing Hue from the Knox UI when the `idle_session_timeout` property is not set to -1.

None

Query history displays "Result Expired" message

You see the "Result Expired" message under the Query History column on the **Queries** tab for queries which were run back to back. This is a known behaviour.

None.

CDPD-43956: Manually replace UUID when importing Oozie workflows containing sub-workflows

When importing Oozie workflows that contain sub-workflows, you must replace all the UUID entries with unique new entries. If you change the UUID of a sub-workflow, you must update that reference in the parent workflow to avoid circular dependencies.

Hue limitation after upgrading from CDH to CDP Private Cloud Base

The `hive.server2.parallel.ops.in.session` configuration property changes from `TRUE` to `FALSE` after upgrading from CDH to CDP Private Cloud Base. Current versions of Hue are compatible with this property change; however, if you still would like to use an earlier version of Hue that was not compatible with this property being `FALSE` and shared a single JDBC connection to issue queries concurrently, the connection will no longer work after upgrading.

Hue UI is blank upon login after upgrading to CDP 7.1.7 from CDH 6

If your cluster was secured using Knox, and if you have upgraded from CDH 6 to CDP 7.1.7, then you may see a blank Hue screen. This could happen because the `knox_proxyhosts` parameter is newly introduced in CDP, and it is possible that this parameter is not configured in Cloudera Manager under Hue configuration.

Specify the host on which you have installed Knox in the Hue Knox Proxy Hosts configuration as follows:

1. Log in to Cloudera Manager as an Administrator.
2. Obtain the host name of the Knox Gateway by going to Clusters Knox service Instances .
3. Go to Clusters Hue service Configuration and search for the Knox Proxy Hosts field.

Note: Cloudera Manager displays the following warning if the Knox Proxy Hosts field is empty when Knox Gateway is enabled on the CDP cluster: The parameter `knox_proxyhosts` cannot be empty. This can happen if there are no Knox Gateways. Please set the `knox_proxyhosts` to the list of hosts that have Knox Gateways.

4. Specify the Knox Gateway hostname in the Knox Proxy Hosts field.
5. Click Save Changes and restart the Hue service.

Unsupported features

CDPD-59595: Spark SQL does not work with all Livy servers that are configured for High Availability

SparkSQL support in Hue with Livy servers in HA mode is not supported. Hue does not automatically connect to one of the Livy servers. You must specify the Livy server in the Hue Advanced Configuration Snippet as follows:

```
[desktop]
[spark]
livy_server_url=http(s)://[***LIVY-FOR-SPARK3-SERVER-HOST***]:
[***LIVY-FOR-SPARK3-SERVER-PORT***]
```

Moreover, you may see the following error in Hue when you submit a SparkSQL query: Expecting value: line 2 column 1 (char 1). This happens when the Livy server does not respond to the request from Hue.

Specify all different Livy servers in the `livy_server_url` property one at a time and use the one which does not cause the issue.

CDPD-18491: PySpark and SparkSQL are not supported with Livy in Hue

Hue does not support configuring and using PySpark and SparkSQL with Livy in CDP Private Cloud Base.

Importing and exporting Oozie workflows across clusters and between different CDH versions is not supported

You can export Oozie workflows, schedules, and bundles from Hue and import them only within the same cluster if the cluster is unchanged. You can migrate bundle and coordinator jobs with their workflows only if their arguments have not changed between the old and the new cluster. For example, hostnames, NameNode, Resource Manager names, YARN queue names, and all the other parameters defined in the workflow.xml and job.properties files.

Using the import-export feature to migrate data between clusters is not recommended. To migrate data between different versions of CDH, for example, from CDH 5 to CDP 7, you must take the dump of the Hue database on the old cluster, restore it on the new cluster, and set up the database in the new environment. Also, the authentication method on the old and the new cluster should be the same because the Oozie workflows are tied to a user ID, and the exact user ID needs to be present in the new environment so that when a user logs into Hue, they can access their respective workflows.

Note: Migrating Oozie workflows from HDP clusters is not supported.

Known Issues in Impala

Learn about the known issues in Impala, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94720: Impala startup failure due to invalid TLS v1.3 ciphers

When running Impala on a machine with OpenSSL 1.1.1, providing an invalid or TLS v1.2 ciphersuite in the `--tls_ciphersuites` startup flag causes the process to fail during startup. While OpenSSL 3.x ignores invalid ciphers, OpenSSL 1.1.1 returns an error if any ciphersuite in the list is invalid, even if other valid TLS v1.3 ciphers are present.

Ensure that the list in the `--tls_ciphersuites` startup flag contains only valid TLS v1.3 ciphersuites and does not contain any TLS v1.2 ciphersuites.

Apache Jira: [IMPALA-14625](#)

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-59625: Impala shell in RHEL 9 with Python 2 as default does not work

If you try to run `impala-shell` on RHEL 9 by setting the default python executable available in `PATH` to Python 2, it will fail since RHEL 9 is compatible only with Python 3.

If you run into such issues, set this parameter pointing to Python 3, `IMPALA_PYTHON_EXECUTABLE=python3`.

CDPD-81980: Impala query may fail due to backpressure

Impala queries could fail with a dropped due to backpressure error, even when service queue and memory usage appear normal.

Increase the value of the `--mem_limit` startup option.

CDPD-42958: After upgrading the CDH 7.1.9 from CDH 6.x, under certain conditions you cannot insert data into a table

Under the following conditions, after upgrading from CDH 6.x to CDH 7.1.9 you cannot insert data into a table from Impala:

- On CDH 6.x, you created a database with Impala in a user specified HDFS location.
- Using Hive, you then created a table in the database.

Under these conditions, the database and table are stored in the user-specified HDFS directory. After upgrading, the HDFS directory of the table is read-only for Impala. Consequently, from Impala you cannot insert new data into the table because Impala does not have write permission on the HDFS directory.

Workaround: To resolve this issue, use either one of the following workarounds:

- Using the Ranger Web UI, in the policy repository `cm_hdfs`, grant the user 'impala' write permission on the directory where the table resides.
- Enter the following command to grant write permission to user 'impala' on the HDFS directory where the table resides.

```
hdfs dfs -setfacl -m default:user:impala:rwX <HDFS directory>
```

CDPD-80019: Impala fails to start due to large catalog-update topic

Impala coordinators fail to start if the catalog-update store topic exceeds 2GB, hitting the Thrift 0.16.0 message size limit (`thrift_rpc_max_message_size`). This prevents the coordinator from processing the update.

- Enable local catalog mode: `--use_local_catalog=true`
- In Cloudera Manager, go to Impala Configuration search for "Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)" and click 
- Add property name and value:

```
Name : --catalog_topic_mode
Value: minimal
```

- Save changes.

Apache Jira: [IMPALA-12350](#)

Impala cannot update table if the 'external.table.purge' property is not set to true

Impala cannot update a table using DDL statements if the 'external.table.purge' property is FALSE. ALTER TABLE statements return success with no changes to the table.

ALTER TABLE statements should be issued twice if "external.table.purge" was FALSE initially.

Note: For Iceberg tables, Impala users should always use CREATE TABLE since the Impala CREATE TABLE statement sets the flag to TRUE. However, Impala CREATE EXTERNAL TABLE sets the flag to FALSE.

Impala's known limitation when querying compacted tables

When the compaction process deletes the files for a table from the underlying HDFS location, the Impala service does not detect the changes as the compactions does not allocate new write ids. When the same table is queried from Impala it throws a 'File does not exist' exception that looks something like this:

```
Query Status: Disk I/O error on <node>:22000: Failed to open HDF
S file hdfs://nameservice1/warehouse/tablespace/managed/hive/<da
tabase>/<table>/xxxxx
Error(2): No such file or directory Root cause: RemoteException:
File does not exist: /warehouse/tablespace/managed/hive/<data
base>/<table>/xxxx
```

Use the [REFRESH/INVALIDATE](#) statements on the affected table to overcome the 'File does not exist' exception.

CDPD-28431: Intermittent errors could be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

Impala api calls via knox require configuration if the knox customized kerberos principal name is a default service user name

To access impala api calls via knox, if the knox customized kerberos principal name is a default service user name, then configure "authorized_proxy_user_config" by clicking Clusters->impala->configuration. Include the knox customized kerberos principal name in the comma separated list of values <knox_custom_kerberos_principal_name>="*" where <knox_custom_kerberos_principal_name> is the value of the Kerberos Principal in the Knox service. Select Clusters>Knox>Configuration and search for Kerberos Principal to display this value.

CDPD-21828: Multiple permission assignment through grant is not working

None

Problem configuring masking on tables using Ranger

The following Knowledge Base article describes the behavior when we configure masking on tables using Ranger. This configuration works for Hive, but breaks queries in some scenarios for Impala.

For a workaround, see the following Knowledge Base article: [ERROR: "AnalysisException: No matching function with signature: mask\(FLOAT\)" when Impala jobs fail with the following error with signature: mask\(FLOAT\)](#)

IMPALA-11871: INSERT statement does not respect Ranger policies for HDFS

In a cluster with Ranger auth (and with legacy catalog mode), even if you provide RWX to cm_hdfs -> all-path for the user impala, inserting into a table whose HDFS POSIX permissions happen to exclude impala access will result in "AnalysisException: Unable to INSERT into target table (default.t1) because Impala does not have WRITE access to HDFS location: hdfs://XXXXXXXXXXXXX"

IMPALA-532: Impala should tolerate bad locale settings

If the LC_* environment variables specify an unsupported locale, Impala does not start.

Add LC_ALL="C" to the environment settings for both the Impala daemon and the Statestore daemon.

Avro Scanner fails to parse some schemas

The default value in Avro schema must match type of first union type, e.g. if the default value is null, then the first type in the UNION must be "null".

Swap the order of the fields in the schema specification. For example, use ["null", "string"] instead of ["string", "null"]. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

IMPALA-691: Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the impalad daemon.

To monitor overall memory usage, use the `top` command, or add the memory figures in the Impala web UI `/memz` tab to JVM memory usage shown on the `/metrics` tab.

IMPALA-1024: Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Remove trailing semicolon from the Avro schema.

IMPALA-1652: Incorrect results with basic predicate on CHAR typed column

When comparing a CHAR column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Use the `RPAD()` function to blank-pad literals compared with `CHAR` columns to the expected length.

IMPALA-1821: Casting scenarios with invalid/inconsistent results

Using a `CAST()` function to convert large literal values to smaller types, or to convert special values such as NaN or Inf, produces values not consistent with other database systems. This could lead to unexpected results from queries.

None

IMPALA-2005: A failed CTAS does not drop the table if the insert fails

If a CREATE TABLE AS SELECT operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Drop the new table manually after a failed CREATE TABLE AS SELECT

IMPALA-2422: % escaping does not work correctly when occurs at the end in a LIKE clause

If the final character in the RHS argument of a LIKE operator is an escaped \% character, it does not match a % final character of the LHS argument.

None

IMPALA-2603: Crash: impala::Coordinator::ValidateCollectionSlots

A query could encounter a serious error if includes multiple nested levels of INNER JOIN clauses involving subqueries.

None

IMPALA-3094: Incorrect result due to constant evaluation in query with outer join

An OUTER JOIN query could omit some expected result rows due to a constant such as FALSE in another join clause. For example:

```
explain SELECT 1 FROM alltypestiny a1
  INNER JOIN alltypesagg a2 ON a1.smallint_col = a2.year AND fals
e
  RIGHT JOIN alltypes a3 ON a1.year = a1.bigint_col;
+---+
|
```

[illegible]

IMPALA-3509: Breakpad minidumps can be very large when the thread count is high

The size of the breakpad minidump files grows linearly with the number of threads. By default, each thread adds 8 KB to the minidump size. Minidump files could consume significant disk space when the daemons have a high number of threads.

Add `-minidump_size_limit_hint_kb=size` to set a soft upper limit on the size of each minidump file. If the minidump file would exceed that limit, Impala reduces the amount of information for each thread from 8 KB to 2 KB. (Full thread information is captured for the first 20 threads, then 2 KB per thread after that.) The minidump file can still grow larger than the "hinted" size. For example, if you have 10,000 threads, the minidump file can be more than 20 MB.

IMPALA-4978: Impala requires FQDN from hostname command on Kerberized clusters

The method Impala uses to retrieve the host name while constructing the Kerberos principal is the `gethostname()` system call. This function might not always return the fully qualified domain name, depending on the network configuration. If the daemons cannot determine the FQDN, Impala does not start on a Kerberized cluster.

Test if a host is affected by checking whether the output of the `hostname` command includes the FQDN. On hosts where `hostname`, only returns the short name, pass the command-line flag `##hostname=FULLY_QUALIFIED_DOMAIN_NAME` in the startup options of all Impala-related daemons.

IMPALA-6671: Metadata operations block read-only operations on unrelated tables

Metadata operations that change the state of a table, like `COMPUTE STATS` or `ALTER RECOVER PARTITIONS`, may delay metadata propagation of unrelated unloaded tables triggered by statements like `DESCRIBE` or `SELECT` queries.

None

IMPALA-7072: Impala does not support Heimdal Kerberos

None

OPSAPS-46641: A single parameter exists in Cloudera Manager for specifying the Impala Daemon Load Balancer. Because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

The workaround is to use the load balancer configuration either without a port specification, or with the Beeswax port: this will configure BDR. To configure Hue use the "Hue Server Advanced Configuration Snippet (Safety Valve) for impalad_flags" to specify the the load balancer address with the HiveServer2 port.

CDPD-28139: Set spark.hadoop.hive.stats.autogather to false by default

As an Impala user, if you submit a query against a table containing data ingested using Spark and you are concerned about the quality of the query plan, you must run `COMPUTE STATS` against such a table in any case after an ETL operation because numRows created by Spark could be incorrect. Also, use other stats computed by `COMPUTE STATS`, e.g., Number of Distinct Values (NDV) and NULL count for good selectivity estimates.

For example, when a user ingests data from a file into a partition of an existing table using Spark, if `spark.hadoop.hive.stats.autogather` is not set to `false` explicitly, `numRows` associated with this

partition would be 0 even though there is at least one row in the file. To avoid this, the workaround is to set "spark.hadoop.hive.stats.autogather=false" in the "Spark Client Advanced Configuration Snippet (Safety Valve) for spark-conf/spark-defaults.conf" in Spark's CM Configuration section.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker) in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Save Changes > Restart SMM.

The offsets.topic.replication.factor property must be less than or equal to the number of live brokers

The `offsets.topic.replication.factor` broker configuration is now enforced upon auto topic creation. Internal auto topic creation will fail with a `GROUP_COORDINATOR_NOT_AVAILABLE` error until the cluster size meets this replication factor requirement.

None

Requests fail when sending to a nonexistent topic with `auto.create.topics.enable` set to true

The first few produce requests fail when sending to a nonexistent topic with `auto.create.topics.enable` set to true.

Increase the number of retries in the producer configuration setting `retries`.

Performance degradation when SSL Is enabled

In some configuration scenarios, significant performance degradation can occur when SSL is enabled. The impact varies depending on your CPU, JVM version, Kafka configuration, and message size. Consumers are typically more affected than producers.

Configure brokers and clients with `ssl.secure.random.implementation = SHA1PRNG`. It often reduces this degradation drastically, but its effect is CPU and JVM dependent.

OPSAPS-43236: Kafka garbage collection logs are written to the process directory

By default Kafka garbage collection logs are written to the agent process directory. Changing the default path for these log files is currently unsupported.

None

RANGER-3809: Idempotent Kafka producer fails to initialize due to an authorization failure

Kafka producers that have idempotence enabled require the Idempotent Write permission to be set on the cluster resource in Ranger. If permission is not given, the client fails to initialize and an error similar to the following is thrown:

```
org.apache.kafka.common.KafkaException: Cannot execute transactional method because we are in an error state
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeFailWithError(TransactionManager.java:1125)
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeAddPartition(TransactionManager.java:442)
    at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:1000)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:914)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:800)
    .
    .
    .
    Caused by: org.apache.kafka.common.errors.ClusterAuthorizationException: Cluster authorization failed.
```

Idempotence is enabled by default for clients in Kafka 3.0.1, 3.1.1, and any version after 3.1.1. This means that any client updated to 3.0.1, 3.1.1, or any version after 3.1.1 is affected by this issue.

This issue has two workarounds, do either of the following:

- Explicitly disable idempotence for the producers. This can be done by setting `enable.idempotence` to false.
- Update your policies in Ranger and ensure that producers have Idempotent Write permission on the cluster resource.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a `STRUCT` type default value.

None.

DBZ-4990: The Debezium Db2 Source connector does not support schema evolution

The Debezium Db2 Source connector does not support the evolution (updates) of schemas. In addition, schema change events are not emitted to the schema change topic if there is a change in the schema of a table that is in capture mode. For more information, see [DBZ-4990](#).

None.

CFM-3532: The Stateless NiFi Source, Stateless NiFi Sink, and HDFS Stateless Sink connectors cannot use Snappy compression

This issue only affects Stateless NiFi Source and Sink connectors if the connector is running a dataflow that uses a processor that uses Hadoop libraries and is configured to use Snappy compression. The HDFS Stateless Sink connector is only affected if the Compression Codec or Compression Codec for Parquet properties are set to SNAPPY.

If you are affected by this issue, errors similar to the following will be present in the logs.

```
Failed to write to HDFS due to java.lang.UnsatisfiedLinkError: o
rg.apache.hadoop.util.NativeCodeLoader.buildSupportsSnappy()
```

```
Failed to write to HDFS due to java.lang.RuntimeException: nativ
e snappy library not available: this version of libhadoop was bu
ilt without snappy support.
```

Download and deploy missing libraries.

Important: Ensure that you complete steps 1-11 on all Kafka Connect hosts. Additionally, ensure that the advanced configuration snippet in step 12 is configured for all Kafka Connect role instances.

1. Create the `/opt/nativelibs` directory.

```
mkdir /opt/nativelibs
```

2. Change the owner to kafka.

```
chown kafka:kafka /opt/nativelibs
```

3. Locate the directory containing the Hadoop native libraries and copy its contents to the directory you created.

```
cp /opt/cloudera/parcels/CDH/lib/hadoop/lib/native/* /opt/nativelibs
```

4. Verify that `libsnappy.so` was copied to the directory you created.
5. Remove the following from `/opt/nativelibs`.

```
libhadoop.a
libhadoop.so
libhadoop.so.1.0.0
```

6. Run the following command.

```
hadoop version
```

The command returns the Hadoop version running in the cluster. Note down the first three digits in the version.

7. Go to <https://archive.apache.org/dist/hadoop/common/> and download the Hadoop version that matches the first three digits of the version running in the cluster.
For example, if your Hadoop version is 3.1.1.7.1.9.0-296, then you need to download Hadoop 3.1.1.
8. Extract the downloaded archive.
9. Copy the following libraries from the downloaded archive to /opt/nativelibs on the cluster host.

```
libhadoop.a      libhadoop.so.1.0.0
```

The libraries are located in `hadoop-[***VERSION***]/lib/native`.

10. Create a symlink named `libhadoop.so` and point it to `/opt/nativelibs/libhadoop.so.1.0.0`.

```
ln -s /opt/nativelibs/libhadoop.so.1.0.0 /opt/nativelibs/libhadoop.so
```

11. Change the owner of every entry within `/opt/nativelibs` to `kafka`.

```
chown -h kafka:kafka /opt/nativelibs/*
```

12. In Cloudera Manager, go to `Kafka service Configuration`.
13. Add the following key-value pair to `Kafka Connect Environment Advanced Configuration Snippet (Safety Valve)`.
 - Key: `LD_LIBRARY_PATH`
 - Value: `/opt/nativelibs`
14. Click `Save Changes`.
15. Restart the Kafka service.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to `required`. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to `requested` instead of `required` and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Unsupported Features

The following Kafka features are not supported in Cloudera Data Platform:

- Only Java and .Net based clients are supported. Clients developed with C, C++, Python, and other languages are currently not supported.
- The Kafka default authorizer is not supported. This includes setting ACLs and all related APIs, broker functionality, and command-line tools.
- SASL/SCRAM is only supported for delegation token based authentication. It is not supported as a standalone authentication mechanism.
- Kafka KRaft in this release of Cloudera Runtime is in technical preview and does not support the following:
 - Deployments with multiple log directories. This includes deployments that use JBOD for storage.
 - Delegation token based authentication.
 - Migrating an already running Kafka service from ZooKeeper to KRaft.
 - Atlas Integration.

Limitations

Collection of Partition Level Metrics May Cause Cloudera Manager's Performance to Degrade

If the Kafka service operates with a large number of partitions, collection of partition level metrics may cause Cloudera Manager's performance to degrade.

If you are observing performance degradation and your cluster is operating with a high number of partitions, you can choose to disable the collection of partition level metrics.

Important: If you are using SMM to monitor Kafka or Cruise Control for rebalancing Kafka partitions, be aware that both SMM and Cruise Control rely on partition level metrics. If partition level metric collection is disabled, SMM will not be able to display information about partitions. In addition, Cruise Control will not operate properly.

Complete the following steps to turn off the collection of partition level metrics:

1. Obtain the Kafka service name:
 - a. In Cloudera Manager, Select the Kafka service.
 - b. Select any available chart, and select Open in Chart Builder from the configuration icon drop-down.
 - c. Find \$SERVICENAME= near the top of the display.

The Kafka service name is the value of \$SERVICENAME.

2. Turn off the collection of partition level metrics:
 - a. Go to Hosts Hosts Configuration .
 - b. Find and configure the Cloudera Manager Agent Monitoring Advanced Configuration Snippet (Safety Valve) configuration property.

Enter the following to turn off the collection of partition level metrics:

```
[KAFKA_SERVICE_NAME]_feature_send_broker_topic_partition_entity_update_enabled=false
```

Replace [KAFKA_SERVICE_NAME] with the service name of Kafka obtained in step 1. The service name should always be in lower case.

- c. Click Save Changes.

Known Issues in Knox

Learn about the known issues in Knox, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-92941: Knox Gateway logging configuration cannot be customized through Cloudera Manager

The Knox Gateway Logging Configuration (Safety Valve) in Cloudera Manager is not applied to Knox Gateway. Individual logger configurations cannot be set or modified through the Cloudera Manager UI.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-76435: Default HTTP client timeout for Streams Messaging Manager requests may cause connection timeouts

Some Streams Messaging Manager requests, particularly those retrieving topic data, may take up to 30 seconds to complete, even when there are no connectivity issues. Since the default gateway timeout is set to 20 seconds, this can result in connection timeouts despite the system functioning as expected.

Increase the HTTP client and socket timeouts for Streams Messaging Manager services to 60 seconds. This prevents connection timeouts when the requests take longer than the default gateway timeout.

Follow these steps to configure the required properties for the SMM API and SMM UI services:

1. In Cloudera Manager, select the Knox service.
2. Go to Configuration.
3. Find the Knox Simplified Topology Management - cdp-proxy property, and click **+** to add the following lines:

```
SMM-UI:replayBufferSize=512
SMM-UI:httpclient.connectionTimeout=1m
SMM-UI:client.socketTimeout=1m
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

4. Find the Knox Simplified Topology Management - cdp-proxy-api property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

5. Find the Knox Simplified Topology Management - cdp-proxy-token property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

6. Save your changes.
7. Refresh the cluster.

Known Issues in Kudu

Learn about the known issues in Kudu, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-94474: Kudu Tablet Server Crash on RHEL9

Kudu tablet servers kudu-tserver crash on Red Hat Enterprise Linux 9 (RHEL9) x86_64 platforms when the libgcc package is updated to version 11.5.0-11 or newer. This crash manifests as a Segmentation Fault (SIGSEGV) or an Abort (SIGABRT) error under certain workloads.

1. Log in to Cloudera Manager as an Administrator.
2. Navigate to Cloudera Manager Clusters Kudu Configuration .
3. Navigate to the Configuration tab, and add the following value in the Tablet Server Advanced Configuration Snippet (Safety Valve) for gflagfile for the Tablet Server Default Group field:

```
--mrs_use_codegen=false
```

4. Click Save Changes.
5. Restart the Kudu Service.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

You get "The user 'kudu' is not part of group 'hive' on the following hosts:" warning by the Host Inspector.

If you are using fine-grained authorization for Kudu, and you are also using Kudu-HMS integration with HDFS-Sentry sync, then you may get the "The user 'kudu' is not part of group 'hive' on the following hosts:" warning while upgrading.

Workaround: Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Unsupported features

Kudu HMS Sync is disabled and is not yet supported

Known Issues in Ozone

Learn about the known issues in Ozone, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-88335: Datanode decommission fails when other datanodes are offline due to invalid affinity node in Ratis replication

Datanode decommissioning fails if one or more datanodes holding Ratis replicas are offline. During decommission, the Storage Container Manager (SCM) tries to replicate Ratis container data to maintain redundancy. However, SCM's placement logic still references an affinity node that was previously part of the network topology but has since been removed due to the datanode going offline. This causes repeated placement errors and prevents the decommission process from completing successfully.

Apache Issue: [HDDS-13544](#)

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-87429: Unexpected log lines in Ozone snapshot diff output

`ozone.client.server-defaults.validity.period.ms` configuration introduced to get server default configurations causes Replication Manager to fail when replicating data between Ozone buckets with the following error when the config value does not specify a timeunit.

```

...
java.lang.IllegalStateException: Invalid first line in diff: "25
/07/02 05:58:44 INFO Configuration.deprecation: No unit for ozon
e.client.server-defaults.validity.period.ms(3600000) assuming MI
LLISECONDS"
at com.cloudera.enterprise.distcp.OzoneCopyListingUtils.parseOz
oneDiff(OzoneCopyListingUtils.java:397)
...

```

Overwrite the `ozone.client.server-defaults.validity.period.ms` to configure the value to have time unit (ns, ms, s, m, h). For example, 3600000ms.

CDPD-71648: Snapshot creation failing with "PERMISSION_DENIED" error on a bucket created during pre-upgrade in 7.1.7 SP3

On upgrade of cluster from 7.1.7 SP3 to 7.1.9 SP1, we are not able to create snapshots on a pre-upgrade volume or bucket with "PERMISSION_DENIED" error, since in 7.1.7SP3, we were using full KRB owner name with domain but currently, we only use and search for user shortname.

Update the owner of the bucket with the user shortname and then create snapshot by running the commands:

```
ozone sh bucket update --user=[***USER_SHORT_NAME***] {volume}/
{bucket}
```

```
ozone sh snapshot create {volume}/{bucket}
{[***SNAPSHOT_NAME***]}
```

OPSAPS-74668: ozone.snapshot.deep.cleaning.enabled and ozone.snapshot.ordered.deletion.enabled configurations are missing with CDP 7.1.9 SP1 CHF and Cloudera Manager 7.13.1

Two Ozone Manager configurations are missing while using CDP 7.1.9 SP1 CHF after upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400.

If you are using CDP 7.1.9 SP1 CHF, before upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400, add the following configs to Ozone Manager Advanced Configuration Snippet (Safety Valve) for ozone-conf/ozone-site.xml so that Ozone Manager does not miss important config after the Cloudera Manager upgrade:

```
<property>
<name>ozone.snapshot.deep.cleaning.enabled</name>
<value>false</value>
</property>

<property>
<name>ozone.snapshot.ordered.deletion.enabled</name>
<value>true</value>
</property>
```

CDPD-64865: Intermittent timeout in TestBlockDeletion.testBlockDeletion (BlockDeletionService stuck)

If the event of SCM exiting safe mode was triggered multiple times, this might eventually cause the SCMBlockDeletingService to transition into the PAUSING state.

Check the SCM logs and ensure that the SCMBlockDeletingService is not running, and then restart the SCM.

CDPD-81569: Recon is not reflecting correct metrics for Volumes, Buckets, Keys, and Pending Key Deletions

Recon is displaying data for container and space utilisation only. The metrics for Volumes, Buckets, Keys, and Pending Key Deletions are not being updated and displayed correctly.

Apache Jira: [HDDS-12607](#)

CDPD-54885: Ozone Prometheus does not work with TLS

The Prometheus service shipped by Ozone does not support TLS mode. So, Prometheus is not able to gather metrics from Ozone endpoints when TLS is enabled.

Go to Ozone Configuration Ozone Prometheus Endpoint Token and update the Ozone Prometheus Endpoint Token with any random string. This makes a token available in the process directory of the Ozone endpoint in plaintext, which Prometheus can use to get around the TLS limitation.

CDPD-69681: Ozone Ranger plugin does recursive listing for ACL checks

Ozone Ranger plugin does recursive listing in unoptimized path for performing ACL check on a directory. Recursive rename and delete operations on directories with layers of subdirectories causes a performance problem.

[Enable Ranger subaccess optimization for rename and delete operations in Ozone.](#)

Apache Issue: [HDDS-10823](#)

CDPD-51490: Installing HDFS and Ozone datanode instances on the same server (in case of a small test or development platform), can cause the Ozone UI to fail as it attempts to use the same default port 9864 already taken by HDFS.

On the Ozone configuration, overwrite the hdds.datanode.client.port value = 19864 and restart the Ozone service. This will allow Ozone UI to load without colliding with the HDFS service.

The Prometheus binary is not available in CDP Private Cloud Base 7.1.9 for the Ubuntu operating system.

You can install Prometheus separately and specify the path to the parent directory, for example /usr/bin, in the prometheus.location parameter in Ozone.

After upgrading the cluster from CDP Private Cloud Base 7.1.8 to CDP Private Cloud Base 7.1.9 and if Ozone is in the Non-HA environment, an exception message is observed during the finalization of the Ozone upgrade.

During the finalization of the upgrade, a ClassNotFoundException message for org.cloudera.log4j.redactor.RedactorAppender class may be displayed. The error message can be ignored because the upgrade is successful. The error existed previously and does not affect the Ozone service and its operation.

None.

CDPD-68951: In CDP Private Cloud Base 7.1.9 CHF2 version and lower, the command `ozone sh key list <bucket_path>` displays the isFile flag in a key's metadata as false even when the key is a file. This issue is rectified in CDP Private Cloud Base 7.1.9 CHF3. However, the pre-existing (pre-upgrade) key's metadata cannot be changed.

None

CDPD-67771: When using S3A committer `fs.s3a.committer.name=directory` with `fs.s3a.committer.staging.conflict-mode=replace` to write to FSO buckets, the client fails with the following error.

```
DIRECTORY_NOT_FOUND
org.apache.hadoop.ozone.om.exceptions.OMException:
Failed to find parent directory of xxxxxxxx at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentId(OMFileRequest
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteRequest
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteRequest
at
org.apache.hadoop.ozone.protocolPB.OzoneManagerRequestHandler.handleWriteRequest
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.runCommand(OzoneManag
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.lambda
$1(OzoneManagerStateMachine.java:363) at
java.base/java.util.concurrent.CompletableFuture
$AsyncSupply.run(CompletableFuture.java:1700) at java.base/
java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1128)
at java.base/java.util.concurrent.ThreadPoolExecutor
$Worker.run(ThreadPoolExecutor.java:628) at java.base/
java.lang.Thread.run(Thread.java:834)
```

This occurs because S3A uses multipart upload to commit job results in a batch. The staging committer's replace mode deletes the target directory before completing Memory Protection Unit (MPU). The problem is that File System Optimization (FSO) does not create intermediate directories during MPU, it does only for regular file/dir/key requests.

Use `fs.s3a.committer.name=magic` for affected versions.

CDPD-64398: In SCM with non-HA configuration, Secret key manager does not initialise. Hence, the startup of OM and DataNode fails because it cannot get a secret key. This key is used when security is enabled and used in Block token and container token verification while communicating between the Ozone client, OM, and Datanode.

This issue does not occur in SCM with HA configuration.

You must force exit from the safe mode for SCM. This triggers the initialization of the Secret key manager. Below are the options:

- exit safe mode manually whenever SCM is started
- disable safe mode by setting `hdds.scm.safemode.enabled=false` in safety valve for SCM configuration

Impact of disabling safe mode and the purpose of safe mode:

- Write should not fail once the cluster is out of safe mode
- Read of existing data should not fail after the cluster is out of safe mode
- Unnecessary re-replication should be avoided during cluster restart

So disabling safe mode does not have any major impact on Ozone.

HDDS-9512: Ozone DataNode's new client port conflicts with HDFS DataNode's web port if both Ozone and HDFS DataNode roles are placed on the same host.

You must set `hdds.datanode.client.port` to any unused port. For example, 19864, through the Ozone DataNode safety valve.

CDPD-52412: keyManagerImpl#listStatus exceeds the maximum RPC length.

To reduce the payload, you must increase the part size.

OPSAPS-68159: If you did not deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Error when distributing parcel to host, Ignoring non-compliant parcel manifest error is displayed after Cloudera Manager is upgraded to 7.11.3.

If you encounter the error, perform the following steps:

1. Deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.11.3.
2. Restart the cluster with a delay of 10 minutes.
3. Continue to upgrade CDH 7.1.8 to CDH 7.1.9.

OPSAPS-68159: If you did not deactivate the Ozone parcel 718.2.x on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Ozone roles during the CDH 7.1.8 upgrade to CDH 7.1.9.

If you encounter the error, perform the following steps:

1. Deactivate the Ozone parcel 718.2.x.
2. Restart the Ozone service.
3. Perform Finalize Upgrade for the Ozone service.

Step result: The Ozone roles will be displayed in green.

CDPD-60989: The packaging version for Apache Ozone points to the 1.2.0 older version. This is a version string problem and not a packaging issue. The version of the Apache Ozone binary is closest to 1.4.0.

None. This only affects the JAR versioning.

CDPD-60366: Native library loader fails when system property `native.lib.tmp.dir` is not set. It fails because the library is copied to / instead of the `cwd`.

Setting `native.lib.tmp.dir` to a certain path like `/tmp` should solve the issue. To set this system property, you must add `-Dnative.lib.tmp.dir=/tmp` to `ozone_java_opts` in Cloudera Manager configuration of the Ozone cluster.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-60598: DataNode can consume up to the JVM heap size worth of direct memory buffers under specific failure scenarios. This can lead to a DataNode crash. This is due to Netty allocating and not freeing the direct memory buffers.

Restarting DataNode will resolve this issue.

CDPD-60466: The Ozone client is missing in the Cloudera Manager's Service Monitor node. This causes Ozone Canary's health check to fail.

Ensure you install Ozone CLI on the same node as Cloudera Manager's Service Monitor.

CDPD-60012: The Ozone SCM may be stuck in safe mode after upgrade to 7.1.9. This is due to a bug in how the SCM accounts for open storage containers.

The workaround is to temporarily set the Ozone configuration `hdds.scm.safemode.threshold.pct` to a lower value like 0.90 and restart the SCM.

CDPD-59679: In some scenarios, excess UNHEALTHY replicas of EC containers may not be removed from the cluster.

None

CDPD-50116: Topology-aware reads can provide better performance by routing applications to the closest replica of a file, if available, on the same physical node or same rack. However this feature is disabled by default in CDP 7.1.9.

This feature can be enabled by setting `ozone.network.topology.aware.read` to true using Cloudera Manager safety valve.

CDPD-57165: The DataNode disk usage thread may abort due to Ratis log tailing.

Use `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory` to calculate disk usage. Configure in the `ozone-site.xml` property: `hdds.datanode.du.factory` value: `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory`

OPSAPS-63510: When Ozone Container Balancer is started using Activate Container Balancer from Cloudera Manager, it runs on the Storage Container Manager (SCM) host which is the Ratis leader. However, the link to the Full Log File under Role Log in the Cloudera Manager command window for the Activate Container Balancer command may not link to the leader SCM's logs.

1. Find the leader SCM. Using Cloudera Manager and SCM Web UI: Go to Clusters Ozone **Web UI**. Open any of the Storage Container Manager web UI. In the UI, search for SCM Roles (HA) in the Status section. The leader SCM's hostname is mentioned. Or using Terminal: Log in to any Ozone host and run `ozone admin scm roles`. Note the leader.
2. After finding the leader SCM, search in this leader host's logs for ContainerBalancer related logs.

OPSAPS-67373: Toggling the Enable Ozone S3 Multi-Tenancy feature configuration in the Cloudera Manager Ozone service configuration page affects more service roles than actually needed.

Enabling multi-tenancy only requires restarting the Ozone Managers.

CDPD-55513: Hive external table replication policy does not migrate Hive tables in HDFS storage to Ozone.

To replicate data from HDFS to Ozone, see [Migrating your data from HDFS to Ozone](#). You can use HMS Mirror to replicate the metadata.

OPSAPS-67757: Hive external tables in Ozone storage cannot be replicated using Hive external table replication policies.

To replicate the Hive external tables' data, consider using DistCp. To replicate the metadata of Hive external tables, consider using HMS Mirror.

Remove bucket recursively using `rb -f -force` command from AWS S3 cannot work for FSO buckets.

Use the Ozone shell command `ozone sh bucket delete -r [***BUCKET ADDRESS***]`

CDPD-59126: Info log displays "noexec permission on /tmp/liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86" on client while executing command with noexec on /tmp.

To suppress Info log related to `liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86` library: Export `OZONE_OPTS` environment variable on the client terminal by running the command `export OZONE_OPTS="-`

```
Dorg.apache.ratis.thirdparty.io.netty.native.workdir=/var/tmp
$OZONE_OPTS"
```

OPSAPS-67650: Ozone uses RocksDB as a library to persist metadata locally.

By default, RocksDB places certain executables in /tmp, and thus encounters errors when /tmp is mounted with noexec.

The workaround is to configure RocksDB to put executables at another location. On a PhatCat node, the steps are:

1. Go to Cloudera Manager UI OZONE Configuration .
2. Find Ozone Service Environment Advanced Configuration Snippet (Safety Valve) and set the following environment variable: `ROCKSDB_SHAREDLIB_DIR=/VAR/TMP`
3. Restart Ozone.

CDPD-49137: Ozone Manager Kerberos token expires for SCM communication and OM does not log in again.

Sometimes, OM's Kerberos token is not updated and it stops to communicate with SCM. When this occurs, writes start failing.

Restart OM or set the safety valve `hadoop.kerberos.keytab.login.autorenewal.enabled = true`

CDPD-56684: Keys get deleted when you do not have permission on volume

When a volume is deleted, it recursively deletes the buckets and keys inside it and only then deletes the volume. The volume delete ACL check is done only in the end, due to which you may end up deleting all the data inside the volume without having delete permission on the volume.

Note: There was no bucket/key permission available which allowed the user to delete them recursively.

CDPD-50610: Large file uploads are slow with OPEN and stream data approach

Hue file browser uses the append operation for large files. This API is not supported by Ozone in 7.1.9 and therefore large file uploads can be slow or timeout from the browser.

Use native Ozone client to upload large files instead of the Hue file browser.

OPSAPS-64097: Ozone service restart failed at SCM

Stopping SCM service using Cloudera Manager can sometimes timeout and need a retry. The Cloudera Manager API waits for 90 seconds which is not sufficient under certain circumstances.

Retry the shutdown using Cloudera Manager if the SCM still shows as running after a refresh of the service status.

OPSAPS-66469: Ozone-site.xml is missing if the host does not contain HDFS roles

The client side `ozone-site.xml` (/etc/hadoop/conf/ozone-site.xml) is not generated by Cloudera Manager if the host does not have any HDFS role. Because of this, issuing Ozone commands from that host fails because it cannot find the service name to host name mapping. The error message is similar to this: `# ozone sh volume list o3://ozoneabc 23/03/06 18:46:15 WARN ha.OMProxyInfo: OzoneManager address ozoneabc:9862 for serviceID null remains unresolved for node ID null` Check your `ozone-site.xml` file to ensure ozone manager addresses are configured properly.

Add the HDFS gateway role on that host.

OPSAPS-67607: Cloudera Manager FirstRun failure at the “Upload YARN MapReduce Framework JARs” step.

If this failure is attributed to the broken symbolic link, `/var/lib/hadoop-hdfs/ozone-filesystem-hadoop3.jar`, it is likely due to the presence of the user `hdfs` on the node prior to CDP parcel activation. As a result, the Cloudera Manager agent skips the initialization related to HDFS, leading to the non-creation of the `/var/lib/hadoop-hdfs` directory.

Create the directory `“/var/lib/hadoop-hdfs”` on all nodes followed by the deactivation and activation of the CDP parcel (deactivate and activate the Ozone parcel instead, in case Ozone parcel is used).

CDPD-50447: When SCM High Availability is enabled, each of the SCM web UIs report the host of the web UI as the leader of HA, and the other two as followers. This gives wrong information

Correct output is available by running the `ozone admin scm roles --service-id=<ID>` command.

OPSAPS-66501: Currently it is not possible to configure High Availability for SCM roles in Ozone post deployment. You should be able to change the HA configuration through Cloudera Manager, bringing it in line with other services.

At present it requires deleting Ozone and then adding it back with the SCM HA configuration in place and manually cleaning up the Ozone data in between. For more information, read the [KB article](#).

OPSAPS-66500: Currently, it is not possible to enable Kerberos in Ozone after it has been deployed, despite all the required configuration changes being created when the box is checked in the Ozone configurations in Cloudera Manager.

Ozone must be deleted and redeployed with Kerberos enabled. Due to OPSAPS-66499, this requires manual data cleanup in between. For more information, read the [KB article](#).

OPSAPS-66499: When you delete Ozone from a cluster using Cloudera Manager, Ozone data is not cleaned up. This may cause issues when Ozone is redeployed.

You must clean up the data manually. For more information, read the [KB article](#).

OPSAPS-62327: In an Ozone cluster without any gateway roles, Ozone is unable to deploy client configurations and displays the ConfigGenException error.

You must add the Ozone gateway roles to the cluster.

CDPD-49027: SCM certificates are not renewed automatically

The certificates that are there to ensure encrypted communication and authentication between Ozone internal services are not renewed automatically for Storage Container Managers.

Certificate revocation

Once these certificates expire, a manual re-bootstrap of the internal Ozone certificates is necessary.

To revoke a certificate, remove the full trust chain to stop trusting a compromised certificate. For this, remove the SCM certificates or any other certificates from the system. During the startup of the system, new certificates are created and distributed. The old certificates are not trusted anymore as the root CA certificate changes as well.

Procedure to force revoke internal certificates:

1. Stop Ozone service and all of its roles including SCMs
2. Include SCM's certs folders. Note that the Primordial SCM node has two certs folder, one for the root CA and other for the intermediate CA that the node holds. Rest of the SCMs have just one folder for the intermediate CA role that the node serves. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name certs; done`
3. Move these certs directories to a backup location
4. Locate the key material and move it to a backup folder. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name keys; done`
5. Move these keys directories to a backup location
6. The VERSION file of SCM has to be updated similarly to Ozone Manager's VERSION file. To locate both the SCM and OM VERSION files on the hosts, execute the following command: `find / -name om -o -name scm 2>/dev/null | while read line; do find $line -name VERSION; done | sort | uniq`
7. Backup the version file (just in case you need to restore for any reason)
8. In OM's VERSION file remove the line starting with `omCertSerialId`, in SCM's VERSION file remove the line starting with `scmCertSerialId`.

9. Start the stopped Ozone roles and certificates will be regenerated during startup.

CDPD-35632: The default block level checksum does not work when running distcp from HDFS to Ozone or the other way around, because the two file systems manage underlying blocks very differently.

Use a file level checksum instead. For example, append ``-Ddfs.checksum.combine.mode=COMPOSITE_CRC`` to the distcp command.

CDPD-43942: Requests to modify an Ozone S3 tenant may fail with the error "Timed out acquiring authorizer write lock. Another multi-tenancy request is in-progress." even if another request is not in progress.

Retry the request.

CDPD-36389: The configurations `datanodes.involved.max.percentage.per.iteration` and `size.moved.max.per.iteration` are meant to limit the max number of DataNodes that is involved and maximum size that can move in an iteration. This bug causes balancer to stop an iteration when it is two DataNodes or 1 Container size (5GB) away from hitting these limits. However, these DataNodes can again be considered for balancing in the next iteration. This means the cluster is balanced after enough iterations, albeit a bit slowly. This bug is apparent in small clusters of around four DataNodes where the DataNodes can be either the source or target for a lot of moves but the iteration gets stopped when three DataNodes have been involved. It takes a higher number of iterations to eventually balance this cluster. While this is a performance issue, it does not prevent balancer from ultimately balancing the cluster.

Increase the speed for balancing by decreasing the interval between each iteration using the configuration `balancing.iteration.interval`. The value of this configuration must be greater than `hdds.datanode.du.refresh.period`. `size.moved.max.per.iteration` can be increased to allow more data to move in one iteration.

CDPD-22519: HDFS user is unable to run Ozone SCM client CLI.

SCM client CLIs are run using SCM user.

CDPD-34187: This is an usability issue where warnings are displayed on the console while running Ozone fs/CLI commands, which restricts user experience. .

Instead of logging into the user console, you redirect these log messages to a file called `ozone-shell-log4j.properties` which should avoid warnings to the user. Ozone-shell commands used a similar method of directing messages to the LogFile.

CDPD-35141: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2> (state=08S01,code=40000) java.sql.SQLException: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2>. This issue does not occur if the source and target buckets are different in Hive queries. Currently, copying across the same bucket is only supported.

Avoid different buckets in source and target path. Ensure that `hive.exec.stagingdir` is unset or set to the same bucket as the warehouse so that staging directories are created in the same bucket as the warehouse.

CDPD-40594: Ozone admin container create command does not work. The command fails at getCAList for the SCM Client to create a container.

Avoid using the create container command

CDPD-40966: df command on Ozone returns incorrect result.

None

CDPD-41184: With Legacy buckets, FileSystem Optimised is not interoperating with the Ozone shell command. The cause is that the directory key entry in the DB KeyTable is stored as `"dir1/"` with trailing slash. But while performing the described operation, Ozone shell (`o3://`) is normalizing the given path and removing the trailing slash `"/"` from it. That results in `KEY_NOT_FOUND` exception.

There are three workarounds:

- Use FileSystem API to Delete the Directories rather than Shell-Command API.

- Use FSO buckets instead of Legacy Buckets. As in FSO, you can create Intermediate Directories and Delete Directories using the Ozone shell commands.
- Disable and set the configuration `ozone.om.enable.filesystem.pathsflag` to false in order to delete the directories. This is generally not a preferred workaround because the cluster must be restarted to pick up the new changes.

CDPD-34867: Container Balancer might not balance if only Over-Utilized or only Under-Utilized DataNodes are reported. The log line displays the "Container Balancer has identified x Over-Utilized and y Under-Utilized DataNodes that need to be balanced" message where one of x or y will be 0.

Decrease the threshold using "utilization.threshold". This allows the balancer to find non zero number of both over and under utilized nodes.

CDPD-12966: Ozone du -s -h should report correct values with replication information.

None

CDPD-12542: Mount of Ozone filesystem with the help of FUSE fails.

None

CDPD-31910: In a non-Ranger deployment, the owner/group are shown based on Kerberos user or sudo user.

For correct owner/group, user needs a Ranger deployment.

CDPD-42691: During the upgrade - all pipelines will be closed when the upgrade is finalized on SCM, temporarily bringing the cluster to a read-only state.

When you execute the finalize command, the cluster will temporarily go into a read-only state.

CDPD-42945: When many EC buckets are created with different EC chunk sizes, it creates pipeline for each chunk size. As a result, large number of pipelines are created in the system.

None

OPSAPS-60721: Ozone SCM Primordial Node ID is a required field which needs to be specified with one of the SCM hostnames during Ozone HA installation. In Cloudera Manager this field is not mandatory during Ozone deployment. This can cause end users to continue further with installation which causes startup to fail in Ozone services.

During Ozone HA installation make sure that Ozone SCM Primordial Node ID is specified with one of the SCM hostname.

HDDS-4209: S3A Filesystem does not work with Ozone S3 in file system compact mode. When you create a directory, the S3A filesystem creates an empty file. When the `ozone.om.enable.filesystem.paths` parameter is enabled, the `hdfs dfs -mkdir -p s3a://b12345/d11/d12` command runs successfully. However, running the `hdfs dfs -put /tmp/file1 s3a://b12345/d11/d12/file1` command fails with an error: `ERROR org.apache.hadoop.ozone.om.request.key.OMKeyCreateRequest: Key creation failed`.

The HDDS-4209 Jira fixes the file system semantics and management in Ozone. On top of the flat name structure, which is Pure Object store, as a workaround the Hierarchical namespace structure is added. This ensures S3A compatibility with Ozone.

CDPD-42897: EC writes are failing with "No enough datanodes to choose" after EC replication config is set globally.

EC writes start failing when large number of pipelines are created as a result of multiple EC configs with different chunk sizes used to write keys.

If standard EC configs (that is, rs-3-2-1024k) are used to write keys, number of pipelines created per DataNode is limited to five and this issue is not seen with standard EC configs.

The recommendation is not to create too many random chunk sizes. It is configurable because, users can decide based on their workload. But do not to have separate chunk sizes for each file.

CDPD-41539: The "No such file or directory" imessage is displayed when EC file is read using older ofs client.

You must upgrade the client before trying to read the key: vol1/ecbuck1/1GB_ec".

CDPD-40560: Filesystem Operations using Hadoop S3a connector on a FILE_SYSTEM_OPTIMIZED bucket fails. org.apache.hadoop.ozone.om.exceptions.OMException: Unable to get file status: volume: s3v bucket: fso key: test/

Do not run Hadoop S3a commands on a FILE_SYSTEM_OPTIMIZED bucket. Use OBJECT_STORE bucket layouts.

CDPD-42832: With this issue, any long running setup or a production server results in data corruption due to inconsistency issues. This may result in major issues with the existing Legacy layout type.

FSO provides atomicity and consistency guarantees for the path (dir or file) rename/delete operations irrespective of the large sub-dirs/files contained in it. These capabilities help to make the long running test more consistent without any failures so far. Recommendation is to run bigdata HCFS workloads using the FSO bucket layout types.

CDPD-43432: Ozone Service in fault state in DataNode - Long Running setup.

Upgrade RocksDB to the latest version.

OPSAPS-63999: In the newly installed cluster, the Finish upgrade option is clickable.

None

OPSAPS-64648: Failed to start Ozone node using Cloudera Manager if default log path /var/log/hadoop-ozone does not exist. If this path does not exist, any Ozone nodes(for example SCM or DataNode) restart will fail.

Run the following command `sudo -u hdfs mkdir -p /var/log/hadoop-ozone` or replace hdfs with the user Ozone roles that are running.

CDPD-45932: Investigate impersonation with "is admin" in Ozone WebUIs /logLevel servlet endpoint

In a secure Kerberized cluster, due to an impersonation issue, changing log levels using Knox on the corresponding endpoint of the WebUI does not work. Note that this is only true, when the WebUI is accessed using Knox. Other means of changing log levels in Ozone services are not affected by this problem.

None.

Known Issues in Ranger

Learn about the known issues in Ranger, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

Access issues with users having similar name as admin or keyadmin users

Users with USER role that have a similar name as admin or keyadmin users are able to query those admin and keyadmin users.

None.

UnsupportedClassVersionError

JDK 8 deployments support Nashorn JavaScript engine, which is built-in and fully compatible, whereas JDK 17 deployments support GraalJS script engine due to unavailability of Nashorn.

When your cluster supports both JDK 8 and JDK 17, then while a Java application, running on JDK 8, uses generic interfaces like ScriptEngine (from the javax.script package), the ScriptEngineManager class scans the classpath for available script engine implementations through the service provider mechanism, and detects the GraalJS as a provider for JavaScript, because in this case the GraalJS library (version 22.3.0) is also included on the classpath. The

ScriptEngineManager then attempts to instantiate it, when requesting a "js" or "javascript" engine, and triggers an `UnsupportedClassVersionError`.

Remove the GraalJS library from the classpath.

CDPD-68806: The Revoke operation for users belonging to a group or role permission does not function as expected.

List command is listing all the tables even when the user permission is revoked. And also the command does not add any deny policy to Ranger for that specific user.

For example:

user_1 is the part of group_1

user_2 is the part of role_1

Create a Ranger policy for group_1 and role_1 to access all the resources in HBase.

Try to revoke the permission for user_1 and user_2 using HBase shell global revoke command:

```
revoke 'user_1'
```

```
revoke 'user_2'
```

But there is no deny policy added for that user. And access is still granted to user_1 and user_2.

This behavior is currently not supported in HBase shell. Must be handled manually using the Ranger policy change.

CDPD-68739: The revoke command does not work when using the HBase shell

While using the HBase shell, running the revoke command does not cancel the user permission. Users are able to perform actions even after running the revoke command.

For example:

When a user is granted permission to a particular table using the HBase grant command.

```
hbase:003:0> grant 'user_1', 'RWCA', 'some_abc_table'
```

And then execute the global revoke command for that user:

```
hbase:005:0> revoke 'user_1'
```

Permission for that user 'user_1' for the table 'some_abc_table' not got revoked.

None.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-58860: After upgrading CDP-7.1.8 to CDP-7.1.9, cdp-proxy token missing from Knox-Ranger policy.

As part of [OPSAPS-67480](#) in 719 default ranger policy is added from cdp-proxy-token topology, so that after a new installation of CDP-7.1.9, the Knox-Ranger policy includes cdp-proxy-token. However, upgrades do not add cdp-proxy-token to cm_knox policies automatically.

Manually add cdp-proxy-token to the Knox policy, using Ranger Admin Web UI.

1. Log in to Cloudera ManagerRangerRanger Admin Web UI, as a Ranger administrator.
2. On Ranger Admin Web UIService ManagerResourceKnox, click cm_knox.
3. In Knox Policies, open the CDP Proxy UI, API and Token policy.
4. In Knox Topology*, add cdp-proxy-token.
5. Click Save.
6. Restart Ranger.

CDPD-58704: hadoop roll key / key delete command shows operation failed error when one KMS host is down, even when operation succeeds

In case of rollover/delete, client sends one more (last after delete request) request to KMS instances to clean their cache and that too to all registered kms instances. if one KMS instance is stopped (not deleted), client gets runtime exception.

This simply returns the runtime exception on client end for stopped instances but doesn't break any functionality.

CDPD-56803: When there is no existing policy for user and a revoke request comes from hbase, then will get this error.

```
hbase:001:0> revoke 'hrt_11'
ERROR: org.apache.hadoop.hbase.coprocessor.CoprocessorException: HTTP 400 Error: processSecureRevokeRequest processing failed

    at org.apache.hadoop.hbase.ipc.RpcExecutor$Handler.run(RpcExecutor.java:369)
    at org.apache.hadoop.hbase.ipc.RpcExecutor$Handler.run(RpcExecutor.java:349)
```

None

CDPD-56741: Improvement in log message when jwtauth not used

The following exception is printed at startup only and it is not cluttering logs:

```
2023-05-30 06:18:40,127 ERROR org.apache.ranger.rms.security.RMSJwtAuthFilter:
quasar-pibgzl-1.quasar-pibgzl.root.hwx.site-startStop-1]:
Failed to initialize Ranger RMS JWT Auth Filter.
java.lang.Exception: RangerJwtAuthHandler:
Mandatory configs ('jwks.provider-url' & 'jwt.public-key')
are missing, must provide atleast one.
    at org.apache.ranger.authz.handler.jwt.RangerJwtAuthHandler.initialize(RangerJwtAuthHandler.java:84)
    ~[ranger-authn-2.4.0.7.1.9.0-186.jar:2.4.0.7.1.9.0-186]
```

```

        at org.apache.ranger.rms.security.RMSJwtAuthFilter.initialize(RMSJwtAuthFilter.java:77)
        ~[ranger-rms-common-2.4.0.7.1.9.0-186.jar:2.4.0.7.1.9.0-186]
        at jdk.internal.reflect.NativeMethodAccessorImpl.invoke0(Native Method) ~[?:?]
        at jdk.internal.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl

```

This exception is logged, since mandatory JWT auth filter configs are not provided (expected for some environments like y-cloud) Even though JWT auth filter is failed to initialised, it falls back to kerberos auth, hence no impact from auth perspective

NA

CDPD-56738: Ranger RMS showing FileNotFoundException: /usr/share/java/oraclepki.jar in Oracle 19 setup

This is a warning log printed in catalina.out file when Ranger RMS server is initialised. Following exception is observed only in Oracle 19 setup. FileNotFoundException: /usr/share/java/oraclepki.jar

NA

CDPD-48975: Ranger KMS KTS to KMS DB migration : keys with the same name but different case are not migrated

KMS keys are not case sensitive

No workarounds. Such keys combination are very rare and migration doc was updated to check such keys before starting the migration.

CDPD-42598: Kafka policy creation allowed with incorrect permissions.

When creating a Kafka policy from the UI, the permissions "Idempotent write" and "Cluster action" are not displayed as they are not applicable for the "topic" resource, but when creating a policy for the "topic" resource with the permissions "Idempotent write" and "Cluster Action", the policy is created successfully when the expected behaviour is that the policy creation must fail as the permission is not applicable for the Kafka topic resource

None.

CDPD-41582: Atlas Resource Lookup : Classification for "entity-type" lists only classification for the following payload:

```
{"resourceName": "classification", "userInput": "", "resources": {"classification": []}}
```

expectation is to return all the classifications . But the response has only "classification" Happens similarly for entity-label , entity-business-metadata.

None.

CDPD-40734: User allowed to insert data into a hive table when there is a deny policy on a table column.

A user is allowed to enter data into a table even if there is a deny policy present on one of the table columns.

Test scenario details:

```

Policy setup :-
policy 1 :- all access policy for hrt_qa, hive and impala
users
resources - database - * , table - *, column - *
users : hrt_qa, hive, impala
access - all access allowed
policy 2 :- policy on test_1.table_1 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column - *
access :- all access allowed

```

```

policy 3 :- deny policy on test_1.table_1.c0 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column -
c0
access - all access denied
data setup :-
database - test_1
table - table_1(c0 int, c1 int)

```

The user is able to insert data into the table.

None.

Known Issues in Schema Registry

Learn about the known issues in Schema Registry, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-40380: Authorization checking issue when Kerberos is disabled

Due to an issue in Ranger, when Kerberos is disabled then it is not possible to check authorization.

1. Open Schema Registry configuration in Cloudera Manager.
2. Find the `ranger.plugin.schema-registry.service.name` field.
3. Replace `GENERATED_RANGER_SERVICE_NAME` with the actual name of the service.
4. Restart the Schema Registry service.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a `STRUCT` type default value.

None.

CDPD-59015: Schema Registry does not create new versions of schemas even if the schema is changed

Schema Registry uses a schema fingerprinting mechanism to differentiate between schemas. However, fingerprinting does not take into consideration the schema attributes of the field type. As a result, if you have two schemas where the only difference is that one has type attributes defined and the other does not, they will be considered identical by Schema Registry. For example, the following schemas are considered identical:

```

#Schema V1
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":"long"}]}

#Schema V2
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":{"type":"long","logicalType":"local-timestamp-micros"}]}

```

Notice that the only difference is that in the second schema, the `local_timestamp_micros_long` field has a logical type specified. In cases like this, the new version of the schema is not created, the initial version is used. This is true even if the data that is being produced has a new schema version. The ID of the first schema version is used and is put in the serialized record. The new schema version is not created.

This issue is common when using change data capture (CDC) connectors like the Debezium connectors. This is because CDC connectors create schemas with the logical type decimal based on the column type in the database schema. For example:

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 0}}]}
```

If the database schema changes (for example, the column type), it is possible that only scale changes, which is a schema attribute.

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 1}}]}
```

In this case, even though scale changed to 1, the first version of the schema is used where scale is 0. As a result, the data is consumed with the wrong scale.

Avoid using logical types or other attributes. Alternatively, ensure that there are no changes in the logical types or other attributes between schema versions.

OPSAPS-68708: Schema Registry might fail to start if a load balancer address is specified in Ranger

Schema Registry does not start if the address specified in the Load Balancer Address Ranger property does not end with a trailing slash (/).

Set the value of the RANGER_REST_URL Schema Registry environment variable to an address that includes a trailing slash.

1. In Cloudera Manager, select the Schema Registry service.
2. Go to Configuration.
3. Find the Schema Registry Server Environment Advanced Configuration Snippet (Safety Valve) property and add the following:

```
Key: RANGER_REST_URL
Value: [***RANGER REST API URL***]
```

Replace [***RANGER REST API URL***] with an address that can be used by Schema Registry to access Ranger. Ensure that the address ends with a trailing slash. For example: `http s://ranger-1.cloudera.com:6182/`

4. Restart the Schema Registry service.

OPSAPS-70971: Schema Registry does not have permissions to use Atlas after an upgrade

Following an upgrade, Schema Registry might not have the required permissions in Ranger to access Atlas. As a result, Schema Registry's integration with Atlas might not function in secure clusters where Ranger authorization is enabled.

1. Access the Ranger Console (Ranger Admin web UI).
2. Click the `cm_atlas` resource-based service.
3. Add the `schemaregistry` user to the `all - *` policies.
4. Click `Manage Service Edit Service`.
5. Add the `schemaregistry` user to the `default.policy.users` property.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect

instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Known Issues in Spark

Learn about the known issues in Spark the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

The following known issues were identified in this release:

No new known issues in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-94393: RuntimeWarning Failed to add file" message appears even when Spark successfully loads files

In both Spark 2 and 3, due to an exception when attempting to add files to the Python path, the RuntimeWarning: Failed to add file message appears even when the Python JAR file is successfully loaded.

None. You can safely ignore the message as the file is loaded successfully and the message does not affect job completion.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-67517: Spark3 tests are failing if /tmp is mounted as NOEXEC.

Map the tmpdir to a writable path in spark3-conf/spark-defaults.conf using the following steps:

1. Go to the Cloudera Manager.
2. Go to the Spark service.
3. Click the Configuration tab.
4. Select Scope Gateway .
5. Select Category Advanced .
6. Locate the Spark Client Advanced Configuration Snippet (Safety Valve) for spark3-conf/spark-defaults.conf_client_config_safety_valve property.
7. Map the tmpdir to a writable path:

```
spark.driver.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
spark.executor.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
```

8. Enter a Reason for change, and then click Save Changes to commit the changes.
9. Deploy the client configuration.

CDPD-23817: In the upgraded Cluster, the permission of /tmp/spark is restricted due to the HDP configuration `hive.exec.scratchdir=/tmp/spark`.

If you are using the /tmp/spark directory in the CDP cluster, you must provide the required additional Policies/ACL permissions.

CDPD-22670 and CDPD-23103: There are two configurations in Spark, "Atlas dependency" and "spark_lineage_enabled", which are conflicted. The issue is when Atlas dependency is turned off but spark_lineage_enabled is turned on.

Run Spark application, Spark will log some error message and cannot continue. That can be restored by correcting the configurations and restarting Spark component with distributing client configurations.

CDPD-23007: Mismatch in the Spark Default DB Location. In HDP 3.1.5, hive_db entities have one attribute - 'location' which is configured to the '/managed' path. In fresh install of CDP 7.1.7, hive_db entities now have 2 attributes 'location' configured to '/external' path and 'managedLocation' configured to '/managed' path. In the AM2CM migration (HDP 3.1.5 -> CDP 7.1.7), the 'location' attribute from hive_db entities in HDP 3.1.5 comes unaltered to CDP 7.1.7 and hence maps to '/managed' path.

This issue arises only if you are upgrading from HDP 3.1.5 to CDP 7.1.7. If you are performing a fresh install of CDP 7.1.7, you can ignore this issue.

None

CDPD-217: The Apache Spark connector is not supported

The old *Apache Spark - Apache HBase Connector* (shc) is not supported in CDP releases.

Use the new HBase-Spark connector shipped in CDP release.

CDPD-3038: Launching pyspark displays several HiveConf warning messages

When pyspark starts, several Hive configuration warning messages are displayed, similar to the following:

```
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of name hive.meta
store.runworker.in does not exist
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of
name hive.masking.algo does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of
name hive.metastore.runworker.in does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of na
me hive.masking.algo does not exist
```

These errors can be safely ignored.

Known Issues in Sqoop

Learn about the known issues in Sqoop, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-54770: Unable to read Sqoop metastore created by an older HSQLDB version

If you have upgraded to CDP PvC Base 7.1.8 Cumulative hotfix 4 or higher versions, you may encounter issues in reading the Sqoop metastore that was created using an older version of HyperSQL Database (HSQLDB).

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

After upgrading to CDP PvC Base 7.1.8 Cumulative hotfix 4, you must upgrade the Sqoop metastore and convert the database files to a format that can easily be read by HSQLDB 2.7.1. For more information, see [Troubleshooting Apache Sqoop issues](#).

CDPD-44431: Using direct mode causes problems

Using direct mode has several drawbacks:

- Imports can cause an intermittent and overlapping input split.
- Imports can generate duplicate data.
- Many problems, such as intermittent failures, can occur.
- Additional configuration is required.

Stop using direct mode. Do not use the `--direct` option in Sqoop import or export commands.

Sqoop direct mode is disabled by default. However, if you still want to use it, enable it by either setting the `sqoop.enable.deprecated.direct` property globally in Cloudera Manager for Sqoop or by specifying it in the command-line through `-Dsqoop.enable.deprecated.direct=true`.

CDPD-3089: Avro, S3, and HCat do not work together properly

Importing an Avro file into S3 with HCat fails with Delegation Token not available.

Parquet columns inadvertently renamed

Column names that start with a number are renamed when you use the `--as-parquetfile` option to import data.

Prepend column names in Parquet tables with one or more letters or underscore characters.

PARQUET-99: Importing Parquet files might cause out-of-memory (OOM) errors

Importing multiple megabytes per row before initial-page-run check (ColumnWriter) can cause OOM. Also, rows that vary significantly by size so that the next-page-size check is based on small rows, and is set very high, followed by many large rows can also cause OOM.

Known Issues in Streams Messaging Manager

Learn about the known issues in Streams Messaging Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13**OPSAPS-59597: SMM UI logs are not supported by Cloudera Manager**

Cloudera Manager does not display a Log Files menu for SMM UI role (and SMM UI logs cannot be displayed in the Cloudera Manager UI) because the logging type used by SMM UI is not supported by Cloudera Manager.

View the SMM UI logs on the host.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker). Add the bootstrap server details in SMM safety valve in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server
Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Add the
following value for bootstrap servers>Save Changes > Restart SMM.

```
streams.messaging.manager.kafka.bootstrap.servers=<comma-separated list of brokers>
```

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the hadoop.auth cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the www-authenticate: Negotiate header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at Clusters SMM Streams Messaging Manager Web UI and log in using the Kerberos username and password.

CDPD-82560: Streams Messaging Manager known unprotected endpoint

The Streams Messaging Manager Frontend exposes the /cm-configs and /configs public endpoints without requiring authentication. These endpoints do not share any sensitive information.

None.

CDPD-88488: The Streams Messaging Manager server fails to start if its keystore password starts with a special character or includes quotation marks

Ensure that the Streams Messaging Manager server keystore password meets the following requirements:

- It does not start with a special character. Special characters are permitted in other positions.
- It does not contain quotation marks (single or double) anywhere.

CDPD-76375: Topic column name is incorrect in the replications table

On the **Cluster Replications** page, in the replications table, the topic column name is incorrectly named **Source Topic Name** instead of Target Topic Name. This means that the **Source Topic Name** column currently shows the topic name on the target cluster, instead of the topic name on the source cluster.

Limitations

CDPD-36422: 1MB flow.snapshot freezes Safari

While importing large connector configurations, flow.snapshots reduces the usability of the Streams Messaging Manager when using Safari browser.

Use a different browser (Chrome/Firefox/Edge).

Known Issues in Streams Replication Manager

Learn about the known issues in Streams Replication Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-22089: SRM does not sync re-created source topics until the offsets have caught up with target topic

Messages written to topics that were deleted and re-created are not replicated until the source topic reaches the same offset as the target topic. For example, if at the time of deletion and re-creation there are a 100 messages on the source and target clusters, new messages will only get replicated once the re-created source topic has 100 messages. This leads to messages being lost.

None

CDPD-11079: Blacklisted topics appear in the list of replicated topics

If a topic was originally replicated but was later excluded for replication, it will still appear as a replicated topic under the /remote-topics REST API endpoint. As a result, if a call is made to this endpoint, this topic will be included in the response. Additionally, the excluded topic will also be visible in the SMM UI. However, its Partitions and Consumer Groups will be 0, its Throughput, Replication Latency and Checkpoint Latency will show N/A.

None

CDPD-30275: SRM may automatically re-create deleted topics on target clusters

If auto.create.topics.enable is enabled, deleted topics might get automatically re-created on target clusters. This is a timing issue. It only occurs if remote topics are deleted while the replication of the topic is still ongoing.

1. Remove the topic from the topic allowlist with srm-control. For example:

```
srm-control topics --source [SOURCE_CLUSTER] --target [TARGET_CLUSTER] --remove [TOPIC1]
```

2. Wait until SRM is no longer replicating the topic.
3. Delete the remote topic in the target cluster.

Limitations

SRM cannot replicate Ranger authorization policies to or from Kafka clusters

Due to a limitation in the Kafka-Ranger plugin, SRM cannot replicate Ranger policies to or from clusters that are configured to use Ranger for authorization. If you are using SRM to replicate data to or from a cluster that uses Ranger, disable authorization policy synchronization in SRM. This can be achieved by clearing the Sync Topic Acls Enabled (sync.topic.acls.enabled) checkbox.

SRM cannot ensure the exactly-once semantics of transactional source topics

SRM data replication uses at-least-once guarantees, and as a result cannot ensure the exactly-once semantics (EOS) of transactional topics in the backup/target cluster.

Note: Even though EOS is not guaranteed, you can still replicate the data of a transactional source, but you must set isolation.level to read_committed for SRM's internal consumers. This can be done by adding [***SOURCE CLUSTER ALIAS***]->[***TARGET CLUSTER ALIAS***].consumer.isolation.level=read_committed to the Streams Replication Manager's Replication Configs SRM service property in Cloudera Manager. The isolation.level property can be set on a global connector or replication level. For example:

```
#Global connector level
connectors.consumer.isolation.level
=read_committed
#Replication level
uswest->useast.consumer.isolation.level=read_committed
```

SRM checkpointing is not supported for transactional source topics

SRM does not correctly translate checkpoints (committed consumer group offsets) for transactional topics. Checkpointing assumes that the offset mapping function is always increasing, but with transactional source topics this is violated. Transactional topics have control messages in them, which take up an offset in the log, but they are never returned on the consumer API. This causes the mappings to decrease, causing issues in the checkpointing feature. As a result of this limitation, failover operations for transactional topics is not possible.

Known Issues in YARN and YARN Queue Manager

Learn about the known issues in YARN and YARN Queue Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

COMPX-14820: Delete Queue and its Children throws "Queue capacity was reduced to zero, but failed to delete queue."

When trying to perform the operation "Delete Queue and its Children" on a queue that has one or more siblings, the operation fails as YARN has some constraints. If the queue performing the operation "Delete Queue and its Children" is a leaf node, then the operations succeeds.

None.

COMPX-4644: Queue capacity rounding problem when configuration is initially set via YARN

When setting the capacity scheduler configuration through the YARN/Cloudera Manager configuration, there may be capacity values that use multiple decimal places. This results in rounding/floating point precision discrepancies in the UI when trying to validate that all sibling capacities equal 100%. The UI looks like all the numbers add up to 100, but the validation still displays an error and does not allow to save the capacities. It is also observed that the capacity is being calculated as, for example, 99.9999999991 in the backend.

- Create queues within the UI, or
- Ensure that capacities configured through the Capacity Scheduler safety valve do not have more than one decimal place.

20202 Database migration after enabling opt-in migration

When migrating from an H2 database to a PostgreSQL database in YARN Queue Manager after installation or upgrade, you might encounter an issue only when you have followed the following specific scenario:

- New install or upgrade to CDP 7.1.9, forcing migration from H2 to PostgreSQL database.
- Upgrade to CDP 7.1.9 CHF2, moving back to H2 database.
- Upgrade to CDP 7.1.9 SP1 with valid PostgreSQL connection details in Queue Manager configurations.

To avoid any issues during the upgrade to version CDP 7.1.9 SP1, ensure that PostgreSQL connection details are removed from the YARN database configuration if you prefer to continue using the H2 database.

CDPD-56559: MapReduce jobs can intermittently fail during a rolling upgrade.

During a rolling upgrade between CDP versions 7.1.8 and 7.1.9, MapReduce jobs may fail with message, `RuntimeException: native snappy library not available`. Although the native Snappy compression library is not loaded, a checkmark displays to indicate that the Snappy compression library is loading for NodeManagers that are pending upgrades. This causes the MapReduce jobs that are associated with the NodeManagers to fail. After the upgrade, the jobs work as expected. This issue only impacts rolling upgrades from before CDP 7.1.9 to a higher version.

None.

COMPX-12021 Queue Manager configurations on Scheduler Configuration page are not working

When setting the following properties on the YARN Queue Manager UI, the properties are set in the `capacity-scheduler.xml` file which does not have any effect on YARN. The properties need to be set in the `yarn-site.xml` file, which does not happen when you set them through YARN Queue Manager.

- "Maximum Application Priority" – `yarn.cluster.max-application-priority`

- "Enable Monitoring Policies" – "yarn.resourcemanager.scheduler.monitor.enable"
- "Monitoring Policies" – "yarn.resourcemanager.scheduler.monitor.policies"

Note: You can also set this property on the YARN configuration page in Cloudera Manager as "Capacity Scheduler Preemption".

- "Preemption: Observe Only" – "yarn.resourcemanager.monitor.capacity.preemption.observe_only"
- "Preemption: Monitoring Interval (ms)" – "yarn.resourcemanager.monitor.capacity.preemption.monitoring_interval"
- "Preemption: Maximum Wait Before Kill (ms)" – "yarn.resourcemanager.monitor.capacity.preemption.max_wait_before_kill"
- "Preemption: Total Resources Per Round" – "yarn.resourcemanager.monitor.capacity.preemption.total_preemption_per_round"
- "Preemption: Over Capacity Tolerance" – "yarn.resourcemanager.monitor.capacity.preemption.max_ignored_over_capacity"
- "Preemption: Maximum Termination Factor" – "yarn.resourcemanager.monitor.capacity.preemption.natural_termination_factor"
- "Enable Intra Queue Preemption" – "yarn.resourcemanager.monitor.capacity.preemption.intra-queue-preemption.enabled"

1. In Cloudera Manager, select the YARN service.
2. Click the Configuration tab.
3. Search for yarn-site.xml.
4. Under YARN Service Advanced Configuration Snippet (Safety Valve) for yarn-site.xml, add the corresponding parameter and value you need.
5. Click Save Changes.
6. Restart the YARN services.

COMPX-13177: QueueManager webapp requests fail with 'HTTP ERROR 400

java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA'

Products:

- Cloudera Manager for CDP Private
- Cloud Base Cloudera Manager for CDP Public Cloud

Context:

- Centos 7.8 and Redhat 7.8 operating systems, when FIPS support is enabled.

Problem:

- When attempting to display the Yarn Queue Manager interface, Cloudera Manager displays an error: "HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA".

1. Edit the file [/etc/default/cloudera-scm-server]
2. Around line 28, modify the line that starts with

```
#export CMF_OVERRIDE_TLS_CIPHERS=...
```

3. Remove the comment mark #.
4. Remove all ciphers with "3DES" in the name.
5. Save the file.
6. Restart the Cloudera Manager Server service.

Third-party applications do not launch if MapReduce framework path is not included in the client configuration

MapReduce application framework is loaded from HDFS instead of being present on the NodeManagers. By default the `mapreduce.application.framework.path` property is set to the appropriate value, but third-party applications with their own configurations does not launch.

Set the `mapreduce.application.framework.path` property to the appropriate configuration for third-party applications.

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated the `mapred-site.xml` file that references the correct JobHistory Server.

YARN cannot start if Kerberos principal name is changed

If the Kerberos principal name is changed in Cloudera Manager after launch, YARN does not start. In such cases, the keytabs can be correctly generated but YARN cannot access ZooKeeper with the new Kerberos principal name and old ACLs.

There are two possible workarounds:

- Delete the `znode` and restart the YARN service.
- Use the `reset ZK ACLs` command. This also sets the `znodes` below `/rmstore/ZKRMStateRoot` to `world:anyone:cdw` which is less secure.

Queue Manager does not open on using a custom user with a default Kerberos principal

If a custom user is used with the default Kerberos principal, the Queue Manager web UI displays an HTTP ERROR 400 error.

Ensure that the Queue Manager `process_username` property matches the YARN `process_username` property.

Known Issues in Zeppelin

Learn about the known issues in Zeppelin the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

BUG-125263: Zeppelin service move fails on clusters upgraded from HDP3.1.5

Resolve the circular symlink issue on the Zeppelin node by linking the `conf` directory to a new directory under `/etc/zeppelin`:

- `# mkdir -p /etc/zeppelin/<version>/0`
- `# rm /usr/hdp/<version>/zeppelin/conf`
- `# ln -s /etc/zeppelin/<version>/0 /usr/hdp/<version>/zeppelin/conf`

Where `version` is the HDP version. For example, `7.1.x-yyy`. Restart the Zeppelin server in Ambari.

CDPD-3090: Due to a configuration typo, functionality involving notebook repositories does not work

Due to a missing closing brace, access to the notebook repositories API is blocked by default.

From the CDP Management Console, go to Cloudera Manager for the cluster running Zeppelin. On the Zeppelin configuration page (Zeppelin serviceConfiguration), enter shiro urls in the Search field, and then add the missing closing brace to the notebook-repositories URL, as follows:

```
/api/notebook-repositories/** = authc, roles[{{zeppelin_admin_group}}]
```

Click Save Changes, and restart the Zeppelin service.

CDPD-2406: Logout button does not work

Clicking the Logout button in the Zeppelin UI logs you out, but then immediately logs you back in using SSO.

Close the browser.

OPSAPS-59802: Zeppelin and Livy roles should be co-located on the same host.

When installing or upgrading to CDP Private Cloud Base, you must co-locate all Zeppelin and Livy roles on the same cluster host due to an issue with certificate generation.

Known Issues in ZooKeeper

Learn about the known issues in ZooKeeper the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 13.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 13

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 13

There are no new known issues identified in the previous releases.

Cumulative hotfix 12

Know more about the cumulative hotfix 12 for CDP 7.1.9 SP1. This cumulative hotfix was released on October 21, 2025.

Important:

The minimum required Cloudera Manager version for Cloudera Runtime 7.1.9 SP1 CHF 12 is Cloudera Manager 7.13.1 CHF4 (7.13.1.400).

Cloudera Runtime 7.1.9.1064-1 (Cumulative Hotfix 12) download URL:

Parcel Repository Location

```
https://[USERNAME]:[PASSWORD]@archive.cloudera.com/p/cdh7/7.1.9.1064/parcels/
```

What's new in Cloudera Runtime 7.1.9 SP1 CHF 12

Understand the functionalities and improvements to features of components in Cloudera Runtime 7.1.9 SP1 CHF 12.

What's new in Ozone

Increased default value of ozone.om.ratis.segment.size and ozone.scm.ha.ratis.segment.size

Previously, the default value of the ozone.om.ratis.segment.size and ozone.scm.ha.ratis.segment.size configuration parameters was 4 MB. Now, the default value is increased to 64 MB.

- The ozone.om.ratis.segment.size configuration parameter sets the size of the raft segment used by Apache Ratis on Ozone Manager.

- The `ozone.scm.ha.ratis.segment.size` configuration parameter sets the size of the raft segment used by Apache Ratis on SCM.

Increased default value of `hdds.datanode.volume.min.free.space`

Previously, the default value of the `hdds.datanode.volume.min.free.space` minimum free space configuration was 5 GB. Now, the default value is increased to 20 GB.

Fixed issues in 7.1.9 SP1 CHF 12

Know more about the list of fixes that are shipped for CDP Private Cloud Base version 7.1.9 SP1 CHF 12.

Note: Contact Cloudera Support for questions related to any specific hotfixes. The version and build identifier for this CDH Parcel is 7.1.9-1.cdh7.1.9.p1064.71379092.

CDPD-82979: Added Cloudera-specific configuration for MapPartitionsRDD default determinacy

To avoid failures during error handling, a Cloudera-specific configuration was added to change the default determinacy level for any MapPartitionsRDD.

CDPD-91213: Non-deterministic SQL expressions failed to set indeterminate map stage output level

Previously, a bug in Spark related to handling non-deterministic data types could cause data corruption or loss during task failures and retries. This issue is now fixed.

Apache Jira: [SPARK-51272](#)

CDPD-89515: Fixed assertion error in Spark submit application

A missing commons-configuration dependency in the spark-atlas-connector assembly jar failed caused an assertion error, as the spark-submit application did not return an application ID. This issue is now fixed.

CDPD-87670: [Atlas UI] Apache Atlas Glossary becomes unresponsive when the page size is set to 50

Previously, when the page limit was set to 50 in **Glossary**, the user interface was unresponsive due to an incorrect API call with an error message, when trying to show more than 25 associated entities for a glossary item. This issue is now fixed by updating the API function logic, and now more than 50 associated glossary items can be shown.

Apache Jira: [ATLAS-5067](#)

CDPD-88447: Prevent unchecked scheduling of flush operations under memory pressure

Previously, in some clusters, tablet servers (tservers) maintained high memory usage up to 60%–80%, causing the maintenance manager to limit operations to WAL garbage collection and MRS/DRS flushes. This led to degraded performance and potential OOM failures.

The issue is now resolved with a configurable parameter that allows the maintenance manager to continue additional operations under moderate memory pressure. It dynamically adjusts MRS/DRS flush probability based on memory usage thresholds, improving resource management and preventing performance issues.

Apache Jira: [KUDU-3407](#)

CDPD-75829: Memory leak when using Ozone FS filesystem through Hadoop FileContext API

Previously, memory used to leak when the Hadoop `FileContext` API was used. The Hadoop `FileContext` API internally uses the `AbstractFileSystem` API that is implemented by the `org.apache.hadoop.fs.ozone.RootedOzFs` class when using the Ozone FS filesystem. The `org.apache.hadoop.fs.ozone.RootedOzFs` class internally creates a new `RootedOzoneFileSystem` instance that never closes and might cause a memory leak. This issue is now fixed.

Apache Jira: [HDDS-11635](#)

CDPD-72076: The `OMDoubleBuffer` error is displayed when handling `OMRequest: cmdType: SnapshotMoveDeletedKeys`

Previously, the Ozone Manager crashed when the follower was lagging and executed the `purgeKeys` or `snapshotMoveDeletedKeys` task for the Snapshot in a single transaction. This issue is now fixed.

Apache Jira: [HDDS-11152](#)

CDPD-73318: Datanode cannot report for a long time

Previously, some datanodes could not report for a long time and their status was DEAD or STALE. This issue is now fixed.

Apache Jira: [HDDS-11331](#)

CDPD-89911: High hash collision could slow down table renames

Previously, performance was low when renaming tables with a large number of columns. This issue is addressed by optimizing the hashing function for PartColNameInfo component.

Apache Jira: [HIVE-29165](#)

CDPD-90263: Performance degradation with LIMIT clause in vectorized queries

Some vectorized queries that included a LIMIT clause would process all rows instead of stopping after the limit was reached. This issue is now resolved by modifying the vectorized code to correctly check if child operators are done, allowing the query to terminate early and significantly improving performance.

Apache Jira: [HIVE-24930](#)

CDPD-90821: Bucket map join query hangs due to auto-parallelism changes

Queries using a bucket map join could hang when auto-reducer parallelism changed the number of tasks for a source vertex. This issue is now resolved by temporarily disabling when auto-reducer parallelism for any vertices that are the source of a bucket map join.

Apache Jira: [HIVE-27078](#)

CDPD-91157: Incorrect results from bucket map join on decimal bucketed columns

Queries using a bucket map join on tables with decimal bucketed columns could return incorrect results.

The issue is now resolved by ensuring that the bucket map join correctly gathers bucket expression indices, allowing for a complete hash table and accurate results.

Apache Jira: [HIVE-27267](#)

CDPD-89389: Major compaction could lead to data loss

A major compaction could cause data loss when a table was overwritten and then new data was inserted.

This issue is now resolved by ensuring that the compactor correctly handles these bucket mismatches, so all base files are included in the major compaction, preventing data loss.

Apache Jira: [HIVE-28700](#)

CDPD-89791: Incorrect COUNT(DISTINCT) results in subqueries

Queries using the COUNT(DISTINCT) SQL function within a subquery were returning incorrect results.

This issue is now resolved by ensuring that the optimizer uses the most current plan, fixing the incorrect count.

Apache Jira: [HIVE-27084](#)

CDPD-89852/ CDPD-89853: Crash when casting timestamp strings with timezone offsets to DATE

Attempting to cast a timestamp string that included a timezone offset, such as "+08:00" in "2025-08-31 06:23:24.9392129 +08:00", to the DATE data type would cause a crash.

This issue is now resolved by adding a check to ensure that the timestamp string length does not exceed the maximum length of the default date-time format. Longer strings will now use a lazily-created format, which prevents the crash.

Apache Jira: [IMPALA-14383](#)

CDPD-89964/CDPD-88861: SHA2 function fails in FIPS mode

When using the SHA2 function with a bit length of 384 in a FIPS-compliant environment, Impala crashed.

This issue is now resolved by updating the function to ensure compatibility with FIPS mode, preventing the crash.

Apache Jira: [IMPALA-14385](#)

CDPD-90828: Revert HDDS-8923 since it is using a lot of memory

HDDS-8923 added CacheMetrics to XceiverClientManager and created a unique name per instance. This process could use a lot of memory. This issue is now fixed, as HDDS-8923 is now reverted.

COMPX-22905: Null Pointer Exception in FifoCandidatesSelector during preemption check in Scheduling Monitor

A Null Pointer Exception occurred during preemption because childless parent queues were being misidentified as leaf queues. This issue is now resolved by adding an explicit check to ensure that only a true instance of the Abstract Leaf Queues are processed.

CDPD-90931: Emit offset syncs more often than offset.lag.max for low-throughput or finite partitions

Previously, Streams Replication Manager (SRM) only emitted offset syncs based on message count. This could cause steady offset translation lag (up to the value of offset.lag.max) for finite-length or low-throughput topics.

This issue is now resolved by adding time-based offset sync emission. This ensures offset syncs are emitted regularly, even for slow or stopped topics

Apache Jira: [KAFKA-15906](#)

COMPX-22434: Queue Manager failed to recreate DQS rule after exiting mixed mode

Previously, Queue Manager failed to recreate the Dynamic Queue Schedules (DQS) rule after exiting YARN mixed mode. This issue is now resolved.

Common Vulnerabilities and Exposures (CVE) that is fixed in this CHF:

CVE-2025-58754	Axios
CVE-2025-48989	Apache Tomcat

Behavioral changes in Cloudera Runtime 7.1.9 SP1 CHF 12

Know more about the behavioral changes in cumulative hotfix 12 for 7.1.9 SP1.

CDPD-88944: New configuration available to disable the Partition Management Task

Previous behavior:

Disable the PartitionManagementTask, which put a heavy load on the Hive Metastore when managing a large number of tables and partitions. Users had a tedious workaround by providing a pattern through metastore.partition.management.database.pattern or metastore.partition.management.table.pattern.

New behavior:

You can now set the metastore.partition.management.task.frequency configuration to 0 to disable the partition management task cluster-wide.

Apache Jira: [HIVE-25324](#)

Known issues in 7.1.9 SP1 CHF 12

The following section lists the known issues and limitations, the areas of impact, and workaround for each Runtime component.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-93307: Hive import logs are truncated during bulk import

When running the import-hive.sh script to perform bulk Hive metadata imports, the logging process fails to retain the expected history. The import-hive.log file rotates prematurely when it reaches 10 MB and retains only one backup file (import-hive.log.1), instead of the expected 100 MB file size and 20 backup files.

Supply a custom log4j configuration file with the correct structure by using the ATLAS_OPTS environment variable before running the import script:

```
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE log4j:configuration SYSTEM "log4j.dtd">
<log4j:configuration xmlns:log4j="http://jakarta.apache.org/log4j/">
  <appender name="console" class="org.apache.log4j.ConsoleAppender">
    <param name="Target" value="System.out"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <appender name="FILE" class="org.apache.log4j.RollingFileAppender">
    <param name="File" value="${atlas.log.dir}/${atlas.log.file}"/>
    <param name="Append" value="true"/>
    <param name="maxFileSize" value="100MB"/>
    <param name="maxBackupIndex" value="20"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <logger name="org.apache.atlas" additivity="false">
    <level value="info"/>
    <appender-ref ref="FILE"/>
  </logger>
  <logger name="org.apache.kafka.common.config.AbstractConfig" additivity="false">
    <level value="error"/>
    <appender-ref ref="FILE"/>
  </logger>
  <root>
    <priority value="warn"/>
    <appender-ref ref="FILE"/>
  </root>
</log4j:configuration>
```

Export the ATLAS_OPTS variable to point to your custom file before running the import script:

```
export ATLAS_OPTS="-Dlog4j.configuration=file:/path/to/custom-hive-import-log4j.xml"
```

```
./import-hive.sh
```

CDPD-87670: [Atlas UI] Apache Atlas Glossary becomes unresponsive when the page size is set to 50

When the page limit is set to 50 in **Glossary**, the user interface becomes unresponsive due to an incorrect API call with the error message, when trying to show more than 25 associated entities for a glossary item: "expected type AtlasGlossaryCategory; found AtlasGlossaryTerm".

Apache Jira: [ATLAS-5067](#)

CDPD-70450: Impala SQL queries that include the “WITH” clause should populate lineage in Atlas

Impala SQL queries that do not use the WITH clause can show lineage in Atlas, but queries that do use the WITH clause cannot show lineage in Apache Atlas. Impala SQL queries using the WITH clause are not supported.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-6565: Issue with ddlQueries in Atlas for Hive/Impala tables created in default/non-default db using DAS/HUE respectively

ddlQueries are not created for Impala origin table. ddlQueries created for Impala/Hive CTAS tables have difference in names as compared to same operation for Hive table. The Impala table has the query in the ddlQueries entity name.

None

CDPD-55301: ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created through spark3-shell

The ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created using spark3-shell.

None

CDPD-56085: LOAD DATA INPATH to iceberg_table creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas

Running a query like LOAD DATA INPATH to iceberg_table, creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas. So in Atlas, a deleted entity is created corresponding to the temporary table <iceberg_table_name>_tmp*.

None

CDPD-58554: Discard audits of specific classification, label, and business metadata

Support to control audits for specific classification, label, and business metadata is not present in the Custom Audit Filters feature.

None

CDPD-40346: The ddlQueries and ALTERNATIVE_ADDCOLS lineage missing for Impala tables.

The ALTERNATIVE_ADDCOLS lineage has some issue when an Impala table is altered and the corresponding lineage is not created.

CDPD-67112: Import transforms do not work as expected when replacing a string which already has ":"

The character ":" is not supported in path replacements. The import succeeds but location remains unchanged. The character ":" must be avoided.

None

CDPD-69150: Unable to add labels or user defined properties in Japanese

Adding Japanese labels or user defined properties results in the error message: "Invalid label: ###, label should contain alphanumeric characters, _ or -"

None

CDPD-69279: Quick search does not return entities when using Japanese or Chinese characters to search properties

Entities, such as `hdfs_path`, are not returned by the search when their indexable properties are searched using partial search terms made of Japanese or Chinese characters. Only exact matches return results when searching the indexed properties made of Japanese or Chinese characters.

None

CDPD-68191: Suggestions do not return the correct results when searching multiple Chinese characters

Free text search does not return results when searching Chinese phrases made of multiple characters. Partial searches return the correct results.

None.

CDPD-71219: Regression : Suggestions don't work for single character words on indexable attributes

When searching for entities whose name (entity names are indexable) is a single character, search results are returned but suggestions are not. When searching for entities whose description (entity descriptions are not indexable) is a single character, both search results and suggestions are returned.

None.

CDPD-67450: Table name renaming operation is not updating or creating iceberg_table entity

Renaming an Iceberg table does not update the corresponding Atlas entity.

None.

CDPD-67089: Export/Import: When a table with Ozone path is exported as "connected", only the Ozone key is exported.

When table with Ozone path is exported as "connected", only Ozone key is exported. Other Ozone entities, such as Ozone volume, Ozone bucket are not exported.

None.

CDPD-43772: Performance issues with Atlas service

If there are lot of update operations and the compression type of column families of `atlas_janus` table is SNAPPY, then the Kafka message processing might become slower.

- Consider setting compression type of column families of `atlas_janus` table as GZ.

OPSAPS-67783: During rolling upgrade one among two Atlas server failed to start but Cloudera Manager considered as success

Cloudera Manager marks the Execute command `Start on service Atlas-1` as a success even when Atlas service had failed to start successfully. In such cases, Atlas logs give the exact reason for Atlas start-up failure.

None

CDPD-19358: "IsIndexable" and "isOptional" value of a typedef's attribute is modified post migration.

In HDP-265, `falcon_feed_creation` has "stored-in" attribute which has `IsIndexable` value set to `True`.

Post migration, "stored-in" is moved to `relationshipAttributeDefs` and has `IsIndexable` value set to `False`.

Similarly, in HDP-265 the table attribute of `hive_storage_desc` `isOptional` is set to `true`. Post migration, `isOptional` set to `False`.

None.

CDPD-11941: Table creation events missed when multiple tables are created in the same Hive command

When multiple Hive tables are created in the same database in a single command, the Atlas audit log for the database may not capture all the table creation events. When there is a delay between creation commands, audits are created as expected.

None.

CDPD-11940: Database audit record misses table delete

When a hive_table entity is created, the Atlas audit list for the parent database includes an update audit. However, at this time, the database does not show an audit when the table is deleted.

None.

CDPD-11692: Navigator table creation time not converted to Atlas

In converting content from Navigator to Atlas, the create time for Hive tables is not moved to Atlas.

None

CDPD-10574: Suggestion order doesn't match search weights

At this time, the order of search suggestions does not honor the search weight for attributes.

None.

CDPD-7982: HBase bridge stops at HBase table with deleted column family

Bridge importing metadata from HBase fails when it encounters an HBase table for which a column family was previously dropped. The error indicates:

```
Metadata service API org.apache.atlas.AtlasClientV2$API_V2@58112
bc4 failed with status 404 (Not Found) Response Body
({"errorCode":"","ATLAS-404-00-007","errorMessage":"Invalid
instance creation/updation parameters passed :
hbase_column_family.table: mandatory attribute value missing in
type hbase_column_family"})
```

None.

CDPD-6675: Irregular qualifiedName format for Azure storage

The qualifiedName for hdfs_path entities created from Azure blob locations (ABFS) does not have the clusterName appended to it as do hdfs_path entities in other location types.

None.

CDPD-4762: Spark metadata order may affect lineage

Atlas may record unexpected lineage relationships when metadata collection from the Spark Atlas Connector occurs out of sequence from the metadata collection from HMS. For example, if an ALTER TABLE operation in Spark that is changing a table name and is reporting to Atlas before HMS has processed the change, Atlas may not show the correct lineage relationships to the altered table.

None.

CDPD-4545: Searches for Qualified Names with "@" does not fetch the correct results

When searching Atlas qualifiedName values that include an "at" character (@), Atlas does not return the expected results or generate appropriate search suggestions.

Consider leaving out the portion of the search string that includes the @ sign, and use the wildcard character * instead.

CDPD-3208: Table alias values are not found in search

When table names are changed, Atlas keeps the old name of the table in a list of aliases. These values are not included in the search index in this release, so after a table name is changed, searching on the old table name does not return the entity for the table.

None.

CDPD-3160: Hive lineage missing for INSERT OVERWRITE queries

Lineage is not generated for Hive INSERT OVERWRITE queries on partitioned tables. Lineage is generated as expected for CTAS queries from partitioned tables.

None.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a logout event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent access to Atlas after logging out, close all browser windows and exit the browser.

CDPD-1892: Ranking of top results in free-text search not intuitive

The Free-text search feature ranks results based on which attributes match the search criteria. The attribute ranking is evolving and therefore the choice of top results may not be intuitive in this release.

If you don't find what you need in the top 5 results, use the full results or refine the search.

CDPD-1884: Free text search in Atlas is case sensitive

The free text search bar in the top of the screen allows you to search across entity types and through all text attributes for all entities. The search shows the top 5 results that match the search terms at any place in the text (*term* logic). It also shows suggestions that match the search terms that begin with the term (term* logic). However, in this release, the search results are case-sensitive.

If you don't see the results you expect, repeat the search changing the case of the search terms.

CDPD-1823: Queries with ? wildcard return unexpected results

DSL queries in Advanced Search return incorrect results when the query text includes a question mark (?) wildcard character. This problem occurs in environments where trusted proxy for Knox is enabled, which is always the case for CDP.

None.

CDPD-1664: Guest users are redirected incorrectly

Authenticated users logging in to Atlas are redirected to the CDP Knox-based login page. However, if a guest user (without Atlas privileges) attempts to log in to Atlas, the user is redirected instead to the Atlas login page.

To avoid this problem, open the Atlas Dashboard in a private or incognito browser window.

CDPD-922: The IsUnique relationship attribute not honored

The Atlas model includes the ability to ensure that an attribute can be set to a specific value in only one relationship entity across the cluster metadata. For example, to add metadata tags to relationships that you wanted to make sure were unique in the system, you can design the relationship attribute with the property IsUnique equal true. However, in this release, the IsUnique attribute is not enforced.

None.

DOCS-13759: Tag Propagation stops after a certain depth while the lineage is being extended

When a tag is added to an entity at timestamp T1, the entities along the lineage to which the tag must be propagated is calculated at T1. Before tag propagation completes, if the lineage is extended, tag does not propagate to the entities in the extended lineage.

CDPD-41142: When a Kafka console consumer group is run, more than one update audits are seen

After running the console consumer with a consumer group, verify the consumer group entity created, along with the metrics and notifications for the consumer group and topic. The expected result can be: one ENTITY_CREATE audit and one ENTITY_UPDATE audit. But more than one ENTITY_UPDATE audits are seen.

CDPD-40165: Two audits are created for SPARK CTAS table

When following Spark queries are fired:

```
spark.sql("create table table1(id int)")
```

```
spark.sql("create table table2 as select * from table1")
```

HMS sends "ENTITY_CREATE" and "ENTITY_FULL_UPDATE_V2".

The extra ENTITY_FULL_UPDATE_V2 message received from HMS is sent as a part of ALTER_TABLE_ADDCOLS event from the HMS Hook side. This behaviour is observed only when the queries are run from Spark SQL and not when run the same queries are run from Beeline.

CDPD-39197: Debug metrics returns empty data

When debug metrics is enabled and some operations are performed, the response is empty

CDPD-36495: Updating legacyAttribute from False to True resets the initially created relationshipAttributes values

Creating types, entities, and to start, you must set the relationship with is_legacy_attribute value as **False**.

Later, update the value relationshipDef is_legacy_attribute to True.

For the entities that were created before updating the is_legacy_attribute to True, the relationship Attributes value is reset.

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-29409: Hive import: Suggestion suggests entity which is deleted.

Suggestions suggests tables of a database, which is a deleted entity.

CDPD-25152: Tag propagation through deferred actions consumes additional time as compared to default flow

The additional time might be due to the small overhead added to create / update task vertex and which is run in the background. This also depends on number of tasks queued to be executed.

CDPD-42954: Zeppelin notebook fails after enabling Atlas-HDFS hook

The Zeppelin notebooks are failing with errors after enabling Atlas-HDFS hook in the CDP cluster.

When the below properties are set for atlas-client.properties in Cloudera Manager:

- atlas.jaas.KafkaClient.option.keyTab
- atlas.jaas.KafkaClient.option.principal

Along with adding the properties in /etc/atlas/conf/atlas-application.properties, Cloudera Manager also adds these properties to atlas-application.properties for other services (like Spark).

Adding these properties interferes with the normal flow of the services (like Spark)

To enable HDFS lineage feature, instead of setting these properties through Cloudera Manager, users can manually add the properties directly in /etc/atlas/conf/atlas-application.properties

CDPD-10576: Deleted Business Metadata attributes appear in Search Suggestions

Atlas search suggestions continue to show Business Metadata attributes even if the attributes have been deleted.

None.

CDPD-39427: [HDFS Lineage]: When the input is a directory in case of put/copyfromLocal/cp/mv commands, lineage is not created even though the script succeeds.

When Source is a directory and target is a directory which is already present in Atlas, the command succeeds and inserts the data in the desired location, but lineage is not created.

DOCS-13760: System Attributes search, __classificationNames: Search with parent tag does not return entities associated to its children tags

System attribute search with __classificationNames = parent_tag returns entities associated to parent_tag only and not entities associated to its children tag.

Workaround: Instead of using system attribute, employ the basic search attribute "classification" which lists entities associated with inherited classifications.

CDPD-35818: Basic search with tag filter provides approximateCount as -1 when there is no match and is 0 otherwise

When the following search operations are performed:

- Faceted search with both tag filter and entity filter

The observed approximateCount is -1.

Here both entity filter and tag filter are present and when there is no match the response received is -1.

- Faceted search with only entity filter

Performing a basic search provides an approximate value of 0 when there is no match.

- Faceted search with only tag filter

Whenever there is tag filter in the query and there is no entity match, the approximateCount is -1 and if the tag filter is not available, the response approximateCount is 0

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-76035: Resource lookup for Atlas service is failing

Once the Atlas configuration snippet atlas.authentication.method.file is enabled and a classification is created, these do not synchronize correctly to the **Type Category** resource field setting of Apache Ranger. The newly created classification won't be able to be selected as the **Type Name**.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-69140: Incremental export: When an entity has tag propagated and is exported, the tag is not propagated to it in the export

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After exporting the last table, it will not have the propagated tag.

Apache JIRA: [ATLAS-4889](#)

CDPD-69213: Export/Import, Incremental Export: When entity exported has a tag propagated from entity which is deleted, tag is not propagated to it at target

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After dropping the first table and exporting the entire lineage, the child tables will not have the propagated tag.

Apache JIRA: [ATLAS-5055](#)

CDPD-76789: Creating tag with name description throws java.lang.ClassCastException

Creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options" can lead to HTTP 500 error in Apache Atlas.

Avoid creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options".

CDPD-77435: RAZ: Import-hive on Cloudera Data Engineering cluster fails

Running import-hive command on RAZ enabled Cloudera Data Engineering cluster fails with error "NoClassDefFoundError: com/sun/jersey/core/spi/factory/ResponseBuilderImpl".

CDPD-70321: Atlas Parallel import is failing with various errors

During a parallel import-export activity with six iceberg table policies with exportOption as db1.* for all six exports, all import fail after the exports.

CDPD-75994: Post DL regular upgrade (non ZDU) to 7.3.1, "Exception in getKafkaConsumer ,WakeupException: null" is seen

After the data lake is upgraded to 7.3.1, sometimes Atlas Hook does not function when Apache Atlas and Apache Kafka are started at the same time, thus Atlas is unable to connect to Kafka while Kafka is still being set up. Atlas performs only three attempts.

Restart the cluster, after the upgrade to trigger to reconnect to Apache Kafka. The Kafka consumer creation should be retried if the Kafka service is unavailable during Atlas startup.

DOCS-26821: Iceberg entities created in 7.2.17 Atlas-Hook (Hive,Impala,Spark) is not ingested by 7.2.18/7.3.1 Atlas Server

When using an Atlas hook from 7.3.1 with an earlier version of Atlas server (7.1.9 SP1 CHF5 or earlier) to create an Iceberg table, the older data model of Iceberg cannot process the features of the new data models. For example, when encountering relationships or attributes in queries which do not have a definition in the earlier model, Iceberg fails to create new tables with an error message. The data model of the Iceberg in Cloudera Runtime 7.1.9 SP1 CHF5 or later is not backward compatible with earlier data models.

It is recommended to upgrade your Atlas server version to at least 7.1.9 SP1 CHF5 or later.

CDPD-28741: Atlas node start failure : PermanentLockingException: Expected value mismatch for KeyColumn

In an Atlas High Availability (HA) enabled environment, starting both Atlas hosts at the same time can result in both trying to access or modify the same graph database resulting in a race condition. One instance successfully modifies the patch vertex, while the other instance triggers a Locking Exception (Concurrent modification exception).

Start Atlas instances in sequence and not in parallel to avoid the potential race condition. If the exception is already present, restart the second Atlas instance after triggering the PermanentLockingException.

CDPD-79099: Unable to import hive tables using import script in Public Cloud

The validation of import .zip files can cause the org.apache.atlas.AtlasServiceException error if the .zip file contains Atlas shell entities missing mandatory attributes such as a name. Therefore, the import of shell entities fails.

CDPD-88230: Bulk import operations currently do not construct lineage as expected

Bulk import operations do not create lineage consistently, even when the entities are imported successfully.

CDPD-88302: Bulk import operations currently do not create audits for the imported entities

Bulk import operations do not create audits for the imported entities.

Known Issues in Cruise Control

Learn about the known issues in Cruise Control, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

Rebalancing with Cruise Control does not work due to the metric reporter failing to report the CPU usage metric

On the Kafka broker, the Cruise control metric reporter plugin may fail to report the CPU usage metric.

If the CPU usage metric is not reported, the numValidWindows in Cruise Control will be 0 and proposal generation as well as partition rebalancing will not work. If this issue is present, the following message will be included in the Kafka logs:

```
WARN com.linkedin.kafka.cruisecontrol.metricsreporter.CruiseControlMetricsReporter:
[CruiseControlMetricsReporterRunner]: Failed reporting CPU
util.
```

```
java.io.IOException: Java Virtual Machine recent CPU usage is not
available.
```

This issue is only known to affect Kafka broker hosts that have the following specifications:

- CPU: Intel(R) Xeon(R) CPU E5-2699 v4 @ 2.20GHz
- OS: Linux 4.18.5-1.el7.elrepo.x86_64 #1 SMP Fri Aug 24 11:35:05 EDT 2018 x86_64
- Java version: 8-18

Move the broker to a different machine where the CPU is different. This can be done by moving the host to a different cluster. For more information, see the [Moving a Host Between Clusters](#).

Note: Cluster nodes affected by this issue are not displayed as unhealthy.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60770: Beeline Authentication Issue with Special Characters in Passwords

When LDAP is enabled, users cannot authenticate with Beeline if the password contains a special character. For example, the following string fails:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>;user=user@XXX;password='R3G#xpXyoy1M0Jb1'
```

Use the `-p` parameter to execute the Beeline command:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>; -n user@XXX -p 'R3G#xpXyoy1M0Jb1'
```

CDPD-43769: Inconsistent behavior with CHAR comparisons and string literals

In Hive, 'char' data to 'string' data comparison is considered as equal, but 'char' data to 'varchar' data comparison is considered as not equal if the data has trailing spaces. For example,

```
create table test(colchar char(10), colvarchar varchar(20), colstring string);
insert into test values ('a ', 'a ', 'a ');

select count(*) from test where colchar = colstring;
Output returns 1 because char and string data is considered as equal

select count(*) from test where colchar = colvarchar;
Output returns 0 because char and varchar data is considered as not equal
```

It is recommended that you use 'varchar or string' data type instead of 'char' data type for any character or string representation.

CDPD-42726: Wrong results for agg queries from stats after running multi-insert query on managed table

Multiple inserts at the same time into the same partition results in invalid stats. For example:

```
create table source(p int, key int, value string);
insert into source(p, key, value) values (101,42,'string42');

create table stats_part(key int,value string) partitioned by (p int);
from source
insert into stats_part select key, value, p
insert into stats_part select key, value, p;

select count(*) from stats_part;
-- In this scenario, StatsOptimizer helps serving this query because the result should be rowNum of the partition p=101.
-- The result is 1, however, the result should be 2.
```

Rewrite the multi-insert statement by merging the branches inserting into the same partition to one branch.

CDPD-57574: Query execution fails due to NullPointerException in DagUtils.setupQuickStart

Hive queries may fail at runtime with a `NullPointerException` while executing the Tez graph at `DagUtils.setupQuickStart` method. A part of the stack trace from the error is shown below:

```
ERROR : Failed to execute tez graph.
java.lang.NullPointerException: null at org.apache.hadoop.hive.ql.exec.tez.DagUtils.setupQuickStart(DagUtils.java:1724)
```

The error usually occurs from an invalid plan that has cycles created by semi-join or map-join edges.

Disable some of the optimizations in order to remove the cycles from the plan. It is sufficient to set one of the following properties:

- `set hive.tez.dynamic.partition.pruning=false;`
- `set hive.tez.dynamic.semijoin.reduction=false;`
- `set hive.auto.convert.join=false;`

To avoid any undesired performance regressions, disable the optimization(s) only for specific queries and not globally (through Cloudera Manager) for the whole workload or cluster.

CDPD-45370: Cartesian join fails with an empty table

When the configuration `hive.tez.cartesian-product.enabled` is set to true, query fails if one of the tables involved in a Cartesian join has zero rows. This results in an `IllegalArgumentException` with the message `Number of items is 0. Should be positive.`

To address this issue, set `hive.tez.cartesian-product.enabled` to false before running the query.

Apache Jira: [\[HIVE-26582\]](#)

CDPD-43107: SemanticException for INSERT INTO statement when Hive Cost-based Optimizer (CBO) is disabled

If you are running the `INSERT INTO` query and `hive.cbo.enable` is set to "false", the query fails with a `SemanticException`. For example,

```
set hive.cbo.enable=false;

CREATE TABLE mytable (
  id INT,
  str STRING
);

INSERT INTO mytable (id, str) VALUES (1, 'a');
```

```
Output:
org.apache.hadoop.hive.ql.parse.SemanticException: 0:0 Expected
2 columns for insclause-0/default@mytable; select produces 1 col
umns. Error encountered near token 'a'
```

This issue occurs only when columns are specified for the target table in the query. `INSERT INTO mytable values (1, 'a');` does not result in an exception.

Enable CBO and run the query.

CDPD-43957: HiveServer shuts down during replication due to high resource usage

During Hive replication (both bootstrap and incremental), you may notice that the HiveServer (HS2) shuts down periodically with the following error:

```
java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientE
xception: Unable to read HiveServer2 configs from ZooKeeper

nParams(ZooKeeperHiveClientHelper.java:172)
... 8 mor

```

This issue occurs when you replicate at scale with an unbalanced cluster setup that has all the roles running on the Cloudera Manager host. As a result, Cloudera Manager ends up in a bottleneck situation because HS2 crashes, preventing further replication. The logs (/var/log/messages) indicate that there were a large number of Java processes running on the host, which exhausted the host's memory and triggered an Out Of Memory Killer process to stop HS2.

You can restart HS2 and reinitiate replication. However, the replication process may take a longer time to complete.

- Follow these recommendations when setting up your source and target clusters:
 - Ensure that no HS2, Hive metastore (HMS), DataNode, or NameNode roles are running on the Cloudera Manager host.
 - Ensure that you have multiple instances of HS2 and HMS roles on different nodes.
 - It is recommended that you have the HS2 and HMS roles on different nodes than the DataNodes or NameNodes.

These practices increase the possibility of Hive replication at scale completing successfully.

- Limit the scale of Hive replication by temporarily disabling replication policies.

CDPD-40730: Parquet change can cause incompatibility

Parquet files written by the parquet-mr library in CDP 7.1.9, where the schema contains a timestamp with no UTC conversion will not be compatible with older versions of Parquet readers. The effect is that the older versions will still consider these timestamps as they would require UTC conversions and will thus end up with a wrong result. You can encounter this problem only when you write Parquet-based tables using Hive, and tables have the non-default configuration `hive.parquet.write.int64.timestamp=true`.

None.

CDPD-41274: HWC + Oozie issue: Could not open client transport with JDBC Uri

Currently only Spark cluster mode is supported in the Oozie Spark Action with Hive Warehouse Connector (HWC).

Use Spark action in cluster mode.

```

<spark xmlns="uri:oozie:spark-action:1.0">
  ...

```

```
<mode>cluster</mode>
...
</spark>
```

CDPD-26556 After an upgrade, querying a CTAS table under certain conditions might throw an exception

If you upgrade your Hive cluster from CDH 6 to CDP 7, create a CTAS table in the CDP cluster from a table you upgraded from CDH, you might see the following exception when you query the new table:

```
class org.apache.hadoop.io.IntWritable cannot be cast to class o
rg.apache.hadoop.hive.serde2.objectinspector.StandardUnionObject
Inspector$StandardUnion
```

This issue involves CDH-based tables having columns of complex types ARRAY, MAP, and STRUCT.

CDPD-23506: OutOfMemoryError in LLAP

Long running spark-shell applications can leave sessions in interactive Hiveserver2 until the Spark application finishes (user exists from spark-shell), causing memory pressure in case of a high number of queries in the same shell (1000+).

You must close spark-shell so that sessions are closed. Add the owner of the database or the tables as a user with read or read/write access to the tables directly.

CDPD-23041: DROP TABLE on a table having an index does not work

If you migrate a Hive table to CDP having an index, DROP TABLE does not drop the table. Hive no longer supports indexes ([HIVE-18448](#)). A foreign key constraint on the indexed table prevents dropping the table. Attempting to drop such a table results in the following error:

```
java.sql.BatchUpdateException: Cannot delete or update a parent
row: a foreign key constraint fails ("hive"."IDXS", CONSTRAINT "
IDXS_FK1" FOREIGN KEY ("ORIG_TBL_ID") REFERENCES "TBLS" ("TBL_ID"
))
```

There are two workarounds:

- Drop the foreign key "IDXS_FK1" on the "IDXS" table within the metastore. You can also manually drop indexes, but do not cascade any drops because the IDXS table includes references to "TBLS".
- Launch an older version of Hive, such as Hive 2.3 that includes IDXS in the DDL, and then drop the indexes as described in [Language Manual Indexing](#).

Apache Issue: [Hive-24815](#)

CDPD-17766: Queries fail when using spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive.

Do not specify spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive remotely.

Workaround: specify principal=hive.server2.authentication.kerberos.principal as shown in the following syntax:

```
jdbc:hive://<host>:<port>/<dbName>;principal=hive.server2.authen
tication.kerberos.principal;<otherSessionConfs>?<hiveConfs>#<hiv
eVars>
```

CDPD-13636: Hive job fails with OutOfMemory exception in the Azure DE cluster

Set the parameter hive.optimize.sort.dynamic.partition.threshold=0. Add this parameter in Cloudera Manager (Hive Service Advanced Configuration Snippet (Safety Valve) for hive-site.xml)

CDPD-10848: HiveServer Web UI displays incorrect data

If you enabled auto-TLS for TLS encryption, the HiveServer2 Web UI does not display the correct data in the following tables: Active Sessions, Open Queries, Last Max n Closed Queries

Known Issues in HDFS

Learn about the known issues in HDFS, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known Issues in Hue

Learn about the known issues in Hue, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12**CDPD-58978: Batch query execution using Hue fails with Kerberos error**

When you run Impala queries in a batch mode, you encounter failures with a Kerberos error even if the keytab is configured correctly. This is because submitting Impala, Sqoop, Pig, or pyspark queries in a batch mode launches a shell script Oozie job from Hue and this is not supported on a secure cluster.

There is no workaround. You can submit the queries individually.

OPSAPS-69659: Hue service fails on restart with "Unable to find pycogp2 2.5.4" error

Hue service fails to restart and you see the following error: Unable to find pycogp2 2.5.4. This could be because you have installed Python in a non-default location and Hue is unable to locate the pycogp2 PostgreSQL database adapter.

You must specify the path where you have installed Python in the PYTHONPATH property in the Hue Advanced Configuration Snippet using Cloudera Manager.

1. Log in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue Configurations and add the following key and value in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

Key: PYTHONPATH

Value: `[***PYTHON-PATH***]`

Replace `[***PYTHON-PATH***]` with the actual location where you have installed Python. For example, `/opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python3.8/site-packages`

3. Click Save Changes.
4. Restart the Hue service.

CDPD-59677: Unable to view Phoenix tables on the left assist in Hue

On clusters secured with Knox, you may not be able to see Phoenix tables on the left assist that are present under the default database (that is, an empty("") database).

None.

CDPD-58142: A query is not pre-populated in the Hue editor after clicking on the "Re Execute" button

When you click Re Execute to rerun a query from the Job Browser Queries Query Details page, the query does not get populated on the Hue editor, as expected.

None.

CDPD-54376: Clicking the home button on the File Browser page redirects to HDFS user directory

When you are previewing a file on any supported filesystem, such as S3 or ABFS, and you click on the Home button, you are redirected to the HDFS user home directory instead of the user home directory on the said filesystem.

None.

CDPD-41306: pip3.8 freeze command does not work and results into an error

You see the `/usr/lib/hue/build/env/bin/python: No such file or directory` error when you run the following command:

```
build/env/bin/pip3.8 freeze
```

Run the freeze command as follows by specifying the paths of python3.8 and pip3.8:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/python3.8 /opt/cloudera/parcels/CDH/lib/hue/build/env/bin/pip3.8 freeze
```

CDPD-43293: Unable to import Impala table using Importer

Creating Impala tables using the Hue Importer may fail.

If you have both Hive and Impala services installed on your cluster, then you can import the table using by selecting the Hive dialect from Tables Sources .

If only Impala service is installed on your cluster, then go to Cloudera Manager Clusters Hue Configurations and add the following line in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[beeswax]
max_number_of_sessions=1
```

DWX-8602: Unable to import a large CSV file from the local workstation

You may see an error message while importing a CSV file into Hue from your workstation, stating that you cannot import files of size more than 200 KB.

Upload the file to S3 or ABFS and then import them into Hue using the Importer.

CDPD-39330: Unable to use the pip command in CDP

You may not be able to use the pip command in CDP 7.1.7 or higher and may see the following error when using pip in a command: “ImportError: cannot import name chardet”.

Follow the steps listed on [Unable to use pip command in CDP](#).

CDPD-24294: Hue uses the unsafe-inline directive in its Content Security Policy (CSP) header

Hue 4 web interface uses the unsafe-inline directive in its CSP header. As a result, the application server does not set the CSP header in its HTTP responses, and therefore does not benefit from the additional protection against potential cross-site scripting issues and other modern application vulnerabilities which a properly configured CSP may provide. This could lead to application vulnerability.

Cloudera recommends deploying additional security measures such as a firewall within the Hue server to control allowed connections, and SSO-based authentications mechanisms such as LDAP or SAML.

OPSAPS-58927: Connection failed error when accessing the Search app (Solr) from Hue

If you are using Solr with Hue to generate interactive dashboards and for indexing data, and if you have deployed two Solr services on your cluster and selected the second one as a dependency for Hue, then Cloudera Manager assigns the hostname of the first Solr service and the port number of the second Solr service generating an incorrect Solr URL in the search section of the hue.ini file. As a result, you may see a “Connection failed” error when you try to access the Search app from the Hue web UI.

1. Log into Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[search]
# URL of the Solr Server
solr_url=http://[***HOSTNAME***]:[***PORT***]/solr/
```

For example:

```
solr_url=http://solr2:4567/solr/
```

3. Click Save Changes.
4. Restart the Hue service.

CDPD-41136: Importing files from the local workstation is disabled by default

Cloudera has disabled the functionality to import files from your local workstation into Hue because it may cause errors. You may not see the Local File option in the Type drop-down menu on the **Importer** page by default.

You can enable the functionality to import files from your local workstation by specifying the following parameter in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field in Hue configurations in Cloudera Manager:

```
[indexer]
enable_direct_upload=true
```

Invalid S3 URI error while accessing S3 bucket

The Hue Load Balancer merges the double slashes (//) in the S3 URI into a single slash (/) so that the URI prefix "/filebrowser/view=S3A://" is changed to "/filebrowser/view=S3A:". This results in an error when you try to access the S3 buckets from the Hue File Browser through the port 8889.

The Hue web UI displays the following error: “Unknown error occurred”.

The Hue server logs record the “ValueError: Invalid S3 URI: S3A” error.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

You should be able to load the S3 browser from both 8888 and 8889 ports.

Alternatively, you can use the Hue server port 8888 instead of the load balancer port 8889 to resolve this issue.

Error while rerunning Oozie workflow

You may see an error such as the following while rerunning an already executed and finished Oozie workflow through the Hue web interface: E0504: App directory [hdfs://cdh/user/hue/oozie/workspaces/hue-oozie-1571929263.84] does not exist.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

CDPD-17956, CDPD-14167: Setting idle session timeout for Hue does not work when the cluster is secured using Knox SSO

If Hue is configured with desktop.auth.backend.KnoxSpnegoDjangoBackend as the Authentication Backend, then the automatic idle session logout that is set by configuring the `idle_session_timeout` property does not take effect. You may also see 404 error while accessing Hue from the Knox UI when the `idle_session_timeout` property is not set to -1.

None

Query history displays "Result Expired" message

You see the "Result Expired" message under the Query History column on the **Queries** tab for queries which were run back to back. This is a known behaviour.

None.

CDPD-43956: Manually replace UUID when importing Oozie workflows containing sub-workflows

When importing Oozie workflows that contain sub-workflows, you must replace all the UUID entries with unique new entries. If you change the UUID of a sub-workflow, you must update that reference in the parent workflow to avoid circular dependencies.

Hue limitation after upgrading from CDH to CDP Private Cloud Base

The `hive.server2.parallel.ops.in.session` configuration property changes from TRUE to FALSE after upgrading from CDH to CDP Private Cloud Base. Current versions of Hue are compatible with this property change; however, if you still would like to use an earlier version of Hue that was not compatible with this property being FALSE and shared a single JDBC connection to issue queries concurrently, the connection will no longer work after upgrading.

Hue UI is blank upon login after upgrading to CDP 7.1.7 from CDH 6

If your cluster was secured using Knox, and if you have upgraded from CDH 6 to CDP 7.1.7, then you may see a blank Hue screen. This could happen because the `knox_proxyhosts` parameter is newly introduced in CDP, and it is possible that this parameter is not configured in Cloudera Manager under Hue configuration.

Specify the host on which you have installed Knox in the Hue Knox Proxy Hosts configuration as follows:

1. Log in to Cloudera Manager as an Administrator.
2. Obtain the host name of the Knox Gateway by going to Clusters Knox service Instances .
3. Go to Clusters Hue service Configuration and search for the Knox Proxy Hosts field.

Note: Cloudera Manager displays the following warning if the Knox Proxy Hosts field is empty when Knox Gateway is enabled on the CDP cluster: The parameter `knox_proxyhosts` cannot be empty. This can happen if there are no Knox Gateways. Please set the `knox_proxyhosts` to the list of hosts that have Knox Gateways.

4. Specify the Knox Gateway hostname in the Knox Proxy Hosts field.

5. Click Save Changes and restart the Hue service.

Unsupported features

CDPD-59595: Spark SQL does not work with all Livy servers that are configured for High Availability

SparkSQL support in Hue with Livy servers in HA mode is not supported. Hue does not automatically connect to one of the Livy servers. You must specify the Livy server in the Hue Advanced Configuration Snippet as follows:

```
[desktop]
[spark]
livy_server_url=http(s)://[***LIVY-FOR-SPARK3-SERVER-HOST***]:
[***LIVY-FOR-SPARK3-SERVER-PORT***]
```

Moreover, you may see the following error in Hue when you submit a SparkSQL query: Expecting value: line 2 column 1 (char 1). This happens when the Livy server does not respond to the request from Hue.

Specify all different Livy servers in the `livy_server_url` property one at a time and use the one which does not cause the issue.

CDPD-18491: PySpark and SparkSQL are not supported with Livy in Hue

Hue does not support configuring and using PySpark and SparkSQL with Livy in CDP Private Cloud Base.

Importing and exporting Oozie workflows across clusters and between different CDH versions is not supported

You can export Oozie workflows, schedules, and bundles from Hue and import them only within the same cluster if the cluster is unchanged. You can migrate bundle and coordinator jobs with their workflows only if their arguments have not changed between the old and the new cluster. For example, hostnames, NameNode, Resource Manager names, YARN queue names, and all the other parameters defined in the `workflow.xml` and `job.properties` files.

Using the import-export feature to migrate data between clusters is not recommended. To migrate data between different versions of CDH, for example, from CDH 5 to CDP 7, you must take the dump of the Hue database on the old cluster, restore it on the new cluster, and set up the database in the new environment. Also, the authentication method on the old and the new cluster should be the same because the Oozie workflows are tied to a user ID, and the exact user ID needs to be present in the new environment so that when a user logs into Hue, they can access their respective workflows.

Note: Migrating Oozie workflows from HDP clusters is not supported.

Known Issues in Impala

Learn about the known issues in Impala, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala

- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94720: Impala startup failure due to invalid TLS v1.3 ciphers

When running Impala on a machine with OpenSSL 1.1.1, providing an invalid or TLS v1.2 ciphersuite in the `--tls_ciphersuites` startup flag causes the process to fail during startup. While OpenSSL 3.x ignores invalid ciphers, OpenSSL 1.1.1 returns an error if any ciphersuite in the list is invalid, even if other valid TLS v1.3 ciphers are present.

Ensure that the list in the `--tls_ciphersuites` startup flag contains only valid TLS v1.3 ciphersuites and does not contain any TLS v1.2 ciphersuites.

Apache Jira: [IMPALA-14625](#)

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-59625: Impala shell in RHEL 9 with Python 2 as default does not work

If you try to run `impala-shell` on RHEL 9 by setting the default python executable available in `PATH` to Python 2, it will fail since RHEL 9 is compatible only with Python 3.

If you run into such issues, set this parameter pointing to Python 3, `IMPALA_PYTHON_EXECUTABLE=python3`.

CDPD-81980: Impala query may fail due to backpressure

Impala queries could fail with a dropped due to backpressure error, even when service queue and memory usage appear normal.

Increase the value of the `--mem_limit` startup option.

CDPD-42958: After upgrading the CDH 7.1.9 from CDH 6.x, under certain conditions you cannot insert data into a table

Under the following conditions, after upgrading from CDH 6.x to CDH 7.1.9 you cannot insert data into a table from Impala:

- On CDH 6.x, you created a database with Impala in a user specified HDFS location.
- Using Hive, you then created a table in the database.

Under these conditions, the database and table are stored in the user-specified HDFS directory. After upgrading, the HDFS directory of the table is read-only for Impala. Consequently, from Impala you cannot insert new data into the table because Impala does not have write permission on the HDFS directory.

Workaround: To resolve this issue, use either one of the following workarounds:

- Using the Ranger Web UI, in the policy repository `cm_hdfs`, grant the user 'impala' write permission on the directory where the table resides.
- Enter the following command to grant write permission to user 'impala' on the HDFS directory where the table resides.

```
hdfs dfs -setfacl -m default:user:impala:rwx <HDFS directory>
```

CDPD-80019: Impala fails to start due to large catalog-update topic

Impala coordinators fail to start if the catalog-update statestore topic exceeds 2GB, hitting the Thrift 0.16.0 message size limit (`thrift_rpc_max_message_size`). This prevents the coordinator from processing the update.

- Enable local catalog mode: `--use_local_catalog=true`
- In Cloudera Manager, go to Impala Configuration search for "Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)" and click 
- Add property name and value:

```
Name : --catalog_topic_mode
Value: minimal
```

- Save changes.

Apache Jira: [IMPALA-12350](#)

Impala cannot update table if the 'external.table.purge' property is not set to true

Impala cannot update a table using DDL statements if the 'external.table.purge' property is FALSE. ALTER TABLE statements return success with no changes to the table.

ALTER TABLE statements should be issued twice if "external.table.purge" was FALSE initially.

Note: For Iceberg tables, Impala users should always use CREATE TABLE since the Impala CREATE TABLE statement sets the flag to TRUE. However, Impala CREATE EXTERNAL TABLE sets the flag to FALSE.

Impala's known limitation when querying compacted tables

When the compaction process deletes the files for a table from the underlying HDFS location, the Impala service does not detect the changes as the compactions does not allocate new write ids. When the same table is queried from Impala it throws a 'File does not exist' exception that looks something like this:

```
Query Status: Disk I/O error on <node>:22000: Failed to open HDF
S file hdfs://nameservice1/warehouse/tablespace/managed/hive/<da
tabase>/<table>/xxxxx
Error(2): No such file or directory Root cause: RemoteException:
File does not exist: /warehouse/tablespace/managed/hive/<data
base>/<table>/xxxx
```

Use the [REFRESH/INVALIDATE](#) statements on the affected table to overcome the 'File does not exist' exception.

CDPD-28431: Intermittent errors could be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

Impala api calls via kinox require configuration if the kinox customized kerberos principal name is a default service user name

To access impala api calls via kinox, if the kinox customized kerberos principal name is a default service user name, then configure "authorized_proxy_user_config" by clicking Clusters->impala->configuration. Include the kinox customized kerberos principal name in the comma separated list of values `<knox_custom_kerberos_principal_name>=*` where `<knox_custom_kerberos_principal_name>` is the value of the Kerberos Principal in the Knox service. Select Clusters>Knox>Configuration and search for Kerberos Principal to display this value.

CDPD-21828: Multiple permission assignment through grant is not working

None

Problem configuring masking on tables using Ranger

The following Knowledge Base article describes the behavior when we configure masking on tables using Ranger. This configuration works for Hive, but breaks queries in some scenarios for Impala.

For a workaround, see the following Knowledge Base article: [ERROR: "AnalysisException: No matching function with signature: mask\(FLOAT\)" when Impala jobs fail with the following error with signature: mask\(FLOAT\)](#)

IMPALA-11871: INSERT statement does not respect Ranger policies for HDFS

In a cluster with Ranger auth (and with legacy catalog mode), even if you provide RWX to cm_hdfs -> all-path for the user impala, inserting into a table whose HDFS POSIX permissions happen to exclude impala access will result in "AnalysisException: Unable to INSERT into target table (default.t1) because Impala does not have WRITE access to HDFS location: hdfs://XXXXXXXXXXXXX"

IMPALA-532: Impala should tolerate bad locale settings

If the LC_* environment variables specify an unsupported locale, Impala does not start.

Add LC_ALL="C" to the environment settings for both the Impala daemon and the Statestore daemon.

Avro Scanner fails to parse some schemas

The default value in Avro schema must match type of first union type, e.g. if the default value is null, then the first type in the UNION must be "null".

Swap the order of the fields in the schema specification. For example, use ["null", "string"] instead of ["string", "null"]. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

IMPALA-691: Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the impalad daemon.

To monitor overall memory usage, use the top command, or add the memory figures in the Impala web UI /memz tab to JVM memory usage shown on the /metrics tab.

IMPALA-1024: Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Remove trailing semicolon from the Avro schema.

IMPALA-1652: Incorrect results with basic predicate on CHAR typed column

When comparing a CHAR column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Use the RPAD() function to blank-pad literals compared with CHAR columns to the expected length.

IMPALA-1821: Casting scenarios with invalid/inconsistent results

Using a CAST() function to convert large literal values to smaller types, or to convert special values such as NaN or Inf, produces values not consistent with other database systems. This could lead to unexpected results from queries.

None

IMPALA-2005: A failed CTAS does not drop the table if the insert fails

If a CREATE TABLE AS SELECT operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Metadata operations that change the state of a table, like COMPUTE STATS or ALTER RECOVER PARTITIONS, may delay metadata propagation of unrelated unloaded tables triggered by statements like DESCRIBE or SELECT queries.

None

IMPALA-7072: Impala does not support Heimdal Kerberos

None

OPSAPS-46641: A single parameter exists in Cloudera Manager for specifying the Impala Daemon Load Balancer. Because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

The workaround is to use the load balancer configuration either without a port specification, or with the Beeswax port: this will configure BDR. To configure Hue use the "Hue Server Advanced Configuration Snippet (Safety Valve) for impalad_flags" to specify the the load balancer address with the HiveServer2 port.

CDPD-28139: Set spark.hadoop.hive.stats.autogather to false by default

As an Impala user, if you submit a query against a table containing data ingested using Spark and you are concerned about the quality of the query plan, you must run COMPUTE STATS against such a table in any case after an ETL operation because numRows created by Spark could be incorrect. Also, use other stats computed by COMPUTE STATS, e.g., Number of Distinct Values (NDV) and NULL count for good selectivity estimates.

For example, when a user ingests data from a file into a partition of an existing table using Spark, if spark.hadoop.hive.stats.autogather is not set to false explicitly, numRows associated with this partition would be 0 even though there is at least one row in the file. To avoid this, the workaround is to set "spark.hadoop.hive.stats.autogather=false" in the "Spark Client Advanced Configuration Snippet (Safety Valve) for spark-conf/spark-defaults.conf" in Spark's CM Configuration section.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala

- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker) in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Save Changes > Restart SMM.

The offsets.topic.replication.factor property must be less than or equal to the number of live brokers

The offsets.topic.replication.factor broker configuration is now enforced upon auto topic creation. Internal auto topic creation will fail with a GROUP_COORDINATOR_NOT_AVAILABLE error until the cluster size meets this replication factor requirement.

None

Requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true

The first few produce requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true.

Increase the number of retries in the producer configuration setting retries.

Performance degradation when SSL Is enabled

In some configuration scenarios, significant performance degradation can occur when SSL is enabled. The impact varies depending on your CPU, JVM version, Kafka configuration, and message size. Consumers are typically more affected than producers.

Configure brokers and clients with ssl.secure.random.implementation = SHA1PRNG. It often reduces this degradation drastically, but its effect is CPU and JVM dependent.

OPSAPS-43236: Kafka garbage collection logs are written to the process directory

By default Kafka garbage collection logs are written to the agent process directory. Changing the default path for these log files is currently unsupported.

None

RANGER-3809: Idempotent Kafka producer fails to initialize due to an authorization failure

Kafka producers that have idempotence enabled require the Idempotent Write permission to be set on the cluster resource in Ranger. If permission is not given, the client fails to initialize and an error similar to the following is thrown:

```
org.apache.kafka.common.KafkaException: Cannot execute transactional method because we are in an error state
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeFailWithError(TransactionManager.java:1125)
```

```

        at org.apache.kafka.clients.producer.internals.TransactionManager.maybeAddPartition(TransactionManager.java:442)
        at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:1000)
        at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:914)
        at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:800)
        .
        .
        .
    Caused by: org.apache.kafka.common.errors.ClusterAuthorizationException: Cluster authorization failed.

```

Idempotence is enabled by default for clients in Kafka 3.0.1, 3.1.1, and any version after 3.1.1. This means that any client updated to 3.0.1, 3.1.1, or any version after 3.1.1 is affected by this issue.

This issue has two workarounds, do either of the following:

- Explicitly disable idempotence for the producers. This can be done by setting `enable.idempotence` to `false`.
- Update your policies in Ranger and ensure that producers have Idempotent Write permission on the cluster resource.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

DBZ-4990: The Debezium Db2 Source connector does not support schema evolution

The Debezium Db2 Source connector does not support the evolution (updates) of schemas. In addition, schema change events are not emitted to the schema change topic if there is a change in the schema of a table that is in capture mode. For more information, see [DBZ-4990](#).

None.

CFM-3532: The Stateless NiFi Source, Stateless NiFi Sink, and HDFS Stateless Sink connectors cannot use Snappy compression

This issue only affects Stateless NiFi Source and Sink connectors if the connector is running a dataflow that uses a processor that uses Hadoop libraries and is configured to use Snappy compression. The HDFS Stateless Sink connector is only affected if the `Compression Codec` or `Compression Codec` for Parquet properties are set to `SNAPPY`.

If you are affected by this issue, errors similar to the following will be present in the logs.

```
Failed to write to HDFS due to java.lang.UnsatisfiedLinkError: org.apache.hadoop.util.NativeCodeLoader.buildSupportsSnappy()
```

```
Failed to write to HDFS due to java.lang.RuntimeException: native snappy library not available: this version of libhadoop was built without snappy support.
```

Download and deploy missing libraries.

Important: Ensure that you complete steps 1-11 on all Kafka Connect hosts. Additionally, ensure that the advanced configuration snippet in step 12 is configured for all Kafka Connect role instances.

1. Create the `/opt/nativelibs` directory.

```
mkdir /opt/nativelibs
```

2. Change the owner to kafka.

```
chown kafka:kafka /opt/nativelibs
```

3. Locate the directory containing the Hadoop native libraries and copy its contents to the directory you created.

```
cp /opt/cloudera/parcels/CDH/lib/hadoop/lib/native/* /opt/nativelibs
```

4. Verify that libsnappy.so was copied to the directory you created.
5. Remove the following from /opt/nativelibs.

```
libhadoop.a
libhadoop.so
libhadoop.so.1.0.0
```

6. Run the following command.

```
hadoop version
```

The command returns the Hadoop version running in the cluster. Note down the first three digits in the version.

7. Go to <https://archive.apache.org/dist/hadoop/common/> and download the Hadoop version that matches the first three digits of the version running in the cluster.

For example, if your Hadoop version is 3.1.1.7.1.9.0-296, then you need to download Hadoop 3.1.1.

8. Extract the downloaded archive.
9. Copy the following libraries from the downloaded archive to /opt/nativelibs on the cluster host.

```
libhadoop.a
libhadoop.so.1.0.0
```

The libraries are located in `hadoop-[*VERSION*]/lib/native`.

10. Create a symlink named libhadoop.so and point it to /opt/nativelibs/libhadoop.so.1.0.0.

```
ln -s /opt/nativelibs/libhadoop.so.1.0.0 /opt/nativelibs/libhadoop.so
```

11. Change the owner of every entry within /opt/nativelibs to kafka.

```
chown -h kafka:kafka /opt/nativelibs/*
```

12. In Cloudera Manager, go to **Kafka service Configuration**.
13. Add the following key-value pair to **Kafka Connect Environment Advanced Configuration Snippet (Safety Valve)**.
 - Key: LD_LIBRARY_PATH
 - Value: /opt/nativelibs
14. Click **Save Changes**.
15. Restart the Kafka service.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect

instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Unsupported Features

The following Kafka features are not supported in Cloudera Data Platform:

- Only Java and .Net based clients are supported. Clients developed with C, C++, Python, and other languages are currently not supported.
- The Kafka default authorizer is not supported. This includes setting ACLs and all related APIs, broker functionality, and command-line tools.
- SASL/SCRAM is only supported for delegation token based authentication. It is not supported as a standalone authentication mechanism.
- Kafka KRaft in this release of Cloudera Runtime is in technical preview and does not support the following:
 - Deployments with multiple log directories. This includes deployments that use JBOD for storage.
 - Delegation token based authentication.
 - Migrating an already running Kafka service from ZooKeeper to KRaft.
 - Atlas Integration.

Limitations

Collection of Partition Level Metrics May Cause Cloudera Manager's Performance to Degrade

If the Kafka service operates with a large number of partitions, collection of partition level metrics may cause Cloudera Manager's performance to degrade.

If you are observing performance degradation and your cluster is operating with a high number of partitions, you can choose to disable the collection of partition level metrics.

Important: If you are using SMM to monitor Kafka or Cruise Control for rebalancing Kafka partitions, be aware that both SMM and Cruise Control rely on partition level metrics. If partition level metric collection is disabled, SMM will not be able to display information about partitions. In addition, Cruise Control will not operate properly.

Complete the following steps to turn off the collection of partition level metrics:

1. Obtain the Kafka service name:
 - a. In Cloudera Manager, Select the Kafka service.
 - b. Select any available chart, and select Open in Chart Builder from the configuration icon drop-down.
 - c. Find \$SERVICENAME= near the top of the display.
The Kafka service name is the value of \$SERVICENAME.
2. Turn off the collection of partition level metrics:
 - a. Go to Hosts Hosts Configuration .
 - b. Find and configure the Cloudera Manager Agent Monitoring Advanced Configuration Snippet (Safety Valve) configuration property.

Enter the following to turn off the collection of partition level metrics:

```
[KAFKA_SERVICE_NAME]_feature_send_broker_topic_partition_entity_update_enabled=false
```

Replace [KAFKA_SERVICE_NAME] with the service name of Kafka obtained in step 1. The service name should always be in lower case.

- c. Click Save Changes.

Known Issues in Knox

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-76435: Default HTTP client timeout for Streams Messaging Manager requests may cause connection timeouts

Some Streams Messaging Manager requests, particularly those retrieving topic data, may take up to 30 seconds to complete, even when there are no connectivity issues. Since the default gateway timeout is set to 20 seconds, this can result in connection timeouts despite the system functioning as expected.

Increase the HTTP client and socket timeouts for Streams Messaging Manager services to 60 seconds. This prevents connection timeouts when the requests take longer than the default gateway timeout.

Follow these steps to configure the required properties for the SMM API and SMM UI services:

1. In Cloudera Manager, select the Knox service.
2. Go to Configuration.
3. Find the Knox Simplified Topology Management - cdp-proxy property, and click **+** to add the following lines:

```
SMM-UI:replayBufferSize=512
SMM-UI:httpclient.connectionTimeout=1m
SMM-UI:client.socketTimeout=1m
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

4. Find the Knox Simplified Topology Management - cdp-proxy-api property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

5. Find the Knox Simplified Topology Management - cdp-proxy-token property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

6. Save your changes.

7. Refresh the cluster.

Known Issues in Kudu

Learn about the known issues in Kudu, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

You get "The user 'kudu' is not part of group 'hive' on the following hosts:" warning by the Host Inspector.

If you are using fine-grained authorization for Kudu, and you are also using Kudu-HMS integration with HDFS-Sentry sync, then you may get the "The user 'kudu' is not part of group 'hive' on the following hosts:" warning while upgrading.

Workaround: Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Unsupported features

Kudu HMS Sync is disabled and is not yet supported

CDPD-87429: Unexpected log lines in Ozone snapshot diff output

``ozone.client.server-defaults.validity.period.ms`` configuration introduced to get server default configurations causes Replication Manager to fail when replicating data between Ozone buckets with the following error when the config value does not specify a timeunit.

```

` ``
java.lang.IllegalStateException: Invalid first line in diff: "25
/07/02 05:58:44 INFO Configuration.deprecation: No unit for ozon
e.client.server-defaults.validity.period.ms(3600000) assuming MI
LLISECONDS"
  at com.cloudera.enterprise.distcp.OzoneCopyListingUtils.parseOz
oneDiff(OzoneCopyListingUtils.java:397)
` ``

```

Overwrite the ``ozone.client.server-defaults.validity.period.ms`` to configure the value to have time unit (ns, ms, s, m, h). For example, 3600000ms.

CDPD-71648: Snapshot creation failing with "PERMISSION_DENIED" error on a bucket created during pre-upgrade in 7.1.7 SP3

On upgrade of cluster from 7.1.7 SP3 to 7.1.9 SP1, we are not able to create snapshots on a pre-upgrade volume or bucket with "PERMISSION_DENIED" error, since in 7.1.7SP3, we were using full KRB owner name with domain but currently, we only use and search for user shortname.

Update the owner of the bucket with the user shortname and then create snapshot by running the commands:

```
ozone sh bucket update --user=[***USER_SHORT_NAME***] {volume}/
{bucket}
```

```
ozone sh snapshot create {volume}/{bucket}
{[***SNAPSHOT_NAME***]}
```

OPSAPS-74668: ozone.snapshot.deep.cleaning.enabled and ozone.snapshot.ordered.deletion.enabled configurations are missing with CDP 7.1.9 SP1 CHF and Cloudera Manager 7.13.1

Two Ozone Manager configurations are missing while using CDP 7.1.9 SP1 CHF after upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400.

If you are using CDP 7.1.9 SP1 CHF, before upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400, add the following configs to Ozone Manager Advanced Configuration Snippet (Safety Valve) for ozone-conf/ozone-site.xml so that Ozone Manager does not miss important config after the Cloudera Manager upgrade:

```
<property>
<name>ozone.snapshot.deep.cleaning.enabled</name>
<value>>false</value>
</property>

<property>
<name>ozone.snapshot.ordered.deletion.enabled</name>
<value>>true</value>
</property>
```

CDPD-64865: Intermittent timeout in TestBlockDeletion.testBlockDeletion (BlockDeletionService stuck)

If the event of SCM exiting safe mode was triggered multiple times, this might eventually cause the SCMBlockDeletingService to transition into the PAUSING state.

Check the SCM logs and ensure that the SCMBlockDeletingService is not running, and then restart the SCM.

CDPD-81569: Recon is not reflecting correct metrics for Volumes, Buckets, Keys, and Pending Key Deletions

Recon is displaying data for container and space utilisation only. The metrics for Volumes, Buckets, Keys, and Pending Key Deletions are not being updated and displayed correctly.

Apache Jira: [HDDS-12607](#)

CDPD-54885: Ozone Prometheus does not work with TLS

The Prometheus service shipped by Ozone does not support TLS mode. So, Prometheus is not able to gather metrics from Ozone endpoints when TLS is enabled.

Go to Ozone Configuration Ozone Prometheus Endpoint Token and update the Ozone Prometheus Endpoint Token with any random string. This makes a token available in the process directory of the Ozone endpoint in plaintext, which Prometheus can use to get around the TLS limitation.

CDPD-69681: Ozone Ranger plugin does recursive listing for ACL checks

Ozone Ranger plugin does recursive listing in unoptimized path for performing ACL check on a directory. Recursive rename and delete operations on directories with layers of subdirectories causes a performance problem.

[Enable Ranger subaccess optimization for rename and delete operations in Ozone.](#)

Apache Issue: [HDDS-10823](#)

CDPD-51490: Installing HDFS and Ozone datanode instances on the same server (in case of a small test or development platform), can cause the Ozone UI to fail as it attempts to use the same default port 9864 already taken by HDFS.

On the Ozone configuration, overwrite the hdds.datanode.client.port value = 19864 and restart the Ozone service. This will allow Ozone UI to load without colliding with the HDFS service.

The Prometheus binary is not available in CDP Private Cloud Base 7.1.9 for the Ubuntu operating system.

You can install Prometheus separately and specify the path to the parent directory, for example /usr/bin, in the prometheus.location parameter in Ozone.

After upgrading the cluster from CDP Private Cloud Base 7.1.8 to CDP Private Cloud Base 7.1.9 and if Ozone is in the Non-HA environment, an exception message is observed during the finalization of the Ozone upgrade.

During the finalization of the upgrade, a ClassNotFoundException message for org.cloudera.log4j.redactor.RedactorAppender class may be displayed. The error message can be ignored because the upgrade is successful. The error existed previously and does not affect the Ozone service and its operation.

None.

CDPD-68951: In CDP Private Cloud Base 7.1.9 CHF2 version and lower, the command `ozone sh key list <bucket_path>` displays the isFile flag in a key's metadata as false even when the key is a file. This issue is rectified in CDP Private Cloud Base 7.1.9 CHF3. However, the pre-existing (pre-upgrade) key's metadata cannot be changed.

None

CDPD-67771: When using S3A committer `fs.s3a.committer.name=directory` with `fs.s3a.committer.staging.conflict-mode=replace` to write to FSO buckets, the client fails with the following error.

```
DIRECTORY_NOT_FOUND

java.lang.Thread.run(Thread.java:834)
```

This occurs because S3A uses multipart upload to commit job results in a batch. The staging committer's replace mode deletes the target directory before completing Memory Protection Unit (MPU). The problem is that File System Optimization (FSO) does not create intermediate directories during MPU, it does only for regular file/dir/key requests.

Use `fs.s3a.committer.name=magic` for affected versions.

CDPD-64398: In SCM with non-HA configuration, Secret key manager does not initialise. Hence, the startup of OM and DataNode fails because it cannot get a secret key. This key is used when security is enabled and used in Block token and container token verification while communicating between the Ozone client, OM, and Datanode.

This issue does not occur in SCM with HA configuration.

You must force exit from the safe mode for SCM. This triggers the initialization of the Secret key manager. Below are the options:

- exit safe mode manually whenever SCM is started
- disable safe mode by setting `hdds.scm.safemode.enabled=false` in safety valve for SCM configuration

Impact of disabling safe mode and the purpose of safe mode:

- Write should not fail once the cluster is out of safe mode
- Read of existing data should not fail after the cluster is out of safe mode
- Unnecessary re-replication should be avoided during cluster restart

So disabling safe mode does not have any major impact on Ozone.

HDDS-9512: Ozone DataNode's new client port conflicts with HDFS DataNode's web port if both Ozone and HDFS DataNode roles are placed on the same host.

You must set `hdds.datanode.client.port` to any unused port. For example, 19864, through the Ozone DataNode safety valve.

CDPD-52412: keyManagerImpl#listStatus exceeds the maximum RPC length.

To reduce the payload, you must increase the part size.

OPSAPS-68159: If you did not deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Error when distributing parcel to host, Ignoring non-compliant parcel manifest error is displayed after Cloudera Manager is upgraded to 7.11.3.

If you encounter the error, perform the following steps:

1. Deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.11.3.
2. Restart the cluster with a delay of 10 minutes.
3. Continue to upgrade CDH 7.1.8 to CDH 7.1.9.

OPSAPS-68159: If you did not deactivate the Ozone parcel 718.2.x on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Ozone roles during the CDH 7.1.8 upgrade to CDH 7.1.9.

If you encounter the error, perform the following steps:

1. Deactivate the Ozone parcel 718.2.x.
2. Restart the Ozone service.
3. Perform Finalize Upgrade for the Ozone service.

Step result: The Ozone roles will be displayed in green.

CDPD-60989: The packaging version for Apache Ozone points to the 1.2.0 older version. This is a version string problem and not a packaging issue. The version of the Apache Ozone binary is closest to 1.4.0.

None. This only affects the JAR versioning.

CDPD-60366: Native library loader fails when system property `native.lib.tmp.dir` is not set. It fails because the library is copied to / instead of the `cwd`.

Setting `native.lib.tmp.dir` to a certain path like `/tmp` should solve the issue. To set this system property, you must add `-Dnative.lib.tmp.dir=/tmp` to `ozone_java_opts` in Cloudera Manager configuration of the Ozone cluster.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-60598: DataNode can consume up to the JVM heap size worth of direct memory buffers under specific failure scenarios. This can lead to a DataNode crash. This is due to Netty allocating and not freeing the direct memory buffers.

Restarting DataNode will resolve this issue.

CDPD-60466: The Ozone client is missing in the Cloudera Manager's Service Monitor node. This causes Ozone Canary's health check to fail.

Ensure you install Ozone CLI on the same node as Cloudera Manager's Service Monitor.

CDPD-60012: The Ozone SCM may be stuck in safe mode after upgrade to 7.1.9. This is due to a bug in how the SCM accounts for open storage containers.

The workaround is to temporarily set the Ozone configuration `hdds.scm.safemode.threshold.pct` to a lower value like 0.90 and restart the SCM.

CDPD-59679: In some scenarios, excess UNHEALTHY replicas of EC containers may not be removed from the cluster.

None

CDPD-50116: Topology-aware reads can provide better performance by routing applications to the closest replica of a file, if available, on the same physical node or same rack. However this feature is disabled by default in CDP 7.1.9.

This feature can be enabled by setting `ozone.network.topology.aware.read` to true using Cloudera Manager safety valve.

CDPD-57165: The DataNode disk usage thread may abort due to Ratis log tailing.

Use `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory` to calculate disk usage. Configure in the `ozone-site.xml` property: `hdds.datanode.du.factory` value: `org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory`

OPSAPS-63510: When Ozone Container Balancer is started using Activate Container Balancer from Cloudera Manager, it runs on the Storage Container Manager (SCM) host which is the Ratis leader. However, the link to the Full Log File under Role Log in the Cloudera Manager command window for the Activate Container Balancer command may not link to the leader SCM's logs.

1. Find the leader SCM. Using Cloudera Manager and SCM Web UI: Go to Clusters Ozone **Web UI**. Open any of the Storage Container Manager web UI. In the UI, search for SCM Roles (HA) in the Status section. The leader SCM's hostname is mentioned. Or using Terminal: Log in to any Ozone host and run `ozone admin scm roles`. Note the leader.
2. After finding the leader SCM, search in this leader host's logs for ContainerBalancer related logs.

OPSAPS-67373: Toggling the Enable Ozone S3 Multi-Tenancy feature configuration in the Cloudera Manager Ozone service configuration page affects more service roles than actually needed.

Enabling multi-tenancy only requires restarting the Ozone Managers.

CDPD-55513: Hive external table replication policy does not migrate Hive tables in HDFS storage to Ozone.

To replicate data from HDFS to Ozone, see [Migrating your data from HDFS to Ozone](#). You can use HMS Mirror to replicate the metadata.

OPSAPS-67757: Hive external tables in Ozone storage cannot be replicated using Hive external table replication policies.

To replicate the Hive external tables' data, consider using DistCp. To replicate the metadata of Hive external tables, consider using HMS Mirror.

Remove bucket recursively using `rb -f -force` command from AWS S3 cannot work for FSO buckets.

Use the Ozone shell command `ozone sh bucket delete -r [***BUCKET ADDRESS***]`

CDPD-59126: Info log displays "noexec permission on /tmp/liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86" on client while executing command with noexec on /tmp.

To suppress Info log related to `liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86` library: Export `OZONE_OPTS` environment variable on the client terminal by running the command `export OZONE_OPTS="-`

```
Dorg.apache.ratis.thirdparty.io.netty.native.workdir=/var/tmp
$OZONE_OPTS"
```

OPSAPS-67650: Ozone uses RocksDB as a library to persist metadata locally.

By default, RocksDB places certain executables in /tmp, and thus encounters errors when /tmp is mounted with noexec.

The workaround is to configure RocksDB to put executables at another location. On a PhatCat node, the steps are:

1. Go to Cloudera Manager UI OZONE Configuration .
2. Find Ozone Service Environment Advanced Configuration Snippet (Safety Valve) and set the following environment variable: `ROCKSDB_SHAREDLIB_DIR=/VAR/TMP`
3. Restart Ozone.

CDPD-49137: Ozone Manager Kerberos token expires for SCM communication and OM does not log in again.

Sometimes, OM's Kerberos token is not updated and it stops to communicate with SCM. When this occurs, writes start failing.

Restart OM or set the safety valve `hadoop.kerberos.keytab.login.autorenewal.enabled = true`

CDPD-56684: Keys get deleted when you do not have permission on volume

When a volume is deleted, it recursively deletes the buckets and keys inside it and only then deletes the volume. The volume delete ACL check is done only in the end, due to which you may end up deleting all the data inside the volume without having delete permission on the volume.

Note: There was no bucket/key permission available which allowed the user to delete them recursively.

CDPD-50610: Large file uploads are slow with OPEN and stream data approach

Hue file browser uses the append operation for large files. This API is not supported by Ozone in 7.1.9 and therefore large file uploads can be slow or timeout from the browser.

Use native Ozone client to upload large files instead of the Hue file browser.

OPSAPS-64097: Ozone service restart failed at SCM

Stopping SCM service using Cloudera Manager can sometimes timeout and need a retry. The Cloudera Manager API waits for 90 seconds which is not sufficient under certain circumstances.

Retry the shutdown using Cloudera Manager if the SCM still shows as running after a refresh of the service status.

OPSAPS-66469: Ozone-site.xml is missing if the host does not contain HDFS roles

The client side `ozone-site.xml` (/etc/hadoop/conf/ozone-site.xml) is not generated by Cloudera Manager if the host does not have any HDFS role. Because of this, issuing Ozone commands from that host fails because it cannot find the service name to host name mapping. The error message is similar to this: `# ozone sh volume list o3://ozoneabc 23/03/06 18:46:15 WARN ha.OMProxyInfo: OzoneManager address ozoneabc:9862 for serviceID null remains unresolved for node ID null` Check your `ozone-site.xml` file to ensure ozone manager addresses are configured properly.

Add the HDFS gateway role on that host.

OPSAPS-67607: Cloudera Manager FirstRun failure at the “Upload YARN MapReduce Framework JARs” step.

If this failure is attributed to the broken symbolic link, `/var/lib/hadoop-hdfs/ozone-filesystem-hadoop3.jar`, it is likely due to the presence of the user `hdfs` on the node prior to CDP parcel activation. As a result, the Cloudera Manager agent skips the initialization related to HDFS, leading to the non-creation of the `/var/lib/hadoop-hdfs` directory.

Create the directory `“/var/lib/hadoop-hdfs”` on all nodes followed by the deactivation and activation of the CDP parcel (deactivate and activate the Ozone parcel instead, in case Ozone parcel is used).

CDPD-50447: When SCM High Availability is enabled, each of the SCM web UIs report the host of the web UI as the leader of HA, and the other two as followers. This gives wrong information

Correct output is available by running the `ozone admin scm roles --service-id=<ID>` command.

OPSAPS-66501: Currently it is not possible to configure High Availability for SCM roles in Ozone post deployment. You should be able to change the HA configuration through Cloudera Manager, bringing it in line with other services.

At present it requires deleting Ozone and then adding it back with the SCM HA configuration in place and manually cleaning up the Ozone data in between. For more information, read the [KB article](#).

OPSAPS-66500: Currently, it is not possible to enable Kerberos in Ozone after it has been deployed, despite all the required configuration changes being created when the box is checked in the Ozone configurations in Cloudera Manager.

Ozone must be deleted and redeployed with Kerberos enabled. Due to OPSAPS-66499, this requires manual data cleanup in between. For more information, read the [KB article](#).

OPSAPS-66499: When you delete Ozone from a cluster using Cloudera Manager, Ozone data is not cleaned up. This may cause issues when Ozone is redeployed.

You must clean up the data manually. For more information, read the [KB article](#).

OPSAPS-62327: In an Ozone cluster without any gateway roles, Ozone is unable to deploy client configurations and displays the ConfigGenException error.

You must add the Ozone gateway roles to the cluster.

CDPD-49027: SCM certificates are not renewed automatically

The certificates that are there to ensure encrypted communication and authentication between Ozone internal services are not renewed automatically for Storage Container Managers.

Certificate revocation

Once these certificates expire, a manual re-bootstrap of the internal Ozone certificates is necessary.

To revoke a certificate, remove the full trust chain to stop trusting a compromised certificate. For this, remove the SCM certificates or any other certificates from the system. During the startup of the system, new certificates are created and distributed. The old certificates are not trusted anymore as the root CA certificate changes as well.

Procedure to force revoke internal certificates:

1. Stop Ozone service and all of its roles including SCMs
2. Include SCM's certs folders. Note that the Primordial SCM node has two certs folder, one for the root CA and other for the intermediate CA that the node holds. Rest of the SCMs have just one folder for the intermediate CA role that the node serves. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name certs; done`
3. Move these certs directories to a backup location
4. Locate the key material and move it to a backup folder. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name keys; done`
5. Move these keys directories to a backup location
6. The VERSION file of SCM has to be updated similarly to Ozone Manager's VERSION file. To locate both the SCM and OM VERSION files on the hosts, execute the following command: `find / -name om -o -name scm 2>/dev/null | while read line; do find $line -name VERSION; done | sort | uniq`
7. Backup the version file (just in case you need to restore for any reason)
8. In OM's VERSION file remove the line starting with `omCertSerialId`, in SCM's VERSION file remove the line starting with `scmCertSerialId`.

9. Start the stopped Ozone roles and certificates will be regenerated during startup.

CDPD-35632: The default block level checksum does not work when running distcp from HDFS to Ozone or the other way around, because the two file systems manage underlying blocks very differently.

Use a file level checksum instead. For example, append ``-Ddfs.checksum.combine.mode=COMPOSITE_CRC`` to the distcp command.

CDPD-43942: Requests to modify an Ozone S3 tenant may fail with the error "Timed out acquiring authorizer write lock. Another multi-tenancy request is in-progress." even if another request is not in progress.

Retry the request.

CDPD-36389: The configurations `datanodes.involved.max.percentage.per.iteration` and `size.moved.max.per.iteration` are meant to limit the max number of DataNodes that is involved and maximum size that can move in an iteration. This bug causes balancer to stop an iteration when it is two DataNodes or 1 Container size (5GB) away from hitting these limits. However, these DataNodes can again be considered for balancing in the next iteration. This means the cluster is balanced after enough iterations, albeit a bit slowly. This bug is apparent in small clusters of around four DataNodes where the DataNodes can be either the source or target for a lot of moves but the iteration gets stopped when three DataNodes have been involved. It takes a higher number of iterations to eventually balance this cluster. While this is a performance issue, it does not prevent balancer from ultimately balancing the cluster.

Increase the speed for balancing by decreasing the interval between each iteration using the configuration `balancing.iteration.interval`. The value of this configuration must be greater than `hdds.datanode.du.refresh.period`. `size.moved.max.per.iteration` can be increased to allow more data to move in one iteration.

CDPD-22519: HDFS user is unable to run Ozone SCM client CLI.

SCM client CLIs are run using SCM user.

CDPD-34187: This is an usability issue where warnings are displayed on the console while running Ozone fs/CLI commands, which restricts user experience. .

Instead of logging into the user console, you redirect these log messages to a file called `ozone-shell-log4j.properties` which should avoid warnings to the user. Ozone-shell commands used a similar method of directing messages to the LogFile.

CDPD-35141: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2> (state=08S01,code=40000) java.sql.SQLException: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2>. This issue does not occur if the source and target buckets are different in Hive queries. Currently, copying across the same bucket is only supported.

Avoid different buckets in source and target path. Ensure that `hive.exec.stagingdir` is unset or set to the same bucket as the warehouse so that staging directories are created in the same bucket as the warehouse.

CDPD-40594: Ozone admin container create command does not work. The command fails at getCAList for the SCM Client to create a container.

Avoid using the create container command

CDPD-40966: df command on Ozone returns incorrect result.

None

CDPD-41184: With Legacy buckets, FileSystem Optimised is not interoperating with the Ozone shell command. The cause is that the directory key entry in the DB KeyTable is stored as "dir1/" with trailing slash. But while performing the described operation, Ozone shell (o3://) is normalizing the given path and removing the trailing slash "/" from it. That results in KEY_NOT_FOUND exception.

There are three workarounds:

- Use FileSystem API to Delete the Directories rather than Shell-Command API.

- Use FSO buckets instead of Legacy Buckets. As in FSO, you can create Intermediate Directories and Delete Directories using the Ozone shell commands.
- Disable and set the configuration `ozone.om.enable.filesystem.pathsflag` to false in order to delete the directories. This is generally not a preferred workaround because the cluster must be restarted to pick up the new changes.

CDPD-34867: Container Balancer might not balance if only Over-Utilized or only Under-Utilized DataNodes are reported. The log line displays the "Container Balancer has identified x Over-Utilized and y Under-Utilized DataNodes that need to be balanced" message where one of x or y will be 0.

Decrease the threshold using "utilization.threshold". This allows the balancer to find non zero number of both over and under utilized nodes.

CDPD-12966: Ozone du -s -h should report correct values with replication information.

None

CDPD-12542: Mount of Ozone filesystem with the help of FUSE fails.

None

CDPD-31910: In a non-Ranger deployment, the owner/group are shown based on Kerberos user or sudo user.

For correct owner/group, user needs a Ranger deployment.

CDPD-42691: During the upgrade - all pipelines will be closed when the upgrade is finalized on SCM, temporarily bringing the cluster to a read-only state.

When you execute the finalize command, the cluster will temporarily go into a read-only state.

CDPD-42945: When many EC buckets are created with different EC chunk sizes, it creates pipeline for each chunk size. As a result, large number of pipelines are created in the system.

None

OPSAPS-60721: Ozone SCM Primordial Node ID is a required field which needs to be specified with one of the SCM hostnames during Ozone HA installation. In Cloudera Manager this field is not mandatory during Ozone deployment. This can cause end users to continue further with installation which causes startup to fail in Ozone services.

During Ozone HA installation make sure that Ozone SCM Primordial Node ID is specified with one of the SCM hostname.

HDDS-4209: S3A Filesystem does not work with Ozone S3 in file system compact mode. When you create a directory, the S3A filesystem creates an empty file. When the `ozone.om.enable.filesystem.paths` parameter is enabled, the `hdfs dfs -mkdir -p s3a://b12345/d11/d12` command runs successfully. However, running the `hdfs dfs -put /tmp/file1 s3a://b12345/d11/d12/file1` command fails with an error: `ERROR org.apache.hadoop.ozone.om.request.key.OMKeyCreateRequest: Key creation failed`.

The HDDS-4209 Jira fixes the file system semantics and management in Ozone. On top of the flat name structure, which is Pure Object store, as a workaround the Hierarchical namespace structure is added. This ensures S3A compatibility with Ozone.

CDPD-42897: EC writes are failing with "No enough datanodes to choose" after EC replication config is set globally.

EC writes start failing when large number of pipelines are created as a result of multiple EC configs with different chunk sizes used to write keys.

If standard EC configs (that is, rs-3-2-1024k) are used to write keys, number of pipelines created per DataNode is limited to five and this issue is not seen with standard EC configs.

The recommendation is not to create too many random chunk sizes. It is configurable because, users can decide based on their workload. But do not to have separate chunk sizes for each file.

CDPD-41539: The "No such file or directory" imessage is displayed when EC file is read using older ofs client.

You must upgrade the client before trying to read the key: vol1/ecbuck1/1GB_ec".

CDPD-40560: Filesystem Operations using Hadoop S3a connector on a FILE_SYSTEM_OPTIMIZED bucket fails. org.apache.hadoop.ozone.om.exceptions.OMException: Unable to get file status: volume: s3v bucket: fso key: test/

Do not run Hadoop S3a commands on a FILE_SYSTEM_OPTIMIZED bucket. Use OBJECT_STORE bucket layouts.

CDPD-42832: With this issue, any long running setup or a production server results in data corruption due to inconsistency issues. This may result in major issues with the existing Legacy layout type.

FSO provides atomicity and consistency guarantees for the path (dir or file) rename/delete operations irrespective of the large sub-dirs/files contained in it. These capabilities help to make the long running test more consistent without any failures so far. Recommendation is to run bigdata HCFS workloads using the FSO bucket layout types.

CDPD-43432: Ozone Service in fault state in DataNode - Long Running setup.

Upgrade RocksDB to the latest version.

OPSAPS-63999: In the newly installed cluster, the Finish upgrade option is clickable.

None

OPSAPS-64648: Failed to start Ozone node using Cloudera Manager if default log path /var/log/hadoop-ozone does not exist. If this path does not exist, any Ozone nodes(for example SCM or DataNode) restart will fail.

Run the following command `sudo -u hdfs mkdir -p /var/log/hadoop-ozone` or replace hdfs with the user Ozone roles that are running.

CDPD-45932: Investigate impersonation with "is admin" in Ozone WebUIs /logLevel servlet endpoint

In a secure Kerberized cluster, due to an impersonation issue, changing log levels using Knox on the corresponding endpoint of the WebUI does not work. Note that this is only true, when the WebUI is accessed using Knox. Other means of changing log levels in Ozone services are not affected by this problem.

None.

Known Issues in Ranger

Learn about the known issues in Ranger, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

Access issues with users having similar name as admin or keyadmin users

Users with USER role that have a similar name as admin or keyadmin users are able to query those admin and keyadmin users.

None.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

UnsupportedClassVersionError

JDK 8 deployments support Nashorn JavaScript engine, which is built-in and fully compatible, whereas JDK 17 deployments support GraalJS script engine due to unavailability of Nashorn.

When your cluster supports both JDK 8 and JDK 17, then while a Java application, running on JDK 8, uses generic interfaces like ScriptEngine (from the javax.script package), the ScriptEngineManager class scans the classpath for available script engine implementations through the service provider mechanism, and detects the GraalJS as a provider for JavaScript, because in this case the GraalJS library (version 22.3.0) is also included on the classpath. The ScriptEngineManager then attempts to instantiate it, when requesting a "js" or "javascript" engine, and triggers an UnsupportedClassVersionError.

Remove the GraalJS library from the classpath.

CDPD-68806: The Revoke operation for users belonging to a group or role permission does not function as expected.

List command is listing all the tables even when the user permission is revoked. And also the command does not add any deny policy to Ranger for that specific user.

For example:

user_1 is the part of group_1

user_2 is the part of role_1

Create a Ranger policy for group_1 and role_1 to access all the resources in HBase.

Try to revoke the permission for user_1 and user_2 using HBase shell global revoke command:

```
revoke 'user_1'
```

```
revoke 'user_2'
```

But there is no deny policy added for that user. And access is still granted to user_1 and user_2.

This behavior is currently not supported in HBase shell. Must be handled manually using the Ranger policy change.

CDPD-68739: The revoke command does not work when using the HBase shell

While using the HBase shell, running the revoke command does not cancel the user permission. Users are able to perform actions even after running the revoke command.

For example:

When a user is granted permission to a particular table using the HBase grant command.

```
hbase:003:0> grant 'user_1', 'RWCA', 'some_abc_table'
```

And then execute the global revoke command for that user:

```
hbase:005:0> revoke 'user_1'
```

Permission for that user 'user_1' for the table 'some_abc_table' not got revoked.

None.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-58860: After upgrading CDP-7.1.8 to CDP-7.1.9, cdp-proxy token missing from Knox-Ranger policy.

As part of [OPSAPS-67480](#) in 719 default ranger policy is added from cdp-proxy-token topology, so that after a new installation of CDP-7.1.9, the Knox-Ranger policy includes cdp-proxy-token. However, upgrades do not add cdp-proxy-token to cm_knox policies automatically.

Manually add cdp-proxy-token to the Knox policy, using Ranger Admin Web UI.

1. Log in to Cloudera ManagerRangerRanger Admin Web UI, as a Ranger administrator.
2. On Ranger Admin Web UIService ManagerResourceKnox, click cm_knox.
3. In Knox Policies, open the CDP Proxy UI, API and Token policy.
4. In Knox Topology*, add cdp-proxy-token.
5. Click Save.
6. Restart Ranger.

CDPD-58704: hadoop roll key / key delete command shows operation failed error when one KMS host is down, even when operation succeeds

In case of rollover/delete, client sends one more (last after delete request) request to KMS instances to clean their cache and that too to all registered kms instances. if one KMS instance is stopped (not deleted), client gets runtime exception.

This simply returns the runtime exception on client end for stopped instances but doesn't break any functionality.

CDPD-56803: When there is no existing policy for user and a revoke request comes from hbase, then will get this error.

```
hbase:001:0> revoke 'hrt_11'
ERROR: org.apache.hadoop.hbase.coprocessor.CoprocessorException: HTTP 400 Error: processSecureRevokeRequest processing failed

ativeMethodAccessorImp

```

This exception is logged, since mandatory JWT auth filter configs are not provided (expected for some environments like y-cloud) Even though JWT auth filter is failed to initialised, it falls back to kerberos auth, hence no impact from auth perspective

NA

CDPD-56738: Ranger RMS showing FileNotFoundException: /usr/share/java/oraclepki.jar in Oracle 19 setup

This is a warning log printed in catalina.out file when Ranger RMS server is initialised. Following exception is observed only in Oracle 19 setup. FileNotFoundException: /usr/share/java/oraclepki.jar

NA

CDPD-48975: Ranger KMS KTS to KMS DB migration : keys with the same name but different case are not migrated

KMS keys are not case sensitive

No workarounds. Such keys combination are very rare and migration doc was updated to check such keys before starting the migration.

CDPD-42598: Kafka policy creation allowed with incorrect permissions.

When creating a Kafka policy from the UI, the permissions "Idempotent write" and "Cluster action" are not displayed as they are not applicable for the "topic" resource, but when creating a policy for the "topic" resource with the permissions "Idempotent write" and "Cluster Action", the policy is created successfully when the expected behaviour is that the policy creation must fail as the permission is not applicable for the Kafka topic resource

None.

CDPD-41582: Atlas Resource Lookup : Classification for "entity-type" lists only classification for the following payload:

```

{"resourceName": "classification", "userInput": "", "resources":  {""classification": []}}

```

expectation is to return all the classifications . But the response has only "classification" Happens similarly for entity-label , entity-business-metadata.

None.

CDPD-40734: User allowed to insert data into a hive table when there is a deny policy on a table column.

A user is allowed to enter data into a table even if there is a deny policy present on one of the table columns.

Test scenario details:

```

Policy setup :-
policy 1 :- all access policy for hrt_qa, hive and impala
users
resources - database - * , table - * , column - *
users : hrt_qa, hive, impala
access - all access allowed
policy 2 :- policy on test_1.table_1 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column - *
access :- all access allowed
policy 3 :- deny policy on test_1.table_1.c0 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column -
c0

```

```
access - all access denied
data setup :-
database - test_1
table - table_1(c0 int, c1 int)
```

The user is able to insert data into the table.

None.

Known Issues in Schema Registry

Learn about the known issues in Schema Registry, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-40380: Authorization checking issue when Kerberos is disabled

Due to an issue in Ranger, when Kerberos is disabled then it is not possible to check authorization.

1. Open Schema Registry configuration in Cloudera Manager.
2. Find the `ranger.plugin.schema-registry.service.name` field.
3. Replace `GENERATED_RANGER_SERVICE_NAME` with the actual name of the service.
4. Restart the Schema Registry service.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

CDPD-59015: Schema Registry does not create new versions of schemas even if the schema is changed

Schema Registry uses a schema fingerprinting mechanism to differentiate between schemas. However, fingerprinting does not take into consideration the schema attributes of the field type. As a result, if you have two schemas where the only difference is that one has type attributes defined and the other does not, they will be considered identical by Schema Registry. For example, the following schemas are considered identical:

```
#Schema V1
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":"long"}]}

#Schema V2
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":{"type":"long","logicalType":"local-timestamp-micros"}}]}
```

Notice that the only difference is that in the second schema, the `local_timestamp_micros_long` field has a logical type specified. In cases like this, the new version of the schema is not created, the initial version is used. This is true even if the data that is being produced has a new schema version. The ID of the first schema version is used and is put in the serialized record. The new schema version is not created.

This issue is common when using change data capture (CDC) connectors like the Debezium connectors. This is because CDC connectors create schemas with the logical type decimal based on the column type in the database schema. For example:

```
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"database_column","type":{"type":"bytes","logicalType":"decimal","precision":64,"scale":0}}]}
```

If the database schema changes (for example, the column type), it is possible that only scale changes, which is a schema attribute.

```
{ "type": "record", "name": "schema_name", "namespace": "ns", "fields":
  [ { "name": "database_column", "type": { "type": "bytes", "logicalType":
    "decimal", "precision": 64, "scale": 1 } } ] }
```

In this case, even though scale changed to 1, the first version of the schema is used where scale is 0. As a result, the data is consumed with the wrong scale.

Avoid using logical types or other attributes. Alternatively, ensure that there are no changes in the logical types or other attributes between schema versions.

OPSAPS-68708: Schema Registry might fail to start if a load balancer address is specified in Ranger

Schema Registry does not start if the address specified in the Load Balancer Address Ranger property does not end with a trailing slash (/).

Set the value of the RANGER_REST_URL Schema Registry environment variable to an address that includes a trailing slash.

1. In Cloudera Manager, select the Schema Registry service.
2. Go to Configuration.
3. Find the Schema Registry Server Environment Advanced Configuration Snippet (Safety Valve) property and add the following:

```
Key: RANGER_REST_URL
Value: [***RANGER REST API URL***]
```

Replace [***RANGER REST API URL***] with an address that can be used by Schema Registry to access Ranger. Ensure that the address ends with a trailing slash. For example: <http://ranger-1.cloudera.com:6182/>

4. Restart the Schema Registry service.

OPSAPS-70971: Schema Registry does not have permissions to use Atlas after an upgrade

Following an upgrade, Schema Registry might not have the required permissions in Ranger to access Atlas. As a result, Schema Registry's integration with Atlas might not function in secure clusters where Ranger authorization is enabled.

1. Access the Ranger Console (Ranger Admin web UI).
2. Click the cm_atlas resource-based service.
3. Add the schemaregistry user to the all - * policies.
4. Click Manage Service Edit Service .
5. Add the schemaregistry user to the default.policy.users property.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the ssl.client.auth option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set ssl.client.auth to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Known Issues in Spark

Learn about the known issues in Spark the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

The following known issues were identified in this release:

No new known issues in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-94393: RuntimeWarning Failed to add file" message appears even when Spark successfully loads files

In both Spark 2 and 3, due to an exception when attempting to add files to the Python path, the RuntimeWarning: Failed to add file message appears even when the Python JAR file is successfully loaded.

None. You can safely ignore the message as the file is loaded successfully and the message does not affect job completion.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-67517: Spark3 tests are failing if /tmp is mounted as NOEXEC.

Map the tmpdir to a writable path in spark3-conf/spark-defaults.conf using the following steps:

1. Go to the Cloudera Manager.
2. Go to the Spark service.
3. Click the Configuration tab.
4. Select Scope Gateway .
5. Select Category Advanced .
6. Locate the Spark Client Advanced Configuration Snippet (Safety Valve) for spark3-conf/spark-defaults.conf_client_config_safety_valve property.
7. Map the tmpdir to a writable path:

```
spark.driver.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
spark.executor.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
```

8. Enter a Reason for change, and then click Save Changes to commit the changes.
9. Deploy the client configuration.

CDPD-23817: In the upgraded Cluster, the permission of /tmp/spark is restricted due to the HDP configuration hive.exec.scratchdir=/tmp/spark.

If you are using the /tmp/spark directory in the CDP cluster, you must provide the required additional Policies/ACL permissions.

CDPD-22670 and CDPD-23103: There are two configurations in Spark, "Atlas dependency" and "spark_lineage_enabled", which are conflicted. The issue is when Atlas dependency is turned off but spark_lineage_enabled is turned on.

Run Spark application, Spark will log some error message and cannot continue. That can be restored by correcting the configurations and restarting Spark component with distributing client configurations.

CDPD-23007: Mismatch in the Spark Default DB Location. In HDP 3.1.5, hive_db entities have one attribute - 'location' which is configured to the '/managed' path. In fresh install of CDP 7.1.7, hive_db entities now have 2 attributes 'location' configured to '/external' path and 'managedLocation' configured to '/managed' path. In the AM2CM migration (HDP 3.1.5 -> CDP 7.1.7), the 'location' attribute from hive_db entities in HDP 3.1.5 comes unaltered to CDP 7.1.7 and hence maps to '/managed' path.

This issue arises only if you are upgrading from HDP 3.1.5 to CDP 7.1.7. If you are performing a fresh install of CDP 7.1.7, you can ignore this issue.

None

CDPD-217: The Apache Spark connector is not supported

The old *Apache Spark - Apache HBase Connector* (shc) is not supported in CDP releases.

Use the new HBase-Spark connector shipped in CDP release.

CDPD-3038: Launching pyspark displays several HiveConf warning messages

When pyspark starts, several Hive configuration warning messages are displayed, similar to the following:

```
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of name hive.meta
store.runworker.in does not exist
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of
name hive.masking.algo does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of
name hive.metastore.runworker.in does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of na
me hive.masking.algo does not exist
```

These errors can be safely ignored.

Known Issues in Sqoop

Learn about the known issues in Sqoop, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-54770: Unable to read Sqoop metastore created by an older HSQLDB version

If you have upgraded to CDP PvC Base 7.1.8 Cumulative hotfix 4 or higher versions, you may encounter issues in reading the Sqoop metastore that was created using an older version of HyperSQL Database (HSQLDB).

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

After upgrading to CDP PvC Base 7.1.8 Cumulative hotfix 4, you must upgrade the Sqoop metastore and convert the database files to a format that can easily be read by HSQLDB 2.7.1. For more information, see [Troubleshooting Apache Sqoop issues](#).

CDPD-44431: Using direct mode causes problems

Using direct mode has several drawbacks:

- Imports can cause an intermittent and overlapping input split.
- Imports can generate duplicate data.
- Many problems, such as intermittent failures, can occur.
- Additional configuration is required.

Stop using direct mode. Do not use the `--direct` option in Sqoop import or export commands.

Sqoop direct mode is disabled by default. However, if you still want to use it, enable it by either setting the `sqoop.enable.deprecated.direct` property globally in Cloudera Manager for Sqoop or by specifying it in the command-line through `-Dsqoop.enable.deprecated.direct=true`.

CDPD-3089: Avro, S3, and HCat do not work together properly

Importing an Avro file into S3 with HCat fails with Delegation Token not available.

Parquet columns inadvertently renamed

Column names that start with a number are renamed when you use the `--as-parquetfile` option to import data.

Prepend column names in Parquet tables with one or more letters or underscore characters.

PARQUET-99: Importing Parquet files might cause out-of-memory (OOM) errors

Importing multiple megabytes per row before initial-page-run check (ColumnWriter) can cause OOM. Also, rows that vary significantly by size so that the next-page-size check is based on small rows, and is set very high, followed by many large rows can also cause OOM.

Known Issues in Streams Messaging Manager

Learn about the known issues in Streams Messaging Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

OPSAPS-59597: SMM UI logs are not supported by Cloudera Manager

Cloudera Manager does not display a Log Files menu for SMM UI role (and SMM UI logs cannot be displayed in the Cloudera Manager UI) because the logging type used by SMM UI is not supported by Cloudera Manager.

View the SMM UI logs on the host.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker). Add the bootstrap server details in SMM safety valve in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Add the following value for bootstrap servers>Save Changes > Restart SMM.

```
streams.messaging.manager.kafka.bootstrap.servers=<comma-separated list of brokers>
```

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the `hadoop.auth` cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the `www-authenticate: Negotiate` header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at `Clusters SMM Streams Messaging Manager Web UI` and log in using the Kerberos username and password.

CDPD-82560: Streams Messaging Manager known unprotected endpoint

The Streams Messaging Manager Frontend exposes the `/cm-configs` and `/configs` public endpoints without requiring authentication. These endpoints do not share any sensitive information.

None.

CDPD-88488: The Streams Messaging Manager server fails to start if its keystore password starts with a special character or includes quotation marks

Ensure that the Streams Messaging Manager server keystore password meets the following requirements:

- It does not start with a special character. Special characters are permitted in other positions.
- It does not contain quotation marks (single or double) anywhere.

CDPD-76375: Topic column name is incorrect in the replications table

On the **Cluster Replications** page, in the replications table, the topic column name is incorrectly named **Source Topic Name** instead of Target Topic Name. This means that the **Source Topic Name** column currently shows the topic name on the target cluster, instead of the topic name on the source cluster.

Limitations

CDPD-36422: 1MB flow.snapshot freezes Safari

While importing large connector configurations, `flow.snapshot` reduces the usability of the Streams Messaging Manager when using Safari browser.

Use a different browser (Chrome/Firefox/Edge).

Known Issues in Streams Replication Manager

Learn about the known issues in Streams Replication Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-22089: SRM does not sync re-created source topics until the offsets have caught up with target topic

Messages written to topics that were deleted and re-created are not replicated until the source topic reaches the same offset as the target topic. For example, if at the time of deletion and re-creation there are a 100 messages on the source and target clusters, new messages will only get replicated once the re-created source topic has 100 messages. This leads to messages being lost.

None

CDPD-11079: Blacklisted topics appear in the list of replicated topics

If a topic was originally replicated but was later excluded for replication, it will still appear as a replicated topic under the `/remote-topics` REST API endpoint. As a result, if a call is made to this endpoint, this topic will be included in the response. Additionally, the excluded topic will also be visible in the SMM UI. However, its Partitions and Consumer Groups will be 0, its Throughput, Replication Latency and Checkpoint Latency will show N/A.

None

CDPD-30275: SRM may automatically re-create deleted topics on target clusters

If `auto.create.topics.enable` is enabled, deleted topics might get automatically re-created on target clusters. This is a timing issue. It only occurs if remote topics are deleted while the replication of the topic is still ongoing.

1. Remove the topic from the topic allowlist with `srm-control`. For example:

```
srm-control topics --source [SOURCE_CLUSTER] --target [TARGET_CLUSTER] --remove [TOPIC1]
```

2. Wait until SRM is no longer replicating the topic.
3. Delete the remote topic in the target cluster.

Limitations

SRM cannot replicate Ranger authorization policies to or from Kafka clusters

Due to a limitation in the Kafka-Ranger plugin, SRM cannot replicate Ranger policies to or from clusters that are configured to use Ranger for authorization. If you are using SRM to replicate data to or from a cluster that uses Ranger, disable authorization policy synchronization in SRM. This can be achieved by clearing the Sync Topic Acls Enabled (`sync.topic.acls.enabled`) checkbox.

SRM cannot ensure the exactly-once semantics of transactional source topics

SRM data replication uses at-least-once guarantees, and as a result cannot ensure the exactly-once semantics (EOS) of transactional topics in the backup/target cluster.

Note: Even though EOS is not guaranteed, you can still replicate the data of a transactional source, but you must set `isolation.level` to `read_committed` for SRM's internal consumers. This can be done by adding `[***SOURCE_CLUSTER_ALIAS***]->[***TARGET_CLUSTER_ALIAS***].consumer.isolation.level=read_committed` to the Streams Replication Manager's Replication Configs SRM service property in Cloudera Manager. The `isolation.level` property can be set on a global connector or replication level. For example:

```
#Global connector level
connectors.consumer.isolation.level
=read_committed
#Replication level
uswest->useast.consumer.isolation.level=read_committed
```

SRM checkpointing is not supported for transactional source topics

SRM does not correctly translate checkpoints (committed consumer group offsets) for transactional topics. Checkpointing assumes that the offset mapping function is always increasing, but with transactional source topics this is violated. Transactional topics have control messages in them, which take up an offset in the log, but they are never returned on the consumer API. This causes the mappings to decrease, causing issues in the checkpointing feature. As a result of this limitation, failover operations for transactional topics is not possible.

Known Issues in YARN and YARN Queue Manager

Learn about the known issues in YARN and YARN Queue Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12**COMPX-14820: Delete Queue and its Children throws "Queue capacity was reduced to zero, but failed to delete queue."**

When trying to perform the operation "Delete Queue and its Children" on a queue that has one or more siblings, the operation fails as YARN has some constraints. If the queue performing the operation "Delete Queue and its Children" is a leaf node, then the operations succeeds.

None.

COMPX-4644: Queue capacity rounding problem when configuration is initially set via YARN

When setting the capacity scheduler configuration through the YARN/Cloudera Manager configuration, there may be capacity values that use multiple decimal places. This results in rounding/floating point precision discrepancies in the UI when trying to validate that all sibling capacities equal 100%. The UI looks like all the numbers add up to 100, but the validation still displays an error and does not allow to save the capacities. It is also observed that the capacity is being calculated as, for example, 99.9999999991 in the backend.

- Create queues within the UI, or
- Ensure that capacities configured through the Capacity Scheduler safety valve do not have more than one decimal place.

20202 Database migration after enabling opt-in migration

When migrating from an H2 database to a PostgreSQL database in YARN Queue Manager after installation or upgrade, you might encounter an issue only when you have followed the following specific scenario:

- New install or upgrade to CDP 7.1.9, forcing migration from H2 to PostgreSQL database.
- Upgrade to CDP 7.1.9 CHF2, moving back to H2 database.
- Upgrade to CDP 7.1.9 SP1 with valid PostgreSQL connection details in Queue Manager configurations.

To avoid any issues during the upgrade to version CDP 7.1.9 SP1, ensure that PostgreSQL connection details are removed from the YARN database configuration if you prefer to continue using the H2 database.

CDPD-56559: MapReduce jobs can intermittently fail during a rolling upgrade.

During a rolling upgrade between CDP versions 7.1.8 and 7.1.9, MapReduce jobs may fail with message, `RuntimeException: native snappy library not available`. Although the native Snappy compression library is not loaded, a checkmark displays to indicate that the Snappy compression library is loading for NodeManagers that are pending upgrades. This causes the MapReduce jobs that are associated with the NodeManagers to fail. After the upgrade, the jobs work as expected. This issue only impacts rolling upgrades from before CDP 7.1.9 to a higher version.

None.

COMPX-12021 Queue Manager configurations on Scheduler Configuration page are not working

When setting the following properties on the YARN Queue Manager UI, the properties are set in the `capacity-scheduler.xml` file which does not have any effect on YARN. The properties need to be set in the `yarn-site.xml` file, which does not happen when you set them through YARN Queue Manager.

- "Maximum Application Priority" – `yarn.cluster.max-application-priority`
- "Enable Monitoring Policies" – `yarn.resourcemanager.scheduler.monitor.enable`
- "Monitoring Policies" – `yarn.resourcemanager.scheduler.monitor.policies`

Note: You can also set this property on the YARN configuration page in Cloudera Manager as "Capacity Scheduler Preemption".

- "Preemption: Observe Only" – `yarn.resourcemanager.monitor.capacity.preemption.observe_only`

- "Preemption: Monitoring Interval (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.monitoring_interval"`
 - "Preemption: Maximum Wait Before Kill (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.max_wait_before_kill"`
 - "Preemption: Total Resources Per Round" – `"yarn.resourcemanager.monitor.capacity.preemption.total_preemption_per_round"`
 - "Preemption: Over Capacity Tolerance" – `"yarn.resourcemanager.monitor.capacity.preemption.max_ignored_over_capacity"`
 - "Preemption: Maximum Termination Factor" – `"yarn.resourcemanager.monitor.capacity.preemption.natural_termination_factor"`
 - "Enable Intra Queue Preemption" – `"yarn.resourcemanager.monitor.capacity.preemption.intra-queue-preemption.enabled"`
1. In Cloudera Manager, select the YARN service.
 2. Click the Configuration tab.
 3. Search for `yarn-site.xml`.
 4. Under YARN Service Advanced Configuration Snippet (Safety Valve) for `yarn-site.xml`, add the corresponding parameter and value you need.
 5. Click Save Changes.
 6. Restart the YARN services.

COMPX-13177: QueueManager webapp requests fail with 'HTTP ERROR 400

java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA'

Products:

- Cloudera Manager for CDP Private
- Cloud Base Cloudera Manager for CDP Public Cloud

Context:

- Centos 7.8 and Redhat 7.8 operating systems, when FIPS support is enabled.

Problem:

- When attempting to display the Yarn Queue Manager interface, Cloudera Manager displays an error: "HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA".

1. Edit the file `[/etc/default/cloudera-scm-server]`
2. Around line 28, modify the line that starts with

```
#export CMF_OVERRIDE_TLS_CIPHERS= . . . .
```

3. Remove the comment mark #.
4. Remove all ciphers with "3DES" in the name.
5. Save the file.
6. Restart the Cloudera Manager Server service.

Third-party applications do not launch if MapReduce framework path is not included in the client configuration

MapReduce application framework is loaded from HDFS instead of being present on the NodeManagers. By default the `mapreduce.application.framework.path` property is set to the appropriate value, but third-party applications with their own configurations does not launch.

Set the `mapreduce.application.framework.path` property to the appropriate configuration for third-party applications.

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated the mapred-site.xml file that references the correct JobHistory Server.

YARN cannot start if Kerberos principal name is changed

If the Kerberos principal name is changed in Cloudera Manager after launch, YARN does not start. In such cases, the keytabs can be correctly generated but YARN cannot access ZooKeeper with the new Kerberos principal name and old ACLs.

There are two possible workarounds:

- Delete the znodel and restart the YARN service.
- Use the reset ZK ACLs command. This also sets the znodels below /rmstore/ZKRMStateRoot to world:anyone:cdwra which is less secure.

Queue Manager does not open on using a custom user with a default Kerberos principal

If a custom user is used with the default Kerberos principal, the Queue Manager web UI displays an HTTP ERROR 400 error.

Ensure that the Queue Manager process_username property matches the YARN process_username property.

Known Issues in Zeppelin

Learn about the known issues in Zeppelin the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

BUG-125263: Zeppelin service move fails on clusters upgraded from HDP3.1.5

Resolve the circular symlink issue on the Zeppelin node by linking the conf directory to a new directory under /etc/zeppelin:

- # mkdir -p /etc/zeppelin/<version>/0
- # rm /usr/hdp/<version>/zeppelin/conf
- # ln -s /etc/zeppelin/<version>/0 /usr/hdp/<version>/zeppelin/conf

Where version is the HDP version. For example, 7.1.x-yyy. Restart the Zeppelin server in Ambari.

CDPD-3090: Due to a configuration typo, functionality involving notebook repositories does not work

Due to a missing closing brace, access to the notebook repositories API is blocked by default.

From the CDP Management Console, go to Cloudera Manager for the cluster running Zeppelin. On the Zeppelin configuration page (Zeppelin serviceConfiguration), enter shiro urls in the Search field, and then add the missing closing brace to the notebook-repositories URL, as follows:

```
/api/notebook-repositories/** = authc, roles[{{zeppelin_admin_group}}]
```

Click Save Changes, and restart the Zeppelin service.

CDPD-2406: Logout button does not work

Clicking the Logout button in the Zeppelin UI logs you out, but then immediately logs you back in using SSO.

Close the browser.

OPSAPS-59802: Zeppelin and Livy roles should be co-located on the same host.

When installing or upgrading to CDP Private Cloud Base, you must co-locate all Zeppelin and Livy roles on the same cluster host due to an issue with certificate generation.

Known Issues in ZooKeeper

Learn about the known issues in ZooKeeper the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 12.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 12

There are no new known issues identified in the previous releases.

Cumulative hotfix 11

Know more about the cumulative hotfix 11 for CDP 7.1.9 SP1. This cumulative hotfix was released on September 10, 2025.

Cloudera Runtime 7.1.9.1059-4 (Cumulative Hotfix 11) download URL:**Parcel Repository Location**

```
https://[USERNAME]:[PASSWORD]@archive.cloudera.com/p/cdh7/7.1.9.1059/parcels/
```

Replication Manager

Before you use Replication Manager with CDP Private Cloud Base 7.1.9 SP1 CHF11 and Cloudera Manager 7.13.1.400, you must be aware that certain Cloudera Replication Manager fixes are not included in this combination. While general usage is supported, specific features or use cases might be impacted if they rely on the missing fixes.

To ensure full feature compatibility and to access the latest fixes, Cloudera recommends upgrading to Cloudera Manager 7.13.1.500 or higher versions when using CDP Private Cloud Base 7.1.9 SP1 CHF11.

What's new in Cloudera Runtime 7.1.9 SP1 CHF 11

Understand the functionalities and improvements to features of components in Cloudera Runtime 7.1.9 SP1 CHF 11.

What's new in Hue**Enhanced file extension controls for Hue file upload**

Previously, Hue allowed only restricting specific file extensions across all configured filesystems to enhance security.

Hue now allows you to control both allowed and restricted file type extensions for Hue file uploads. This improves flexibility and enhances the overall user experience.

For more information, see [Managing file extensions for Hue uploads](#).

Python 3.11 support in Impala-shell

The Impala shell now supports Python 3.11.

Fixed issues in 7.1.9 SP1 CHF 11

Know more about the cumulative hotfix 11 for 7.1.9 SP1.

Note: Contact Cloudera Support for questions related to any specific hotfixes.

Following are the list of fixes that were shipped for CDP Private Cloud Base version 7.1.9-1.cdh7.1.9.p1059.70393529.

CDPD-73189: Not all tables are loading in the left assist panel

Previously, in the Hue left assist panel, only the initial 5,000 tables were loaded because the default value of `max_catalog_sql_entries` was set to 5,000. Increasing this configuration in Hue Safety Valve only allowed loading up to 10,000 tables due to the `max_rows` parameter being hardcoded to 10,000.

This issue is now resolved by fixing the hardcoded limitation. You can now load more than 10,000 tables in the left assist panel.

CDPD-84277: Query Processor cleanup failures on MySQL due to DELETE syntax errors

Previously, the cleanup DELETE operations in Query Processor were failing on MySQL versions 8.0.25 to 10.3.32 due to the unsupported use of the **USING** clause in **DELETE** statements. The legacy SQL syntax DELETE or USING caused syntax errors and prevented proper execution of cleanup tasks. This issue is now resolved by replacing the **USING** clause with proper **JOIN** syntax in the **DELETE** queries.

CDPD-81753: Added a configurable flag to optionally reenableView data preview on database views in Hue

Previously, in the Hue 7.1.9 SP1 CHF4 release, data preview for database views was disabled by default due to resource strains caused by complex or long-running views, impacting data validation and analysis.

This issue has now been improved by adding the new `allow_sample_data_from_views` flag, with the default value set to false. Setting this flag to true enables Hue to fetch sample data for database views and thus restore the data preview functionality in the SQL assist panel and Table browser without affecting default system performance. You can enable the flag by performing the following steps:

1. Navigate to Cloudera Manager Clusters Hue service Configuration .
2. In the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field, specify the following parameter:

```
[metastore]
allow_sample_data_from_views=true
```

3. Click Save Changes.

CDPD-55789: Memory leak in NSSummary in Recon

Previously, the memory in the NSSummary map used to leak when multiple files and directories were deleted and some orphan directory links were unlinked from the NSSummary tree, but, the orphan links could remain in the map forever. This fix cleans up the entries including the deleted files and directories and also the orphan directory links from both the NSSummary map and the NSSummary tree after the directories and files are completely deleted from Ozone, including the `deletedDirTable` table.

Apache Jira: [HDDS-8565](#)

CDPD-87864: Retrigger of Recon NSSummary tree build is not controlled with central flag

Previously, the retriggering of the Recon NSSummary tree was called from multiple places in the source code and was not controlled using a common flag. This issue is now fixed by controlling the retriggering using a central flag.

Apache Jira: [HDDS-13443](#)

CDPD-89346/CDPD-89159: Enhanced join strategy selection for large clusters

The query planner cost model for broadcast joins can be skewed by the number of nodes in a cluster. Previously, this could lead to suboptimal join strategy choices, especially in large clusters with skewed data where a partitioned join was chosen over a more efficient broadcast join.

This issue is now resolved by introducing the `broadcast_cost_scale_factor` query option as an additional tuning option besides query hint to override query planner decisions.

Apache Jira: [IMPALA-14263](#)

Stable catalog cache after INVALIDATE METADATA

Previously, the `INVALIDATE METADATA <table>` command on tables created outside Impala caused tables to be temporarily dropped from the catalog cache.

This issue is now resolved by ensuring that the `INVALIDATE METADATA` command fetches the latest valid event ID from the Hive Metastore and assigns it to the table.

Apache Jira: [IMPALA-12712](#)

CDPD-88652: Catalogd HA warm failover

In a Catalog high availability (HA) setup, a failover cause service delays because the standby Catalogd has a cold cache so need to load the metadata again which takes time. This is particularly noticeable when metadata of lots of the tables have been loaded in the active Catalogd.

This issue is now resolved by allowing the standby Catalogd to keep its metadata cache ready, including a new method, added in [IMPALA-14074](#), to pre-load metadata of critical tables and keep the tables up-to-date. As a result, when a failover happens, the new active Catalogd can serve requests on critical tables right away without any delays.

The fix includes the following JIRA changes:

1. • [IMPALA-14074](#) – Adds the following flags to enable metadata cache warmup in Catalogd for critical tables, ensuring that the standby is ready for failover:

- `--warmup_tables_config_file` – Specifies a configuration file with the tables whose metadata is to be preloaded. The file can be on local storage or remote storage, such as HDFS. Each line can list a fully qualified table or a wildcard for all tables under a database, for example, `tpch.*`. Tables are loaded in the order listed in the file.

Example:

```
--warmup_tables_config_file=file:///opt/impala/
warmup_table_list.txt
--warmup_tables_config_file=hdfs:///tmp/
warmup_table_list.txt
```

- `--keeps_warmup_tables_loaded` – Controls whether the listed tables are automatically reloaded after invalidation. By default, this is set to false.

Important: Avoid setting this flag to true if the Catalogd heap size is not large enough to cache all the warmup tables. Otherwise, tables might be repeatedly loaded and invalidated, causing memory pressure.

- `--catalogd_ha_reset_metadata_on_failover` – Must be set to false to ensure that the standby Catalogd maintains a warm metadata cache for a faster switch during failover.
2. [IMPALA-14227](#) – Adds a waiting time during HA failover to ensure the new active Catalogd applies all the pending HMS events before serving requests.
 3. [IMPALA-12876](#) – Exposes the Catalog version and loaded timestamps in query profiles to help debug stale metadata issues.

Apache Jira: [IMPALA-14074](#), [IMPALA-14227](#), [IMPALA-12876](#)

New configuration to disable block location retrieval

Impala is designed to optimize reads by retrieving file block locations from storage systems like HDFS and Ozone, and scheduling read operations on the same nodes where the data resides. In on-premise environments, Impala nodes are typically colocated with storage nodes. However, in scenarios where they are not colocated, retrieving the block location information is a resource-intensive operation.

This issue is now fixed by introducing new Hadoop configuration properties that allow you to disable the retrieval of block location information during table loading. Disabling the retrieval of block location information can be configured in the following ways:

- Globally, using the Hadoop Safety Valve for core-site.xml advanced configuration snippet.

```
'impala.preload-block-locations-for-scheduling': 'false'
```

- By using a Filesystem scheme to disable it for a specific type of storage.

```
'impala.preload-block-locations-for-scheduling.scheme.hdfs':  
'false'
```

- By authority, to disable block location retrieval for a specific endpoint when multiple storage systems are configured with the same scheme.

```
'impala.preload-block-locations-for-  
scheduling.authority.mycluster': 'false'
```

This disables block location retrieval only for URIs as `hdfs://mycluster/warehouse/tablespace/...`

Apache Jira: [IMPALA-14138](#)

Fix performance regression on Catalog operations when Catalogd HA is enabled

Previously, when Catalogd HA was enabled, performance regression occurred because a lock contention issue blocked new requests. This was caused by an additional check in each request that unnecessarily acquired an exclusive lock, impacting concurrent performance.

This issue is now resolved by optimizing the check to not depend on the exclusive lock. This change improves the concurrent performance of Catalogd in HA environments.

Apache Jira: [IMPALA-14220](#)

CDPD-87722: Merge/Update jobs fail with vertex errors after upgrading to 7.1.9

In CDP 7.1.9, improvements for update and delete operations were introduced to write data directly to table locations instead of using a staging directory. However, after upgrading to CDP 7.1.9, merge, update, and delete queries might occasionally fail with the following error:

```
java.lang.RuntimeException: Hive Runtime Error while closing  
operators: Index 17 out of bounds for length 17  
    at  
    org.apache.hadoop.hive ql.exec.tez.TezProcessor.initializeAndRunProcessor(TezPr

    org.apache.hadoop.hive.ql.exec.Operator.close(Operator.java:755)
    at
    org.apache.hadoop.hive.ql.exec.tez.ReduceRecordProcessor.close(ReduceRecordProc

```

This issue is now fixed.

CDPD-88850/CDPD-89412: Compaction cleaner prematurely cleans up deltas

Previously, queries that ran for a long time failed after a compaction because the compaction cleaner prematurely removed delta files. This was a regression introduced by a change in HIVE-23107, which removed a mechanism used to prevent the deletion of files still needed by running queries.

This issue is now resolved by ensuring the compaction cleaner waits for all previous transactions to commit before it begins cleaning delta files.

Apache Jira: [HIVE-24291](#), [HIVE-23107](#)

CDPD-88851: Backward compatibility for Hive Metastore schema

An update from HIVE-23107 caused a problem when you used different versions of Hive Metastore services in the same environment. This was because the newer version removed a database table called `min_history_level` that was required for older versions to function correctly.

This issue is now resolved by a new change that keeps the `min_history_level` table.

Apache Jira: [HIVE-24403](#)

CDPD-88487: Queries with subqueries failing compilation

After upgrading to CDP 7.1.9 SP1 CHF10, some queries that included subqueries failed during compilation. The queries failed with the `UnsupportedOperationException` error.

This issue is now resolved by correcting the compilation failure that occurred in the `SharedWorkOp` timer.

CDPD-89289: Backport RATIS-1884 to 7.1.9 SP1

Previously, a regression occurred in 7.1.9 SP1 CHF 9 and 7.1.9 SP1 CHF 10 where the Ozone Manager log listed the `RUNNING` retry cache entry of leader should be pending Ratis error message.

This issue is now resolved.

Apache Jira: [RATIS-1884](#)

CDPD-23034: Port COMPLEX-17261 to 7.1.9.1000

The `yarn.nodemanager.disk-health-checker.min-free-space-per-disk-watermark-high-mb` new optional configuration value is now created. This value refers to the minimum space in megabytes that must be available on a bad disk for it to be marked as good. This value must not be less than the `yarn.nodemanager.disk-health-checker.min-free-space-per-disk-mb` value. If it is less than the `yarn.nodemanager.disk-health-checker.min-free-space-per-disk-mb` value or not set, the same value is used as the `yarn.nodemanager.disk-health-checker.min-free-space-per-disk-mb` value. This setting applies to both the `yarn.nodemanager.local-dirs` and `yarn.nodemanager.log-dirs` directories.

CDPD-22902: 7.1.9.1000: RM UI2 cannot show logs for non-MapReduce jobs with MR ACLs enabled

Previously, container log ACL checks failed for non-MapReduce jobs.

This issue is now resolved by applying the MapReduce ACLs only if the container belongs to a MapReduce job

Common Vulnerabilities and Exposures (CVE) that is fixed in this CHF:

CVE-2017-7525	jackson-mapper-asl
CVE-2019-10172	jackson-mapper-asl
CVE-2025-52434	Apache Tomcat
CVE-2025-52520	Apache Tomcat
CVE-2025-53506	Apache Tomcat
CVE-2024-13009	Eclipse Jetty
CVE-2024-8184	Eclipse Jetty

Behavioral changes in Cloudera Runtime 7.1.9 SP1 CHF 11

Know more about the behavioral changes in cumulative hotfix 11 for 7.1.9 SP1.

HBase

Summary:

Added security headers to the thrift or HTTP server

Previous Behavior: Previously, security headers were absent in the responses of Thrift or HTTP servers when utilizing HBase-exposed services.

New Behavior: To address this, additional security headers are introduced in the responses of the HBase Thrift server when HTTP or HTTPS transport is enabled.

Apache Jira: [HBASE-27118](#)

Impala

Summary:

Batched Insert events for Impala

Previous Behavior: Impala initiated insert statements using a single API call for each partition. This could become a performance bottleneck when inserting data into tables with a large number of partitions.

New Behavior: This change speeds up computing file checksums during INSERT operations, especially for tables with many files and partitions. This is achieved by leveraging a new batch insert API in the Hive Metastore to process events more efficiently.

Apache Jira: [IMPALA-14051](#)

Summary:

Support for parquet PageHeaderV2

Previous Behavior: The parquet scanner did not support reading or processing of V2 Parquet DataPageHeader.

New Behavior: The parquet scanner now supports reading of V2 Parquet DataPageHeader.

Apache Jira: [IMPALA-6433](#)

Summary:

Faster checksum computation during INSERT

Previous Behavior: During INSERT operations, most of the time was spent fetching file checksums, which was a slow process. The system acquired a table lock before performing these checksum calculations, causing other operations that required the lock to be blocked.

New Behavior: Impala now collects file checksums and ACID directory paths before acquiring the table lock. This change ensures that the time-consuming process of fetching checksums does not block other operations. As a result, computing file checksums during INSERT operations with many files is now faster.

Apache Jira: [IMPALA-12162](#)

Known issues in 7.1.9 SP1 CHF 11

The following section lists the known issues and limitations, the areas of impact, and workaround for each Runtime component.

Known Issues in Atlas

Learn about the known issues in Atlas the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-93307: Hive import logs are truncated during bulk import

When running the import-hive.sh script to perform bulk Hive metadata imports, the logging process fails to retain the expected history. The import-hive.log file rotates prematurely when it reaches 10 MB and retains only one backup file (import-hive.log.1), instead of the expected 100 MB file size and 20 backup files.

Supply a custom log4j configuration file with the correct structure by using the ATLAS_OPTS environment variable before running the import script:

```
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE log4j:configuration SYSTEM "log4j.dtd">
<log4j:configuration xmlns:log4j="http://jakarta.apache.org/lo
g4j/">
  <appender name="console" class="org.apache.log4j.ConsoleAppen
der">
    <param name="Target" value="System.out"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <appender name="FILE" class="org.apache.log4j.RollingFileApp
ender">
    <param name="File" value="${atlas.log.dir}/${atlas.log.f
ile}"/>
    <param name="Append" value="true"/>
    <param name="maxFileSize" value="100MB"/>
    <param name="maxBackupIndex" value="20"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <logger name="org.apache.atlas" additivity="false">
    <level value="info"/>
    <appender-ref ref="FILE"/>
  </logger>
  <logger name="org.apache.kafka.common.config.AbstractConfig"
additivity="false">
    <level value="error"/>
    <appender-ref ref="FILE"/>
  </logger>
```

```
<root>
  <priority value="warn"/>
  <appender-ref ref="FILE"/>
</root>
</log4j:configuration>
```

Export the ATLAS_OPTS variable to point to your custom file before running the import script:

```
export ATLAS_OPTS="-Dlog4j.configuration=file:/path/to/custom-hi
ve-import-log4j.xml"
./import-hive.sh
```

CDPD-87670: [Atlas UI] Apache Atlas Glossary becomes unresponsive when the page size is set to 50

When the page limit is set to 50 in **Glossary**, the user interface becomes unresponsive due to an incorrect API call with the error message, when trying to show more than 25 associated entities for a glossary item: "expected type AtlasGlossaryCategory; found AtlasGlossaryTerm".

Apache Jira: [ATLAS-5067](#)

CDPD-70450: Impala SQL queries that include the “WITH” clause should populate lineage in Atlas

Impala SQL queries that do not use the WITH clause can show lineage in Atlas, but queries that do use the WITH clause cannot show lineage in Apache Atlas. Impala SQL queries using the WITH clause are not supported.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-6565: Issue with ddlQueries in Atlas for Hive/Impala tables created in default/non-default db using DAS/HUE respectively

ddlQueries are not created for Impala origin table. ddlQueries created for Impala/Hive CTAS tables have difference in names as compared to same operation for Hive table. The Impala table has the query in the ddlQueries entity name.

None

CDPD-55301: ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created through spark3-shell

The ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created using spark3-shell.

None

CDPD-56085: LOAD DATA INPATH to iceberg_table creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas

Running a query like LOAD DATA INPATH to iceberg_table, creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas. So in Atlas, a deleted entity is created corresponding to the temporary table <iceberg_table_name>_tmp*.

None

CDPD-58554: Discard audits of specific classification, label, and business metadata

Support to control audits for specific classification, label, and business metadata is not present in the Custom Audit Filters feature.

None

CDPD-40346: The ddlQueries and ALTERNATIVE_ADDCOLS lineage missing for Impala tables.

The ALTERNATIVE_ADDCOLS lineage has some issue when an Impala table is altered and the corresponding lineage is not created.

CDPD-67112: Import transforms do not work as expected when replacing a string which already has ":"

The character “:” is not supported in path replacements. The import succeeds but location remains unchanged. The character “:” must be avoided.

None

CDPD-69150: Unable to add labels or user defined properties in Japanese

Adding Japanese labels or user defined properties results in the error message: “Invalid label: ###, label should contain alphanumeric characters, _ or -”

None

CDPD-69279: Quick search does not return entities when using Japanese or Chinese characters to search properties

Entities, such as hdfs_path, are not returned by the search when their indexable properties are searched using partial search terms made of Japanese or Chinese characters. Only exact matches return results when searching the indexed properties made of Japanese or Chinese characters.

None

CDPD-68191: Suggestions do not return the correct results when searching multiple Chinese characters

Free text search does not return results when searching Chinese phrases made of multiple characters. Partial searches return the correct results.

None.

CDPD-71219: Regression : Suggestions don't work for single character words on indexable attributes

When searching for entities whose name (entity names are indexable) is a single character, search results are returned but suggestions are not. When searching for entities whose description (entity descriptions are not indexable) is a single character, both search results and suggestions are returned.

None.

CDPD-67450: Table name renaming operation is not updating or creating iceberg_table entity

Renaming an Iceberg table does not update the corresponding Atlas entity.

None.

CDPD-67089: Export/Import: When a table with Ozone path is exported as "connected", only the Ozone key is exported.

When table with Ozone path is exported as "connected", only Ozone key is exported. Other Ozone entities, such as Ozone volume, Ozone bucket are not exported.

None.

CDPD-43772: Performance issues with Atlas service

If there are lot of update operations and the compression type of column families of atlas_janus table is SNAPPY, then the Kafka message processing might become slower.

- Consider setting compression type of column families of atlas_janus table as GZ.

OPSAPS-67783: During rolling upgrade one among two Atlas server failed to start but Cloudera Manager considered as success

Cloudera Manager marks the Execute command Start on service Atlas-1 as a success even when Atlas service had failed to start successfully. In such cases, Atlas logs give the exact reason for Atlas start-up failure.

None

CDPD-19358: "IsIndexable" and "isOptional" value of a typedef's attribute is modified post migration.

In HDP-265, falcon_feed_creation has "stored-in" attribute which has IsIndexable value set to True.

Post migration , "stored-in" is moved to relationshipAttributeDefs and has IsIndexable value set to False.

Similarly, in HDP-265 the table attribute of `hive_storage_desc` isOptional is set to true. Post migration, isOptional set to False.

None.

CDPD-11941: Table creation events missed when multiple tables are created in the same Hive command

When multiple Hive tables are created in the same database in a single command, the Atlas audit log for the database may not capture all the table creation events. When there is a delay between creation commands, audits are created as expected.

None.

CDPD-11940: Database audit record misses table delete

When a `hive_table` entity is created, the Atlas audit list for the parent database includes an update audit. However, at this time, the database does not show an audit when the table is deleted.

None.

CDPD-11692: Navigator table creation time not converted to Atlas

In converting content from Navigator to Atlas, the create time for Hive tables is not moved to Atlas.

None

CDPD-10574: Suggestion order doesn't match search weights

At this time, the order of search suggestions does not honor the search weight for attributes.

None.

CDPD-7982: HBase bridge stops at HBase table with deleted column family

Bridge importing metadata from HBase fails when it encounters an HBase table for which a column family was previously dropped. The error indicates:

```
Metadata service API org.apache.atlas.AtlasClientV2$API_V2@58112bc4 failed with status 404 (Not Found) Response Body
({ "errorCode": "ATLAS-404-00-007", "errorMessage": "Invalid instance creation/updation parameters passed : hbase_column_family.table: mandatory attribute value missing in type hbase_column_family" })
```

None.

CDPD-6675: Irregular qualifiedName format for Azure storage

The `qualifiedName` for `hdfs_path` entities created from Azure blob locations (ABFS) does not have the `clusterName` appended to it as do `hdfs_path` entities in other location types.

None.

CDPD-4762: Spark metadata order may affect lineage

Atlas may record unexpected lineage relationships when metadata collection from the Spark Atlas Connector occurs out of sequence from the metadata collection from HMS. For example, if an ALTER TABLE operation in Spark that is changing a table name and is reporting to Atlas before HMS has processed the change, Atlas may not show the correct lineage relationships to the altered table.

None.

CDPD-4545: Searches for Qualified Names with "@" does not fetch the correct results

When searching Atlas `qualifiedName` values that include an "@" character (@), Atlas does not return the expected results or generate appropriate search suggestions.

Consider leaving out the portion of the search string that includes the @ sign, and use the wildcard character * instead.

CDPD-3208: Table alias values are not found in search

When table names are changed, Atlas keeps the old name of the table in a list of aliases. These values are not included in the search index in this release, so after a table name is changed, searching on the old table name does not return the entity for the table.

None.

CDPD-3160: Hive lineage missing for INSERT OVERWRITE queries

Lineage is not generated for Hive INSERT OVERWRITE queries on partitioned tables. Lineage is generated as expected for CTAS queries from partitioned tables.

None.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a logout event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent access to Atlas after logging out, close all browser windows and exit the browser.

CDPD-1892: Ranking of top results in free-text search not intuitive

The Free-text search feature ranks results based on which attributes match the search criteria. The attribute ranking is evolving and therefore the choice of top results may not be intuitive in this release.

If you don't find what you need in the top 5 results, use the full results or refine the search.

CDPD-1884: Free text search in Atlas is case sensitive

The free text search bar in the top of the screen allows you to search across entity types and through all text attributes for all entities. The search shows the top 5 results that match the search terms at any place in the text (*term* logic). It also shows suggestions that match the search terms that begin with the term (term* logic). However, in this release, the search results are case-sensitive.

If you don't see the results you expect, repeat the search changing the case of the search terms.

CDPD-1823: Queries with ? wildcard return unexpected results

DSL queries in Advanced Search return incorrect results when the query text includes a question mark (?) wildcard character. This problem occurs in environments where trusted proxy for Knox is enabled, which is always the case for CDP.

None.

CDPD-1664: Guest users are redirected incorrectly

Authenticated users logging in to Atlas are redirected to the CDP Knox-based login page. However, if a guest user (without Atlas privileges) attempts to log in to Atlas, the user is redirected instead to the Atlas login page.

To avoid this problem, open the Atlas Dashboard in a private or incognito browser window.

CDPD-922: The IsUnique relationship attribute not honored

The Atlas model includes the ability to ensure that an attribute can be set to a specific value in only one relationship entity across the cluster metadata. For example, to add metadata tags to relationships that you wanted to make sure were unique in the system, you can design the relationship attribute with the property IsUnique equal true. However, in this release, the IsUnique attribute is not enforced.

None.

DOCS-13759: Tag Propagation stops after a certain depth while the lineage is being extended

When a tag is added to an entity at timestamp T1, the entities along the lineage to which the tag must be propagated is calculated at T1. Before tag propagation completes, if the lineage is extended, tag does not propagate to the entities in the extended lineage.

CDPD-41142: When a Kafka console consumer group is run, more than one update audits are seen

After running the console consumer with a consumer group, verify the consumer group entity created, along with the metrics and notifications for the consumer group and topic. The expected result can be: one ENTITY_CREATE audit and one ENTITY_UPDATE audit. But more than one ENTITY_UPDATE audits are seen.

CDPD-40165: Two audits are created for SPARK CTAS table

When following Spark queries are fired:

```
spark.sql("create table table1(id int)")
spark.sql("create table table2 as select * from table1")
```

HMS sends "ENTITY_CREATE" and "ENTITY_FULL_UPDATE_V2".

The extra ENTITY_FULL_UPDATE_V2 message received from HMS is sent as a part of ALTER_TABLE_ADDCOLS event from the HMS Hook side. This behaviour is observed only when the queries are run from Spark SQL and not when run the same queries are run from Beeline.

CDPD-39197: Debug metrics returns empty data

When debug metrics is enabled and some operations are performed, the response is empty

CDPD-36495: Updating legacyAttribute from False to True resets the initially created relationshipAttributes values

Creating types, entities, and to start, you must set the relationship with is_legacy_attribute value as **False**.

Later, update the value relationshipDef is_legacy_attribute to **True**.

For the entities that were created before updating the is_legacy_attribute to **True**, the relationship Attributes value is reset.

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-29409: Hive import: Suggestion suggests entity which is deleted.

Suggestions suggests tables of a database, which is a deleted entity.

CDPD-25152: Tag propagation through deferred actions consumes additional time as compared to default flow

The additional time might be due to the small overhead added to create / update task vertex and which is run in the background. This also depends on number of tasks queued to be executed.

CDPD-42954: Zeppelin notebook fails after enabling Atlas-HDFS hook

The Zeppelin notebooks are failing with errors after enabling Atlas-HDFS hook in the CDP cluster.

When the below properties are set for atlas-client.properties in Cloudera Manager:

- atlas.jaas.KafkaClient.option.keyTab
- atlas.jaas.KafkaClient.option.principal

Along with adding the properties in /etc/atlas/conf/atlas-application.properties, Cloudera Manager also adds these properties to atlas-application.properties for other services (like Spark).

Adding these properties interferes with the normal flow of the services (like Spark)

To enable HDFS lineage feature, instead of setting these properties through Cloudera Manager, users can manually add the properties directly in /etc/atlas/conf/atlas-application.properties

CDPD-10576: Deleted Business Metadata attributes appear in Search Suggestions

Atlas search suggestions continue to show Business Metadata attributes even if the attributes have been deleted.

None.

CDPD-39427: [HDFS Lineage]: When the input is a directory in case of put/copyfromLocal/cp/mv commands, lineage is not created even though the script succeeds.

When Source is a directory and target is a directory which is already present in Atlas, the command succeeds and inserts the data in the desired location, but lineage is not created.

DOCS-13760: System Attributes search, __classificationNames: Search with parent tag does not return entities associated to its children tags

System attribute search with __classificationNames = parent_tag returns entities associated to parent_tag only and not entities associated to its children tag.

Workaround: Instead of using system attribute, employ the basic search attribute "classification" which lists entities associated with inherited classifications.

CDPD-35818: Basic search with tag filter provides approximateCount as -1 when there is no match and is 0 otherwise

When the following search operations are performed:

- Faceted search with both tag filter and entity filter

The observed approximateCount is -1.

Here both entity filter and tag filter are present and when there is no match the response received is -1.

- Faceted search with only entity filter

Performing a basic search provides an approximate value of 0 when there is no match.

- Faceted search with only tag filter

Whenever there is tag filter in the query and there is no entity match, the approximateCount is -1 and if the tag filter is not available, the response approximateCount is 0

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-76035: Resource lookup for Atlas service is failing

Once the Atlas configuration snippet atlas.authentication.method.file is enabled and a classification is created, these do not synchronize correctly to the **Type Category** resource field setting of Apache Ranger. The newly created classification won't be able to be selected as the **Type Name**.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-69140: Incremental export: When an entity has tag propagated and is exported, the tag is not propagated to it in the export

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After exporting the last table, it will not have the propagated tag.

Apache JIRA: [ATLAS-4889](#)

CDPD-69213: Export/Import, Incremental Export: When entity exported has a tag propagated from entity which is deleted, tag is not propagated to it at target

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After dropping the first table and exporting the entire lineage, the child tables will not have the propagated tag.

Apache JIRA: [ATLAS-5055](#)

CDPD-76789: Creating tag with name description throws java.lang.ClassCastException

Creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options" can lead to HTTP 500 error in Apache Atlas.

Avoid creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options".

CDPD-77435: RAZ: Import-hive on Cloudera Data Engineering cluster fails

Running import-hive command on RAZ enabled Cloudera Data Engineering cluster fails with error "NoClassDefFoundError: com/sun/jersey/core/spi/factory/ResponseBuilderImpl".

CDPD-70321: Atlas Parallel import is failing with various errors

During a parallel import-export activity with six iceberg table policies with exportOption as db1.* for all six exports, all import fail after the exports.

CDPD-75994: Post DL regular upgrade (non ZDU) to 7.3.1, "Exception in getKafkaConsumer ,WakeUpException: null" is seen

After the data lake is upgraded to 7.3.1, sometimes Atlas Hook does not function when Apache Atlas and Apache Kafka are started at the same time, thus Atlas is unable to connect to Kafka while Kafka is still being set up. Atlas performs only three attempts.

Restart the cluster, after the upgrade to trigger to reconnect to Apache Kafka. The Kafka consumer creation should be retried if the Kafka service is unavailable during Atlas startup.

DOCS-26821: Iceberg entities created in 7.2.17 Atlas-Hook (Hive,Impala,Spark) is not ingested by 7.2.18/7.3.1 Atlas Server

When using an Atlas hook from 7.3.1 with an earlier version of Atlas server (7.1.9 SP1 CHF5 or earlier) to create an Iceberg table, the older data model of Iceberg cannot process the features of the new data models. For example, when encountering relationships or attributes in queries which do not have a definition in the earlier model, Iceberg fails to create new tables with an error message. The data model of the Iceberg in Cloudera Runtime 7.1.9 SP1 CHF5 or later is not backward compatible with earlier data models.

It is recommended to upgrade your Atlas server version to at least 7.1.9 SP1 CHF5 or later.

CDPD-28741: Atlas node start failure : PermanentLockingException: Expected value mismatch for KeyColumn

In an Atlas High Availability (HA) enabled environment, starting both Atlas hosts at the same time can result in both trying to access or modify the same graph database resulting in a race condition. One instance successfully modifies the patch vertex, while the other instance triggers a Locking Exception (Concurrent modification exception).

Start Atlas instances in sequence and not in parallel to avoid the potential race condition. If the exception is already present, restart the second Atlas instance after triggering the PermanentLockingException.

CDPD-79099: Unable to import hive tables using import script in Public Cloud

The validation of import .zip files can cause the org.apache.atlas.AtlasServiceException error if the .zip file contains Atlas shell entities missing mandatory attributes such as a name. Therefore, the import of shell entities fails.

CDPD-88230: Bulk import operations currently do not construct lineage as expected

Bulk import operations do not create lineage consistently, even when the entities are imported successfully.

CDPD-88302: Bulk import operations currently do not create audits for the imported entities

Bulk import operations do not create audits for the imported entities.

Known Issues in Cruise Control

Learn about the known issues in Cruise Control, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11**Rebalancing with Cruise Control does not work due to the metric reporter failing to report the CPU usage metric**

On the Kafka broker, the Cruise control metric reporter plugin may fail to report the CPU usage metric.

If the CPU usage metric is not reported, the numValidWindows in Cruise Control will be 0 and proposal generation as well as partition rebalancing will not work. If this issue is present, the following message will be included in the Kafka logs:

```
WARN com.linkedin.kafka.cruisecontrol.metricsreporter.CruiseControlMetricsReporter:
[CruiseControlMetricsReporterRunner]: Failed reporting CPU
util.
```

```
java.io.IOException: Java Virtual Machine recent CPU usage is not
available.
```

This issue is only known to affect Kafka broker hosts that have the following specifications:

- CPU: Intel(R) Xeon(R) CPU E5-2699 v4 @ 2.20GHz
- OS: Linux 4.18.5-1.el7.elrepo.x86_64 #1 SMP Fri Aug 24 11:35:05 EDT 2018 x86_64
- Java version: 8-18

Move the broker to a different machine where the CPU is different. This can be done by moving the host to a different cluster. For more information, see the [Moving a Host Between Clusters](#).

Note: Cluster nodes affected by this issue are not displayed as unhealthy.

Known Issues in Hue

Learn about the known issues in Hue, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11**OPSAPS-75134: LDAP and Kerberos dual authentication fails with HiveOnTez in HTTP Transport Mode**

Enabling LDAP for the HiveOnTez service in a Kerberos environment with transport mode set to HTTP, Hue fails to load database information due to unsupported server authentication combinations. The HiveOnTez requires `hive.server2.authentication=LDAP, KERBEROS` parameter, but Hue supports the KERBEROS and LDAP values separately, but not combined, causing a conflict and preventing a successful connection to HiveServer2.

- Log into Cloudera Manager go to Hive-On-Tez Configuration Hive Service Advanced Configuration Snippet (Safety Valve) for hive-site.xml and set the following value:

```
hive.server2.authentication=LDAP,KERBEROS
```

- Go to Hue Configuration Hue Server Advanced Configuration Snippet (Safety Valve) for hive-site.xml and set the following value:

```
hive.server2.authentication=KERBEROS
```

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-58978: Batch query execution using Hue fails with Kerberos error

When you run Impala queries in a batch mode, you encounter failures with a Kerberos error even if the keytab is configured correctly. This is because submitting Impala, Sqoop, Pig, or pyspark queries in a batch mode launches a shell script Oozie job from Hue and this is not supported on a secure cluster.

There is no workaround. You can submit the queries individually.

OPSAPS-69659: Hue service fails on restart with "Unable to find pycogp2 2.5.4" error

Hue service fails to restart and you see the following error: Unable to find pycogp2 2.5.4. This could be because you have installed Python in a non-default location and Hue is unable to locate the pycogp2 PostgreSQL database adapter.

You must specify the path where you have installed Python in the PYTHONPATH property in the Hue Advanced Configuration Snippet using Cloudera Manager.

- Log in to Cloudera Manager as an Administrator.
- Go to Clusters Hue Configurations and add the following key and value in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

Key: PYTHONPATH

Value: [***PYTHON-PATH***]

Replace [***PYTHON-PATH***] with the actual location where you have installed Python. For example, /opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python3.8/site-packages

- Click Save Changes.
- Restart the Hue service.

CDPD-59677: Unable to view Phoenix tables on the left assist in Hue

On clusters secured with Knox, you may not be able to see Phoenix tables on the left assist that are present under the default database (that is, an empty("") database).

None.

CDPD-58142: A query is not pre-populated in the Hue editor after clicking on the "Re Execute" button

When you click Re Execute to rerun a query from the Job Browser Queries Query Details page, the query does not get populated on the Hue editor, as expected.

None.

CDPD-54376: Clicking the home button on the File Browser page redirects to HDFS user directory

When you are previewing a file on any supported filesystem, such as S3 or ABFS, and you click on the Home button, you are redirected to the HDFS user home directory instead of the user home directory on the said filesystem.

None.

CDPD-41306: pip3.8 freeze command does not work and results into an error

You see the `/usr/lib/hue/build/env/bin/python: No such file or directory` error when you run the following command:

```
build/env/bin/pip3.8 freeze
```

Run the freeze command as follows by specifying the paths of python3.8 and pip3.8:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/python3.8 /opt/cloudera/parcels/CDH/lib/hue/build/env/bin/pip3.8 freeze
```

CDPD-43293: Unable to import Impala table using Importer

Creating Impala tables using the Hue Importer may fail.

If you have both Hive and Impala services installed on your cluster, then you can import the table using by selecting the Hive dialect from **Tables Sources**.

If only Impala service is installed on your cluster, then go to **Cloudera Manager Clusters Hue Configurations** and add the following line in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field:

```
[beeswax]
max_number_of_sessions=1
```

DWX-8602: Unable to import a large CSV file from the local workstation

You may see an error message while importing a CSV file into Hue from your workstation, stating that you cannot import files of size more than 200 KB.

Upload the file to S3 or ABFS and then import them into Hue using the Importer.

CDPD-39330: Unable to use the pip command in CDP

You may not be able to use the pip command in CDP 7.1.7 or higher and may see the following error when using pip in a command: “ImportError: cannot import name chardet”.

Follow the steps listed on [Unable to use pip command in CDP](#).

CDPD-24294: Hue uses the unsafe-inline directive in its Content Security Policy (CSP) header

Hue 4 web interface uses the unsafe-inline directive in its CSP header. As a result, the application server does not set the CSP header in its HTTP responses, and therefore does not benefit from the additional protection against potential cross-site scripting issues and other modern application vulnerabilities which a properly configured CSP may provide. This could lead to application vulnerability.

Cloudera recommends deploying additional security measures such as a firewall within the Hue server to control allowed connections, and SSO-based authentications mechanisms such as LDAP or SAML.

OPSAPS-58927: Connection failed error when accessing the Search app (Solr) from Hue

If you are using Solr with Hue to generate interactive dashboards and for indexing data, and if you have deployed two Solr services on your cluster and selected the second one as a dependency for Hue, then Cloudera Manager assigns the hostname of the first Solr service and the port number of the second Solr service generating an incorrect Solr URL in the search section of the `hue.ini` file. As a result, you may see a “Connection failed” error when you try to access the Search app from the Hue web UI.

1. Log into Cloudera Manager as an Administrator.
2. Go to **Clusters Hue service Configuration** and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field:

```
[search]
# URL of the Solr Server
```

```
solr_url=http://[***HOSTNAME***]:[***PORT***]/solr/
```

For example:

```
solr_url=http://solr2:4567/solr/
```

3. Click Save Changes.
4. Restart the Hue service.

CDPD-41136: Importing files from the local workstation is disabled by default

Cloudera has disabled the functionality to import files from your local workstation into Hue because it may cause errors. You may not see the Local File option in the Type drop-down menu on the **Importer** page by default.

You can enable the functionality to import files from your local workstation by specifying the following parameter in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field in Hue configurations in Cloudera Manager:

```
[indexer]
enable_direct_upload=true
```

Invalid S3 URI error while accessing S3 bucket

The Hue Load Balancer merges the double slashes (//) in the S3 URI into a single slash (/) so that the URI prefix `"/filebrowser/view=S3A:/"` is changed to `"/filebrowser/view=S3A:/"`. This results in an error when you try to access the S3 buckets from the Hue File Browser through the port 8889.

The Hue web UI displays the following error: “Unknown error occurred”.

The Hue server logs record the “ValueError: Invalid S3 URI: S3A” error.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to **Clusters Hue service Configurations Load Balancer** and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
3. Specify `MergeSlashes OFF` in the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

You should be able to load the S3 browser from both 8888 and 8889 ports.

Alternatively, you can use the Hue server port 8888 instead of the load balancer port 8889 to resolve this issue.

Error while rerunning Oozie workflow

You may see an error such as the following while rerunning an already executed and finished Oozie workflow through the Hue web interface: `E0504: App directory [hdfs://cdh/user/hue/oozie/workspaces/hue-oozie-1571929263.84] does not exist`.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to **Clusters Hue service Configurations Load Balancer** and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
3. Specify `MergeSlashes OFF` in the Load Balancer Advanced Configuration Snippet (Safety Valve) for `httpd.conf` field.
4. Click Save Changes.

- Restart the Hue Load Balancer.

CDPD-17956, CDPD-14167: Setting idle session timeout for Hue does not work when the cluster is secured using Knox SSO

If Hue is configured with `desktop.auth.backend.KnoxSpnegoDjangoBackend` as the Authentication Backend, then the automatic idle session logout that is set by configuring the `idle_session_timeout` property does not take effect. You may also see 404 error while accessing Hue from the Knox UI when the `idle_session_timeout` property is not set to -1.

None

Query history displays "Result Expired" message

You see the "Result Expired" message under the Query History column on the **Queries** tab for queries which were run back to back. This is a known behaviour.

None.

CDPD-43956: Manually replace UUID when importing Oozie workflows containing sub-workflows

When importing Oozie workflows that contain sub-workflows, you must replace all the UUID entries with unique new entries. If you change the UUID of a sub-workflow, you must update that reference in the parent workflow to avoid circular dependencies.

Hue limitation after upgrading from CDH to CDP Private Cloud Base

The `hive.server2.parallel.ops.in.session` configuration property changes from TRUE to FALSE after upgrading from CDH to CDP Private Cloud Base. Current versions of Hue are compatible with this property change; however, if you still would like to use an earlier version of Hue that was not compatible with this property being FALSE and shared a single JDBC connection to issue queries concurrently, the connection will no longer work after upgrading.

Hue UI is blank upon login after upgrading to CDP 7.1.7 from CDH 6

If your cluster was secured using Knox, and if you have upgraded from CDH 6 to CDP 7.1.7, then you may see a blank Hue screen. This could happen because the `knox_proxyhosts` parameter is newly introduced in CDP, and it is possible that this parameter is not configured in Cloudera Manager under Hue configuration.

Specify the host on which you have installed Knox in the Hue Knox Proxy Hosts configuration as follows:

- Log in to Cloudera Manager as an Administrator.
- Obtain the host name of the Knox Gateway by going to Clusters Knox service Instances .
- Go to Clusters Hue service Configuration and search for the Knox Proxy Hosts field.

Note: Cloudera Manager displays the following warning if the Knox Proxy Hosts field is empty when Knox Gateway is enabled on the CDP cluster: The parameter `knox_proxyhosts` cannot be empty. This can happen if there are no Knox Gateways. Please set the `knox_proxyhosts` to the list of hosts that have Knox Gateways.

- Specify the Knox Gateway hostname in the Knox Proxy Hosts field.
- Click Save Changes and restart the Hue service.

Unsupported features

CDPD-59595: Spark SQL does not work with all Livy servers that are configured for High Availability

SparkSQL support in Hue with Livy servers in HA mode is not supported. Hue does not automatically connect to one of the Livy servers. You must specify the Livy server in the Hue Advanced Configuration Snippet as follows:

```
[desktop]
[spark]
```

```
livy_server_url=http(s)://[***LIVY-FOR-SPARK3-SERVER-HOST***]:
[***LIVY-FOR-SPARK3-SERVER-PORT***]
```

Moreover, you may see the following error in Hue when you submit a SparkSQL query: Expecting value: line 2 column 1 (char 1). This happens when the Livy server does not respond to the request from Hue.

Specify all different Livy servers in the `livy_server_url` property one at a time and use the one which does not cause the issue.

CDPD-18491: PySpark and SparkSQL are not supported with Livy in Hue

Hue does not support configuring and using PySpark and SparkSQL with Livy in CDP Private Cloud Base.

Importing and exporting Oozie workflows across clusters and between different CDH versions is not supported

You can export Oozie workflows, schedules, and bundles from Hue and import them only within the same cluster if the cluster is unchanged. You can migrate bundle and coordinator jobs with their workflows only if their arguments have not changed between the old and the new cluster. For example, hostnames, NameNode, Resource Manager names, YARN queue names, and all the other parameters defined in the `workflow.xml` and `job.properties` files.

Using the import-export feature to migrate data between clusters is not recommended. To migrate data between different versions of CDH, for example, from CDH 5 to CDP 7, you must take the dump of the Hue database on the old cluster, restore it on the new cluster, and set up the database in the new environment. Also, the authentication method on the old and the new cluster should be the same because the Oozie workflows are tied to a user ID, and the exact user ID needs to be present in the new environment so that when a user logs into Hue, they can access their respective workflows.

Note: Migrating Oozie workflows from HDP clusters is not supported.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60770: Beeline Authentication Issue with Special Characters in Passwords

When LDAP is enabled, users cannot authenticate with Beeline if the password contains a special character. For example, the following string fails:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>;user=user@XXX;password='R3G#xpXyoy1M0Jb1'
```

Use the `-p` parameter to execute the Beeline command:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>; -n user@XXX -p 'R3G#xpXyoy1M0Jb1'
```

CDPD-43769: Inconsistent behavior with CHAR comparisons and string literals

In Hive, 'char' data to 'string' data comparison is considered as equal, but 'char' data to 'varchar' data comparison is considered as not equal if the data has trailing spaces. For example,

```
create table test(colchar char(10), colvarchar varchar(20), colstring string);
insert into test values ('a ', 'a ', 'a ');

select count(*) from test where colchar = colstring;
Output returns 1 because char and string data is considered as equal

select count(*) from test where colchar = colvarchar;
Output returns 0 because char and varchar data is considered as not equal
```

It is recommended that you use 'varchar or string' data type instead of 'char' data type for any character or string representation.

CDPD-42726: Wrong results for agg queries from stats after running multi-insert query on managed table

Multiple inserts at the same time into the same partition results in invalid stats. For example:

```
create table source(p int, key int, value string);
insert into source(p, key, value) values (101,42,'string42');

create table stats_part(key int,value string) partitioned by (p int);
from source
insert into stats_part select key, value, p
insert into stats_part select key, value, p;

select count(*) from stats_part;
```

```
-- In this scenario, StatsOptimizer helps serving this query be
cause the result should be rowNum of the partition p=101.
-- The result is 1, however, the result should be 2.
```

Rewrite the multi-insert statement by merging the branches inserting into the same partition to one branch.

CDPD-57574: Query execution fails due to NullPointerException in DagUtils.setupQuickStart

Hive queries may fail at runtime with a NullPointerException while executing the Tez graph at DagUtils.setupQuickStart method. A part of the stack trace from the error is shown below:

```
ERROR : Failed to execute tez graph.
java.lang.NullPointerException: null at org.apache.hadoop.hive.
ql.exec.tez.DagUtils.setupQuickStart(DagUtils.java:1724)
```

The error usually occurs from an invalid plan that has cycles created by semi-join or map-join edges.

Disable some of the optimizations in order to remove the cycles from the plan. It is sufficient to set one of the following properties:

- set hive.tez.dynamic.partition.pruning=false;
- set hive.tez.dynamic.semijoin.reduction=false;
- set hive.auto.convert.join=false;

To avoid any undesired performance regressions, disable the optimization(s) only for specific queries and not globally (through Cloudera Manager) for the whole workload or cluster.

CDPD-45370: Cartesian join fails with an empty table

When the configuration hive.tez.cartesian-product.enabled is set to true, query fails if one of the tables involved in a Cartesian join has zero rows. This results in an IllegalArgumentException with the message Number of items is 0. Should be positive.

To address this issue, set hive.tez.cartesian-product.enabled to false before running the query.

Apache Jira: [\[HIVE-26582\]](#)

CDPD-43107: SemanticException for INSERT INTO statement when Hive Cost-based Optimizer (CBO) is disabled

If you are running the INSERT INTO query and hive.cbo.enable is set to "false", the query fails with a SemanticException. For example,

```
set hive.cbo.enable=false;

CREATE TABLE mytable (
  id INT,
  str STRING
);

INSERT INTO mytable (id, str) VALUES (1, 'a');
```

```
Output:
org.apache.hadoop.hive.ql.parse.SemanticException: 0:0 Expected
2 columns for insclause-0/default@mytable; select produces 1 col
umns. Error encountered near token 'a'
```

This issue occurs only when columns are specified for the target table in the query. INSERT INTO mytable values (1, 'a'); does not result in an exception.

Enable CBO and run the query.

CDPD-43957: HiveServer shuts down during replication due to high resource usage

During Hive replication (both bootstrap and incremental), you may notice that the HiveServer (HS2) shuts down periodically with the following error:

```
java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper
    at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:265)
    at org.apache.hive.jdbc.HiveDriver.connect(HiveDriver.java:107)
    at java.sql.DriverManager.getConnection(DriverManager.java:664)
    at java.sql.DriverManager.getConnection(DriverManager.java:247)
    at com.cloudera.enterprise.hive3qt.Hive3QueryTool$HiveOperation.execute(Hive3QueryTool.java:682)
    at com.cloudera.enterprise.hive3qt.Hive3QueryTool.main(Hive3QueryTool.java:935)
Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.configureConnParams(ZooKeeperHiveClientHelper.java:177)
    at org.apache.hive.jdbc.Utills.configureConnParamsFromZooKeeper(Utills.java:580)
    at org.apache.hive.jdbc.Utills.parseURL(Utills.java:391)
    at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:263)
    ... 5 more
Caused by: org.apache.hive.jdbc.ZooKeeperHiveClientException: Tried all existing HiveServer2 uris from ZooKeeper.
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.getServerHosts(ZooKeeperHiveClientHelper.java:132)
    at org.apache.hive.jdbc.ZooKeeperHiveClientHelper.configureConnParams(ZooKeeperHiveClientHelper.java:172)
    ... 8 more
```

This issue occurs when you replicate at scale with an unbalanced cluster setup that has all the roles running on the Cloudera Manager host. As a result, Cloudera Manager ends up in a bottleneck situation because HS2 crashes, preventing further replication. The logs (/var/log/messages) indicate that there were a large number of Java processes running on the host, which exhausted the host's memory and triggered an Out Of Memory Killer process to stop HS2.

You can restart HS2 and reinitiate replication. However, the replication process may take a longer time to complete.

- Follow these recommendations when setting up your source and target clusters:
 - Ensure that no HS2, Hive metastore (HMS), DataNode, or NameNode roles are running on the Cloudera Manager host.
 - Ensure that you have multiple instances of HS2 and HMS roles on different nodes.
 - It is recommended that you have the HS2 and HMS roles on different nodes than the DataNodes or NameNodes.

These practices increase the possibility of Hive replication at scale completing successfully.

- Limit the scale of Hive replication by temporarily disabling replication policies.

CDPD-40730: Parquet change can cause incompatibility

Parquet files written by the parquet-mr library in CDP 7.1.9, where the schema contains a timestamp with no UTC conversion will not be compatible with older versions of Parquet readers. The effect is that the older versions will still consider these timestamps as they would require UTC conversions and will thus end up with a wrong result. You can encounter this problem only when you write Parquet-based tables using Hive, and tables have the non-default configuration `hive.parquet.write.int64.timestamp=true`.

None.

CDPD-41274: HWC + Oozie issue: Could not open client transport with JDBC Uri

Currently only Spark cluster mode is supported in the Oozie Spark Action with Hive Warehouse Connector (HWC).

Use Spark action in cluster mode.

```
<spark xmlns="uri:oozie:spark-action:1.0">
  ...
  <mode>cluster</mode>
  ...
</spark>
```

CDPD-26556 After an upgrade, querying a CTAS table under certain conditions might throw an exception

If you upgrade your Hive cluster from CDH 6 to CDP 7, create a CTAS table in the CDP cluster from a table you upgraded from CDH, you might see the following exception when you query the new table:

```
class org.apache.hadoop.io.IntWritable cannot be cast to class o
rg.apache.hadoop.hive.serde2.objectinspector.StandardUnionObject
Inspector$StandardUnion
```

This issue involves CDH-based tables having columns of complex types ARRAY, MAP, and STRUCT.

CDPD-23506: OutOfMemoryError in LLAP

Long running spark-shell applications can leave sessions in interactive Hiveserver2 until the Spark application finishes (user exists from spark-shell), causing memory pressure in case of a high number of queries in the same shell (1000+).

You must close spark-shell so that sessions are closed. Add the owner of the database or the tables as a user with read or read/write access to the tables directly.

CDPD-23041: DROP TABLE on a table having an index does not work

If you migrate a Hive table to CDP having an index, DROP TABLE does not drop the table. Hive no longer supports indexes ([HIVE-18448](#)). A foreign key constraint on the indexed table prevents dropping the table. Attempting to drop such a table results in the following error:

```
java.sql.BatchUpdateException: Cannot delete or update a parent
row: a foreign key constraint fails ("hive"."IDX", CONSTRAINT "
IDX_FK1" FOREIGN KEY ("ORIG_TBL_ID") REFERENCES "TBLS ("TBL_ID"
))
```

There are two workarounds:

- Drop the foreign key "IDX_FK1" on the "IDX" table within the metastore. You can also manually drop indexes, but do not cascade any drops because the IDX table includes references to "TBLS".
- Launch an older version of Hive, such as Hive 2.3 that includes IDX in the DDL, and then drop the indexes as described in [Language Manual Indexing](#).

Apache Issue: [Hive-24815](#)

CDPD-17766: Queries fail when using spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive.

Do not specify spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive remotely.

Workaround: specify `principal=hive.server2.authentication.kerberos.principal` as shown in the following syntax:

```
jdbc:hive://<host>:<port>/<dbName>;principal=hive.server2.authentication.kerberos.principal;<otherSessionConfs>?<hiveConfs>#<hiveVars>
```

CDPD-13636: Hive job fails with OutOfMemory exception in the Azure DE cluster

Set the parameter `hive.optimize.sort.dynamic.partition.threshold=0`. Add this parameter in Cloudera Manager (Hive Service Advanced Configuration Snippet (Safety Valve) for `hive-site.xml`)

CDPD-10848: HiveServer Web UI displays incorrect data

If you enabled auto-TLS for TLS encryption, the HiveServer2 Web UI does not display the correct data in the following tables: Active Sessions, Open Queries, Last Max n Closed Queries

Known Issues in Impala

Learn about the known issues in Impala, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94720: Impala startup failure due to invalid TLS v1.3 ciphers

When running Impala on a machine with OpenSSL 1.1.1, providing an invalid or TLS v1.2 ciphersuite in the `--tls_ciphersuites` startup flag causes the process to fail during startup. While OpenSSL 3.x ignores invalid ciphers, OpenSSL 1.1.1 returns an error if any ciphersuite in the list is invalid, even if other valid TLS v1.3 ciphers are present.

Ensure that the list in the `--tls_ciphersuites` startup flag contains only valid TLS v1.3 ciphersuites and does not contain any TLS v1.2 ciphersuites.

Apache Jira: [IMPALA-14625](#)

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-59625: Impala shell in RHEL 9 with Python 2 as default does not work

If you try to run `impala-shell` on RHEL 9 by setting the default python executable available in `PATH` to Python 2, it will fail since RHEL 9 is compatible only with Python 3.

If you run into such issues, set this parameter pointing to Python 3, `IMPALA_PYTHON_EXECUTABLE=python3`.

CDPD-81980: Impala query may fail due to backpressure

Impala queries could fail with a dropped due to backpressure error, even when service queue and memory usage appear normal.

Increase the value of the `--mem_limit` startup option.

CDPD-42958: After upgrading the CDH 7.1.9 from CDH 6.x, under certain conditions you cannot insert data into a table

Under the following conditions, after upgrading from CDH 6.x to CDH 7.1.9 you cannot insert data into a table from Impala:

- On CDH 6.x, you created a database with Impala in a user specified HDFS location.
- Using Hive, you then created a table in the database.

Under these conditions, the database and table are stored in the user-specified HDFS directory. After upgrading, the HDFS directory of the table is read-only for Impala. Consequently, from Impala you cannot insert new data into the table because Impala does not have write permission on the HDFS directory.

Workaround: To resolve this issue, use either one of the following workarounds:

- Using the Ranger Web UI, in the policy repository `cm_hdfs`, grant the user 'impala' write permission on the directory where the table resides.
- Enter the following command to grant write permission to user 'impala' on the HDFS directory where the table resides.

```
hdfs dfs -setfacl -m default:user:impala:rwx <HDFS directory>
```

CDPD-80019: Impala fails to start due to large catalog-update topic

Impala coordinators fail to start if the catalog-update statestore topic exceeds 2GB, hitting the Thrift 0.16.0 message size limit (`thrift_rpc_max_message_size`). This prevents the coordinator from processing the update.

- Enable local catalog mode: `--use_local_catalog=true`
- In Cloudera Manager, go to Impala Configuration search for "Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)" and click 
- Add property name and value:

```
Name : --catalog_topic_mode
Value: minimal
```

- Save changes.

Apache Jira: [IMPALA-12350](#)

Impala cannot update table if the 'external.table.purge' property is not set to true

Impala cannot update a table using DDL statements if the 'external.table.purge' property is FALSE. ALTER TABLE statements return success with no changes to the table.

ALTER TABLE statements should be issued twice if "external.table.purge" was FALSE initially.

Note: For Iceberg tables, Impala users should always use CREATE TABLE since the Impala CREATE TABLE statement sets the flag to TRUE. However, Impala CREATE EXTERNAL TABLE sets the flag to FALSE.

Impala's known limitation when querying compacted tables

When the compaction process deletes the files for a table from the underlying HDFS location, the Impala service does not detect the changes as the compactions does not allocate new write ids. When the same table is queried from Impala it throws a 'File does not exist' exception that looks something like this:

```
Query Status: Disk I/O error on <node>:22000: Failed to open HDF
S file hdfs://nameservice1/warehouse/tablespace/managed/hive/<da
tabase>/<table>/xxxxx
Error(2): No such file or directory Root cause: RemoteException:
File does not exist: /warehouse/tablespace/managed/hive/<data
base>/<table>/xxxx
```

Use the [REFRESH/INVALIDATE](#) statements on the affected table to overcome the 'File does not exist' exception.

CDPD-28431: Intermittent errors could be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

Impala api calls via knox require configuration if the knox customized kerberos principal name is a default service user name

To access impala api calls via knox, if the knox customized kerberos principal name is a default service user name, then configure "authorized_proxy_user_config" by clicking Clusters->impala->configuration. Include the knox customized kerberos principal name in the comma separated list of values <knox_custom_kerberos_principal_name>="*" where <knox_custom_kerberos_principal_name> is the value of the Kerberos Principal in the Knox service. Select Clusters>Knox>Configuration and search for Kerberos Principal to display this value.

CDPD-21828: Multiple permission assignment through grant is not working

None

Problem configuring masking on tables using Ranger

The following Knowledge Base article describes the behavior when we configure masking on tables using Ranger. This configuration works for Hive, but breaks queries in some scenarios for Impala.

For a workaround, see the following Knowledge Base article: [ERROR: "AnalysisException: No matching function with signature: mask\(FLOAT\)" when Impala jobs fail with the following error with signature: mask\(FLOAT\)](#)

IMPALA-11871: INSERT statement does not respect Ranger policies for HDFS

In a cluster with Ranger auth (and with legacy catalog mode), even if you provide RWX to cm_hdfs -> all-path for the user impala, inserting into a table whose HDFS POSIX permissions happen to exclude impala access will result in "AnalysisException: Unable to INSERT into target table (default.t1) because Impala does not have WRITE access to HDFS location: hdfs://XXXXXXXXXXXXX"

IMPALA-532: Impala should tolerate bad locale settings

If the LC_* environment variables specify an unsupported locale, Impala does not start.

Add LC_ALL="C" to the environment settings for both the Impala daemon and the Statestore daemon.

Avro Scanner fails to parse some schemas

The default value in Avro schema must match type of first union type, e.g. if the default value is null, then the first type in the UNION must be "null".

Swap the order of the fields in the schema specification. For example, use ["null", "string"] instead of ["string", "null"]. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

IMPALA-691: Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the `impalad` daemon.

To monitor overall memory usage, use the `top` command, or add the memory figures in the Impala web UI `/memz` tab to JVM memory usage shown on the `/metrics` tab.

IMPALA-1024: Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Remove trailing semicolon from the Avro schema.

IMPALA-1652: Incorrect results with basic predicate on CHAR typed column

When comparing a CHAR column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Use the `RPAD()` function to blank-pad literals compared with `CHAR` columns to the expected length.

IMPALA-1821: Casting scenarios with invalid/inconsistent results

Using a CAST() function to convert large literal values to smaller types, or to convert special values such as NaN or Inf, produces values not consistent with other database systems. This could lead to unexpected results from queries.

None

IMPALA-2005: A failed CTAS does not drop the table if the insert fails

If a CREATE TABLE AS SELECT operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Drop the new table manually after a failed CREATE TABLE AS SELECT

IMPALA-2422: % escaping does not work correctly when occurs at the end in a LIKE clause

If the final character in the RHS argument of a LIKE operator is an escaped \% character, it does not match a % final character of the LHS argument.

None

IMPALA-2603: Crash: impala::Coordinator::ValidateCollectionSlots

A query could encounter a serious error if includes multiple nested levels of INNER JOIN clauses involving subqueries.

None

IMPALA-3094: Incorrect result due to constant evaluation in query with outer join

An OUTER JOIN query could omit some expected result rows due to a constant such as FALSE in another join clause. For example:

```
explain SELECT 1 FROM alltypestiny a1
  INNER JOIN alltypesagg a2 ON a1.smallint_col = a2.year AND fals
e
  RIGHT JOIN alltypes a3 ON a1.year = a1.bigint_col;
+---+
| Explain String |
+---+
+---+
+---+
```

```
| Estimated Per-Host Requirements: Memory=1.00KB VCores=1 |
| 00:EMPTYSET |
+---+
- - - - -
```

IMPALA-3509: Breakpad minidumps can be very large when the thread count is high

The size of the breakpoint minidump files grows linearly with the number of threads. By default, each thread adds 8 KB to the minidump size. Minidump files could consume significant disk space when the daemons have a high number of threads.

Add `-lminidump_size_limit_hint_kb=size` to set a soft upper limit on the size of each minidump file. If the minidump file would exceed that limit, Impala reduces the amount of information for each thread from 8 KB to 2 KB. (Full thread information is captured for the first 20 threads, then 2 KB per thread after that.) The minidump file can still grow larger than the "hinted" size. For example, if you have 10,000 threads, the minidump file can be more than 20 MB.

IMPALA-4978: Impala requires FQDN from hostname command on Kerberized clusters

The method Impala uses to retrieve the host name while constructing the Kerberos principal is the `gethostname()` system call. This function might not always return the fully qualified domain name, depending on the network configuration. If the daemons cannot determine the FQDN, Impala does not start on a Kerberized cluster.

Test if a host is affected by checking whether the output of the `hostname` command includes the FQDN. On hosts where `hostname`, only returns the short name, pass the command-line flag `##hostname=FULLY_QUALIFIED_DOMAIN_NAME` in the startup options of all Impala-related daemons.

IMPALA-6671: Metadata operations block read-only operations on unrelated tables

Metadata operations that change the state of a table, like `COMPUTE STATS` or `ALTER RECOVER PARTITIONS`, may delay metadata propagation of unrelated unloaded tables triggered by statements like `DESCRIBE` or `SELECT` queries.

None

IMPALA-7072: Impala does not support Heimdal Kerberos

None

OPSAPS-46641: A single parameter exists in Cloudera Manager for specifying the Impala Daemon Load Balancer. Because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

The workaround is to use the load balancer configuration either without a port specification, or with the Beeswax port: this will configure BDR. To configure Hue use the "Hue Server Advanced Configuration Snippet (Safety Valve) for impalad_flags" to specify the the load balancer address with the HiveServer2 port.

CDPD-28139: Set spark.hadoop.hive.stats.autogather to false by default

As an Impala user, if you submit a query against a table containing data ingested using Spark and you are concerned about the quality of the query plan, you must run `COMPUTE STATS` against such a table in any case after an ETL operation because numRows created by Spark could be incorrect. Also, use other stats computed by `COMPUTE STATS`, e.g., Number of Distinct Values (NDV) and NULL count for good selectivity estimates.

For example, when a user ingests data from a file into a partition of an existing table using Spark, if `spark.hadoop.hive.stats.autogather` is not set to `false` explicitly, `numRows` associated with this partition would be 0 even though there is at least one row in the file. To avoid this, the workaround is to set `"spark.hadoop.hive.stats.autogather=false"` in the "Spark Client Advanced Configuration Snippet (Safety Valve) for `spark-conf/spark-defaults.conf`" in Spark's CM Configuration section.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker) in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Save Changes > Restart SMM.

The `offsets.topic.replication.factor` property must be less than or equal to the number of live brokers

The `offsets.topic.replication.factor` broker configuration is now enforced upon auto topic creation. Internal auto topic creation will fail with a `GROUP_COORDINATOR_NOT_AVAILABLE` error until the cluster size meets this replication factor requirement.

None

Requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true

The first few produce requests fail when sending to a nonexistent topic with auto.create.topics.enable set to true.

Increase the number of retries in the producer configuration setting retries.

Performance degradation when SSL Is enabled

In some configuration scenarios, significant performance degradation can occur when SSL is enabled. The impact varies depending on your CPU, JVM version, Kafka configuration, and message size. Consumers are typically more affected than producers.

Configure brokers and clients with ssl.secure.random.implementation = SHA1PRNG. It often reduces this degradation drastically, but its effect is CPU and JVM dependent.

OPSAPS-43236: Kafka garbage collection logs are written to the process directory

By default Kafka garbage collection logs are written to the agent process directory. Changing the default path for these log files is currently unsupported.

None

RANGER-3809: Idempotent Kafka producer fails to initialize due to an authorization failure

Kafka producers that have idempotence enabled require the Idempotent Write permission to be set on the cluster resource in Ranger. If permission is not given, the client fails to initialize and an error similar to the following is thrown:

```
org.apache.kafka.common.KafkaException: Cannot execute transactional method because we are in an error state
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeFailWithError(TransactionManager.java:1125)
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeAddPartition(TransactionManager.java:442)
    at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:1000)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:914)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:800)
    .
    .
    .
    Caused by: org.apache.kafka.common.errors.ClusterAuthorizationException: Cluster authorization failed.
```

Idempotence is enabled by default for clients in Kafka 3.0.1, 3.1.1, and any version after 3.1.1. This means that any client updated to 3.0.1, 3.1.1, or any version after 3.1.1 is affected by this issue.

This issue has two workarounds, do either of the following:

- Explicitly disable idempotence for the producers. This can be done by setting enable.idempotence to false.
- Update your policies in Ranger and ensure that producers have Idempotent Write permission on the cluster resource.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

DBZ-4990: The Debezium Db2 Source connector does not support schema evolution

The Debezium Db2 Source connector does not support the evolution (updates) of schemas. In addition, schema change events are not emitted to the schema change topic if there is a change in the schema of a table that is in capture mode. For more information, see [DBZ-4990](#).

None.

CFM-3532: The Stateless NiFi Source, Stateless NiFi Sink, and HDFS Stateless Sink connectors cannot use Snappy compression

This issue only affects Stateless NiFi Source and Sink connectors if the connector is running a dataflow that uses a processor that uses Hadoop libraries and is configured to use Snappy compression. The HDFS Stateless Sink connector is only affected if the Compression Codec or Compression Codec for Parquet properties are set to SNAPPY.

If you are affected by this issue, errors similar to the following will be present in the logs.

```
Failed to write to HDFS due to java.lang.UnsatisfiedLinkError: o
rg.apache.hadoop.util.NativeCodeLoader.buildSupportsSnappy()
```

```
Failed to write to HDFS due to java.lang.RuntimeException: nativ
e snappy library not available: this version of libhadoop was bu
ilt without snappy support.
```

Download and deploy missing libraries.

Important: Ensure that you complete steps 1-11 on all Kafka Connect hosts. Additionally, ensure that the advanced configuration snippet in step 12 is configured for all Kafka Connect role instances.

1. Create the `/opt/nativelibs` directory.

```
mkdir /opt/nativelibs
```

2. Change the owner to kafka.

```
chown kafka:kafka /opt/nativelibs
```

3. Locate the directory containing the Hadoop native libraries and copy its contents to the directory you created.

```
cp /opt/cloudera/parcels/CDH/lib/hadoop/lib/native/* /opt/nativelibs
```

4. Verify that `libsnapy.so` was copied to the directory you created.
5. Remove the following from `/opt/nativelibs`.

```
libhadoop.a          libhadoop.so
                     libhadoop.so.1.0.0
```

6. Run the following command.

```
hadoop version
```

The command returns the Hadoop version running in the cluster. Note down the first three digits in the version.

7. Go to <https://archive.apache.org/dist/hadoop/common/> and download the Hadoop version that matches the first three digits of the version running in the cluster.

For example, if your Hadoop version is 3.1.1.7.1.9.0-296, then you need to download Hadoop 3.1.1.

8. Extract the downloaded archive.

- Copy the following libraries from the downloaded archive to /opt/nativelibs on the cluster host.

```
libhadoop.a          libhadoop.so.1.0.0
```

The libraries are located in `hadoop-[***VERSION***]/lib/native`.

- Create a symlink named `libhadoop.so` and point it to `/opt/nativelibs/libhadoop.so.1.0.0`.

```
ln -s /opt/nativelibs/libhadoop.so.1.0.0 /opt/nativelibs/libhadoop.so
```

- Change the owner of every entry within `/opt/nativelibs` to `kafka`.

```
chown -h kafka:kafka /opt/nativelibs/*
```

- In Cloudera Manager, go to `Kafka service Configuration`.
- Add the following key-value pair to `Kafka Connect Environment Advanced Configuration Snippet (Safety Valve)`.
 - Key: `LD_LIBRARY_PATH`
 - Value: `/opt/nativelibs`
- Click `Save Changes`.
- Restart the `Kafka` service.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to `required`. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to `requested` instead of `required` and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Unsupported Features

The following Kafka features are not supported in Cloudera Data Platform:

- Only Java and .Net based clients are supported. Clients developed with C, C++, Python, and other languages are currently not supported.
- The Kafka default authorizer is not supported. This includes setting ACLs and all related APIs, broker functionality, and command-line tools.
- SASL/SCRAM is only supported for delegation token based authentication. It is not supported as a standalone authentication mechanism.
- Kafka KRaft in this release of Cloudera Runtime is in technical preview and does not support the following:
 - Deployments with multiple log directories. This includes deployments that use JBOD for storage.
 - Delegation token based authentication.
 - Migrating an already running Kafka service from ZooKeeper to KRaft.
 - Atlas Integration.

Limitations

Collection of Partition Level Metrics May Cause Cloudera Manager's Performance to Degrade

If the Kafka service operates with a large number of partitions, collection of partition level metrics may cause Cloudera Manager's performance to degrade.

If you are observing performance degradation and your cluster is operating with a high number of partitions, you can choose to disable the collection of partition level metrics.

Important: If you are using SMM to monitor Kafka or Cruise Control for rebalancing Kafka partitions, be aware that both SMM and Cruise Control rely on partition level metrics. If partition level metric collection is disabled, SMM will not be able to display information about partitions. In addition, Cruise Control will not operate properly.

Complete the following steps to turn off the collection of partition level metrics:

1. Obtain the Kafka service name:
 - a. In Cloudera Manager, Select the Kafka service.
 - b. Select any available chart, and select Open in Chart Builder from the configuration icon drop-down.
 - c. Find \$SERVICENAME= near the top of the display.
The Kafka service name is the value of \$SERVICENAME.
2. Turn off the collection of partition level metrics:
 - a. Go to Hosts Hosts Configuration .
 - b. Find and configure the Cloudera Manager Agent Monitoring Advanced Configuration Snippet (Safety Valve) configuration property.

Enter the following to turn off the collection of partition level metrics:

```
[KAFKA_SERVICE_NAME]_feature_send_broker_topic_partition_entity_update_enabled=false
```

Replace [KAFKA_SERVICE_NAME] with the service name of Kafka obtained in step 1. The service name should always be in lower case.

- c. Click Save Changes.

Known Issues in Knox

CDPD-76435: Default HTTP client timeout for Streams Messaging Manager requests may cause connection timeouts

Some Streams Messaging Manager requests, particularly those retrieving topic data, may take up to 30 seconds to complete, even when there are no connectivity issues. Since the default gateway timeout is set to 20 seconds, this can result in connection timeouts despite the system functioning as expected.

Increase the HTTP client and socket timeouts for Streams Messaging Manager services to 60 seconds. This prevents connection timeouts when the requests take longer than the default gateway timeout.

Follow these steps to configure the required properties for the SMM API and SMM UI services:

1. In Cloudera Manager, select the Knox service.
2. Go to Configuration.

3. Find the Knox Simplified Topology Management - cdp-proxy property, and click **+** to add the following lines:

```
SMM-UI:replayBufferSize=512
SMM-UI:httpclient.connectionTimeout=1m
SMM-UI:client.socketTimeout=1m
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

4. Find the Knox Simplified Topology Management - cdp-proxy-api property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

5. Find the Knox Simplified Topology Management - cdp-proxy-token property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

6. Save your changes.
7. Refresh the cluster.

Known Issues in Kudu

Learn about the known issues in Kudu, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

You get "The user 'kudu' is not part of group 'hive' on the following hosts:" warning by the Host Inspector.

If you are using fine-grained authorization for Kudu, and you are also using Kudu-HMS integration with HDFS-Sentry sync, then you may get the "The user 'kudu' is not part of group 'hive' on the following hosts:" warning while upgrading.

Workaround: Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Unsupported features

Kudu HMS Sync is disabled and is not yet supported

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11**CDPD-87429: Unexpected log lines in Ozone snapshot diff output**

`ozone.client.server-defaults.validity.period.ms` configuration introduced to get server default configurations causes Replication Manager to fail when replicating data between Ozone buckets with the following error when the config value does not specify a timeunit.

```

` ` `
java.lang.IllegalStateException: Invalid first line in diff: "25
/07/02 05:58:44 INFO Configuration.deprecation: No unit for ozon
e.client.server-defaults.validity.period.ms(3600000) assuming MI
LLISECONDS"
  at com.cloudera.enterprise.distcp.OzoneCopyListingUtils.parseOz
oneDiff(OzoneCopyListingUtils.java:397)
` ` `

```

Overwrite the `ozone.client.server-defaults.validity.period.ms` to configure the value to have time unit (ns, ms, s, m, h). For example, 3600000ms.

CDPD-71648: Snapshot creation failing with "PERMISSION_DENIED" error on a bucket created during pre-upgrade in 7.1.7 SP3

On upgrade of cluster from 7.1.7 SP3 to 7.1.9 SP1, we are not able to create snapshots on a pre-upgrade volume or bucket with "PERMISSION_DENIED" error, since in 7.1.7SP3, we were using full KRB owner name with domain but currently, we only use and search for user shortname.

Update the owner of the bucket with the user shortname and then create snapshot by running the commands:

```

ozone sh bucket update --user=[***USER_SHORT_NAME***] {volume}/
{bucket}
ozone sh snapshot create {volume}/{bucket}
  {***SNAPSHOT_NAME***}

```

OPSAPS-74668: ozone.snapshot.deep.cleaning.enabled and ozone.snapshot.ordered.deletion.enabled configurations are missing with CDP 7.1.9 SP1 CHF and Cloudera Manager 7.13.1

Two Ozone Manager configurations are missing while using CDP 7.1.9 SP1 CHF after upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400.

If you are using CDP 7.1.9 SP1 CHF, before upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400, add the following configs to Ozone Manager Advanced Configuration Snippet (Safety Valve) for ozone-conf/ozone-site.xml so that Ozone Manager does not miss important config after the Cloudera Manager upgrade:

```

<property>
<name>ozone.snapshot.deep.cleaning.enabled</name>
<value>>false</value>
</property>

<property>
<name>ozone.snapshot.ordered.deletion.enabled</name>
<value>true</value>
</property>

```

CDPD-64865: Intermittent timeout in TestBlockDeletion.testBlockDeletion (BlockDeletionService stuck)

If the event of SCM exiting safe mode was triggered multiple times, this might eventually cause the SCMBlockDeletingService to transition into the PAUSING state.

Check the SCM logs and ensure that the SCMBlockDeletingService is not running, and then restart the SCM.

CDPD-81569: Recon is not reflecting correct metrics for Volumes, Buckets, Keys, and Pending Key Deletions

Recon is displaying data for container and space utilisation only. The metrics for Volumes, Buckets, Keys, and Pending Key Deletions are not being updated and displayed correctly.

Apache Jira: [HDDS-12607](#)

CDPD-54885: Ozone Prometheus does not work with TLS

The Prometheus service shipped by Ozone does not support TLS mode. So, Prometheus is not able to gather metrics from Ozone endpoints when TLS is enabled.

Go to `Ozone Configuration Ozone Prometheus Endpoint Token` and update the Ozone Prometheus Endpoint Token with any random string. This makes a token available in the process directory of the Ozone endpoint in plaintext, which Prometheus can use to get around the TLS limitation.

CDPD-69681: Ozone Ranger plugin does recursive listing for ACL checks

Ozone Ranger plugin does recursive listing in unoptimized path for performing ACL check on a directory. Recursive rename and delete operations on directories with layers of subdirectories causes a performance problem.

[Enable Ranger subaccess optimization for rename and delete operations in Ozone.](#)

Apache Issue: [HDDS-10823](#)

CDPD-51490: Installing HDFS and Ozone datanode instances on the same server (in case of a small test or development platform), can cause the Ozone UI to fail as it attempts to use the same default port 9864 already taken by HDFS.

On the Ozone configuration, overwrite the `hdds.datanode.client.port` value = 19864 and restart the Ozone service. This will allow Ozone UI to load without colliding with the HDFS service.

The Prometheus binary is not available in CDP Private Cloud Base 7.1.9 for the Ubuntu operating system.

You can install Prometheus separately and specify the path to the parent directory, for example `/usr/bin`, in the `prometheus.location` parameter in Ozone.

After upgrading the cluster from CDP Private Cloud Base 7.1.8 to CDP Private Cloud Base 7.1.9 and if Ozone is in the Non-HA environment, an exception message is observed during the finalization of the Ozone upgrade.

During the finalization of the upgrade, a `ClassNotFoundException` message for `org.cloudera.log4j.redactor.RedactorAppender` class may be displayed. The error message can be ignored because the upgrade is successful. The error existed previously and does not affect the Ozone service and its operation.

None.

CDPD-68951: In CDP Private Cloud Base 7.1.9 CHF2 version and lower, the command `ozone sh key list <bucket_path>` displays the `isFile` flag in a key's metadata as `false` even when the key is a file. This issue is rectified in CDP Private Cloud Base 7.1.9 CHF3. However, the pre-existing (pre-upgrade) key's metadata cannot be changed.

None

CDPD-67771: When using S3A committer `fs.s3a.committer.name=directory` with `fs.s3a.committer.staging.conflict-mode=replace` to write to FSO buckets, the client fails with the following error.

```
DIRECTORY_NOT_FOUND
org.apache.hadoop.ozone.om.exceptions.OMException:
Failed to find parent directory of xxxxxxxx at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentID(OMFileRequest
at
```

```

org.apache.hadoop.ozone.om.request.file.OMFileRequest.getParentId(OMFileRequest
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteRequest
at
org.apache.hadoop.ozone.om.request.s3.multipart.S3MultipartUploadCompleteRequest
at
org.apache.hadoop.ozone.protocolPB.OzoneManagerRequestHandler.handleWriteRequest
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.runCommand(OzoneManager
at
org.apache.hadoop.ozone.om.ratis.OzoneManagerStateMachine.lambda
$1(OzoneManagerStateMachine.java:363) at
java.base/java.util.concurrent.CompletableFuture
$AsyncSupply.run(CompletableFuture.java:1700) at java.base/
java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1128)
at java.base/java.util.concurrent.ThreadPoolExecutor
$Worker.run(ThreadPoolExecutor.java:628) at java.base/
java.lang.Thread.run(Thread.java:834)

```

This occurs because S3A uses multipart upload to commit job results in a batch. The staging committer's replace mode deletes the target directory before completing Memory Protection Unit (MPU). The problem is that File System Optimization (FSO) does not create intermediate directories during MPU, it does only for regular file/dir/key requests.

Use `fs.s3a.committer.name=magic` for affected versions.

CDPD-64398: In SCM with non-HA configuration, Secret key manager does not initialise. Hence, the startup of OM and DataNode fails because it cannot get a secret key. This key is used when security is enabled and used in Block token and container token verification while communicating between the Ozone client, OM, and Datanode.

This issue does not occur in SCM with HA configuration.

You must force exit from the safe mode for SCM. This triggers the initialization of the Secret key manager. Below are the options:

- exit safe mode manually whenever SCM is started
- disable safe mode by setting `hdds.scm.safemode.enabled=false` in safety valve for SCM configuration

Impact of disabling safe mode and the purpose of safe mode:

- Write should not fail once the cluster is out of safe mode
- Read of existing data should not fail after the cluster is out of safe mode
- Unnecessary re-replication should be avoided during cluster restart

So disabling safe mode does not have any major impact on Ozone.

HDDS-9512: Ozone DataNode's new client port conflicts with HDFS DataNode's web port if both Ozone and HDFS DataNode roles are placed on the same host.

You must set `hdds.datanode.client.port` to any unused port. For example, 19864, through the Ozone DataNode safety valve.

CDPD-52412: keyManagerImpl#listStatus exceeds the maximum RPC length.

To reduce the payload, you must increase the part size.

OPSAPS-68159: If you did not deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Error when distributing parcel to host, Ignoring non-compliant parcel manifest error is displayed after Cloudera Manager is upgraded to 7.11.3.

If you encounter the error, perform the following steps:

1. Deactivate and undistribute the Ozone parcel 718.1.0 on Cloudera Manager 7.11.3.

2. Restart the cluster with a delay of 10 minutes.
3. Continue to upgrade CDH 7.1.8 to CDH 7.1.9.

OPSAPS-68159: If you did not deactivate the Ozone parcel 718.2.x on Cloudera Manager 7.7.1 with CDH 7.1.8 before upgrading to Cloudera Manager 7.11.3 with CDH 7.1.9, the Ozone roles during the CDH 7.1.8 upgrade to CDH 7.1.9.

If you encounter the error, perform the following steps:

1. Deactivate the Ozone parcel 718.2.x.
2. Restart the Ozone service.
3. Perform Finalize Upgrade for the Ozone service.

Step result: The Ozone roles will be displayed in green.

CDPD-60989: The packaging version for Apache Ozone points to the 1.2.0 older version. This is a version string problem and not a packaging issue. The version of the Apache Ozone binary is closest to 1.4.0.

None. This only affects the JAR versioning.

CDPD-60366: Native library loader fails when system property native.lib.tmp.dir is not set. It fails because the library is copied to / instead of the cwd.

Setting native.lib.tmp.dir to a certain path like /tmp should solve the issue. To set this system property, you must add -Dnative.lib.tmp.dir=/tmp to ozone_java_opts in Cloudera Manager configuration of the Ozone cluster.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-60598: DataNode can consume up to the JVM heap size worth of direct memory buffers under specific failure scenarios. This can lead to a DataNode crash. This is due to Netty allocating and not freeing the direct memory buffers.

Restarting DataNode will resolve this issue.

CDPD-60466: The Ozone client is missing in the Cloudera Manager's Service Monitor node. This causes Ozone Canary's health check to fail.

Ensure you install Ozone CLI on the same node as Cloudera Manager's Service Monitor.

CDPD-60012: The Ozone SCM may be stuck in safe mode after upgrade to 7.1.9. This is due to a bug in how the SCM accounts for open storage containers.

The workaround is to temporarily set the Ozone configuration hdds.scm.safemode.threshold.pct to a lower value like 0.90 and restart the SCM.

CDPD-59679: In some scenarios, excess UNHEALTHY replicas of EC containers may not be removed from the cluster.

None

CDPD-50116: Topology-aware reads can provide better performance by routing applications to the closest replica of a file, if available, on the same physical node or same rack. However this feature is disabled by default in CDP 7.1.9.

This feature can be enabled by setting ozone.network.topology.aware.read to true using Cloudera Manager safety valve.

CDPD-57165: The DataNode disk usage thread may abort due to Ratis log tailing.

Use org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory to calculate disk usage. Configure in the ozone-site.xml property: hdds.datanode.du.factory value: org.apache.hadoop.hdds.fs.DedicatedDiskSpaceUsageFactory

OPSAPS-63510: When Ozone Container Balancer is started using Activate Container Balancer from Cloudera Manager, it runs on the Storage Container Manager (SCM) host which is the Ratis leader. However, the link to the Full Log File under Role Log in the Cloudera Manager command window for the Activate Container Balancer command may not link to the leader SCM's logs.

1. Find the leader SCM. Using Cloudera Manager and SCM Web UI: Go to Clusters Ozone **Web UI** . Open any of the Storage Container Manager web UI. In the UI, search for SCM Roles (HA) in the Status section. The leader SCM's hostname is mentioned. Or using Terminal: Log in to any Ozone host and run `ozone admin scm roles`. Note the leader.
2. After finding the leader SCM, search in this leader host's logs for ContainerBalancer related logs.

OPSAPS-67373: Toggling the Enable Ozone S3 Multi-Tenancy feature configuration in the Cloudera Manager Ozone service configuration page affects more service roles than actually needed.

Enabling multi-tenancy only requires restarting the Ozone Managers.

CDPD-55513: Hive external table replication policy does not migrate Hive tables in HDFS storage to Ozone.

To replicate data from HDFS to Ozone, see [Migrating your data from HDFS to Ozone](#). You can use HMS Mirror to replicate the metadata.

OPSAPS-67757: Hive external tables in Ozone storage cannot be replicated using Hive external table replication policies.

To replicate the Hive external tables' data, consider using DistCp. To replicate the metadata of Hive external tables, consider using HMS Mirror.

Remove bucket recursively using `rb -f force` command from AWS S3 cannot work for FSO buckets.

Use the Ozone shell command `ozone sh bucket delete -r [***BUCKET ADDRESS***]`

CDPD-59126: Info log displays "noexec permission on /tmp/liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86" on client while executing command with noexec on /tmp.

To suppress Info log related to `liborg_apache_ratis_thirdparty_netty_transport_native_epoll_x86` library: Export `OZONE_OPTS` environment variable on the client terminal by running the command `export OZONE_OPTS="-Dorg.apache.ratis.thirdparty.io.netty.native.workdir=/var/tmp $OZONE_OPTS"`

OPSAPS-67650: Ozone uses RocksDB as a library to persist metadata locally.

By default, RocksDB places certain executables in `/tmp`, and thus encounters errors when `/tmp` is mounted with `noexec`.

The workaround is to configure RocksDB to put executables at another location. On a PhatCat node, the steps are:

1. Go to Cloudera Manager UI OZONE Configuration .
2. Find Ozone Service Environment Advanced Configuration Snippet (Safety Valve) and set the following environment variable: `ROCKSDB_SHARED_LIB_DIR=/VAR/TMP`
3. Restart Ozone.

CDPD-49137: Ozone Manager Kerberos token expires for SCM communication and OM does not log in again.

Sometimes, OM's Kerberos token is not updated and it stops to communicate with SCM. When this occurs, writes start failing.

Restart OM or set the safety valve `hadoop.kerberos.keytab.login.autorenewal.enabled = true`

CDPD-56684: Keys get deleted when you do not have permission on volume

When a volume is deleted, it recursively deletes the buckets and keys inside it and only then deletes the volume. The volume delete ACL check is done only in the end, due to which you may end up deleting all the data inside the volume without having delete permission on the volume.

Note: There was no bucket/key permission available which allowed the user to delete them recursively.

CDPD-50610: Large file uploads are slow with OPEN and stream data approach

Hue file browser uses the append operation for large files. This API is not supported by Ozone in 7.1.9 and therefore large file uploads can be slow or timeout from the browser.

Use native Ozone client to upload large files instead of the Hue file browser.

OPSAPS-64097: Ozone service restart failed at SCM

Stopping SCM service using Cloudera Manager can sometimes timeout and need a retry. The Cloudera Manager API waits for 90 seconds which is not sufficient under certain circumstances.

Retry the shutdown using Cloudera Manager if the SCM still shows as running after a refresh of the service status.

OPSAPS-66469: Ozone-site.xml is missing if the host does not contain HDFS roles

The client side ozone-site.xml (/etc/hadoop/conf/ozone-site.xml) is not generated by Cloudera Manager if the host does not have any HDFS role. Because of this, issuing Ozone commands from that host fails because it cannot find the service name to host name mapping. The error message is similar to this: # ozone sh volume list o3://ozoneabc 23/03/06 18:46:15 WARN ha.OMProxyInfo: OzoneManager address ozoneabc:9862 for serviceID null remains unresolved for node ID null. Check your ozone-site.xml file to ensure ozone manager addresses are configured properly.

Add the HDFS gateway role on that host.

OPSAPS-67607: Cloudera Manager FirstRun failure at the “Upload YARN MapReduce Framework JARs” step.

If this failure is attributed to the broken symbolic link, /var/lib/hadoop-hdfs/ozone-filessystem-hadoop3.jar, it is likely due to the presence of the user hdfs on the node prior to CDP parcel activation. As a result, the Cloudera Manager agent skips the initialization related to HDFS, leading to the non-creation of the /var/lib/hadoop-hdfs directory.

Create the directory “/var/lib/hadoop-hdfs” on all nodes followed by the deactivation and activation of the CDP parcel (deactivate and activate the Ozone parcel instead, in case Ozone parcel is used).

CDPD-50447: When SCM High Availability is enabled, each of the SCM web UIs report the host of the web UI as the leader of HA, and the other two as followers. This gives wrong information

Correct output is available by running the `ozone admin scm roles --service-id=<ID>` command.

OPSAPS-66501: Currently it is not possible to configure High Availability for SCM roles in Ozone post deployment. You should be able to change the HA configuration through Cloudera Manager, bringing it in line with other services.

At present it requires deleting Ozone and then adding it back with the SCM HA configuration in place and manually cleaning up the Ozone data in between. For more information, read the [KB article](#).

OPSAPS-66500: Currently, it is not possible to enable Kerberos in Ozone after it has been deployed, despite all the required configuration changes being created when the box is checked in the Ozone configurations in Cloudera Manager.

Ozone must be deleted and redeployed with Kerberos enabled. Due to OPSAPS-66499, this requires manual data cleanup in between. For more information, read the [KB article](#).

OPSAPS-66499: When you delete Ozone from a cluster using Cloudera Manager, Ozone data is not cleaned up. This may cause issues when Ozone is redeployed.

You must clean up the data manually. For more information, read the [KB article](#).

OPSAPS-62327: In an Ozone cluster without any gateway roles, Ozone is unable to deploy client configurations and displays the ConfigGenException error.

You must add the Ozone gateway roles to the cluster.

CDPD-49027: SCM certificates are not renewed automatically

The certificates that are there to ensure encrypted communication and authentication between Ozone internal services are not renewed automatically for Storage Container Managers.

Certificate revocation

Once these certificates expire, a manual re-bootstrap of the internal Ozone certificates is necessary.

To revoke a certificate, remove the full trust chain to stop trusting a compromised certificate. For this, remove the SCM certificates or any other certificates from the system. During the startup of the system, new certificates are created and distributed. The old certificates are not trusted anymore as the root CA certificate changes as well.

Procedure to force revoke internal certificates:

1. Stop Ozone service and all of its roles including SCMs
2. Include SCM's certs folders. Note that the Primordial SCM node has two certs folder, one for the root CA and other for the intermediate CA that the node holds. Rest of the SCMs have just one folder for the intermediate CA role that the node serves. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name certs; done`
3. Move these certs directories to a backup location
4. Locate the key material and move it to a backup folder. The modified command is: `find / -name ozone-metadata 2>/dev/null | while read line; do find $line -name keys; done`
5. Move these keys directories to a backup location
6. The VERSION file of SCM has to be updated similarly to Ozone Manager's VERSION file. To locate both the SCM and OM VERSION files on the hosts, execute the following command: `find / -name om -o -name scm 2>/dev/null | while read line; do find $line -name VERSION; done | sort | uniq`
7. Backup the version file (just in case you need to restore for any reason)
8. In OM's VERSION file remove the line starting with omCertSerialId, in SCM's VERSION file remove the line starting with scmCertSerialId.
9. Start the stopped Ozone roles and certificates will be regenerated during startup.

CDPD-35632: The default block level checksum does not work when running distcp from HDFS to Ozone or the other way around, because the two file systems manage underlying blocks very differently.

Use a file level checksum instead. For example, append ``-Ddfs.checksum.combine.mode=COMPOSITE_CRC`` to the distcp command.

CDPD-43942: Requests to modify an Ozone S3 tenant may fail with the error "Timed out acquiring authorizer write lock. Another multi-tenancy request is in-progress." even if another request is not in progress.

Retry the request.

CDPD-36389: The configurations `datanodes.involved.max.percentage.per.iteration` and `size.moved.max.per.iteration` are meant to limit the max number of DataNodes that is involved and maximum size that can move in an iteration. This bug causes balancer to stop an iteration when it is two DataNodes or 1 Container size (5GB) away from hitting these limits. However, these DataNodes can again be considered for balancing in the next iteration. This means the cluster is balanced after enough iterations, albeit a bit slowly. This bug is apparent in small clusters of around four DataNodes where the DataNodes can be either the source or target for a lot of moves but the iteration gets stopped when three DataNodes have been involved. It takes a higher number of iterations to eventually balance this cluster. While this is a performance issue, it does not prevent balancer from ultimately balancing the cluster.

Increase the speed for balancing by decreasing the interval between each iteration using the configuration `balancing.iteration.interval`. The value of this configuration must be greater than `hdds.datanode.du.refresh.period`. `size.moved.max.per.iteration` can be increased to allow more data to move in one iteration.

CDPD-22519: HDFS user is unable to run Ozone SCM client CLI.

SCM client CLIs are run using SCM user.

CDPD-34187: This is an usability issue where warnings are displayed on the console while running Ozone fs/CLI commands, which restricts user experience. .

Instead of logging into the user console, you redirect these log messages to a file called ozone-shell-log4j.properties which should avoid warnings to the user. Ozone-shell commands used a similar method of directing messages to the LogFile.

CDPD-35141: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2> (state=08S01,code=40000) java.sql.SQLException: Error while compiling statement: FAILED: Execution Error, return code 40000 from org.apache.hadoop.hive ql.exec.MoveTask. Unable to move source <bucket1> to destination <bucket2>. This issue does not occur if the source and target buckets are different in Hive queries. Currently, copying across the same bucket is only supported.

Avoid different buckets in source and target path. Ensure that hive.exec.stagingdir is unset or set to the same bucket as the warehouse so that staging directories are created in the same bucket as the warehouse.

CDPD-40594: Ozone admin container create command does not work. The command fails at getCAList for the SCM Client to create a container.

Avoid using the create container command

CDPD-40966: df command on Ozone returns incorrect result.

None

CDPD-41184: With Legacy buckets, FileSystem Optimised is not interoperating with the Ozone shell command. The cause is that the directory key entry in the DB KeyTable is stored as "dir1/" with trailing slash. But while performing the described operation, Ozone shell (o3://) is normalizing the given path and removing the trailing slash "/" from it. That results in KEY_NOT_FOUND exception.

There are three workarounds:

- Use FileSystem API to Delete the Directories rather than Shell-Command API.
- Use FSO buckets instead of Legacy Buckets. As in FSO, you can create Intermediate Directories and Delete Directories using the Ozone shell commands.
- Disable and set the configuration ozone.om.enable.filesystem.pathsflag to false in order to delete the directories. This is generally not a preferred workaround because the cluster must be restarted to pick up the new changes.

CDPD-34867: Container Balancer might not balance if only Over-Utilized or only Under-Utilized DataNodes are reported. The log line displays the "Container Balancer has identified x Over-Utilized and y Under-Utilized DataNodes that need to be balanced" message where one of x or y will be 0.

Decrease the threshold using "utilization.threshold". This allows the balancer to find non zero number of both over and under utilized nodes.

CDPD-12966: Ozone du -s -h should report correct values with replication information.

None

CDPD-12542: Mount of Ozone filesystem with the help of FUSE fails.

None

CDPD-31910: In a non-Ranger deployment, the owner/group are shown based on Kerberos user or sudo user.

For correct owner/group, user needs a Ranger deployment.

CDPD-42691: During the upgrade - all pipelines will be closed when the upgrade is finalized on SCM, temporarily bringing the cluster to a read-only state.

When you execute the finalize command, the cluster will temporarily go into a read-only state.

CDPD-42945: When many EC buckets are created with different EC chunk sizes, it creates pipeline for each chunk size. As a result, large number of pipelines are created in the system.

None

OPSAPS-60721: Ozone SCM Primordial Node ID is a required field which needs to be specified with one of the SCM hostnames during Ozone HA installation. In Cloudera Manager this field is not mandatory during Ozone deployment. This can cause end users to continue further with installation which causes startup to fail in Ozone services.

During Ozone HA installation make sure that Ozone SCM Primordial Node ID is specified with one of the SCM hostname.

HDDS-4209: S3A Filesystem does not work with Ozone S3 in file system compact mode. When you create a directory, the S3A filesystem creates an empty file. When the ozone.om.enable.filesystem.paths parameter is enabled, the `hdfs dfs -mkdir -p s3a://b12345/d11/d12` command runs successfully. However, running the `hdfs dfs -put /tmp/file1 s3a://b12345/d11/d12/file1` command fails with an error: `ERROR org.apache.hadoop.ozone.om.request.key.OMKeyCreateRequest: Key creation failed.`

The HDDS-4209 Jira fixes the file system semantics and management in Ozone. On top of the flat name structure, which is Pure Object store, as a workaround the Hierarchical namespace structure is added. This ensures S3A compatibility with Ozone.

CDPD-42897: EC writes are failing with "No enough datanodes to choose" after EC replication config is set globally.

EC writes start failing when large number of pipelines are created as a result of multiple EC configs with different chunk sizes used to write keys.

If standard EC configs (that is., rs-3-2-1024k) are used to write keys, number of pipelines created per DataNode is limited to five and this issue is not seen with standard EC configs.

The recommendation is not to create too many random chunk sizes. It is configurable because, users can decide based on their workload. But do not to have separate chunk sizes for each file.

CDPD-41539: The "No such file or directory" message is displayed when EC file is read using older of client.

You must upgrade the client before trying to read the key: `vol1/ecbuck1/1GB_ec`.

CDPD-40560: Filesystem Operations using Hadoop S3a connector on a FILE_SYSTEM_OPTIMIZED bucket fails. `org.apache.hadoop.ozone.om.exceptions.OMException: Unable to get file status: volume: s3v bucket: fso key: test/`

Do not run Hadoop S3a commands on a FILE_SYSTEM_OPTIMIZED bucket. Use OBJECT_STORE bucket layouts.

CDPD-42832: With this issue, any long running setup or a production server results in data corruption due to inconsistency issues. This may result in major issues with the existing Legacy layout type.

FSO provides atomicity and consistency guarantees for the path (dir or file) rename/delete operations irrespective of the large sub-dirs/files contained in it. These capabilities help to make the long running test more consistent without any failures so far. Recommendation is to run bigdata HCFS workloads using the FSO bucket layout types.

CDPD-43432: Ozone Service in fault state in DataNode - Long Running setup.

Upgrade RocksDB to the latest version.

OPSAPS-63999: In the newly installed cluster, the Finish upgrade option is clickable.

None

OPSAPS-64648: Failed to start Ozone node using Cloudera Manager if default log path `/var/log/hadoop-ozone` does not exist. If this path does not exist, any Ozone nodes (for example SCM or DataNode) restart will fail.

Run the following command `sudo -u hdfs mkdir -p /var/log/hadoop-ozone` or replace `hdfs` with the user Ozone roles that are running.

CDPD-45932: Investigate impersonation with "is admin" in Ozone WebUIs /logLevel servlet endpoint

In a secure Kerberized cluster, due to an impersonation issue, changing log levels using Knox on the corresponding endpoint of the WebUI does not work. Note that this is only true, when the WebUI is accessed using Knox. Other means of changing log levels in Ozone services are not affected by this problem.

None.

Known Issues in Spark

Learn about the known issues in Spark the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

The following known issues were identified in this release:

No new known issues in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-94393: RuntimeWarning Failed to add file" message appears even when Spark successfully loads files

In both Spark 2 and 3, due to an exception when attempting to add files to the Python path, the RuntimeWarning: Failed to add file message appears even when the Python JAR file is successfully loaded.

None. You can safely ignore the message as the file is loaded successfully and the message does not affect job completion.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-67517: Spark3 tests are failing if /tmp is mounted as NOEXEC.

Map the tmpdir to a writable path in spark3-conf/spark-defaults.conf using the following steps:

1. Go to the Cloudera Manager.
2. Go to the Spark service.
3. Click the Configuration tab.
4. Select Scope Gateway .
5. Select Category Advanced .
6. Locate the Spark Client Advanced Configuration Snippet (Safety Valve) for spark3-conf/spark-defaults.conf_client_config_safety_valve property.

7. Map the tmpdir to a writable path:

```
spark.driver.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
spark.executor.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
```

8. Enter a Reason for change, and then click Save Changes to commit the changes.
9. Deploy the client configuration.

CDPD-23817: In the upgraded Cluster, the permission of /tmp/spark is restricted due to the HDP configuration hive.exec.scratchdir=/tmp/spark.

If you are using the /tmp/spark directory in the CDP cluster, you must provide the required additional Policies/ACL permissions.

CDPD-22670 and CDPD-23103: There are two configurations in Spark, "Atlas dependency" and "spark_lineage_enabled", which are conflicted. The issue is when Atlas dependency is turned off but spark_lineage_enabled is turned on.

Run Spark application, Spark will log some error message and cannot continue. That can be restored by correcting the configurations and restarting Spark component with distributing client configurations.

CDPD-23007: Mismatch in the Spark Default DB Location. In HDP 3.1.5, hive_db entities have one attribute - 'location' which is configured to the '/managed' path. In fresh install of CDP 7.1.7, hive_db entities now have 2 attributes 'location' configured to '/external' path and 'managedLocation' configured to '/managed' path. In the AM2CM migration (HDP 3.1.5 -> CDP 7.1.7), the 'location' attribute from hive_db entities in HDP 3.1.5 comes unaltered to CDP 7.1.7 and hence maps to '/managed' path.

This issue arises only if you are upgrading from HDP 3.1.5 to CDP 7.1.7. If you are performing a fresh install of CDP 7.1.7, you can ignore this issue.

None

CDPD-217: The Apache Spark connector is not supported

The old *Apache Spark - Apache HBase Connector* (shc) is not supported in CDP releases.

Use the new HBase-Spark connector shipped in CDP release.

CDPD-3038: Launching pyspark displays several HiveConf warning messages

When pyspark starts, several Hive configuration warning messages are displayed, similar to the following:

```
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of name hive.meta
store.runworker.in does not exist
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of
name hive.masking.algo does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of
name hive.metastore.runworker.in does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of na
me hive.masking.algo does not exist
```

These errors can be safely ignored.

Known Issues in Schema Registry

Learn about the known issues in Schema Registry, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-40380: Authorization checking issue when Kerberos is disabled

Due to an issue in Ranger, when Kerberos is disabled then it is not possible to check authorization.

1. Open Schema Registry configuration in Cloudera Manager.
2. Find the `ranger.plugin.schema-registry.service.name` field.
3. Replace `GENERATED_RANGER_SERVICE_NAME` with the actual name of the service.
4. Restart the Schema Registry service.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

CDPD-59015: Schema Registry does not create new versions of schemas even if the schema is changed

Schema Registry uses a schema fingerprinting mechanism to differentiate between schemas. However, fingerprinting does not take into consideration the schema attributes of the field type. As a result, if you have two schemas where the only difference is that one has type attributes defined and the other does not, they will be considered identical by Schema Registry. For example, the following schemas are considered identical:

```
#Schema V1
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":"long"}]}

#Schema V2
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"local_timestamp_micros_long","type":{"type":"long","logicalType":"local-timestamp-micros"}}]}
```

Notice that the only difference is that in the second schema, the `local_timestamp_micros_long` field has a logical type specified. In cases like this, the new version of the schema is not created, the initial version is used. This is true even if the data that is being produced has a new schema version. The ID of the first schema version is used and is put in the serialized record. The new schema version is not created.

This issue is common when using change data capture (CDC) connectors like the Debezium connectors. This is because CDC connectors create schemas with the logical type decimal based on the column type in the database schema. For example:

```
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"database_column","type":{"type":"bytes","logicalType":"decimal","precision":64,"scale":0}}]}
```

If the database schema changes (for example, the column type), it is possible that only scale changes, which is a schema attribute.

```
{"type":"record","name":"schema_name","namespace":"ns","fields":[{"name":"database_column","type":{"type":"bytes","logicalType":"decimal","precision":64,"scale":1}}]}
```

In this case, even though scale changed to 1, the first version of the schema is used where scale is 0. As a result, the data is consumed with the wrong scale.

Avoid using logical types or other attributes. Alternatively, ensure that there are no changes in the logical types or other attributes between schema versions.

OPSAPS-68708: Schema Registry might fail to start if a load balancer address is specified in Ranger

Schema Registry does not start if the address specified in the Load Balancer Address Ranger property does not end with a trailing slash (/).

Set the value of the `RANGER_REST_URL` Schema Registry environment variable to an address that includes a trailing slash.

1. In Cloudera Manager, select the Schema Registry service.
2. Go to Configuration.
3. Find the Schema Registry Server Environment Advanced Configuration Snippet (Safety Valve) property and add the following:

```
Key: RANGER_REST_URL
Value: [***RANGER REST API URL***]
```

Replace [***RANGER REST API URL***] with an address that can be used by Schema Registry to access Ranger. Ensure that the address ends with a trailing slash. For example: `http://ranger-1.cloudera.com:6182/`

4. Restart the Schema Registry service.

OPSAPS-70971: Schema Registry does not have permissions to use Atlas after an upgrade

Following an upgrade, Schema Registry might not have the required permissions in Ranger to access Atlas. As a result, Schema Registry's integration with Atlas might not function in secure clusters where Ranger authorization is enabled.

1. Access the Ranger Console (Ranger Admin web UI).
2. Click the `cm_atlas` resource-based service.
3. Add the `schemaregistry` user to the all - * policies.
4. Click Manage Service Edit Service .
5. Add the `schemaregistry` user to the `default.policy.users` property.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Known Issues in Sqoop

Learn about the known issues in Sqoop, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-54770: Unable to read Sqoop metastore created by an older HSQLDB version

If you have upgraded to CDP PvC Base 7.1.8 Cumulative hotfix 4 or higher versions, you may encounter issues in reading the Sqoop metastore that was created using an older version of HyperSQL Database (HSQLDB).

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

After upgrading to CDP PvC Base 7.1.8 Cumulative hotfix 4, you must upgrade the Sqoop metastore and convert the database files to a format that can easily be read by HSQLDB 2.7.1. For more information, see [Troubleshooting Apache Sqoop issues](#).

CDPD-44431: Using direct mode causes problems

Using direct mode has several drawbacks:

- Imports can cause an intermittent and overlapping input split.

- Imports can generate duplicate data.
- Many problems, such as intermittent failures, can occur.
- Additional configuration is required.

Stop using direct mode. Do not use the `--direct` option in Sqoop import or export commands.

Sqoop direct mode is disabled by default. However, if you still want to use it, enable it by either setting the `sqoop.enable.deprecated.direct` property globally in Cloudera Manager for Sqoop or by specifying it in the command-line through `-Dsqoop.enable.deprecated.direct=true`.

CDPD-3089: Avro, S3, and HCat do not work together properly

Importing an Avro file into S3 with HCat fails with Delegation Token not available.

Parquet columns inadvertently renamed

Column names that start with a number are renamed when you use the `--as-parquetfile` option to import data.

Prepend column names in Parquet tables with one or more letters or underscore characters.

PARQUET-99: Importing Parquet files might cause out-of-memory (OOM) errors

Importing multiple megabytes per row before initial-page-run check (ColumnWriter) can cause OOM. Also, rows that vary significantly by size so that the next-page-size check is based on small rows, and is set very high, followed by many large rows can also cause OOM.

Known Issues in Streams Messaging Manager

Learn about the known issues in Streams Messaging Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

OPSAPS-59597: SMM UI logs are not supported by Cloudera Manager

Cloudera Manager does not display a Log Files menu for SMM UI role (and SMM UI logs cannot be displayed in the Cloudera Manager UI) because the logging type used by SMM UI is not supported by Cloudera Manager.

View the SMM UI logs on the host.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker). Add the bootstrap server details in SMM safety valve in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Add the following value for bootstrap servers>Save Changes > Restart SMM.

```
streams.messaging.manager.kafka.bootstrap.servers=<comma-separated list of brokers>
```

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the `hadoop.auth` cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the `www-authenticate: Negotiate` header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at `Clusters SMM Streams Messaging Manager Web UI` and log in using the Kerberos username and password.

CDPD-82560: Streams Messaging Manager known unprotected endpoint

The Streams Messaging Manager Frontend exposes the `/cm-configs` and `/configs` public endpoints without requiring authentication. These endpoints do not share any sensitive information.

None.

CDPD-88488: The Streams Messaging Manager server fails to start if its keystore password starts with a special character or includes quotation marks

Ensure that the Streams Messaging Manager server keystore password meets the following requirements:

- It does not start with a special character. Special characters are permitted in other positions.
- It does not contain quotation marks (single or double) anywhere.

CDPD-76375: Topic column name is incorrect in the replications table

On the **Cluster Replications** page, in the replications table, the topic column name is incorrectly named **Source Topic Name** instead of Target Topic Name. This means that the **Source Topic Name** column currently shows the topic name on the target cluster, instead of the topic name on the source cluster.

Limitations

CDPD-36422: 1MB flow.snapshot freezes Safari

While importing large connector configurations, `flow.snapshot` reduces the usability of the Streams Messaging Manager when using Safari browser.

Use a different browser (Chrome/Firefox/Edge).

Known Issues in Streams Replication Manager

Learn about the known issues in Streams Replication Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-22089: SRM does not sync re-created source topics until the offsets have caught up with target topic

Messages written to topics that were deleted and re-created are not replicated until the source topic reaches the same offset as the target topic. For example, if at the time of deletion and re-creation there are a 100 messages on the source and target clusters, new messages will only get replicated once the re-created source topic has 100 messages. This leads to messages being lost.

None

CDPD-11079: Blacklisted topics appear in the list of replicated topics

If a topic was originally replicated but was later excluded for replication, it will still appear as a replicated topic under the `/remote-topics` REST API endpoint. As a result, if a call is made to this endpoint, this topic will be included in the response. Additionally, the excluded topic will also be visible in the SMM UI. However, its Partitions and Consumer Groups will be 0, its Throughput, Replication Latency and Checkpoint Latency will show N/A.

None

CDPD-30275: SRM may automatically re-create deleted topics on target clusters

If `auto.create.topics.enable` is enabled, deleted topics might get automatically re-created on target clusters. This is a timing issue. It only occurs if remote topics are deleted while the replication of the topic is still ongoing.

1. Remove the topic from the topic allowlist with `srm-control`. For example:

```
srm-control topics --source [SOURCE_CLUSTER] --target [TARGET_CLUSTER] --remove [TOPIC1]
```

2. Wait until SRM is no longer replicating the topic.
3. Delete the remote topic in the target cluster.

Limitations

SRM cannot replicate Ranger authorization policies to or from Kafka clusters

Due to a limitation in the Kafka-Ranger plugin, SRM cannot replicate Ranger policies to or from clusters that are configured to use Ranger for authorization. If you are using SRM to replicate data to or from a cluster that uses Ranger, disable authorization policy synchronization in SRM. This can be achieved by clearing the Sync Topic Acls Enabled (`sync.topic.acls.enabled`) checkbox.

SRM cannot ensure the exactly-once semantics of transactional source topics

SRM data replication uses at-least-once guarantees, and as a result cannot ensure the exactly-once semantics (EOS) of transactional topics in the backup/target cluster.

Note: Even though EOS is not guaranteed, you can still replicate the data of a transactional source, but you must set `isolation.level` to `read_committed` for SRM's internal consumers. This can be done by adding `[***SOURCE CLUSTER ALIAS***]->[***TARGET CLUSTER ALIAS***].consumer.isolation.level=read_committed` to the Streams Replication Manager's Replication Configs SRM service property in Cloudera Manager. The `isolation.level` property can be set on a global connector or replication level. For example:

```
#Global connector level
connectors.consumer.isolation.level
=read_committed
#Replication level
uswest->useast.consumer.isolation.level
evel=read_committed
```

SRM checkpointing is not supported for transactional source topics

SRM does not correctly translate checkpoints (committed consumer group offsets) for transactional topics. Checkpointing assumes that the offset mapping function is always increasing, but with transactional source topics this is violated. Transactional topics have control messages in them, which take up an offset in the log, but they are never returned on the consumer API. This causes the mappings to decrease, causing issues in the checkpointing feature. As a result of this limitation, failover operations for transactional topics is not possible.

Known Issues in Ranger

Learn about the known issues in Ranger, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

UnsupportedClassVersionError

JDK 8 deployments support Nashorn JavaScript engine, which is built-in and fully compatible, whereas JDK 17 deployments support GraalJS script engine due to unavailability of Nashorn.

When your cluster supports both JDK 8 and JDK 17, then while a Java application, running on JDK 8, uses generic interfaces like ScriptEngine (from the javax.script package), the ScriptEngineManager class scans the classpath for available script engine implementations through the service provider mechanism, and detects the GraalJS as a provider for JavaScript, because in this case the GraalJS library (version 22.3.0) is also included on the classpath. The ScriptEngineManager then attempts to instantiate it, when requesting a "js" or "javascript" engine, and triggers an UnsupportedOperationException.

Remove the GraalJS library from the classpath.

CDPD-68806: The Revoke operation for users belonging to a group or role permission does not function as expected.

List command is listing all the tables even when the user permission is revoked. And also the command does not add any deny policy to Ranger for that specific user.

For example:

user_1 is the part of group_1

user_2 is the part of role_1

Create a Ranger policy for group_1 and role_1 to access all the resources in HBase.

Try to revoke the permission for user_1 and user_2 using HBase shell global revoke command:

```
revoke 'user_1'
```

```
revoke 'user_2'
```

But there is no deny policy added for that user. And access is still granted to user_1 and user_2.

This behavior is currently not supported in HBase shell. Must be handled manually using the Ranger policy change.

CDPD-68739: The revoke command does not work when using the HBase shell

While using the HBase shell, running the revoke command does not cancel the user permission. Users are able to perform actions even after running the revoke command.

For example:

When a user is granted permission to a particular table using the HBase grant command.

```
hbase:003:0> grant 'user_1', 'RWCA', 'some_abc_table'
```

And then execute the global revoke command for that user:

```
hbase:005:0> revoke 'user_1'
```

Permission for that user 'user_1' for the table 'some_abc_table' not got revoked.

None.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-58860: After upgrading CDP-7.1.8 to CDP-7.1.9, cdp-proxy token missing from Knox-Ranger policy.

As part of [OPSAPS-67480](#) in 719 default ranger policy is added from cdp-proxy-token topology, so that after a new installation of CDP-7.1.9, the Knox-Ranger policy includes cdp-proxy-token. However, upgrades do not add cdp-proxy-token to cm_knox policies automatically.

Manually add cdp-proxy-token to the Knox policy, using Ranger Admin Web UI.

1. Log in to Cloudera Manager Ranger Admin Web UI, as a Ranger administrator.

2. On Ranger Admin Web UI Service Manager Resource Knox , click cm_knox.
3. In Knox Policies , open the CDP Proxy UI, API and Token policy.
4. In Knox Topology*, add cdp-proxy-token.
5. Click Save.
6. Restart Ranger.

CDPD-58704: hadoop roll key / key delete command shows operation failed error when one KMS host is down, even when operation succeeds

In case of rollover/delete, client sends one more (last after delete request) request to KMS instances to clean their cache and that too to all registered kms instances. if one KMS instance is stopped (not deleted), client gets runtime exception.

This simply returns the runtime exception on client end for stopped instances but doesn't break any functionality.

CDPD-56803: When there is no existing policy for user and a revoke request comes from hbase, then will get this error.

```
hbase:001:0> revoke 'hrt_11'
ERROR: org.apache.hadoop.hbase.coprocessor.CoprocessorException: HTTP 400 Error: processSecureRevokeRequest processing failed
    at org.apache.ranger.authorization.hbase.RangerAuthorizationCoprocesor.preRevoke(RangerAuthorizationCoprocesor.java:1309)

at jdk.internal.reflect.NativeMethodAccessorImpl.invoke(N
ativeMethodAccessorImp

```

This exception is logged, since mandatory JWT auth filter configs are not provided (expected for some environments like y-cloud) Even though JWT auth filter is failed to initialised, it falls back to kerberos auth, hence no impact from auth perspective

NA

CDPD-56738: Ranger RMS showing FileNotFoundException: /usr/share/java/oraclepki.jar in Oracle 19 setup

This is a warning log printed in catalina.out file when Ranger RMS server is initialised. Following exception is observed only in Oracle 19 setup. FileNotFoundException: /usr/share/java/oraclepki.jar

NA

CDPD-48975: Ranger KMS KTS to KMS DB migration : keys with the same name but different case are not migrated

KMS keys are not case sensitive

No workarounds. Such keys combination are very rare and migration doc was updated to check such keys before starting the migration.

CDPD-42598: Kafka policy creation allowed with incorrect permissions.

When creating a Kafka policy from the UI, the permissions "Idempotent write" and "Cluster action" are not displayed as they are not applicable for the "topic" resource, but when creating a policy for the "topic" resource with the permissions "Idempotent write" and "Cluster Action", the policy is created successfully when the expected behaviour is that the policy creation must fail as the permission is not applicable for the Kafka topic resource

None.

CDPD-41582: Atlas Resource Lookup : Classification for "entity-type" lists only classification for the following payload:

```

{"resourceName": "classification", "userInput": "", "resources": {"classification": []}}

```

expectation is to return all the classifications . But the response has only "classification" Happens similarly for entity-label , entity-business-metadata.

None.

CDPD-40734: User allowed to insert data into a hive table when there is a deny policy on a table column.

A user is allowed to enter data into a table even if there is a deny policy present on one of the table columns.

Test scenario details:

```

Policy setup :-
policy 1 :- all access policy for hrt_qa, hive and impala
users
resources - database - * , table - * , column - *
users : hrt_qa, hive, impala

```

```

access - all access allowed
policy 2 :- policy on test_1.table_1 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column - *
access :- all access allowed
policy 3 :- deny policy on test_1.table_1.c0 for hrt_5
users : hrt_5
resources : database - test_1, table - table_1, column -
c0
access - all access denied
data setup :-
database - test_1
table - table_1(c0 int, c1 int)

```

The user is able to insert data into the table.

None.

Known Issues in YARN and YARN Queue Manager

Learn about the known issues in YARN and YARN Queue Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

COMPX-22434: Queue Manager fails to recreate Dynamic Queue Schedules (DQS) rule after exiting the mixed mode

QueueManager fails to recreate the DQS rule after exiting the Yarn mixed mode. This occurs when the cluster is upgraded from 7.1.9 GA+7.11.3 to 7.1.9 SP1 CHF9.

This error does not occur on a fresh install of 7.1.9 SP1 CHF 9, and also during 7.1.9 SP1 GA to 7.1.9 SP1 CHF9 upgrade.

None.

COMPX-14820: Delete Queue and its Children throws "Queue capacity was reduced to zero, but failed to delete queue."

When trying to perform the operation "Delete Queue and its Children" on a queue that has one or more siblings, the operation fails as YARN has some constraints. If the queue performing the operation "Delete Queue and its Children" is a leaf node, then the operations succeeds.

None.

COMPX-4644: Queue capacity rounding problem when configuration is initially set via YARN

When setting the capacity scheduler configuration through the YARN/Cloudera Manager configuration, there may be capacity values that use multiple decimal places. This results in rounding/floating point precision discrepancies in the UI when trying to validate that all sibling capacities equal 100%. The UI looks like all the numbers add up to 100, but the validation still displays an error and does not allow to save the capacities. It is also observed that the capacity is being calculated as, for example, 99.9999999991 in the backend.

- Create queues within the UI, or
- Ensure that capacities configured through the Capacity Scheduler safety valve do not have more than one decimal place.

20202 Database migration after enabling opt-in migration

When migrating from an H2 database to a PostgreSQL database in YARN Queue Manager after installation or upgrade, you might encounter an issue only when you have followed the following specific scenario:

- New install or upgrade to CDP 7.1.9, forcing migration from H2 to PostgreSQL database.
- Upgrade to CDP 7.1.9 CHF2, moving back to H2 database.
- Upgrade to CDP 7.1.9 SP1 with valid PostgreSQL connection details in Queue Manager configurations.

To avoid any issues during the upgrade to version CDP 7.1.9 SP1, ensure that PostgreSQL connection details are removed from the YARN database configuration if you prefer to continue using the H2 database.

CDPD-56559: MapReduce jobs can intermittently fail during a rolling upgrade.

During a rolling upgrade between CDP versions 7.1.8 and 7.1.9, MapReduce jobs may fail with message, `RuntimeException: native snappy library not available`. Although the native Snappy compression library is not loaded, a checkmark displays to indicate that the Snappy compression library is loading for NodeManagers that are pending upgrades. This causes the MapReduce jobs that are associated with the NodeManagers to fail. After the upgrade, the jobs work as expected. This issue only impacts rolling upgrades from before CDP 7.1.9 to a higher version.

None.

COMPX-12021 Queue Manager configurations on Scheduler Configuration page are not working

When setting the following properties on the YARN Queue Manager UI, the properties are set in the `capacity-scheduler.xml` file which does not have any effect on YARN. The properties need to be set in the `yarn-site.xml` file, which does not happen when you set them through YARN Queue Manager.

- "Maximum Application Priority" – `"yarn.cluster.max-application-priority"`
- "Enable Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.enable"`
- "Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.policies"`

Note: You can also set this property on the YARN configuration page in Cloudera Manager as "Capacity Scheduler Preemption".

- "Preemption: Observe Only" – `"yarn.resourcemanager.monitor.capacity.preemption.observe_only"`
- "Preemption: Monitoring Interval (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.monitoring_interval"`
- "Preemption: Maximum Wait Before Kill (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.max_wait_before_kill"`
- "Preemption: Total Resources Per Round" – `"yarn.resourcemanager.monitor.capacity.preemption.total_preemption_per_round"`
- "Preemption: Over Capacity Tolerance" – `"yarn.resourcemanager.monitor.capacity.preemption.max_ignored_over_capacity"`
- "Preemption: Maximum Termination Factor" – `"yarn.resourcemanager.monitor.capacity.preemption.natural_termination_factor"`
- "Enable Intra Queue Preemption" – `"yarn.resourcemanager.monitor.capacity.preemption.intra-queue-preemption.enabled"`

1. In Cloudera Manager, select the YARN service.
2. Click the Configuration tab.
3. Search for `yarn-site.xml`.
4. Under YARN Service Advanced Configuration Snippet (Safety Valve) for `yarn-site.xml`, add the corresponding parameter and value you need.
5. Click Save Changes.
6. Restart the YARN services.

COMPX-13177: QueueManager webapp requests fail with 'HTTP ERROR 400

`java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA'`

Products:

- Cloudera Manager for CDP Private

- Cloud Base Cloudera Manager for CDP Public Cloud

Context:

- Centos 7.8 and Redhat 7.8 operating systems, when FIPS support is enabled.

Problem:

- When attempting to display the Yarn Queue Manager interface, Cloudera Manager displays an error: "HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA".

1. Edit the file [/etc/default/cloudera-scm-server]
2. Around line 28, modify the line that starts with

```
#export CMF_OVERRIDE_TLS_CIPHERS=...
```

3. Remove the comment mark #.
4. Remove all ciphers with "3DES" in the name.
5. Save the file.
6. Restart the Cloudera Manager Server service.

Third-party applications do not launch if MapReduce framework path is not included in the client configuration

MapReduce application framework is loaded from HDFS instead of being present on the NodeManagers. By default the `mapreduce.application.framework.path` property is set to the appropriate value, but third-party applications with their own configurations does not launch.

Set the `mapreduce.application.framework.path` property to the appropriate configuration for third-party applications.

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated the `mapred-site.xml` file that references the correct JobHistory Server.

YARN cannot start if Kerberos principal name is changed

If the Kerberos principal name is changed in Cloudera Manager after launch, YARN does not start. In such cases, the keytabs can be correctly generated but YARN cannot access ZooKeeper with the new Kerberos principal name and old ACLs.

There are two possible workarounds:

- Delete the `znode` and restart the YARN service.
- Use the `reset ZK ACLs` command. This also sets the `znodes` below `/rmstore/ZKRMStateRoot` to `world:anyone:cdwra` which is less secure.

Queue Manager does not open on using a custom user with a default Kerberos principal

If a custom user is used with the default Kerberos principal, the Queue Manager web UI displays an HTTP ERROR 400 error.

Ensure that the Queue Manager `process_username` property matches the YARN `process_username` property.

Known Issues in Zeppelin

Learn about the known issues in Zeppelin the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

BUG-125263: Zeppelin service move fails on clusters upgraded from HDP3.1.5

Resolve the circular symlink issue on the Zeppelin node by linking the conf directory to a new directory under /etc/zeppelin:

- # mkdir -p /etc/zeppelin/<version>/0
- # rm /usr/hdp/<version>/zeppelin/conf
- # ln -s /etc/zeppelin/<version>/0 /usr/hdp/<version>/zeppelin/conf

Where version is the HDP version. For example, 7.1.x-yyy. Restart the Zeppelin server in Ambari.

CDPD-3090: Due to a configuration typo, functionality involving notebook repositories does not work

Due to a missing closing brace, access to the notebook repositories API is blocked by default.

From the CDP Management Console, go to Cloudera Manager for the cluster running Zeppelin. On the Zeppelin configuration page (Zeppelin serviceConfiguration), enter shiro urls in the Search field, and then add the missing closing brace to the notebook-repositories URL, as follows:

```
/api/notebook-repositories/** = authc, roles[{{zeppelin_admin_group}}]
```

Click Save Changes, and restart the Zeppelin service.

CDPD-2406: Logout button does not work

Clicking the Logout button in the Zeppelin UI logs you out, but then immediately logs you back in using SSO.

Close the browser.

OPSAPS-59802: Zeppelin and Livy roles should be co-located on the same host.

When installing or upgrading to CDP Private Cloud Base, you must co-locate all Zeppelin and Livy roles on the same cluster host due to an issue with certificate generation.

Known Issues in ZooKeeper

Learn about the known issues in ZooKeeper the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 11.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 11

There are no new known issues identified in the previous releases.

Cumulative hotfix 10

Know more about the cumulative hotfix 10 for CDP 7.1.9 SP1. This cumulative hotfix was released on August 13, 2025.

Cloudera Runtime 7.1.9.1054-4 (Cumulative Hotfix 10) download URL:**Parcel Repository Location**

```
https://[USERNAME]:[PASSWORD]@archive.cloudera.com/p/cdh7/7.1.9.1054/parcels/
```

What's new in Cloudera Runtime 7.1.9 SP1 CHF 10

Understand the functionalities and improvements to features of components in Cloudera Runtime 7.1.9 SP1 CHF 10.

Python 3.9 support for Impala on RHEL 8

Cloudera now provides support for Python 3.9 on RHEL 8 within CDP 7.3.1. This new capability ensures that Impala components dependent on Python libraries function completely and reliably.

Ranger mixed case group comparison

When Ranger Usersync is configured with case conversion and special character replacement using Regular Expression (regex), Ranger Usersync transforms the original user or group names from the source, for example, AD or LDAP, before storing them in the Ranger Admin database. Previously, if a Ranger plugin used the original name during authorization checks, the check failed because the Ranger Admin only recognized the transformed name.

This issue is now fixed. The fix is configurable at the plugin level using the `ranger.plugin.<serviceType>.supports.name.transformation` property, allowing users to enable or disable transformation based on their environment needs. For more information, see [Handling inconsistent username and group name conventions for consistent authorization](#).

Upgraded Postgresql to 14.16

The embedded Postgres version within Key Trustee Server is upgraded from 14.2 to 14.16.

What's new in Kafka**The `LdapLoginModule` is blocked by default**

The `LdapLoginModule` (`com.sun.security.auth.module.LdapLoginModule`) class is blocked by default and can not be used in SASL JAAS configurations. Use the `PlainLoginModule` (`org.apache.kafka.common.security.plain.PlainLoginModule`) class for LDAP authentication.

Configurable allow list of URLs for OAuth and LDAP authentication

Two new Java options are introduced for Kafka brokers and Kafka Connect that enable you to specify an allow list of URLs for OAuth and LDAP authentication mechanisms. This gives you stricter control over which URLs can be accessed by Kafka for authentication. The following Java options are introduced:

- **OAuth** – `org.apache.kafka.sasl.oauthbearer.allowed.urls`
- **LDAP** – `com.cloudera.kafka.ldap.allowed.urls`

By default these options are empty, which means that a connection to any URL is allowed. The configuration properties you use in Cloudera Manager to set the options is different for Kafka brokers and Kafka Connect. Use the following configuration properties for Kafka brokers and Kafka Connect:

- For **Kafka brokers**, configure the options by adding them to the Additional Broker Java Options Kafka broker property in Cloudera Manager. For example:

```
-Dorg.apache.kafka.sasl.oauthbearer.allowed.urls=HTTP://WWW.OAUTH-EXAMPLE-1.COM,HTTP://WWW.OAUTH-EXAMPLE-2.COM
```

```
-Dcom.cloudera.kafka.ldap.allowed.urls=HTTP://WWW.LDAP-EXAMPLE-1.COM,HTTP://WWW.LDAP-EXAMPLE-2.COM
```

- For **Kafka Connect**, configure the options by adding them to the EXTRA_ARGS environment variable. The EXTRA_ARGS environment variable is configured by adding it to the Kafka Connect Environment Advanced Configuration Snippet (Safety Valve) property in Cloudera Manager. For example:

```
EXTRA_ARGS=-Dorg.apache.kafka.sasl.oauthbearer.allowed.urls="HTTP://WWW.OAUTH-EXAMPLE-1.COM,HTTP://WWW.OAUTH-EXAMPLE-2.COM"
```

```
EXTRA_ARGS=-Dcom.cloudera.kafka.ldap.allowed.urls="HTTP://WWW.LDAP-EXAMPLE-1.COM,HTTP://WWW.LDAP-EXAMPLE-2.COM"
```

For more information, see:

- [Configure LDAP authentication for Kafka brokers](#)
- [Configuring OAuth2 authentication for Kafka brokers](#)
- [Configuring allowed LDAP and OAuth URLs](#)

What's new in Ozone

Ozone configuration recommendations for improved stability

Cloudera recommends you to update the following configurations to improve stability:

- ozone.scm.block.deletion.max.retry = 5 (default value is 1024)
- hdds.datanode.volume.min.free.space = 20GB (No default value)

Also, if hdds.datanode.volume.min.free.space.percent is configured, make sure that you have removed hdds.datanode.volume.min.free.space.percent from the configurations.

Fixed issues in 7.1.9 SP1 CHF 10

Know more about the cumulative hotfix 10 for 7.1.9 SP1.

Note: Contact Cloudera Support for questions related to any specific hotfixes.

Following are the list of fixes that were shipped for CDP Private Cloud Base version 7.1.9-1.cdh7.1.9.p1054.69605909.

CDPD-85295: Migrate commons-configuration to 2.x

The commons-configuration library is now upgraded in Zeppelin to address security issues and bugfixes.

CDPD-84529: Upgrade Commons BeanUtils to 1.11.0

The Commons BeanUtils library is now upgraded in Zeppelin to address security issues and bugfixes.

CDPD-82056: UI: when server response date fields as '0', UI shows as current time

Previously, if an API response contained an invalid date value, such as 0, intended for display on the user interface, the current system date was shown. Now, instead of displaying the system date when an invalid date value is encountered in the API response, the user interface displays NA.

This issue specifically affects the **Entity Detail** page, where the create time and modified time are displayed.

Apache JIRA: [ATLAS-5015](#)

CDPD-88578: Resolved Missing Python Packages in Hue

Previously, Python packages were missing, leading to failures in Hue operations. This issue is now resolved, as the Hue environment now includes all necessary dependencies, eliminating the previously encountered errors.

CDPD-72557: Use Ozone Manager's KMS from client side when connecting to a cluster and dealing with encrypted data

Ozone client now uses server side Key Management Server (KMS) settings by default to encrypt or decrypt encryption keys with the cluster KMS server.

Apache JIRA: [HDDS-11227](#)

CDPD-84518: Expired secret key can abort leader OM startup

Previously, Ozone Manager (OM) start failure issues were caused by Null Pointer Exception (NPE) because of expired SCM managed secret keys. This issue is now resolved.

Apache JIRA: [HDDS-13234](#)

CDPD-66713: HDDS-9388 broke encryption

Previously, a file was not encrypted in an encrypted bucket caused by HDDS-9388 changes. This issue is now resolved.

Apache JIRA: [HDDS-10363](#)

CDPD-83223: Validate Container Balancer move timeout and replication timeout configurations

The `move.timeout - move.replication.timeout - event.timeout.datanode.offset` rule is now added for container balancer configurations. The timeout value must at least be 9 minutes.

Apache JIRA: [HDDS-13068](#)

CDPD-83224: Container Balancer delete commands are sent with an expiration time in the past

Previously, delete commands were getting discarded in the container balancer due to incorrect expiration time. With this fix, the container balancer can now send delete commands correctly.

Apache JIRA: [HDDS-13067](#)

CDPD-87933: DeleteBlocksCommandHandler thread stop for normal exception

Previously, block deletion was stopped due to invalid volume and container content, which resulted in continuous retry by the Storage Container Manager (SCM). This issue is now fixed.

Apache JIRA: [HDDS-13448](#)

CDPD-64642: DataNode Restart stuck in irrecoverable state with multiple exceptions

Previously, invalid container whose db path was missing in the memory container set, caused Null Pointer Exception for operations when accessing the container. This issue is now fixed.

Apache JIRA: [HDDS-10061](#)

CDPD-62073: OM Ratis Write - Move ACL check and Bucket resolution to preExecute

Previously, inconsistent behavior of Access Control List (ACL) validation on Ozone Manager (OM) nodes in high availability (HA) due to environmental issues could result in different results of data in those OMs and could have inconsistent data in OMs in HA. This issue is now fixed.

Apache JIRA: [HDDS-9388](#)

CDPD-77054: Exporting shell entities can cause the import to fail

Previously, when exporting Apache Hive tables created with Apache Spark, shell entities could be present in Apache Atlas. If these unresolved shell entities were included in the export zip file, the subsequent import operation failed.

This issue is now fixed. The import process now ensures that table entities are properly initialized and marked as complete, even if shell entities are present. This prevents failures during import when unresolved shell entities exist in the export.

CDPD-84502: Advanced Search is not working properly in the Atlas UI

Fixed an issue in the Atlas UI where Advanced Search did not trigger API calls for each relation. The UI now ensures that API calls are made for all relevant relations, providing accurate and complete search results.

This update also incorporates improvements from CDPD-65619, which enhanced the reliability and consistency of the Advanced Search operations in the Atlas UI.

COMPX-21359: Capacity Scheduler UI queue filter is not working as expected

The Capacity Scheduler UI queue filter did not work as expected when submitting apps with leaf queue's name. This issue is now resolved and the Replication Manager now returns the full queue path regardless of whether the application was submitted with a leaf queue name or a full queue path.

Apache JIRA: [YARN-11662](#)

CDPD-83781: Upgraded Jetty version to 9.4.57.v20241219

The Jetty version is upgraded to 9.4.57.v20241219 due to CVE-2024-8184 and CVE-2024-13009.

CDPD-83429: Logic to check if metric collection is thread-safe or not, not to parse the entire configuration every-time

Previously, the KMSWenApp metric collection logic tried getting and parsing the Key Management Server (KMS) configuration every time KMS configuration was required. The underlying configuration class acquired a lock for initialization blocking other threads from using the KMS configuration.

This issue is now fixed. The configuration value is now initialized and kept as an instance member, which is used every time to check metrics collection thread safety flags.

CDPD-88100: Reduced Impala log verbosity for query details

Impala logs were excessively verbose, particularly for Remote Procedure Calls (RPCs) that fetched query runtime profiles and execution summaries.

This issue is now resolved by lowering the logging level for these RPCs to VLOG_QUERY (or VLOG(1))

Apache Jira: [IMPALA-13556](#)

CDPD-85268: Stable table renames during metadata invalidations

A system error previously occurred when renaming a table while also invalidating its metadata.

The issue is now resolved by fixing NullPointerException in Catalogd that may occur when renaming a table while also invalidating its metadata.

Apache Jira: [IMPALA-13631](#)

CDPD-83645: RSASSA-PSS signature algorithm support in kRPC

kRPC communication previously failed when certificates used the RSASSA-PSS signature algorithm.

This issue is now resolved by updating the code (through KUDU-3663) to correctly determine the hash algorithm for RSASSA-PSS signatures.

Apache Jira: [IMPALA-14038](#)

CDPD-83215: Consistent user identity with cookie authentication

When using Impala with proxy clients, such as Knox, and cookie-based authentication, user requests sometimes failed.

This issue is now resolved by ensuring that the Kerberos user identity is correctly set in the connection context for sessions authenticated through cookies.

Apache Jira: [IMPALA-14083](#)

CDPD-87887: Results for HWC direct read V2 mode

After upgrading to CDP 7.1.7, reading tables with Hive Warehouse Connector (HWC) in DIRECT_READ_V2 mode returned incorrect data, as deletes were not applied and updates showed duplicated rows.

This issue is now resolved by reverting a problematic change and applying a new correction. This restores the correct behavior of the DIRECT_READ_V2 mode, ensuring accurate data is returned after update or delete operations.

CDPD-83679: Stable ARRAY(*) function for mixed column types

Users previously encountered a system error when using the ARRAY(*) function on tables combining string and boolean column types. This occurred because the system failed to correctly determine a common data type for these mixed columns.

This issue is now resolved by ensuring that the system correctly identifies string as the common data type when processing mixed string and boolean columns. This prevents the previous error and allows the ARRAY(*) function to work as expected.

Apache Jira: [HIVE-28815](#)

CDPD-65287: Stable Hive client close operations

Hive JDBC clients sometimes failed when closing operations, especially after network timeouts or retries. This happened because a duplicate close request arrived after the operation was already completed.

This issue is now resolved by allowing the JDBC client to ignore duplicate close requests that arrive after an operation is already completed.

Apache Jira: [HIVE-25509](#)

CDPD-84215: DayOfWeek UDF results in consistent results irrespective of UTC / non-UTC timezones

The dayofweek() function previously returned inconsistent results for non-UTC timezones when the vectorized execution path was used.

This issue is now resolved by modifying the internal implementation of the dayofweek() user-defined function (UDF) for the Vectorized path execution in a way that now the date is not converted to UTC timezone before the UDF logic implementation.

Apache Jira: [HIVE-28075](#)

CDPD-84531: Connection starvation in HMS if datanucleus value generation fails

Database connections were sometimes not released as expected when internal processes failed.

This issue is now resolved to ensure continuous and reliable Hive Metastore operation by upgrading the datanucleus-rdbms component to version 5.2.13.

Apache Jira: [HIVE-28839](#)

CDPD-85086/CDPD-85497: Consistent property application for compaction jobs

When you set special rules for Hive compaction jobs, such as how to access logs, those rules weren't always applied to the part that updates statistics. This meant you could not see important logs for fixing problems, and your special settings were not fully used.

This issue is now resolved by making sure that all the special rules you set for compaction jobs are now also applied to the StatsUpdater job. As a result, you can easily check compaction logs for troubleshooting, and all your custom settings work as expected.

Apache Jira: [HIVE-28947](#)

CDPD-83683: String conversion for complex data types

Applying functions such as `md5()` to complex data types previously caused errors because these types could not be directly converted to strings.

This issue is resolved by allowing complex data types to be converted to strings through casting. Now, functions such as `md5()` will work correctly with your complex data.

Apache Jira: [HIVE-28825](#)

CDPD-85189: Open transactions from target cluster after Hive ACID table incremental replication job creates issues

After every incremental replication job run for the Hive ACID table replication policy, the transactions that remain open after the dump and load operation now get aborted on the target cluster.

This is applicable to only those transactions that were not in an open state during the dump operation on the source cluster.

Apache Jira: [HIVE-28975](#)

CDPD-84058: Commit message does not provide the required details

Previously, the commit event message did not provide details about whether the event was associated with the read or write operation. The commit text in the `notification_log` message is now enhanced, so that you can use the commit details during the dump process to decide whether you want to skip or include the commit during the next replication job run.

Apache Jira: [HIVE-28825](#)

CDPD-85723: IllegalStateException with Iceberg table with DELETE

Running a query on an Iceberg table fails with an `IllegalStateException` error in the following scenario:

- The Iceberg table has delete files for every data file (no data files without delete files) AND
- An anti-join operation is performed on the result of the Iceberg delete operation (IcebergDeleteNode or HashJoinNode)

This fix resolves the issue by setting the `TableRefIds` of the node corresponding to the Iceberg delete operation (``IcebergDeleteNode`` or ``HashJoinNode``) to only the table reference associated with the data files, excluding the delete files.

Apache Jira: [IMPALA-14154](#)

CDPD-88148: LEFT ANTI JOIN fails on Iceberg V2 tables with Delete files

Queries using a LEFT ANTI JOIN fail with an `AnalysisException` if the right-side table is an Iceberg V2 table containing delete files. For example, consider the following query:

```
SELECT * FROM table_a a
LEFT ANTI JOIN iceberg_v2_table b
ON a.id = b.id;
```

The error `Illegal column/field reference'b.input_file_name' of semi-/anti-joined table 'b' is displayed because semi-joined tuples need to be explicitly made visible for paths pointing inside them to be resolvable.`

The fix updates the `IcebergScanPlanner` to ensure that the tuple containing the virtual fields is made visible when it is semi-joined.

Apache Jira: [IMPALA-13888](#)

CDPD-87719: Ozone snapshot diff command is failing

The `snapdiff` operation could fail with a `Null Pointer Exception` if a directory had metadata changes such as Access Control List (ACL) updates or modification time updates between snapshots. This issue is now resolved.

CDPD-87776: Recon - Retrigger of build whole NSSummary tree task submission inconsistency

Executor may not run scheduled task or remove executor service:

```
org.apache.hadoop.ozone.recon.ReconUtils#triggerRebuild
```

Apache Jira: [HDDS-13428](#)

CDPD-59790: Fix LDB CLI for Ozone Snapshot DB

The Ozone Debug LDB CLI did not support any Ozone Snapshot databases. This issue is not resolved.

Apache Jira: [HDDS-9119](#)

CDPD-66744: Set Times API does not work with linked buckets

The setTimes API that operated on a linked bucket failed because of a bug. This issue is now resolved.

Apache Jira: [HDDS-10369](#)

CDPD-88172: Make ozone.snapshot.filtering.service.interval reconfigurable

ozone.snapshot.filtering.service.interval can be changed and reconfigured using the ozone admin reconfig CLI to enable or disable the SstFilteringService or change the interval for which the service is run.

Apache Jira: [HDDS-13464](#)

CDPD-88179: Exception handling for unchecked exception for deleteBlock command from SCM

This fix provides improved exception handling for unchecked exception for deleteBlock command from SCM.

Apache Jira: [HDDS-13451](#)

CDPD-87270: dt configuration dependency on secret key configuration

Adjusted the secret key expiry calculation (hdds.secret.key.expiry.duration = 9d) to account for delegation token lifetimes. This change ensures that tokens remain valid for their full configured duration, preventing premature key invalidation and improving stable authentication.

Apache Jira: [HDDS-13343](#)

CDPD-87378: RangerOzoneAuthorizer displays a Null Pointer Exception (NPE) when multiple instances of the classes are initialized

Previously, a NPE can be thrown during Ozone Manager re-initialization while Ozone Manager automatic bootstrap takes place. The follower Ozone Manager can fail to apply a transaction in such a case. This issue is now fixed.

Apache Jira: [HDDS-11472](#)

CDPD-87124: Upgraded the poi-ooxml version to 5.4.0+

The poi-ooxml Java library version is upgraded to 5.4.0 due to CVE-2025-31672.

CDPD-74753: Improvements for large scale deletion

In this release, to speed up ozone data deletion, multiple issues are handled. The fixes under this issue focus on several critical areas, including the following areas:

- Performance Improvements

Improving speed that space is reclaimed from the system. Optimization of deletion processes to handle large-scale operations more efficiently.

- Bug Fixes

Addressing issues that occur specifically when deleting large amounts of data.

- Observability Enhancements

Improving observability throughout the deletion process through logs, metrics, and dashboards. New metrics have been introduced and added to Grafana, with a lightweight dashboard created to track deletion progress.

Apache JIRA: [HDDS-11605](#), [HDDS-11712](#), [HDDS-11713](#), [HDDS-11498](#), [HDDS-8888](#), [HDDS-8882](#), [HDDS-12087](#), [HDDS-11633](#), [HDDS-4368](#), [HDDS-11509](#), [HDDS-11711](#), [HDDS-11779](#), [HDDS-12238](#), [HDDS-11511](#), [HDDS-11512](#), [HDDS-12442](#), [HDDS-12474](#), [HDDS-11507](#), [HDDS-12320](#), [HDDS-12175](#), [HDDS-10407](#), [HDDS-10386](#), [HDDS-12975](#), [HDDS-10561](#), [HDDS-13103](#), [HDDS-13057](#), [HDDS-13259](#), [HDDS-13142](#), [HDDS-13079](#), [HDDS-13080](#), [HDDS-8869](#), [HDDS-10705](#), [HDDS-13489](#)

CDPD-84567: Backport upstream fixes for missing blocks issue

Backported the following upstream fixes:

Apache JIRA: [HDFS-15764](#), [HDFS-16985](#), [HDFS-17342](#)

Common Vulnerabilities and Exposures (CVE) that is fixed in this CHF:

CVE-2024-38827	VMware
CVE-2024-53990	Async HTTP Client
CVE-2024-36114	Aircompressor
CVE-2024-47561	Apache Avro
CVE-2023-39410	Apache Avro
CVE-2025-30065	Apache Parquet
CVE-2025-31672	Poi ooxml
CVE-2025-31651	Apache Tomcat
CVE-2025-48988	Apache Tomcat
CVE-2025-31650	Apache Tomcat
CVE-2025-27817	Apache Kafka
CVE-2025-27818	Apache Kafka
CVE-2025-27819	Apache Kafka

Behavioral changes in Cloudera Runtime 7.1.9 SP1 CHF 10

Know more about the behavioral changes in cumulative hotfix 10 for 7.1.9 SP1.

Impala

Summary:

Simplified Impala INSERT Performance Analysis

Previous Behavior: Query profiles for INSERT operations displayed a long and misleading duration for 'Got Metastore client' right before 'Fired Metastore events'.

New Behavior: Now, the catalog timeline accurately includes a dedicated item for 'Prepared InsertEvent data' within the 'Catalog Server Operation' section of Impala query profiles. This allows users to clearly see the time spent collecting file checksums during INSERT operations, providing more precise performance insights.

Apache Jira: [IMPALA-13960](#)

Kafka

Summary:

The `LdapLoginModule` (`com.sun.security.auth.module.LdapLoginModule`) class is blocked by default and can not be used in SASL JAAS configurations.

Previous Behavior: The `LdapLoginModule` class was an allowed login module.

New Behavior: The `LdapLoginModule` class is no longer allowed and is blocked by default. Use the `PlainLoginModule` (`org.apache.kafka.common.security.plain.PlainLoginModule`) class for LDAP authentication.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-93307: Hive import logs are truncated during bulk import

When running the `import-hive.sh` script to perform bulk Hive metadata imports, the logging process fails to retain the expected history. The `import-hive.log` file rotates prematurely when it reaches 10 MB and retains only one backup file (`import-hive.log.1`), instead of the expected 100 MB file size and 20 backup files.

Supply a custom `log4j` configuration file with the correct structure by using the `ATLAS_OPTS` environment variable before running the import script:

```
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE log4j:configuration SYSTEM "log4j.dtd">
<log4j:configuration xmlns:log4j="http://jakarta.apache.org/lo
g4j/">
  <appender name="console" class="org.apache.log4j.ConsoleAppen
der">
    <param name="Target" value="System.out"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <appender name="FILE" class="org.apache.log4j.RollingFileApp
ender">
    <param name="File" value="${atlas.log.dir}/${atlas.log.f
ile}"/>
    <param name="Append" value="true"/>
    <param name="maxFileSize" value="100MB"/>
    <param name="maxBackupIndex" value="20"/>
    <layout class="org.apache.log4j.PatternLayout">
      <param name="ConversionPattern" value="%d %-5p - [%t:
%x] ~ %m (%C{1}:%L)%n"/>
    </layout>
  </appender>
  <logger name="org.apache.atlas" additivity="false">
    <level value="info"/>
    <appender-ref ref="FILE"/>
  </logger>
  <logger name="org.apache.kafka.common.config.AbstractConfig"
additivity="false">
```

```

        <level value="error"/>
        <appender-ref ref="FILE"/>
    </logger>
    <root>
        <priority value="warn"/>
        <appender-ref ref="FILE"/>
    </root>
</log4j:configuration>

```

Export the ATLAS_OPTS variable to point to your custom file before running the import script:

```

export ATLAS_OPTS="-Dlog4j.configuration=file:/path/to/custom-hi
ve-import-log4j.xml"
./import-hive.sh

```

CDPD-70450: Impala SQL queries that include the “WITH” clause should populate lineage in Atlas

Impala SQL queries that do not use the WITH clause can show lineage in Atlas, but queries that do use the WITH clause cannot show lineage in Apache Atlas. Impala SQL queries using the WITH clause are not supported.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-6565: Issue with ddlQueries in Atlas for Hive/Impala tables created in default/non-default db using DAS/HUE respectively

ddlQueries are not created for Impala origin table. ddlQueries created for Impala/Hive CTAS tables have difference in names as compared to same operation for Hive table. The Impala table has the query in the ddlQueries entity name.

None

CDPD-55301: ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created through spark3-shell

The ddlQueries and ALTERNATIVE_* lineage missing for Spark tables created using spark3-shell.

None

CDPD-56085: LOAD DATA INPATH to iceberg_table creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas

Running a query like LOAD DATA INPATH to iceberg_table, creates a temporary hive_table with name <iceberg_table_name>_tmp* and then marks it as DELETED in Atlas. So in Atlas, a deleted entity is created corresponding to the temporary table <iceberg_table_name>_tmp*.

None

CDPD-58554: Discard audits of specific classification, label, and business metadata

Support to control audits for specific classification, label, and business metadata is not present in the Custom Audit Filters feature.

None

CDPD-40346: The ddlQueries and ALTERNATIVE_ADDCOLS lineage missing for Impala tables.

The ALTERNATIVE_ADDCOLS lineage has some issue when an Impala table is altered and the corresponding lineage is not created.

CDPD-67112: Import transforms do not work as expected when replacing a string which already has ":"

The character ":" is not supported in path replacements. The import succeeds but location remains unchanged. The character ":" must be avoided.

None

CDPD-69150: Unable to add labels or user defined properties in Japanese

Adding Japanese labels or user defined properties results in the error message: “Invalid label: ###, label should contain alphanumeric characters, _ or -”

None

CDPD-69279: Quick search does not return entities when using Japanese or Chinese characters to search properties

Entities, such as `hdfs_path`, are not returned by the search when their indexable properties are searched using partial search terms made of Japanese or Chinese characters. Only exact matches return results when searching the indexed properties made of Japanese or Chinese characters.

None

CDPD-68191: Suggestions do not return the correct results when searching multiple Chinese characters

Free text search does not return results when searching Chinese phrases made of multiple characters. Partial searches return the correct results.

None.

CDPD-71219: Regression : Suggestions don't work for single character words on indexable attributes

When searching for entities whose name (entity names are indexable) is a single character, search results are returned but suggestions are not. When searching for entities whose description (entity descriptions are not indexable) is a single character, both search results and suggestions are returned.

None.

CDPD-67450: Table name renaming operation is not updating or creating iceberg_table entity

Renaming an Iceberg table does not update the corresponding Atlas entity.

None.

CDPD-67089: Export/Import: When a table with Ozone path is exported as "connected", only the Ozone key is exported.

When table with Ozone path is exported as "connected", only Ozone key is exported. Other Ozone entities, such as Ozone volume, Ozone bucket are not exported.

None.

CDPD-43772: Performance issues with Atlas service

If there are lot of update operations and the compression type of column families of `atlas_janus` table is SNAPPY, then the Kafka message processing might become slower.

- Consider setting compression type of column families of `atlas_janus` table as GZ.

OPSAPS-67783: During rolling upgrade one among two Atlas server failed to start but Cloudera Manager considered as success

Cloudera Manager marks the Execute command Start on service Atlas-1 as a success even when Atlas service had failed to start successfully. In such cases, Atlas logs give the exact reason for Atlas start-up failure.

None

CDPD-19358: "IsIndexable" and "isOptional" value of a typedef's attribute is modified post migration.

In HDP-265, `falcon_feed_creation` has "stored-in" attribute which has `IsIndexable` value set to True.

Post migration, "stored-in" is moved to `relationshipAttributeDefs` and has `IsIndexable` value set to False.

Similarly, in HDP-265 the table attribute of `hive_storage_desc` `isOptional` is set to true. Post migration, `isOptional` set to False.

None.

CDPD-11941: Table creation events missed when multiple tables are created in the same Hive command

When multiple Hive tables are created in the same database in a single command, the Atlas audit log for the database may not capture all the table creation events. When there is a delay between creation commands, audits are created as expected.

None.

CDPD-11940: Database audit record misses table delete

When a hive_table entity is created, the Atlas audit list for the parent database includes an update audit. However, at this time, the database does not show an audit when the table is deleted.

None.

CDPD-11692: Navigator table creation time not converted to Atlas

In converting content from Navigator to Atlas, the create time for Hive tables is not moved to Atlas.

None

CDPD-10574: Suggestion order doesn't match search weights

At this time, the order of search suggestions does not honor the search weight for attributes.

None.

CDPD-7982: HBase bridge stops at HBase table with deleted column family

Bridge importing metadata from HBase fails when it encounters an HBase table for which a column family was previously dropped. The error indicates:

```
Metadata service API org.apache.atlas.AtlasClientV2$API_V2@58112bc4 failed with status 404 (Not Found) Response Body
({ "errorCode": "ATLAS-404-00-007", "errorMessage": "Invalid instance creation/updation parameters passed : hbase_column_family.table: mandatory attribute value missing in type hbase_column_family" })
```

None.

CDPD-6675: Irregular qualifiedName format for Azure storage

The qualifiedName for hdfs_path entities created from Azure blob locations (ABFS) does not have the clusterName appended to it as do hdfs_path entities in other location types.

None.

CDPD-4762: Spark metadata order may affect lineage

Atlas may record unexpected lineage relationships when metadata collection from the Spark Atlas Connector occurs out of sequence from the metadata collection from HMS. For example, if an ALTER TABLE operation in Spark that is changing a table name and is reporting to Atlas before HMS has processed the change, Atlas may not show the correct lineage relationships to the altered table.

None.

CDPD-4545: Searches for Qualified Names with "@" does not fetch the correct results

When searching Atlas qualifiedName values that include an "@" character (@), Atlas does not return the expected results or generate appropriate search suggestions.

Consider leaving out the portion of the search string that includes the @ sign, and use the wildcard character * instead.

CDPD-3208: Table alias values are not found in search

When table names are changed, Atlas keeps the old name of the table in a list of aliases. These values are not included in the search index in this release, so after a table name is changed, searching on the old table name does not return the entity for the table.

None.

CDPD-3160: Hive lineage missing for INSERT OVERWRITE queries

Lineage is not generated for Hive INSERT OVERWRITE queries on partitioned tables. Lineage is generated as expected for CTAS queries from partitioned tables.

None.

CDPD-3125: Logging out of Atlas does not manage the external authentication

At this time, Atlas does not communicate a logout event with the external authentication management, Apache Knox. When you log out of Atlas, you can still open the instance of Atlas from the same web browser without re-authentication.

To prevent access to Atlas after logging out, close all browser windows and exit the browser.

CDPD-1892: Ranking of top results in free-text search not intuitive

The Free-text search feature ranks results based on which attributes match the search criteria. The attribute ranking is evolving and therefore the choice of top results may not be intuitive in this release.

If you don't find what you need in the top 5 results, use the full results or refine the search.

CDPD-1884: Free text search in Atlas is case sensitive

The free text search bar in the top of the screen allows you to search across entity types and through all text attributes for all entities. The search shows the top 5 results that match the search terms at any place in the text (*term* logic). It also shows suggestions that match the search terms that begin with the term (term* logic). However, in this release, the search results are case-sensitive.

If you don't see the results you expect, repeat the search changing the case of the search terms.

CDPD-1823: Queries with ? wildcard return unexpected results

DSL queries in Advanced Search return incorrect results when the query text includes a question mark (?) wildcard character. This problem occurs in environments where trusted proxy for Knox is enabled, which is always the case for CDP.

None.

CDPD-1664: Guest users are redirected incorrectly

Authenticated users logging in to Atlas are redirected to the CDP Knox-based login page. However, if a guest user (without Atlas privileges) attempts to log in to Atlas, the user is redirected instead to the Atlas login page.

To avoid this problem, open the Atlas Dashboard in a private or incognito browser window.

CDPD-922: The IsUnique relationship attribute not honored

The Atlas model includes the ability to ensure that an attribute can be set to a specific value in only one relationship entity across the cluster metadata. For example, to add metadata tags to relationships that you wanted to make sure were unique in the system, you can design the relationship attribute with the property IsUnique equal true. However, in this release, the IsUnique attribute is not enforced.

None.

DOCS-13759: Tag Propagation stops after a certain depth while the lineage is being extended

When a tag is added to an entity at timestamp T1, the entities along the lineage to which the tag must be propagated is calculated at T1. Before tag propagation completes, if the lineage is extended, tag does not propagate to the entities in the extended lineage.

CDPD-41142: When a Kafka console consumer group is run, more than one update audits are seen

After running the console consumer with a consumer group, verify the consumer group entity created, along with the metrics and notifications for the consumer group and topic. The expected result can be: one ENTITY_CREATE audit and one ENTITY_UPDATE audit. But more than one ENTITY_UPDATE audits are seen.

CDPD-40165: Two audits are created for SPARK CTAS table

When following Spark queries are fired:

```
spark.sql("create table table1(id int)")
spark.sql("create table table2 as select * from table1")
```

HMS sends "ENTITY_CREATE" and "ENTITY_FULL_UPDATE_V2".

The extra ENTITY_FULL_UPDATE_V2 message received from HMS is sent as a part of ALTER_TABLE_ADDCOLS event from the HMS Hook side. This behaviour is observed only when the queries are run from Spark SQL and not when run the same queries are run from Beeline.

CDPD-39197: Debug metrics returns empty data

When debug metrics is enabled and some operations are performed, the response is empty

CDPD-36495: Updating legacyAttribute from False to True resets the initially created relationshipAttributes values

Creating types, entities, and to start, you must set the relationship with is_legacy_attribute value as **False**.

Later, update the value relationshipDef is_legacy_attribute to True.

For the entities that were created before updating the is_legacy_attribute to True, the relationship Attributes value is reset.

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-29409: Hive import: Suggestion suggests entity which is deleted.

Suggestions suggests tables of a database, which is a deleted entity.

CDPD-25152: Tag propagation through deferred actions consumes additional time as compared to default flow

The additional time might be due to the small overhead added to create / update task vertex and which is run in the background. This also depends on number of tasks queued to be executed.

CDPD-42954: Zeppelin notebook fails after enabling Atlas-HDFS hook

The Zeppelin notebooks are failing with errors after enabling Atlas-HDFS hook in the CDP cluster.

When the below properties are set for atlas-client.properties in Cloudera Manager:

- atlas.jaas.KafkaClient.option.keyTab
- atlas.jaas.KafkaClient.option.principal

Along with adding the properties in /etc/atlas/conf/atlas-application.properties, Cloudera Manager also adds these properties to atlas-application.properties for other services (like Spark).

Adding these properties interferes with the normal flow of the services (like Spark)

To enable HDFS lineage feature, instead of setting these properties through Cloudera Manager, users can manually add the properties directly in /etc/atlas/conf/atlas-application.properties

CDPD-10576: Deleted Business Metadata attributes appear in Search Suggestions

Atlas search suggestions continue to show Business Metadata attributes even if the attributes have been deleted.

None.

CDPD-39427: [HDFS Lineage]: When the input is a directory in case of put/copyfromLocal/cp/mv commands, lineage is not created even though the script succeeds.

When Source is a directory and target is a directory which is already present in Atlas, the command succeeds and inserts the data in the desired location, but lineage is not created.

DOCS-13760: System Attributes search, __classificationNames: Search with parent tag does not return entities associated to its children tags

System attribute search with __classificationNames = parent_tag returns entities associated to parent_tag only and not entities associated to its children tag.

Workaround: Instead of using system attribute, employ the basic search attribute "classification" which lists entities associated with inherited classifications.

CDPD-35818: Basic search with tag filter provides approximateCount as -1 when there is no match and is 0 otherwise

When the following search operations are performed:

- Faceted search with both tag filter and entity filter

The observed approximateCount is -1.

Here both entity filter and tag filter are present and when there is no match the response received is -1.

- Faceted search with only entity filter

Performing a basic search provides an approximate value of 0 when there is no match.

- Faceted search with only tag filter

Whenever there is tag filter in the query and there is no entity match, the approximateCount is -1 and if the tag filter is not available, the response approximateCount is 0

CDPD-13466: Bulk create/update entity POST API does not create / update authorised entities

The bulk API fails with 403 error if some belong to entities on which the user is unauthorized and other GUIDs belong to entities on which user is authorized.

CDPD-22744: Bulk entity DELETE API does not delete authorised entities

Bulk entity DELETE API does not delete authorised entities when the list of authorised and unauthorised entities list is passed.

CDPD-76035: Resource lookup for Atlas service is failing

Once the Atlas configuration snippet atlas.authentication.method.file is enabled and a classification is created, these do not synchronize correctly to the **Type Category** resource field setting of Apache Ranger. The newly created classification won't be able to be selected as the **Type Name**.

CDPD-77738: Atlas hook authorization issue causing HiveCreateSysDb timeout

Atlas hook authorization error causes HiveCreateSysDb command to time out due to repeated retries.

None

CDPD-69140: Incremental export: When an entity has tag propagated and is exported, the tag is not propagated to it in the export

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After exporting the last table, it will not have the propagated tag.

Apache JIRA: [ATLAS-4889](#)

CDPD-69213: Export/Import, Incremental Export: When entity exported has a tag propagated from entity which is deleted, tag is not propagated to it at target

When creating tables with multiple levels of depth, a tag applied to the first table will be propagated along the lineage. After dropping the first table and exporting the entire lineage, the child tables will not have the propagated tag.

Apache JIRA: [ATLAS-5055](#)

CDPD-76789: Creating tag with name description throws java.lang.ClassCastException

Creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options" can lead to HTTP 500 error in Apache Atlas.

Avoid creating classification with reserved names such as "name", "description", "owner", "version", "serviceType" and "options".

CDPD-77435: RAZ: Import-hive on Cloudera Data Engineering cluster fails

Running import-hive command on RAZ enabled Cloudera Data Engineering cluster fails with error "NoClassDefFoundError: com/sun/jersey/core/spi/factory/ResponseBuilderImpl".

CDPD-70321: Atlas Parallel import is failing with various errors

During a parallel import-export activity with six iceberg table policies with exportOption as db1.* for all six exports, all import fail after the exports.

CDPD-75994: Post DL regular upgrade (non ZDU) to 7.3.1, "Exception in getKafkaConsumer ,WakeupException: null" is seen

After the data lake is upgraded to 7.3.1, sometimes Atlas Hook does not function when Apache Atlas and Apache Kafka are started at the same time, thus Atlas is unable to connect to Kafka while Kafka is still being set up. Atlas performs only three attempts.

Restart the cluster, after the upgrade to trigger to reconnect to Apache Kafka. The Kafka consumer creation should be retried if the Kafka service is unavailable during Atlas startup.

DOCS-26821: Iceberg entities created in 7.2.17 Atlas-Hook (Hive,Impala,Spark) is not ingested by 7.2.18/7.3.1 Atlas Server

When using an Atlas hook from 7.3.1 with an earlier version of Atlas server (7.1.9 SP1 CHF5 or earlier) to create an Iceberg table, the older data model of Iceberg cannot process the features of the new data models. For example, when encountering relationships or attributes in queries which do not have a definition in the earlier model, Iceberg fails to create new tables with an error message. The data model of the Iceberg in Cloudera Runtime 7.1.9 SP1 CHF5 or later is not backward compatible with earlier data models.

It is recommended to upgrade your Atlas server version to at least 7.1.9 SP1 CHF5 or later.

CDPD-87670: [Atlas UI] Apache Atlas Glossary becomes unresponsive when the page size is set to 50

When the page limit is set to 50 in **Glossary**, the user interface becomes unresponsive due to an incorrect API call with the error message, when trying to show more than 25 associated entities for a glossary item: "expected type AtlasGlossaryCategory; found AtlasGlossaryTerm".

Apache Jira: [ATLAS-5067](#)

CDPD-28741: Atlas node start failure : PermanentLockingException: Expected value mismatch for KeyColumn

In an Atlas High Availability (HA) enabled environment, starting both Atlas hosts at the same time can result in both trying to access or modify the same graph database resulting in a race condition. One instance successfully modifies the patch vertex, while the other instance triggers a Locking Exception (Concurrent modification exception).

Start Atlas instances in sequence and not in parallel to avoid the potential race condition. If the exception is already present, restart the second Atlas instance after triggering the PermanentLockingException.

CDPD-79099: Unable to import hive tables using import script in Public Cloud

The validation of import .zip files can cause the org.apache.atlas.AtlasServiceException error if the .zip file contains Atlas shell entities missing mandatory attributes such as a name. Therefore, the import of shell entities fails.

CDPD-88230: Bulk import operations currently do not construct lineage as expected

Bulk import operations do not create lineage consistently, even when the entities are imported successfully.

CDPD-88302: Bulk import operations currently do not create audits for the imported entities

Bulk import operations do not create audits for the imported entities.

Known Issues in Hive

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10**CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress**

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-60770: Beeline Authentication Issue with Special Characters in Passwords

When LDAP is enabled, users cannot authenticate with Beeline if the password contains a special character. For example, the following string fails:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>;user=user@XXX;password='R3G#xpXyoy1M0Jb1'
```

Use the `-p` parameter to execute the Beeline command:

```
beeline -u jdbc:hive2://<host>:<port>/<dbName>; -n user@XXX -p 'R3G#xpXyoy1M0Jb1'
```

CDPD-43769: Inconsistent behavior with CHAR comparisons and string literals

In Hive, 'char' data to 'string' data comparison is considered as equal, but 'char' data to 'varchar' data comparison is considered as not equal if the data has trailing spaces. For example,

```
create table test(colchar char(10), colvarchar varchar(20), colstring string);
insert into test values ('a ', 'a ', 'a ');

select count(*) from test where colchar = colstring;
Output returns 1 because char and string data is considered as equal

select count(*) from test where colchar = colvarchar;
```

Output returns 0 because char and varchar data is considered as not equal

It is recommended that you use 'varchar or string' data type instead of 'char' data type for any character or string representation.

CDPD-42726: Wrong results for agg queries from stats after running multi-insert query on managed table

Multiple inserts at the same time into the same partition results in invalid stats. For example:

```
create table source(p int, key int, value string);
insert into source(p, key, value) values (101,42,'string42');

create table stats_part(key int,value string) partitioned by (p
int);
from source
insert into stats_part select key, value, p
insert into stats_part select key, value, p;

select count(*) from stats_part;
-- In this scenario, StatsOptimizer helps serving this query be
cause the result should be rowNum of the partition p=101.
-- The result is 1, however, the result should be 2.
```

Rewrite the multi-insert statement by merging the branches inserting into the same partition to one branch.

CDPD-57574: Query execution fails due to NullPointerException in DagUtils.setupQuickStart

Hive queries may fail at runtime with a NullPointerException while executing the Tez graph at DagUtils.setupQuickStart method. A part of the stack trace from the error is shown below:

```
ERROR : Failed to execute tez graph.
java.lang.NullPointerException: null at org.apache.hadoop.hive.
ql.exec.tez.DagUtils.setupQuickStart(DagUtils.java:1724)
```

The error usually occurs from an invalid plan that has cycles created by semi-join or map-join edges.

Disable some of the optimizations in order to remove the cycles from the plan. It is sufficient to set one of the following properties:

- set hive.tez.dynamic.partition.pruning=false;
- set hive.tez.dynamic.semijoin.reduction=false;
- set hive.auto.convert.join=false;

To avoid any undesired performance regressions, disable the optimization(s) only for specific queries and not globally (through Cloudera Manager) for the whole workload or cluster.

CDPD-43107: SemanticException for INSERT INTO statement when Hive Cost-based Optimizer (CBO) is disabled

If you are running the INSERT INTO query and hive.cbo.enable is set to "false", the query fails with a SemanticException. For example,

```
set hive.cbo.enable=false;

CREATE TABLE mytable (
id INT,
str STRING
);
```

```
INSERT INTO mytable (id, str) VALUES (1, 'a');
```

```
Output:
org.apache.hadoop.hive.ql.parse.SemanticException: 0:0 Expected
2 columns for insclause-0/default@mytable; select produces 1 col
umns. Error encountered near token 'a'
```

This issue occurs only when columns are specified for the target table in the query. INSERT INTO mytable values (1, 'a'); does not result in an exception.

Enable CBO and run the query.

CDPD-45370: Cartesian join fails with an empty table

When the configuration `hive.tez.cartesian-product.enabled` is set to true, query fails if one of the tables involved in a Cartesian join has zero rows. This results in an `IllegalArgumentException` with the message `Number of items is 0. Should be positive.`

To address this issue, set `hive.tez.cartesian-product.enabled` to false before running the query.

Apache Jira: [\[HIVE-26582\]](#)

CDPD-43957: HiveServer shuts down during replication due to high resource usage

During Hive replication (both bootstrap and incremental), you may notice that the HiveServer (HS2) shuts down periodically with the following error:

```
java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientE
xception: Unable to read HiveServer2 configs from ZooKeeper

  ... 8 mor
```

This issue occurs when you replicate at scale with an unbalanced cluster setup that has all the roles running on the Cloudera Manager host. As a result, Cloudera Manager ends up in a bottleneck situation because HS2 crashes, preventing further replication. The logs (`/var/log/messages`) indicate that there were a large number of Java processes running on the host, which exhausted the host's memory and triggered an Out Of Memory Killer process to stop HS2.

You can restart HS2 and reinitiate replication. However, the replication process may take a longer time to complete.

- Follow these recommendations when setting up your source and target clusters:
 - Ensure that no HS2, Hive metastore (HMS), DataNode, or NameNode roles are running on the Cloudera Manager host.
 - Ensure that you have multiple instances of HS2 and HMS roles on different nodes.
 - It is recommended that you have the HS2 and HMS roles on different nodes than the DataNodes or NameNodes.

These practices increase the possibility of Hive replication at scale completing successfully.

- Limit the scale of Hive replication by temporarily disabling replication policies.

CDPD-40730: Parquet change can cause incompatibility

Parquet files written by the parquet-mr library in CDP 7.1.9, where the schema contains a timestamp with no UTC conversion will not be compatible with older versions of Parquet readers. The effect is that the older versions will still consider these timestamps as they would require UTC conversions and will thus end up with a wrong result. You can encounter this problem only when you write Parquet-based tables using Hive, and tables have the non-default configuration `hive.parquet.write.int64.timestamp=true`.

None.

CDPD-41274: HWC + Oozie issue: Could not open client transport with JDBC Uri

Currently only Spark cluster mode is supported in the Oozie Spark Action with Hive Warehouse Connector (HWC).

Use Spark action in cluster mode.

```
<spark xmlns="uri:oozie:spark-action:1.0">
  ...
  <mode>cluster</mode>
  ...
</spark>
```

CDPD-26556 After an upgrade, querying a CTAS table under certain conditions might throw an exception

If you upgrade your Hive cluster from CDH 6 to CDP 7, create a CTAS table in the CDP cluster from a table you upgraded from CDH, you might see the following exception when you query the new table:

```
class org.apache.hadoop.io.IntWritable cannot be cast to class o
rg.apache.hadoop.hive.serde2.objectinspector.StandardUnionObject
Inspector$StandardUnion
```

This issue involves CDH-based tables having columns of complex types ARRAY, MAP, and STRUCT.

CDPD-23506: OutOfMemoryError in LLAP

Long running spark-shell applications can leave sessions in interactive Hiveserver2 until the Spark application finishes (user exists from spark-shell), causing memory pressure in case of a high number of queries in the same shell (1000+).

You must close spark-shell so that sessions are closed. Add the owner of the database or the tables as a user with read or read/write access to the tables directly.

CDPD-23041: DROP TABLE on a table having an index does not work

If you migrate a Hive table to CDP having an index, DROP TABLE does not drop the table. Hive no longer supports indexes ([HIVE-18448](#)). A foreign key constraint on the indexed table prevents dropping the table. Attempting to drop such a table results in the following error:

```
java.sql.BatchUpdateException: Cannot delete or update a parent
row: a foreign key constraint fails ("hive"."IDXS", CONSTRAINT "
```

```
IDXS_FK1" FOREIGN KEY ("ORIG_TBL_ID") REFERENCES "TBLS ("TBL_ID"
))
```

There are two workarounds:

- Drop the foreign key "IDXS_FK1" on the "IDXS" table within the metastore. You can also manually drop indexes, but do not cascade any drops because the IDXS table includes references to "TBLS".
- Launch an older version of Hive, such as Hive 2.3 that includes IDXS in the DDL, and then drop the indexes as described in [Language Manual Indexing](#).

Apache Issue: [Hive-24815](#)

CDPD-17766: Queries fail when using spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive.

Do not specify spark.sql.hive.hiveserver2.jdbc.url.principal in the JDBC URL to invoke Hive remotely.

Workaround: specify principal=hive.server2.authentication.kerberos.principal as shown in the following syntax:

```
jdbc:hive://<host>:<port>/<dbName>;principal=hive.server2.authen
tication.kerberos.principal;<otherSessionConfs>?<hiveConfs>#<hive
eVars>
```

CDPD-13636: Hive job fails with OutOfMemory exception in the Azure DE cluster

Set the parameter hive.optimize.sort.dynamic.partition.threshold=0. Add this parameter in Cloudera Manager (Hive Service Advanced Configuration Snippet (Safety Valve) for hive-site.xml)

CDPD-10848: HiveServer Web UI displays incorrect data

If you enabled auto-TLS for TLS encryption, the HiveServer2 Web UI does not display the correct data in the following tables: Active Sessions, Open Queries, Last Max n Closed Queries

Known Issues in Hue

Learn about the known issues in Hue, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-58978: Batch query execution using Hue fails with Kerberos error

When you run Impala queries in a batch mode, you encounter failures with a Kerberos error even if the keytab is configured correctly. This is because submitting Impala, Sqoop, Pig, or pyspark queries in a batch mode launches a shell script Oozie job from Hue and this is not supported on a secure cluster.

There is no workaround. You can submit the queries individually.

OPSAPS-69659: Hue service fails on restart with "Unable to find pycogp2 2.5.4" error

Hue service fails to restart and you see the following error: Unable to find pycogp2 2.5.4. This could be because you have installed Python in a non-default location and Hue is unable to locate the pycogp2 PostgreSQL database adapter.

You must specify the path where you have installed Python in the PYTHONPATH property in the Hue Advanced Configuration Snippet using Cloudera Manager.

1. Log in to Cloudera Manager as an Administrator.

2. Go to Clusters Hue Configurations and add the following key and value in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

Key: PYTHONPATH

Value: `[***PYTHON-PATH***]`

Replace `[***PYTHON-PATH***]` with the actual location where you have installed Python. For example, `/opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python3.8/site-packages`

3. Click Save Changes.
4. Restart the Hue service.

CDPD-59677: Unable to view Phoenix tables on the left assist in Hue

On clusters secured with Knox, you may not be able to see Phoenix tables on the left assist that are present under the default database (that is, an empty("") database).

None.

CDPD-58142: A query is not pre-populated in the Hue editor after clicking on the “Re Execute” button

When you click Re Execute to rerun a query from the Job Browser Queries Query Details page, the query does not get populated on the Hue editor, as expected.

None.

CDPD-54376: Clicking the home button on the File Browser page redirects to HDFS user directory

When you are previewing a file on any supported filesystem, such as S3 or ABFS, and you click on the Home button, you are redirected to the HDFS user home directory instead of the user home directory on the said filesystem.

None.

CDPD-41306: pip3.8 freeze command does not work and results into an error

You see the `/usr/lib/hue/build/env/bin/python: No such file or directory` error when you run the following command:

```
build/env/bin/pip3.8 freeze
```

Run the freeze command as follows by specifying the paths of python3.8 and pip3.8:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/python3.8 /opt/c  
loudera/parcels/CDH/lib/hue/build/env/bin/pip3.8 freeze
```

CDPD-43293: Unable to import Impala table using Importer

Creating Impala tables using the Hue Importer may fail.

If you have both Hive and Impala services installed on your cluster, then you can import the table using by selecting the Hive dialect from Tables Sources .

If only Impala service is installed on your cluster, then go to Cloudera Manager Clusters Hue Configurations and add the following line in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[beeswax]  
max_number_of_sessions=1
```

DWX-8602: Unable to import a large CSV file from the local workstation

You may see an error message while importing a CSV file into Hue from your workstation, stating that you cannot import files of size more than 200 KB.

Upload the file to S3 or ABFS and then import them into Hue using the Importer.

CDPD-39330: Unable to use the pip command in CDP

You may not be able to use the `pip` command in CDP 7.1.7 or higher and may see the following error when using `pip` in a command: “ImportError: cannot import name `chardet`”.

Follow the steps listed on [Unable to use pip command in CDP](#).

CDPD-24294: Hue uses the unsafe-inline directive in its Content Security Policy (CSP) header

Hue 4 web interface uses the `unsafe-inline` directive in its CSP header. As a result, the application server does not set the CSP header in its HTTP responses, and therefore does not benefit from the additional protection against potential cross-site scripting issues and other modern application vulnerabilities which a properly configured CSP may provide. This could lead to application vulnerability.

Cloudera recommends deploying additional security measures such as a firewall within the Hue server to control allowed connections, and SSO-based authentications mechanisms such as LDAP or SAML.

OPSAPS-58927: Connection failed error when accessing the Search app (Solr) from Hue

If you are using Solr with Hue to generate interactive dashboards and for indexing data, and if you have deployed two Solr services on your cluster and selected the second one as a dependency for Hue, then Cloudera Manager assigns the hostname of the first Solr service and the port number of the second Solr service generating an incorrect Solr URL in the search section of the `hue.ini` file. As a result, you may see a “Connection failed” error when you try to access the Search app from the Hue web UI.

1. Log into Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field:

```
[search]
# URL of the Solr Server
solr_url=http://[***HOSTNAME***]:[***PORT***]/solr/
```

For example:

```
solr_url=http://solr2:4567/solr/
```

3. Click Save Changes.
4. Restart the Hue service.

CDPD-41136: Importing files from the local workstation is disabled by default

Cloudera has disabled the functionality to import files from your local workstation into Hue because it may cause errors. You may not see the Local File option in the Type drop-down menu on the **Importer** page by default.

You can enable the functionality to import files from your local workstation by specifying the following parameter in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field in Hue configurations in Cloudera Manager:

```
[indexer]
enable_direct_upload=true
```

Invalid S3 URI error while accessing S3 bucket

The Hue Load Balancer merges the double slashes (`//`) in the S3 URI into a single slash (`/`) so that the URI prefix `"/filebrowser/view=S3A:/"` is changed to `"/filebrowser/view=S3A:/"`. This results in an error when you try to access the S3 buckets from the Hue File Browser through the port 8889.

The Hue web UI displays the following error: “Unknown error occurred”.

The Hue server logs record the “ValueError: Invalid S3 URI: S3A” error.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

You should be able to load the S3 browser from both 8888 and 8889 ports.

Alternatively, you can use the Hue server port 8888 instead of the load balancer port 8889 to resolve this issue.

Error while rerunning Oozie workflow

You may see an error such as the following while rerunning an already executed and finished Oozie workflow through the Hue web interface: E0504: App directory [hdfs://cdh/user/hue/oozie/workspaces/hue-oozie-1571929263.84] does not exist.

To resolve this issue, add the following property in the Hue Load Balancer Advanced Configuration Snippet:

1. Sign in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configurations Load Balancer and search for the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
3. Specify MergeSlashes OFF in the Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf field.
4. Click Save Changes.
5. Restart the Hue Load Balancer.

CDPD-17956, CDPD-14167: Setting idle session timeout for Hue does not work when the cluster is secured using Knox SSO

If Hue is configured with desktop.auth.backend.KnoxSpnegoDjangoBackend as the Authentication Backend, then the automatic idle session logout that is set by configuring the `idle_session_timeout` property does not take effect. You may also see 404 error while accessing Hue from the Knox UI when the `idle_session_timeout` property is not set to -1.

None

Query history displays "Result Expired" message

You see the "Result Expired" message under the Query History column on the **Queries** tab for queries which were run back to back. This is a known behaviour.

None.

CDPD-43956: Manually replace UUID when importing Oozie workflows containing sub-workflows

When importing Oozie workflows that contain sub-workflows, you must replace all the UUID entries with unique new entries. If you change the UUID of a sub-workflow, you must update that reference in the parent workflow to avoid circular dependencies.

Hue limitation after upgrading from CDH to CDP Private Cloud Base

The `hive.server2.parallel.ops.in.session` configuration property changes from TRUE to FALSE after upgrading from CDH to CDP Private Cloud Base. Current versions of Hue are compatible with this property change; however, if you still would like to use an earlier version of Hue that was not compatible with this property being FALSE and shared a single JDBC connection to issue queries concurrently, the connection will no longer work after upgrading.

Hue UI is blank upon login after upgrading to CDP 7.1.7 from CDH 6

If your cluster was secured using Knox, and if you have upgraded from CDH 6 to CDP 7.1.7, then you may see a blank Hue screen. This could happen because the `knox_proxyhosts` parameter is newly introduced in CDP, and it is possible that this parameter is not configured in Cloudera Manager under Hue configuration.

Specify the host on which you have installed Knox in the Hue Knox Proxy Hosts configuration as follows:

1. Log in to Cloudera Manager as an Administrator.
2. Obtain the host name of the Knox Gateway by going to Clusters Knox service Instances .
3. Go to Clusters Hue service Configuration and search for the Knox Proxy Hosts field.

Note: Cloudera Manager displays the following warning if the Knox Proxy Hosts field is empty when Knox Gateway is enabled on the CDP cluster: The parameter `knox_proxyhosts` cannot be empty. This can happen if there are no Knox Gateways. Please set the `knox_proxyhosts` to the list of hosts that have Knox Gateways.

4. Specify the Knox Gateway hostname in the Knox Proxy Hosts field.
5. Click Save Changes and restart the Hue service.

Unsupported features

CDPD-59595: Spark SQL does not work with all Livy servers that are configured for High Availability

SparkSQL support in Hue with Livy servers in HA mode is not supported. Hue does not automatically connect to one of the Livy servers. You must specify the Livy server in the Hue Advanced Configuration Snippet as follows:

```
[desktop]
[spark]
livy_server_url=http(s)://[***LIVY-FOR-SPARK3-SERVER-HOST***]:
[***LIVY-FOR-SPARK3-SERVER-PORT***]
```

Moreover, you may see the following error in Hue when you submit a SparkSQL query: Expecting value: line 2 column 1 (char 1). This happens when the Livy server does not respond to the request from Hue.

Specify all different Livy servers in the `livy_server_url` property one at a time and use the one which does not cause the issue.

CDPD-18491: PySpark and SparkSQL are not supported with Livy in Hue

Hue does not support configuring and using PySpark and SparkSQL with Livy in CDP Private Cloud Base.

Importing and exporting Oozie workflows across clusters and between different CDH versions is not supported

You can export Oozie workflows, schedules, and bundles from Hue and import them only within the same cluster if the cluster is unchanged. You can migrate bundle and coordinator jobs with their workflows only if their arguments have not changed between the old and the new cluster. For example, hostnames, NameNode, Resource Manager names, YARN queue names, and all the other parameters defined in the `workflow.xml` and `job.properties` files.

Using the import-export feature to migrate data between clusters is not recommended. To migrate data between different versions of CDH, for example, from CDH 5 to CDP 7, you must take the dump of the Hue database on the old cluster, restore it on the new cluster, and set up the database in the new environment. Also, the authentication method on the old and the new cluster should be the same because the Oozie workflows are tied to a user ID, and the exact user ID needs to be present in the new environment so that when a user logs into Hue, they can access their respective workflows.

Note: Migrating Oozie workflows from HDP clusters is not supported.

Known Issues in Kafka

Learn about the known issues in Kafka, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker) in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Save Changes > Restart SMM.

The `offsets.topic.replication.factor` property must be less than or equal to the number of live brokers

The `offsets.topic.replication.factor` broker configuration is now enforced upon auto topic creation. Internal auto topic creation will fail with a `GROUP_COORDINATOR_NOT_AVAILABLE` error until the cluster size meets this replication factor requirement.

None

Requests fail when sending to a nonexistent topic with `auto.create.topics.enable` set to true

The first few produce requests fail when sending to a nonexistent topic with `auto.create.topics.enable` set to true.

Increase the number of retries in the producer configuration setting `retries`.

Performance degradation when SSL Is enabled

In some configuration scenarios, significant performance degradation can occur when SSL is enabled. The impact varies depending on your CPU, JVM version, Kafka configuration, and message size. Consumers are typically more affected than producers.

Configure brokers and clients with `ssl.secure.random.implementation = SHA1PRNG`. It often reduces this degradation drastically, but its effect is CPU and JVM dependent.

OPSAPS-43236: Kafka garbage collection logs are written to the process directory

By default Kafka garbage collection logs are written to the agent process directory. Changing the default path for these log files is currently unsupported.

None

RANGER-3809: Idempotent Kafka producer fails to initialize due to an authorization failure

Kafka producers that have idempotence enabled require the Idempotent Write permission to be set on the cluster resource in Ranger. If permission is not given, the client fails to initialize and an error similar to the following is thrown:

```
org.apache.kafka.common.KafkaException: Cannot execute transactional method because we are in an error state
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeFailWithError(TransactionManager.java:1125)
    at org.apache.kafka.clients.producer.internals.TransactionManager.maybeAddPartition(TransactionManager.java:442)
    at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:1000)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:914)
    at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:800)
    .
    .
    .
    Caused by: org.apache.kafka.common.errors.ClusterAuthorizationException: Cluster authorization failed.
```

Idempotence is enabled by default for clients in Kafka 3.0.1, 3.1.1, and any version after 3.1.1. This means that any client updated to 3.0.1, 3.1.1, or any version after 3.1.1 is affected by this issue.

This issue has two workarounds, do either of the following:

- Explicitly disable idempotence for the producers. This can be done by setting `enable.idempotence` to `false`.
- Update your policies in Ranger and ensure that producers have Idempotent Write permission on the cluster resource.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

DBZ-4990: The Debezium Db2 Source connector does not support schema evolution

The Debezium Db2 Source connector does not support the evolution (updates) of schemas. In addition, schema change events are not emitted to the schema change topic if there is a change in the schema of a table that is in capture mode. For more information, see [DBZ-4990](#).

None.

CFM-3532: The Stateless NiFi Source, Stateless NiFi Sink, and HDFS Stateless Sink connectors cannot use Snappy compression

This issue only affects Stateless NiFi Source and Sink connectors if the connector is running a dataflow that uses a processor that uses Hadoop libraries and is configured to use Snappy compression. The HDFS Stateless Sink connector is only affected if the `Compression Codec` or `Compression Codec` for Parquet properties are set to `SNAPPY`.

If you are affected by this issue, errors similar to the following will be present in the logs.

```
Failed to write to HDFS due to java.lang.UnsatisfiedLinkError: org.apache.hadoop.util.NativeCodeLoader.buildSupportsSnappy()
```

```
Failed to write to HDFS due to java.lang.RuntimeException: native snappy library not available: this version of libhadoop was built without snappy support.
```

Download and deploy missing libraries.

Important: Ensure that you complete steps 1-11 on all Kafka Connect hosts. Additionally, ensure that the advanced configuration snippet in step 12 is configured for all Kafka Connect role instances.

1. Create the /opt/nativelibs directory.

```
mkdir /opt/nativelibs
```

2. Change the owner to kafka.

```
chown kafka:kafka /opt/nativelibs
```

3. Locate the directory containing the Hadoop native libraries and copy its contents to the directory you created.

```
cp /opt/cloudera/parcels/CDH/lib/hadoop/lib/native/* /opt/nativelibs
```

4. Verify that libsnappy.so was copied to the directory you created.
5. Remove the following from /opt/nativelibs.

```
libhadoop.a
libhadoop.so
libhadoop.so.1.0.0
```

6. Run the following command.

```
hadoop version
```

The command returns the Hadoop version running in the cluster. Note down the first three digits in the version.

7. Go to <https://archive.apache.org/dist/hadoop/common/> and download the Hadoop version that matches the first three digits of the version running in the cluster.

For example, if your Hadoop version is 3.1.1.7.1.9.0-296, then you need to download Hadoop 3.1.1.

8. Extract the downloaded archive.
9. Copy the following libraries from the downloaded archive to /opt/nativelibs on the cluster host.

```
libhadoop.a
libhadoop.so.1.0.0
```

The libraries are located in `hadoop-[*VERSION*]/lib/native`.

10. Create a symlink named libhadoop.so and point it to /opt/nativelibs/libhadoop.so.1.0.0.

```
ln -s /opt/nativelibs/libhadoop.so.1.0.0 /opt/nativelibs/libhadoop.so
```

11. Change the owner of every entry within /opt/nativelibs to kafka.

```
chown -h kafka:kafka /opt/nativelibs/*
```

12. In Cloudera Manager, go to Kafka service Configuration .
13. Add the following key-value pair to Kafka Connect Environment Advanced Configuration Snippet (Safety Valve).
 - Key: LD_LIBRARY_PATH
 - Value: /opt/nativelibs
14. Click Save Changes.
15. Restart the Kafka service.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to required. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to requested instead of required and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Unsupported Features

The following Kafka features are not supported in Cloudera Data Platform:

- Only Java and .Net based clients are supported. Clients developed with C, C++, Python, and other languages are currently not supported.
- The Kafka default authorizer is not supported. This includes setting ACLs and all related APIs, broker functionality, and command-line tools.
- SASL/SCRAM is only supported for delegation token based authentication. It is not supported as a standalone authentication mechanism.
- Kafka KRaft in this release of Cloudera Runtime is in technical preview and does not support the following:
 - Deployments with multiple log directories. This includes deployments that use JBOD for storage.
 - Delegation token based authentication.
 - Migrating an already running Kafka service from ZooKeeper to KRaft.
 - Atlas Integration.

Limitations

Collection of Partition Level Metrics May Cause Cloudera Manager's Performance to Degrade

If the Kafka service operates with a large number of partitions, collection of partition level metrics may cause Cloudera Manager's performance to degrade.

If you are observing performance degradation and your cluster is operating with a high number of partitions, you can choose to disable the collection of partition level metrics.

Important: If you are using SMM to monitor Kafka or Cruise Control for rebalancing Kafka partitions, be aware that both SMM and Cruise Control rely on partition level metrics. If partition level metric collection is disabled, SMM will not be able to display information about partitions. In addition, Cruise Control will not operate properly.

Complete the following steps to turn off the collection of partition level metrics:

1. Obtain the Kafka service name:
 - a. In Cloudera Manager, Select the Kafka service.
 - b. Select any available chart, and select Open in Chart Builder from the configuration icon drop-down.
 - c. Find \$SERVICENAME= near the top of the display.

The Kafka service name is the value of \$SERVICENAME.

2. Turn off the collection of partition level metrics:
 - a. Go to Hosts Hosts Configuration .
 - b. Find and configure the Cloudera Manager Agent Monitoring Advanced Configuration Snippet (Safety Valve) configuration property.

Enter the following to turn off the collection of partition level metrics:

```
[KAFKA_SERVICE_NAME]_feature_send_broker_topic_partition_entity_update_enabled=false
```

Replace [KAFKA_SERVICE_NAME] with the service name of Kafka obtained in step 1. The service name should always be in lower case.

- c. Click Save Changes.

Known Issues in Knox

Learn about the known issues in Knox, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-76435: Default HTTP client timeout for Streams Messaging Manager requests may cause connection timeouts

Some Streams Messaging Manager requests, particularly those retrieving topic data, may take up to 30 seconds to complete, even when there are no connectivity issues. Since the default gateway timeout is set to 20 seconds, this can result in connection timeouts despite the system functioning as expected.

Increase the HTTP client and socket timeouts for Streams Messaging Manager services to 60 seconds. This prevents connection timeouts when the requests take longer than the default gateway timeout.

Follow these steps to configure the required properties for the SMM API and SMM UI services:

1. In Cloudera Manager, select the Knox service.
2. Go to Configuration.
3. Find the Knox Simplified Topology Management - cdp-proxy property, and click **+** to add the following lines:

```
SMM-UI:replayBufferSize=512
SMM-UI:httpclient.connectionTimeout=1m
SMM-UI:client.socketTimeout=1m
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

4. Find the Knox Simplified Topology Management - cdp-proxy-api property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

5. Find the Knox Simplified Topology Management - cdp-proxy-token property, and click **+** to add the following lines:

```
SMM-API:replayBufferSize=512
SMM-API:httpclient.connectionTimeout=1m
SMM-API:client.socketTimeout=1m
```

6. Save your changes.
7. Refresh the cluster.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

You get "The user 'kudu' is not part of group 'hive' on the following hosts:" warning by the Host Inspector.

If you are using fine-grained authorization for Kudu, and you are also using Kudu-HMS integration with HDFS-Sentry sync, then you may get the "The user 'kudu' is not part of group 'hive' on the following hosts:" warning while upgrading.

Workaround: Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

Run the following command on all the HMS servers:

```
usermod -aG hive kudu
```

Unsupported features

Kudu HMS Sync is disabled and is not yet supported

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10**CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress**

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-94720: Impala startup failure due to invalid TLS v1.3 ciphers

When running Impala on a machine with OpenSSL 1.1.1, providing an invalid or TLS v1.2 ciphersuite in the `--tls_ciphersuites` startup flag causes the process to fail during startup. While OpenSSL 3.x ignores invalid ciphers, OpenSSL 1.1.1 returns an error if any ciphersuite in the list is invalid, even if other valid TLS v1.3 ciphers are present.

Ensure that the list in the `--tls_ciphersuites` startup flag contains only valid TLS v1.3 ciphersuites and does not contain any TLS v1.2 ciphersuites.

Apache Jira: [IMPALA-14625](#)

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-59625: Impala shell in RHEL 9 with Python 2 as default does not work

If you try to run `impala-shell` on RHEL 9 by setting the default python executable available in `PATH` to Python 2, it will fail since RHEL 9 is compatible only with Python 3.

If you run into such issues, set this parameter pointing to Python 3, `IMPALA_PYTHON_EXECUTABLE=python3`.

CDPD-81980: Impala query may fail due to backpressure

Impala queries could fail with a dropped due to backpressure error, even when service queue and memory usage appear normal.

Increase the value of the `--mem_limit` startup option.

CDPD-42958: After upgrading the CDH 7.1.9 from CDH 6.x, under certain conditions you cannot insert data into a table

Under the following conditions, after upgrading from CDH 6.x to CDH 7.1.9 you cannot insert data into a table from Impala:

- On CDH 6.x, you created a database with Impala in a user specified HDFS location.
- Using Hive, you then created a table in the database.

Under these conditions, the database and table are stored in the user-specified HDFS directory. After upgrading, the HDFS directory of the table is read-only for Impala. Consequently, from Impala you cannot insert new data into the table because Impala does not have write permission on the HDFS directory.

Workaround: To resolve this issue, use either one of the following workarounds:

- Using the Ranger Web UI, in the policy repository `cm_hdfs`, grant the user 'impala' write permission on the directory where the table resides.
- Enter the following command to grant write permission to user 'impala' on the HDFS directory where the table resides.

```
hdfs dfs -setfacl -m default:user:impala:rwX <HDFS directory>
```

CDPD-87697 : Python 3.11 Support in impala-shell

Python 3.11 is not supported in the CDP 7.1.9 SP1 CHF9 versions of the `impala-shell`

CDPD-80019: Impala fails to start due to large catalog-update topic

Impala coordinators fail to start if the catalog-update statestore topic exceeds 2GB, hitting the Thrift 0.16.0 message size limit (`thrift_rpc_max_message_size`). This prevents the coordinator from processing the update.

- Enable local catalog mode: `--use_local_catalog=true`
- In Cloudera Manager, go to Impala Configuration search for "Catalog Server Command Line

Argument Advanced Configuration Snippet (Safety Valve)" and click **+**

- Add property name and value:

```
Name : --catalog_topic_mode
Value: minimal
```

- Save changes.

Apache Jira: [IMPALA-12350](#)

Impala cannot update table if the 'external.table.purge' property is not set to true

Impala cannot update a table using DDL statements if the 'external.table.purge' property is FALSE. ALTER TABLE statements return success with no changes to the table.

ALTER TABLE statements should be issued twice if "external.table.purge" was FALSE initially.

Note: For Iceberg tables, Impala users should always use CREATE TABLE since the Impala CREATE TABLE statement sets the flag to TRUE. However, Impala CREATE EXTERNAL TABLE sets the flag to FALSE.

Impala's known limitation when querying compacted tables

When the compaction process deletes the files for a table from the underlying HDFS location, the Impala service does not detect the changes as the compactions does not allocate new write ids. When the same table is queried from Impala it throws a 'File does not exist' exception that looks something like this:

```
Query Status: Disk I/O error on <node>:22000: Failed to open HDF
S file hdfs://nameservice1/warehouse/tablespace/managed/hive/<da
tabase>/<table>/xxxxx
Error(2): No such file or directory Root cause: RemoteException:
File does not exist: /warehouse/tablespace/managed/hive/<data
base>/<table>/xxxx
```

Use the [REFRESH/INVALIDATE](#) statements on the affected table to overcome the 'File does not exist' exception.

CDPD-28431: Intermittent errors could be potentially encountered when Impala UI is accessed from multiple Knox nodes.

You must use a single Knox node to access Impala UI.

Impala api calls via kinox require configuration if the kinox customized kerberos principal name is a default service user name

To access impala api calls via kinox, if the kinox customized kerberos principal name is a default service user name, then configure "authorized_proxy_user_config" by clicking Clusters->impala->configuration. Include the kinox customized kerberos principal name in the comma separated list of values <knox_custom_kerberos_principal_name>="*" where <knox_custom_kerberos_principal_name> is the value of the Kerberos Principal in the Knox service. Select Clusters>Knox>Configuration and search for Kerberos Principal to display this value.

CDPD-21828: Multiple permission assignment through grant is not working

None

Problem configuring masking on tables using Ranger

The following Knowledge Base article describes the behavior when we configure masking on tables using Ranger. This configuration works for Hive, but breaks queries in some scenarios for Impala.

For a workaround, see the following Knowledge Base article: [ERROR: "AnalysisException: No matching function with signature: mask\(FLOAT\)" when Impala jobs fail with the following error with signature: mask\(FLOAT\)](#)

IMPALA-11871: INSERT statement does not respect Ranger policies for HDFS

In a cluster with Ranger auth (and with legacy catalog mode), even if you provide RWX to cm_hdfs -> all-path for the user impala, inserting into a table whose HDFS POSIX permissions happen to exclude impala access will result in "AnalysisException: Unable to INSERT into target table (default.t1) because Impala does not have WRITE access to HDFS location: hdfs://XXXXXXXXXXXXX"

IMPALA-532: Impala should tolerate bad locale settings

If the LC_* environment variables specify an unsupported locale, Impala does not start.

Add LC_ALL="C" to the environment settings for both the Impala daemon and the Statestore daemon.

Avro Scanner fails to parse some schemas

The default value in Avro schema must match type of first union type, e.g. if the default value is null, then the first type in the UNION must be "null".

Swap the order of the fields in the schema specification. For example, use ["null", "string"] instead of ["string", "null"]. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

IMPALA-691: Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the impalad daemon.

To monitor overall memory usage, use the `top` command, or add the memory figures in the Impala web UI `/memz` tab to JVM memory usage shown on the `/metrics` tab.

IMPALA-1024: Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Remove trailing semicolon from the Avro schema.

IMPALA-1652: Incorrect results with basic predicate on CHAR typed column

When comparing a CHAR column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Use the `RPAD()` function to blank-pad literals compared with `CHAR` columns to the expected length.

IMPALA-1821: Casting scenarios with invalid/inconsistent results

Using a `CAST()` function to convert large literal values to smaller types, or to convert special values such as NaN or Inf, produces values not consistent with other database systems. This could lead to unexpected results from queries.

None

IMPALA-2005: A failed CTAS does not drop the table if the insert fails

If a CREATE TABLE AS SELECT operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Drop the new table manually after a failed CREATE TABLE AS SELECT

IMPALA-2422: % escaping does not work correctly when occurs at the end in a LIKE clause

If the final character in the RHS argument of a LIKE operator is an escaped \% character, it does not match a % final character of the LHS argument.

None

IMPALA-2603: Crash: impala::Coordinator::ValidateCollectionSlots

A query could encounter a serious error if it includes multiple nested levels of INNER JOIN clauses involving subqueries.

None

IMPALA-3094: Incorrect result due to constant evaluation in query with outer join

An OUTER JOIN query could omit some expected result rows due to a constant such as FALSE in another join clause. For example:

```
explain SELECT 1 FROM alltypestiny a1
  INNER JOIN alltypesagg a2 ON a1.smallint_col = a2.year AND fals
e
  RIGHT JOIN alltypes a3 ON a1.year = a1.bigint_col;
+---+
|
```

[illegible]

IMPALA-3509: Breakpad minidumps can be very large when the thread count is high

The size of the breakpad minidump files grows linearly with the number of threads. By default, each thread adds 8 KB to the minidump size. Minidump files could consume significant disk space when the daemons have a high number of threads.

Add `-minidump_size_limit_hint_kb=size` to set a soft upper limit on the size of each minidump file. If the minidump file would exceed that limit, Impala reduces the amount of information for each thread from 8 KB to 2 KB. (Full thread information is captured for the first 20 threads, then 2 KB per thread after that.) The minidump file can still grow larger than the "hinted" size. For example, if you have 10,000 threads, the minidump file can be more than 20 MB.

IMPALA-4978: Impala requires FQDN from hostname command on Kerberized clusters

The method Impala uses to retrieve the host name while constructing the Kerberos principal is the `gethostname()` system call. This function might not always return the fully qualified domain name, depending on the network configuration. If the daemons cannot determine the FQDN, Impala does not start on a Kerberized cluster.

Test if a host is affected by checking whether the output of the `hostname` command includes the FQDN. On hosts where `hostname`, only returns the short name, pass the command-line flag `##hostname=FULLY_QUALIFIED_DOMAIN_NAME` in the startup options of all Impala-related daemons.

IMPALA-6671: Metadata operations block read-only operations on unrelated tables

Metadata operations that change the state of a table, like `COMPUTE STATS` or `ALTER RECOVER PARTITIONS`, may delay metadata propagation of unrelated unloaded tables triggered by statements like `DESCRIBE` or `SELECT` queries.

None

IMPALA-7072: Impala does not support Heimdal Kerberos

None

OPSAPS-46641: A single parameter exists in Cloudera Manager for specifying the Impala Daemon Load Balancer. Because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

The workaround is to use the load balancer configuration either without a port specification, or with the Beeswax port: this will configure BDR. To configure Hue use the "Hue Server Advanced Configuration Snippet (Safety Valve) for impalad_flags" to specify the the load balancer address with the HiveServer2 port.

CDPD-28139: Set spark.hadoop.hive.stats.autogather to false by default

As an Impala user, if you submit a query against a table containing data ingested using Spark and you are concerned about the quality of the query plan, you must run `COMPUTE STATS` against such a table in any case after an ETL operation because numRows created by Spark could be incorrect. Also, use other stats computed by `COMPUTE STATS`, e.g., Number of Distinct Values (NDV) and NULL count for good selectivity estimates.

For example, when a user ingests data from a file into a partition of an existing table using Spark, if `spark.hadoop.hive.stats.autogather` is not set to `false` explicitly, `numRows` associated with this

partition would be 0 even though there is at least one row in the file. To avoid this, the workaround is to set "spark.hadoop.hive.stats.autogather=false" in the "Spark Client Advanced Configuration Snippet (Safety Valve) for spark-conf/spark-defaults.conf" in Spark's CM Configuration section.

Known issues in Navigator Encrypt

Learn about the known issues in Navigator Encrypt, the impact or changes to the functionality, and the workaround.

Failed to start navencrypt-mount.service

After installing NavEncrypt on SLES, if the command "systemctl status navencrypt-mount" fails with the error: "Failed to start navencrypt-mount.service: Unit navencrypt-mount.service failed to load: No such file or directory", the systemd files need to be reloaded.

Run the command:

```
(sudo) systemctl daemon-reload
```

Crash in Navigator Encrypt kernel module if --profile-file= option is used with ACLs

When you add ACLs with the `acl --add --rule` command, if you include any ACLs that uses the `--profile-file=` option, the kernel module (and host) crashes during Navigator Encrypt shutdown.

None

Known issues in Ozone

Learn about the known issues in Ozone, the impact or changes to the functionality, and the workaround.

CDPD-87429: Unexpected log lines in Ozone snapshot diff output

``ozone.client.server-defaults.validity.period.ms`` configuration introduced to get server default configurations causes Replication Manager to fail when replicating data between Ozone buckets with the following error when the config value does not specify a timeunit.

```
...
java.lang.IllegalStateException: Invalid first line in diff: "25
/07/02 05:58:44 INFO Configuration.deprecation: No unit for ozon
e.client.server-defaults.validity.period.ms(3600000) assuming MI
LLISECONDS"
  at com.cloudera.enterprise.distcp.OzoneCopyListingUtils.parseOz
oneDiff(OzoneCopyListingUtils.java:397)
...
```

Overwrite the ``ozone.client.server-defaults.validity.period.ms`` to configure the value to have time unit (ns, ms, s, m, h). For example, 3600000ms.

CDPD-71648: Snapshot creation failing with "PERMISSION_DENIED" error on a bucket created during pre-upgrade in 7.1.7 SP3

On upgrade of cluster from 7.1.7 SP3 to 7.1.9 SP1, we are not able to create snapshots on a pre-upgrade volume or bucket with "PERMISSION_DENIED" error, since in 7.1.7SP3, we were using full KRB owner name with domain but currently, we only use and search for user shortname.

Update the owner of the bucket with the user shortname and then create snapshot by running the commands:

```
ozone sh bucket update --user=[***USER_SHORT_NAME***] {volume}/{bucket}
ozone sh snapshot create {volume}/{bucket}
  {***SNAPSHOT_NAME***}
```

OPSAPS-74668: ozone.snapshot.deep.cleaning.enabled and ozone.snapshot.ordered.deletion.enabled configurations are missing with CDP 7.1.9 SP1 CHF and Cloudera Manager 7.13.1

Two Ozone Manager configurations are missing while using CDP 7.1.9 SP1 CHF after upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400.

If you are using CDP 7.1.9 SP1 CHF, before upgrading Cloudera Manager version from 7.11.3 to 7.13.1.400, add the following configs to Ozone Manager Advanced Configuration Snippet (Safety Valve) for ozone-conf/ozone-site.xml so that Ozone Manager does not miss important config after the Cloudera Manager upgrade:

```
<property>
<name>ozone.snapshot.deep.cleaning.enabled</name>
<value>false</value>
</property>

<property>
<name>ozone.snapshot.ordered.deletion.enabled</name>
<value>true</value>
</property>
```

Known Issues in Ranger

Learn about the known issues in Ranger, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

UnsupportedClassVersionError

JDK 8 deployments support Nashorn JavaScript engine, which is built-in and fully compatible, whereas JDK 17 deployments support GraalJS script engine due to unavailability of Nashorn.

When your cluster supports both JDK 8 and JDK 17, then while a Java application, running on JDK 8, uses generic interfaces like ScriptEngine (from the javax.script package), the ScriptEngineManager class scans the classpath for available script engine implementations through the service provider mechanism, and detects the GraalJS as a provider for JavaScript, because in this case the GraalJS library (version 22.3.0) is also included on the classpath. The ScriptEngineManager then attempts to instantiate it, when requesting a "js" or "javascript" engine, and triggers an UnsupportedClassVersionError.

Remove the GraalJS library from the classpath.

CDPD-68806: The Revoke operation for users belonging to a group or role permission does not function as expected.

List command is listing all the tables even when the user permission is revoked. And also the command does not add any deny policy to Ranger for that specific user.

For example:

user_1 is the part of group_1

user_2 is the part of role_1

Create a Ranger policy for group_1 and role_1 to access all the resources in HBase.

Try to revoke the permission for user_1 and user_2 using HBase shell global revoke command:

```
revoke 'user_1'
```

```
revoke 'user_2'
```

But there is no deny policy added for that user. And access is still granted to user_1 and user_2.

This behavior is currently not supported in HBase shell. Must be handled manually using the Ranger policy change.

CDPD-68739: The revoke command does not work when using the HBase shell

While using the HBase shell, running the revoke command does not cancel the user permission. Users are able to perform actions even after running the revoke command.

For example:

When a user is granted permission to a particular table using the HBase grant command.

```
hbase:003:0> grant 'user_1', 'RWCA', 'some_abc_table'
```

And then execute the global revoke command for that user:

```
hbase:005:0> revoke 'user_1'
```

Permission for that user 'user_1' for the table 'some_abc_table' not got revoked.

None.

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

CDPD-58860: After upgrading CDP-7.1.8 to CDP-7.1.9, cdp-proxy token missing from Knox Ranger policy.

As part of [OPSAPS-67480](#) in 719 default ranger policy is added from cdp-proxy-token topology, so that after a new installation of CDP-7.1.9, the Knox Ranger policy includes cdp-proxy-token. However, upgrades do not add cdp-proxy-token to cm_knox policies automatically.

Manually add cdp-proxy-token to the Knox policy, using Ranger Admin Web UI.

1. Log in to Cloudera Manager Ranger Admin Web UI, as a Ranger administrator.
2. On Ranger Admin Web UI Service Manager Resource Knox, click cm_knox.
3. In Knox Policies, open the CDP Proxy UI, API and Token policy.
4. In Knox Topology*, add cdp-proxy-token.
5. Click Save.
6. Restart Ranger.

CDPD-58704: Hadoop roll key / key delete command shows operation failed error when one KMS host is down, even when operation succeeds

In case of rollover/delete, client sends one more (last after delete request) request to KMS instances to clean their cache and that too to all registered KMS instances. If one KMS instance is stopped (not deleted), client gets runtime exception.

This simply returns the runtime exception on client end for stopped instances but doesn't break any functionality.

CDPD-56803: When there is no existing policy for user and a revoke request comes from HBase, then will get this error.

```
hbase:001:0> revoke 'hrt_11'
ERROR: org.apache.hadoop.hbase.coprocessor.CoprocessorException: HTTP 400 Error: processSecureRevokeRequest processing failed
    at org.apache.ranger.authorization.hbase.RangerAuthorizationCoprocessor.preRevoke(RangerAuthorizationCoprocessor.java:1309)
    at org.apache.ranger.authorization.hbase.RangerAuthorizationCoprocessor.preRevoke(RangerAuthorizationCoprocessor.java:1128)

```

None

CDPD-56741: Improvement in log message when jwtauth not used

The following exception is printed at startup only and it is not cluttering logs:

```

2023-05-30 06:18:40,127 ERROR org.apache.ranger.rms.security.RMSJwtAuthFilter:
    quasar-pibgzl-1.quasar-pibgzl.root.hwx.site-startStop-1]:
    Failed to initialize Ranger RMS JWT Auth Filter.
    java.lang.Exception: RangerJwtAuthHandler:
    Mandatory configs ('jwks.provider-url' & 'jwt.public-key')
    are missing, must provide atleast one.
    at org.apache.ranger.authz.handler.jwt.RangerJwtAuthHandler.initialize(RangerJwtAuthHandler.java:84)
    ~[ranger-authn-2.4.0.7.1.9.0-186.jar:2.4.0.7.1.9.0-186]
    at org.apache.ranger.rms.security.RMSJwtAuthFilter.initialize(RMSJwtAuthFilter.java:77)
    ~[ranger-rms-common-2.4.0.7.1.9.0-186.jar:2.4.0.7.1.9.0-186]
    at jdk.internal.reflect.NativeMethodAccessorImpl.invoke0(Native Method) ~[?:?]
    at jdk.internal.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl

```

This exception is logged, since mandatory JWT auth filter configs are not provided (expected for some environments like y-cloud) Even though JWT auth filter is failed to initialised, it falls back to kerberos auth, hence no impact from auth perspective

NA

CDPD-56738: Ranger RMS showing FileNotFoundException: /usr/share/java/oraclepki.jar in Oracle 19 setup

This is a warning log printed in catalina.out file when Ranger RMS server is initialised. Following exception is observed only in Oracle 19 setup. FileNotFoundException: /usr/share/java/oraclepki.jar

NA

CDPD-48975: Ranger KMS KTS to KMS DB migration : keys with the same name but different case are not migrated

KMS keys are not case sensitive

No workarounds. Such keys combination are very rare and migration doc was updated to check such keys before starting the migration.

CDPD-42598: Kafka policy creation allowed with incorrect permissions.

When creating a Kafka policy from the UI, the permissions "Idempotent write" and "Cluster action" are not displayed as they are not applicable for the "topic" resource, but when creating a policy for the "topic" resource with the permissions "Idempotent write" and "Cluster Action", the policy is created successfully when the expected behaviour is that the policy creation must fail as the permission is not applicable for the Kafka topic resource

None.

CDPD-41582: Atlas Resource Lookup : Classification for "entity-type" lists only classification for the following payload:

```
{"resourceName": "classification", "userInput": "", "resources": {"classification": []}}
```

expectation is to return all the classifications . But the response has only "classification" Happens similarly for entity-label , entity-business-metadata.

None.

CDPD-40734: User allowed to insert data into a hive table when there is a deny policy on a table column.

A user is allowed to enter data into a table even if there is a deny policy present on one of the table columns.

Test scenario details:

```
Policy setup :-
  policy 1 :- all access policy for hrt_qa, hive and impala
  users
    resources - database - * , table - * , column - *
    users : hrt_qa, hive, impala
    access - all access allowed
  policy 2 :- policy on test_1.table_1 for hrt_5
  users : hrt_5
  resources : database - test_1, table - table_1, column - *
  access :- all access allowed
  policy 3 :- deny policy on test_1.table_1.c0 for hrt_5
  users : hrt_5
  resources : database - test_1, table - table_1, column -
c0
  access - all access denied
data setup :-
  database - test_1
  table - table_1(c0 int, c1 int)
```

The user is able to insert data into the table.

None.

Known Issues in Schema Registry

Learn about the known issues in Schema Registry, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-40380: Authorization checking issue when Kerberos is disabled

Due to an issue in Ranger, when Kerberos is disabled then it is not possible to check authorization.

1. Open Schema Registry configuration in Cloudera Manager.
2. Find the ranger.plugin.schema-registry.service.name field.
3. Replace GENERATED_RANGER_SERVICE_NAME with the actual name of the service.

4. Restart the Schema Registry service.

CDPD-49304: AvroConverter does not support composite default values

AvroConverter cannot handle schemas containing a STRUCT type default value.

None.

CDPD-59015: Schema Registry does not create new versions of schemas even if the schema is changed

Schema Registry uses a schema fingerprinting mechanism to differentiate between schemas. However, fingerprinting does not take into consideration the schema attributes of the field type. As a result, if you have two schemas where the only difference is that one has type attributes defined and the other does not, they will be considered identical by Schema Registry. For example, the following schemas are considered identical:

```
#Schema V1
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "local_timestamp_micros_long", "type": "long"}]}

#Schema V2
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "local_timestamp_micros_long", "type": {"type": "long", "logicalType": "local-timestamp-micros"}}]}
```

Notice that the only difference is that in the second schema, the `local_timestamp_micros_long` field has a logical type specified. In cases like this, the new version of the schema is not created, the initial version is used. This is true even if the data that is being produced has a new schema version. The ID of the first schema version is used and is put in the serialized record. The new schema version is not created.

This issue is common when using change data capture (CDC) connectors like the Debezium connectors. This is because CDC connectors create schemas with the logical type decimal based on the column type in the database schema. For example:

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 0}}]}
```

If the database schema changes (for example, the column type), it is possible that only scale changes, which is a schema attribute.

```
{"type": "record", "name": "schema_name", "namespace": "ns", "fields": [{"name": "database_column", "type": {"type": "bytes", "logicalType": "decimal", "precision": 64, "scale": 1}}]}
```

In this case, even though scale changed to 1, the first version of the schema is used where scale is 0. As a result, the data is consumed with the wrong scale.

Avoid using logical types or other attributes. Alternatively, ensure that there are no changes in the logical types or other attributes between schema versions.

OPSAPS-68708: Schema Registry might fail to start if a load balancer address is specified in Ranger

Schema Registry does not start if the address specified in the Load Balancer Address Ranger property does not end with a trailing slash (/).

Set the value of the `RANGER_REST_URL` Schema Registry environment variable to an address that includes a trailing slash.

1. In Cloudera Manager, select the Schema Registry service.
2. Go to Configuration.

- Find the Schema Registry Server Environment Advanced Configuration Snippet (Safety Valve) property and add the following:

```
Key: RANGER_REST_URL
Value: [***RANGER REST API URL***]
```

Replace [***RANGER REST API URL***] with an address that can be used by Schema Registry to access Ranger. Ensure that the address ends with a trailing slash. For example: `http://ranger-1.cloudera.com:6182/`

- Restart the Schema Registry service.

OPSAPS-70971: Schema Registry does not have permissions to use Atlas after an upgrade

Following an upgrade, Schema Registry might not have the required permissions in Ranger to access Atlas. As a result, Schema Registry's integration with Atlas might not function in secure clusters where Ranger authorization is enabled.

- Access the Ranger Console (Ranger Admin web UI).
- Click the `cm_atlas` resource-based service.
- Add the `schemaregistry` user to the `all - *` policies.
- Click `Manage Service Edit Service`.
- Add the `schemaregistry` user to the `default.policy.users` property.

OPSAPS-69317: Kafka Connect Rolling Restart Check fails if SSL Client authentication is required

The rolling restart action does not work in Kafka Connect when the `ssl.client.auth` option is set to `required`. The health check fails with a timeout which blocks restarting the subsequent Kafka Connect instances.

You can set `ssl.client.auth` to `requested` instead of `required` and initiate a rolling restart again. Alternatively, you can perform the rolling restart manually by restarting the Kafka Connect instances one-by-one and checking periodically whether the service endpoint is available before starting the next one.

Known Issues in Spark

Learn about the known issues in Spark the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

The following known issues were identified in this release:

No new known issues in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-94393: RuntimeWarning Failed to add file" message appears even when Spark successfully loads files

In both Spark 2 and 3, due to an exception when attempting to add files to the Python path, the `RuntimeWarning: Failed to add file` message appears even when the Python JAR file is successfully loaded.

None. You can safely ignore the message as the file is loaded successfully and the message does not affect job completion.

CDPD-60862: Rolling restart fails during ZDU when DDL operations are in progress

During a Zero Downtime Upgrade (ZDU), the rolling restart of services that support Data Definition Language (DDL) statements might fail if DDL operations are in progress during the upgrade. As a result, ensure that you do not run DDL statements during ZDU.

The following services support DDL statements:

- Impala
- Hive – using HiveQL
- Spark – using SparkSQL
- HBase
- Phoenix
- Kafka

Data Manipulation Language (DML) statements are not impacted and can be used during ZDU. Following the successful upgrade, you can resume running DDL statements.

None. Cloudera recommends modifying applications to not use DDL statements for the duration of the upgrade. If the upgrade is already in progress, and you have experienced a service failure, you can remove the DDLs in-flight and resume the upgrade from the point of failure.

CDPD-67517: Spark3 tests are failing if /tmp is mounted as NOEXEC.

Map the tmpdir to a writable path in spark3-conf/spark-defaults.conf using the following steps:

1. Go to the Cloudera Manager.
2. Go to the Spark service.
3. Click the Configuration tab.
4. Select Scope Gateway .
5. Select Category Advanced .
6. Locate the Spark Client Advanced Configuration Snippet (Safety Valve) for spark3-conf/spark-defaults.conf_client_config_safety_valve property.
7. Map the tmpdir to a writable path:

```
spark.driver.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
spark.executor.extraJavaOptions=-Djava.io.tmpdir=/var/tmp
```

8. Enter a Reason for change, and then click Save Changes to commit the changes.
9. Deploy the client configuration.

CDPD-23817: In the upgraded Cluster, the permission of /tmp/spark is restricted due to the HDP configuration hive.exec.scratchdir=/tmp/spark.

If you are using the /tmp/spark directory in the CDP cluster, you must provide the required additional Policies/ACL permissions.

CDPD-22670 and CDPD-23103: There are two configurations in Spark, "Atlas dependency" and "spark_lineage_enabled", which are conflicted. The issue is when Atlas dependency is turned off but spark_lineage_enabled is turned on.

Run Spark application, Spark will log some error message and cannot continue. That can be restored by correcting the configurations and restarting Spark component with distributing client configurations.

CDPD-23007: Mismatch in the Spark Default DB Location. In HDP 3.1.5, hive_db entities have one attribute - 'location' which is configured to the '/managed' path. In fresh install of CDP 7.1.7, hive_db entities now have 2 attributes 'location' configured to '/external' path and 'managedLocation' configured to '/managed' path. In the AM2CM migration (HDP 3.1.5 -> CDP 7.1.7), the 'location' attribute from hive_db entities in HDP 3.1.5 comes unaltered to CDP 7.1.7 and hence maps to '/managed' path.

This issue arises only if you are upgrading from HDP 3.1.5 to CDP 7.1.7. If you are performing a fresh install of CDP 7.1.7, you can ignore this issue.

None

CDPD-217: The Apache Spark connector is not supported

The old *Apache Spark - Apache HBase Connector* (shc) is not supported in CDP releases.

Use the new HBase-Spark connector shipped in CDP release.

CDPD-3038: Launching pyspark displays several HiveConf warning messages

When pyspark starts, several Hive configuration warning messages are displayed, similar to the following:

```
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of name hive.meta
store.runworker.in does not exist
23/08/02 08:37:26 WARN conf.HiveConf: HiveConf of
name hive.masking.algo does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of
name hive.metastore.runworker.in does not exist
23/08/02 08:37:34 WARN conf.HiveConf: HiveConf of na
me hive.masking.algo does not exist
```

These errors can be safely ignored.

Known Issues in Sqoop

Learn about the known issues in Sqoop, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10**CDPD-54770: Unable to read Sqoop metastore created by an older HSQLDB version**

If you have upgraded to CDP PvC Base 7.1.8 Cumulative hotfix 4 or higher versions, you may encounter issues in reading the Sqoop metastore that was created using an older version of HyperSQL Database (HSQLDB).

Cloudera upgraded the HSQLDB dependency from 1.8.0.10 to 2.7.1 and this causes incompatibility issues in Sqoop jobs that are stored in HSQLDB.

After upgrading to CDP PvC Base 7.1.8 Cumulative hotfix 4, you must upgrade the Sqoop metastore and convert the database files to a format that can easily be read by HSQLDB 2.7.1. For more information, see [Troubleshooting Apache Sqoop issues](#).

CDPD-44431: Using direct mode causes problems

Using direct mode has several drawbacks:

- Imports can cause an intermittent and overlapping input split.
- Imports can generate duplicate data.
- Many problems, such as intermittent failures, can occur.
- Additional configuration is required.

Stop using direct mode. Do not use the `--direct` option in Sqoop import or export commands.

Sqoop direct mode is disabled by default. However, if you still want to use it, enable it by either setting the `sqoop.enable.deprecated.direct` property globally in Cloudera Manager for Sqoop or by specifying it in the command-line through `-Dsqoop.enable.deprecated.direct=true`.

CDPD-3089: Avro, S3, and HCat do not work together properly

Importing an Avro file into S3 with HCat fails with Delegation Token not available.

Parquet columns inadvertently renamed

Column names that start with a number are renamed when you use the `--as-parquetfile` option to import data.

Prepend column names in Parquet tables with one or more letters or underscore characters.

PARQUET-99: Importing Parquet files might cause out-of-memory (OOM) errors

Importing multiple megabytes per row before initial-page-run check (ColumnWriter) can cause OOM. Also, rows that vary significantly by size so that the next-page-size check is based on small rows, and is set very high, followed by many large rows can also cause OOM.

Known Issues in Streams Messaging Manager

Learn about the known issues in Streams Messaging Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

OPSAPS-59597: SMM UI logs are not supported by Cloudera Manager

Cloudera Manager does not display a Log Files menu for SMM UI role (and SMM UI logs cannot be displayed in the Cloudera Manager UI) because the logging type used by SMM UI is not supported by Cloudera Manager.

View the SMM UI logs on the host.

OPSAPS-59553: SMM's bootstrap server config should be updated based on Kafka's listeners

SMM does not show any metrics for Kafka or Kafka Connect when multiple listeners are set in Kafka.

SMM cannot identify multiple listeners and still points to bootstrap server using the default broker port (9093 for SASL_SSL). You would have to override bootstrap server URL (hostname:port as set in the listeners for broker). Add the bootstrap server details in SMM safety valve in the following path:

Cloudera Manager > SMM > Configuration > Streams Messaging Manager Rest Admin Server Advanced Configuration Snippet (Safety Valve) for streams-messaging-manager.yaml > Add the following value for bootstrap servers>Save Changes > Restart SMM.

```
streams.messaging.manager.kafka.bootstrap.servers=<comma-separated list of brokers>
```

CDPD-70313: KNOX does not send Authentication header on FIPS configuration

KNOX does not send neither the Authentication header nor the hadoop.auth cookie. Because of this, the SMM UI returns an HTTP 401 response and sets the www-authenticate: Negotiate header. After this, KNOX still does not send the Authentication header. This results in the SMM UI being inaccessible through Knox.

You can access the SMM UI directly in Cloudera Manager at Clusters SMM Streams Messaging Manager Web UI and log in using the Kerberos username and password.

CDPD-82560: Streams Messaging Manager known unprotected endpoint

The Streams Messaging Manager Frontend exposes the /cm-configs and /configs public endpoints without requiring authentication. These endpoints do not share any sensitive information.

None.

CDPD-88488: The Streams Messaging Manager server fails to start if its keystore password starts with a special character or includes quotation marks

Ensure that the Streams Messaging Manager server keystore password meets the following requirements:

- It does not start with a special character. Special characters are permitted in other positions.
- It does not contain quotation marks (single or double) anywhere.

CDPD-76375: Topic column name is incorrect in the replications table

On the **Cluster Replications** page, in the replications table, the topic column name is incorrectly named **Source Topic Name** instead of Target Topic Name. This means that the **Source Topic Name** column currently shows the topic name on the target cluster, instead of the topic name on the source cluster.

Limitations

CDPD-36422: 1MB flow.snapshot freezes Safari

While importing large connector configurations, flow.snapshots reduces the usability of the Streams Messaging Manager when using Safari browser.

Use a different browser (Chrome/Firefox/Edge).

Known Issues in Streams Replication Manager

Learn about the known issues in Streams Replication Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-22089: SRM does not sync re-created source topics until the offsets have caught up with target topic

Messages written to topics that were deleted and re-created are not replicated until the source topic reaches the same offset as the target topic. For example, if at the time of deletion and re-creation there are a 100 messages on the source and target clusters, new messages will only get replicated once the re-created source topic has 100 messages. This leads to messages being lost.

None

CDPD-11079: Blacklisted topics appear in the list of replicated topics

If a topic was originally replicated but was later excluded for replication, it will still appear as a replicated topic under the /remote-topics REST API endpoint. As a result, if a call is made to this endpoint, this topic will be included in the response. Additionally, the excluded topic will also be visible in the SMM UI. However, its Partitions and Consumer Groups will be 0, its Throughput, Replication Latency and Checkpoint Latency will show N/A.

None

CDPD-30275: SRM may automatically re-create deleted topics on target clusters

If auto.create.topics.enable is enabled, deleted topics might get automatically re-created on target clusters. This is a timing issue. It only occurs if remote topics are deleted while the replication of the topic is still ongoing.

1. Remove the topic from the topic allowlist with srm-control. For example:

```
srm-control topics --source [SOURCE_CLUSTER] --target [TARGET_CLUSTER] --remove [TOPIC1]
```

2. Wait until SRM is no longer replicating the topic.
3. Delete the remote topic in the target cluster.

Limitations

SRM cannot replicate Ranger authorization policies to or from Kafka clusters

Due to a limitation in the Kafka-Ranger plugin, SRM cannot replicate Ranger policies to or from clusters that are configured to use Ranger for authorization. If you are using SRM to replicate data

to or from a cluster that uses Ranger, disable authorization policy synchronization in SRM. This can be achieved by clearing the Sync Topic Acls Enabled (sync.topic.acls.enabled) checkbox.

SRM cannot ensure the exactly-once semantics of transactional source topics

SRM data replication uses at-least-once guarantees, and as a result cannot ensure the exactly-once semantics (EOS) of transactional topics in the backup/target cluster.

Note: Even though EOS is not guaranteed, you can still replicate the data of a transactional source, but you must set isolation.level to read_committed for SRM's internal consumers. This can be done by adding `[***SOURCE CLUSTER ALIAS***]->[***TARGET CLUSTER ALIAS***].consumer.isolation.level=read_committed` to the Streams Replication Manager's Replication Configs SRM service property in Cloudera Manager. The isolation.level property can be set on a global connector or replication level. For example:

```
#Global connector level
connectors.consumer.isolation.level
=read_committed
#Replication level
uswest->useast.consumer.isolation.l
evel=read_committed
```

SRM checkpointing is not supported for transactional source topics

SRM does not correctly translate checkpoints (committed consumer group offsets) for transactional topics. Checkpointing assumes that the offset mapping function is always increasing, but with transactional source topics this is violated. Transactional topics have control messages in them, which take up an offset in the log, but they are never returned on the consumer API. This causes the mappings to decrease, causing issues in the checkpointing feature. As a result of this limitation, failover operations for transactional topics is not possible.

Known Issues in YARN and YARN Queue Manager

Learn about the known issues in YARN and YARN Queue Manager, the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

COMPX-22434: Queue Manager fails to recreate Dynamic Queue Schedules (DQS) rule after exiting the mixed mode

QueueManager fails to recreate the DQS rule after exiting the Yarn mixed mode. This occurs when the cluster is upgraded from 7.1.9 GA+7.11.3 to 7.1.9 SP1 CHF9.

This error does not occur on a fresh install of 7.1.9 SP1 CHF 9, and also during 7.1.9 SP1 GA to 7.1.9 SP1 CHF9 upgrade.

None.

COMPX-14820: Delete Queue and its Children throws "Queue capacity was reduced to zero, but failed to delete queue."

When trying to perform the operation "Delete Queue and its Children" on a queue that has one or more siblings, the operation fails as YARN has some constraints. If the queue performing the operation "Delete Queue and its Children" is a leaf node, then the operations succeeds.

None.

COMPX-4644: Queue capacity rounding problem when configuration is initially set via YARN

When setting the capacity scheduler configuration through the YARN/Cloudera Manager configuration, there may be capacity values that use multiple decimal places. This results in

rounding/floating point precision discrepancies in the UI when trying to validate that all sibling capacities equal 100%. The UI looks like all the numbers add up to 100, but the validation still displays an error and does not allow to save the capacities. It is also observed that the capacity is being calculated as, for example, 99.9999999991 in the backend.

- Create queues within the UI, or
- Ensure that capacities configured through the Capacity Scheduler safety valve do not have more than one decimal place.

20202 Database migration after enabling opt-in migration

When migrating from an H2 database to a PostgreSQL database in YARN Queue Manager after installation or upgrade, you might encounter an issue only when you have followed the following specific scenario:

- New install or upgrade to CDP 7.1.9, forcing migration from H2 to PostgreSQL database.
- Upgrade to CDP 7.1.9 CHF2, moving back to H2 database.
- Upgrade to CDP 7.1.9 SP1 with valid PostgreSQL connection details in Queue Manager configurations.

To avoid any issues during the upgrade to version CDP 7.1.9 SP1, ensure that PostgreSQL connection details are removed from the YARN database configuration if you prefer to continue using the H2 database.

CDPD-56559: MapReduce jobs can intermittently fail during a rolling upgrade.

During a rolling upgrade between CDP versions 7.1.8 and 7.1.9, MapReduce jobs may fail with message, `RuntimeException: native snappy library not available`. Although the native Snappy compression library is not loaded, a checkmark displays to indicate that the Snappy compression library is loading for NodeManagers that are pending upgrades. This causes the MapReduce jobs that are associated with the NodeManagers to fail. After the upgrade, the jobs work as expected. This issue only impacts rolling upgrades from before CDP 7.1.9 to a higher version.

None.

COMPX-12021 Queue Manager configurations on Scheduler Configuration page are not working

When setting the following properties on the YARN Queue Manager UI, the properties are set in the `capacity-scheduler.xml` file which does not have any effect on YARN. The properties need to be set in the `yarn-site.xml` file, which does not happen when you set them through YARN Queue Manager.

- "Maximum Application Priority" – `"yarn.cluster.max-application-priority"`
- "Enable Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.enable"`
- "Monitoring Policies" – `"yarn.resourcemanager.scheduler.monitor.policies"`

Note: You can also set this property on the YARN configuration page in Cloudera Manager as "Capacity Scheduler Preemption".

- "Preemption: Observe Only" – `"yarn.resourcemanager.monitor.capacity.preemption.observe_only"`
- "Preemption: Monitoring Interval (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.monitoring_interval"`
- "Preemption: Maximum Wait Before Kill (ms)" – `"yarn.resourcemanager.monitor.capacity.preemption.max_wait_before_kill"`
- "Preemption: Total Resources Per Round" – `"yarn.resourcemanager.monitor.capacity.preemption.total_preemption_per_round"`
- "Preemption: Over Capacity Tolerance" – `"yarn.resourcemanager.monitor.capacity.preemption.max_ignored_over_capacity"`
- "Preemption: Maximum Termination Factor" – `"yarn.resourcemanager.monitor.capacity.preemption.natural_termination_factor"`
- "Enable Intra Queue Preemption" – `"yarn.resourcemanager.monitor.capacity.preemption.intra-queue-preemption.enabled"`

1. In Cloudera Manager, select the YARN service.
2. Click the Configuration tab.
3. Search for yarn-site.xml.
4. Under YARN Service Advanced Configuration Snippet (Safety Valve) for yarn-site.xml, add the corresponding parameter and value you need.
5. Click Save Changes.
6. Restart the YARN services.

COMPX-13177: QueueManager webapp requests fail with 'HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA'

Products:

- Cloudera Manager for CDP Private
- Cloud Base Cloudera Manager for CDP Public Cloud

Context:

- Centos 7.8 and Redhat 7.8 operating systems, when FIPS support is enabled.

Problem:

- When attempting to display the Yarn Queue Manager interface, Cloudera Manager displays an error: "HTTP ERROR 400 java.net.ConnectException: Unsupported ciphersuite TLS_EDH_RSA_WITH_3DES_EDE_CBC_SHA".

1. Edit the file [/etc/default/cloudera-scm-server]
2. Around line 28, modify the line that starts with

```
#export CMF_OVERRIDE_TLS_CIPHERS=...
```

3. Remove the comment mark #.
4. Remove all ciphers with "3DES" in the name.
5. Save the file.
6. Restart the Cloudera Manager Server service.

Third-party applications do not launch if MapReduce framework path is not included in the client configuration

MapReduce application framework is loaded from HDFS instead of being present on the NodeManagers. By default the mapreduce.application.framework.path property is set to the appropriate value, but third-party applications with their own configurations does not launch.

Set the mapreduce.application.framework.path property to the appropriate configuration for third-party applications.

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated the mapred-site.xml file that references the correct JobHistory Server.

YARN cannot start if Kerberos principal name is changed

If the Kerberos principal name is changed in Cloudera Manager after launch, YARN does not start. In such cases, the keytabs can be correctly generated but YARN cannot access ZooKeeper with the new Kerberos principal name and old ACLs.

There are two possible workarounds:

- Delete the znode and restart the YARN service.

- Use the reset ZK ACLs command. This also sets the znodes below /rmstore/ZKRMStateRoot to world:anyone:cdw which is less secure.

Queue Manager does not open on using a custom user with a default Kerberos principal

If a custom user is used with the default Kerberos principal, the Queue Manager web UI displays an HTTP ERROR 400 error.

Ensure that the Queue Manager process_username property matches the YARN process_username property.

Known Issues in Zeppelin

Learn about the known issues in Zeppelin the impact or changes to the functionality, and the workaround in Cloudera Runtime 7.1.9 SP1 CHF 10.

Known issues identified in Cloudera Runtime 7.1.9 SP1 CHF 10

There are no new known issues identified in this release.

Known issues identified before Cloudera Runtime 7.1.9 SP1 CHF 10

CDPD-60489: Jackson-dataformat-yaml 2.12.7 and Snakeyaml 2.0 are not compatible.

You must not use Jackson-dataformat-yaml through the platform for YAML parsing.

BUG-125263: Zeppelin service move fails on clusters upgraded from HDP3.1.5

Resolve the circular symlink issue on the Zeppelin node by linking the conf directory to a new directory under /etc/zeppelin:

- # mkdir -p /etc/zeppelin/<version>/0
- # rm /usr/hdp/<version>/zeppelin/conf
- # ln -s /etc/zeppelin/<version>/0 /usr/hdp/<version>/zeppelin/conf

Where version is the HDP version. For example, 7.1.x-yyy. Restart the Zeppelin server in Ambari.

CDPD-3090: Due to a configuration typo, functionality involving notebook repositories does not work

Due to a missing closing brace, access to the notebook repositories API is blocked by default.

From the CDP Management Console, go to Cloudera Manager for the cluster running Zeppelin. On the Zeppelin configuration page (Zeppelin serviceConfiguration), enter shiro urls in the Search field, and then add the missing closing brace to the notebook-repositories URL, as follows:

```
/api/notebook-repositories/** = authc, roles[{{zeppelin_admin_group}}]
```

Click Save Changes, and restart the Zeppelin service.

CDPD-2406: Logout button does not work

Clicking the Logout button in the Zeppelin UI logs you out, but then immediately logs you back in using SSO.

Close the browser.

OPSAPS-59802: Zeppelin and Livy roles should be co-located on the same host.

When installing or upgrading to CDP Private Cloud Base, you must co-locate all Zeppelin and Livy roles on the same cluster host due to an issue with certificate generation.

Known Issues in ZooKeeper

What's new in Cloudera Runtime 7.1.9 SP1 CHF 9

Understand the functionalities and improvements to features of components in Cloudera Runtime 7.1.9 SP1 CHF 9.

New Database Support

Postgres 17 is now supported starting from 7.1.9 SP1 CHF 9.

Rocky Linux support for Cloudera Runtime 7.1.9 SP1 CHF 9

Starting with the Cloudera Runtime 7.1.9 SP1 CHF 9 release, Cloudera Runtime 7.1.9 SP1 CHF 9 provides support for Rocky Linux. This update ensures seamless compatibility with Rocky Linux version 9.4, offering greater flexibility and platform options.

Impala now supports OAuth Authentication

OAuth authentication is now supported using OAuth JWT bearer tokens. For more information, see [OAuth Authentication](#)

Multi-Python Support for Hue

This release introduces Python 3.11 support for Hue across various operating systems. This enhancement ensures continued cluster stability by offering concurrent support for multiple Python versions, including Python 3.8 and Python 3.9. To access Python 3.11 for Hue, you must upgrade to **Cloudera Manager 7.13.1.400** or a higher version.

You can now upgrade to newer Python versions without disrupting ongoing cluster operations, minimizing downtime, and ensuring a smooth transition.

Adopting Python 3.11 gives you access to adopt to the latest features, security patches, and performance improvements.

By default, Hue automatically selects the highest available Python version on the system. To set a specific lower version of Python, see [How to configure a specific Python version for Hue](#).

For more information, see [Python support matrix](#).

Fixed issues in 7.1.9 SP1 CHF 9

Know more about the cumulative hotfix 9 for 7.1.9 SP1.

Note: Contact Cloudera Support for questions related to any specific hotfixes.

Following are the list of fixes that were shipped for CDP Private Cloud Base version 7.1.9-1.cdh7.1.9.p1045.67903105.

CDPD-83120: Solr authentication bypass issue

This fix handles a Solr authentication bypass flaw that allowed unauthorized users to access protected APIs as part of [CVE-2024-45216](#).

Apache Jira: [SOLR-17417](#)

CDPD-82688: Error when building the kernel module

Navigator Encrypt failed to install on RHEL 7.9 with the following error:

```
Failed installation of navencryptfs 7.1.9.1005 DKMS kernel module!
```

This issue is fixed now.

CDPD-82671: Log files for RocksDB ops should be cleaned more frequently for heavy load

The RocksDB log files are quite heavy when a lot of snapshot operations are involved. This fix cleans log files of RocksDB operations frequently for heavy loads.

CDPD-81939: Volume scanner should fail volume if rocksDB is inaccessible

When RocksDB becomes unreadable on a DataNode due to disk-related issues, the DataNode will mark the affected storage volume as unhealthy. This proactive health marking enables the system to initiate data replication processes more rapidly, thereby maintaining data availability and integrity.

Apache Jira: [HDDS-12723](#)

CDPD-81528: Cleanup expired incomplete MPUs

Any parts of a multipart-upload which are not committed are retained for a duration of 30 days by default. With this fix, MultipartUploadCleanupService cleans up the expired parts by aborting the upload. The following configurations can be used to tune the cleanup:

- ozone.om.open.mpu.cleanup.service.interval (default value=24h)
- ozone.om.open.mpu.cleanup.service.timeout (default value=300s)
- ozone.om.open.mpu.expire.threshold (default value=30d)
- ozone.om.open.mpu.parts.cleanup.limit.per.task (default value=1000)

Apache Jira: [HDDS-9095](#)

CDPD-66534: Support cross realm Kerberos out of box

ozone.om.kerberos.principal.pattern was not configured previously which prevented cross-cluster communication in Kerberized environment. This issue is fixed.

Apache Jira: [HDDS-10328](#)

CDPD-81786: Auto-compact tables which can tend to be large in size at intervals

The following configuration properties are added:

Configuration property	Default value	Description
ozone.compaction.service.enabled	false	Enable or disable a background job that periodically compacts rocksdb tables flagged for compaction.
ozone.om.compaction.service.run.interval	6h	A background job that periodically compacts rocksdb tables flagged for compaction. Units can be defined with postfix (ns,ms,s,m,h,d).
ozone.om.compaction.service.timeout	10m	A timeout value of compaction service. If this is set greater than 0, the service will stop waiting for compaction completion after this time. Units can be defined with postfix (ns,ms,s,m,h,d).

Configuration property	Default value	Description
ozone.om.compaction.service.columnfamilyTable	anyTable, fileTable, directoryTable, deleteTable, appendTable, directoryTable, multipartInfoTable	list of all the column families that are compacted by the compaction service. If this is empty, no column families are compacted.

Apache Jira: [HDDS-12819](#)

CDPD-81764: Patch to replace the long strings set in spark_process attributes

As the atlas.process.spark.attributes.update.patch is set to TRUE by default, the spark_process entity attributes details and sparkPlanDescription no longer cause out-of-memory issues as they are no longer contain a large amount of data.

CDPD-80588: Tomcat Upgrade to 9.0.99+

Upgraded Tomcat to 9.0.99+ to address CVE-2025-24813.

CDPD-79160: Nullpointer exception while deleting business metadata

After the update, the migration status is stored correctly and reused to restart migration from the point where it failed earlier.

Apache Jira: [ATLAS-4863](#)

CDPD-83356: Improved database type detection for metastore

Hive Metastore clients sometimes experienced delays when connecting to the metastore.

This issue was addressed by enhancing how the system determines the database type during metastore initialization. This improvement avoids repetitive checks, reduces connection delays, and ensures HMS clients connect more quickly and reliably.

Apache Jira: [HIVE-28460](#)

CDPD-83355/CDPD-73669: Secondary pool connection starvation caused by updatePartitionColumnStatisticsInBatch API

Hive queries intermittently failed with Connection is not available, request timed out errors. The issue occurred because the updatePartitionColumnStatisticsInBatch method in ObjectStore used connections from the secondary pool, which had a pool size of only two, leading to connection starvation.

The fix ensures that the updatePartitionColumnStatisticsInBatch API now requests connections from the primary connection pool, preventing connection starvation in the secondary pool.

Apache Jira: [HIVE-28456](#)

CDPD-81122: Enhanced concurrent access in HWC secure mode

Spark applications running multiple concurrent queries in HWC's SECURE_ACCESS mode encountered failures and correctness problems. This happened because the system faced difficulties when generating temporary table names and managing staging directories simultaneously for multiple reads.

This issue was addressed by improving the handling of concurrent operations within HWC's SECURE_ACCESS mode.

CDPD-82887: Hive web interfaces no longer expose server version

Hive web interfaces and related services previously exposed their underlying server version in the header.

This issue was addressed by stopping the web interfaces from sending information about their server version.

CDPD-83079: Included Iceberg fixes related to EXPIRE SNAPSHOTS

This release includes the following Iceberg fixes to ensure that the EXPIRE SNAPSHOTS can effectively delete data files from storage:

- Deletion of expired snapshot files in a transaction — When a snapshot is expired as part of a transaction, the manifest list files should be deleted upon transaction commit. Previously, a recent change prevented these files from being deleted if they were also committed as part of a transaction. However, this caused issues in simpler cases where no new files were committed.

This issue is now fixed by ensuring deletion is not skipped when the list of committed files is empty.

- Improved logic for determining committed files in Base Transaction — The logic to identify the set of committed files in 'BaseTransaction' has been corrected for scenarios where no new snapshots are available.

CDPD-83116: Query planning incorrectly estimated row counts

Impala's query planner generated negative cardinality estimation over very specific condition (TOP-N sort over very high NDV column). This results in `IllegalStateException: null` thrown and fail the query.

This issue was resolved by improving the calculation that estimates row counts for sorting operations.

CDPD-82273: Backport KUDU-3661 Ranger policy not honored in Kudu

Fixed an issue in the Ranger authorization provider that could cause some table privileges to be missing in certain environments. This happened when processing the SELECT privilege, which caused the system to stop checking for additional permissions. The issue was primarily seen on RHEL/CentOS 8 systems due to platform-specific behavior in the underlying system libraries.

CDPD-82275: Run a range-aware cluster rebalance with multiple tables

Previously, when rebalancing a cluster with the Kudu command-line tool, the `--enable_range_rebalancing` flag required the `--tables` flag to specify exactly one table. This fix removes that restriction. You can now pass multiple tables to the `--tables` flag when range rebalancing is enabled. Range-partitioned tables among those specified will be rebalanced with ranges considered, while other tables rebalance as usual. If you do not set the `--tables` flag, all tables in the cluster will be rebalanced.

CDPD-67359: Improved S3 Directory Listing in Hue for Large Datasets

Previously, Hue encountered "incorrect signature" errors when attempting to list S3 directories containing 1,000 or more objects. This issue was caused by S3's pagination mechanism, where the marker field for subsequent requests was not correctly passed to the Ranger Authorization Service (RAZ). As a result, the signature generated by RAZ did not align with the actual S3 request, leading to verification failures.

This problem is fixed by enhancing Hue's handling of the S3 marker field. Hue now accurately includes this pagination parameter when requesting signed headers from RAZ. This ensures that RAZ provides a precise signature, enabling S3 to successfully verify the request and allow Hue to correctly list and paginate through large directories.

CDPD-82364: Nested loop join rewrites disjunctive subquery incorrectly

Queries with a subquery inside an OR condition could return incorrect results. The join was rewritten incorrectly, leading to a wrong comparison.

The issue was addressed by skipping the join rewrite when the subquery is inside an OR condition.

Apache Jira: [IMPALA-13991](#)

CDPD-82303: EXEC_TIME_LIMIT_S incorrectly includes planning time

The `EXEC_TIME_LIMIT_S` setting was triggered during the planning and scheduling phases, which could cause queries to fail before any processing on backends started.

The issue was addressed by starting the `EXEC_TIME_LIMIT_S` countdown only after the query is ready to run on the backends. This ensures the timeout applies only to the actual processing phase.

Apache Jira: [IMPALA-14001](#)

CDPD-82251: Inconsistent row count output in Impala-shell

When running Impala queries, some commands over HiveServer2 protocol, some commands (like REFRESH or INVALIDATE) did not show the "Fetched X row(s) in Ys" output in Impala-shell, even though Beeswax protocol shows them.

This issue was resolved by adding a new option in Impala-shell called `--beeswax_compat_num_rows`. When this option is enabled, Impala-shell now prints "Fetched 0 row(s) in" along with the elapsed time for all Impala commands.

Apache Jira: [IMPALA-13584](#)

CDPD-81556: Improved handling of invalid data in text files

Impala encountered crashes when processing text files that contained invalid binary data.

This issue was resolved by enhancing Impala's data handling. The system now correctly identifies and flags invalid binary data encountered in text files, preventing system instability.

Apache Jira: [IMPALA-13927](#)

CDPD-80019: Impala now starts with large catalog-update topics

Impala coordinators previously failed to start if their internal update data exceeded 2GB. This prevented the coordinator from processing necessary updates.

This issue was resolved.

Apache Jira: [IMPALA-13020](#)

CDPD-66938: [Analyze] [Atlas] test_time_range tests fail

Atlas stores all timestamps in UTC, but the UI or API would interpret TODAY or YESTERDAY based on the local server time zone. For instance, if the server is in a different time zone from the user, TODAY may refer to different times than expected, causing mismatched results. After the update, search results remain accurate despite the server's timezone as the date and time conversions while fetching the results use UTC time zone.

Common Vulnerabilities and Exposures (CVE) that is fixed in this CHF:

- [CVE-2025-22228](#) - Spring Security

Behavioral changes in Cloudera Runtime 7.1.9 SP1 CHF 9

Know more about the behavioral changes in cumulative hotfix 9 for 7.1.9 SP1.

Atlas

Summary:

A new option to ignore `spark_process.attributes`, `details` and `sparkPlanDescription` is introduced.

Previous behavior:

The `spark_process` entity `attributes`, `details` and `sparkPlanDescription` are populated with query plan details, which can contain a large amount of text, often in megabytes. This amount of data can incur unnecessary processing costs.

New behavior:

The attribute `atlas.notification.consumer.preprocess.spark_process.attributes` is set to false by default. Set it to true to avoid populating the `details` and `sparkPlanDescription` attributes. These attributes can be ignored using above configurations in Atlas server. Ignoring these attributes helps to eliminate the cost of having a large amount of data processed at Atlas.

To keep the data for `details` and `sparkPlanDescription`, `atlas.notification.consumer.preprocess.spark_process.attributes`, set them to false explicitly.

Hive

Summary:

Metastore secondary connection pool size is now configurable

Previous Behavior: The Metastore's secondary connection pool had a fixed size of 2. This often led to connection limitations, especially under heavy workloads.

New Behavior: You can now configure the metastore's secondary connection pool size using the property `datanucleus.connectionPool.secondary.maxPoolSize`. This lets you adjust the pool beyond its default of 2, preventing connection limitations and improving performance.

Apache Jira: <https://issues.apache.org/jira/browse/HIVE-28900>

Impala

Summary:

OAuth Authentication now supported

Previous Behavior: Authentication using OAuth was not available.

New Behavior: OAuth authentication is now supported using OAuth JWT bearer tokens. For more information, see [OAuth Authentication](#)
