Data Services Release Notes

Cloudera Data Services on premises 1.5.5 includes the Cloudera Management Console, Cloudera Data Catalog, Cloudera Data Warehouse, Cloudera AI, and Cloudera Data Engineering. Learn about the new features and improvements in each of these services.

Release notes for component services

- [Data Catalog](#)
- [Management Console](#)
- [Cloudera Data Warehouse](#)
- [Cloudera AI](#)
- [Cloudera Data Engineering](#)
- [Cloudera Manager](#)
- [Replication Manager](#)

What's new in Cloudera Data Services on premises 1.5.5

Understand the functionalities and improvements to features of Cloudera Control Plane install and upgrade components in Cloudera Data Services on premises 1.5.5.

Certificate Management

Cert-manager is an open-source tool for Kubernetes that automates the provisioning, management, and renewal of TLS certificates. Its documentation at <https://cert-manager.io/docs/> provides comprehensive guidance on installing, configuring, and using cert-manager to secure workloads with trusted X.509 certificates. Cloudera provides out-of-the-box support for Venafi Trust Protection Platform (TPP) as part of the Cloudera Cloudera Embedded Container Service installation. By integrating cert-manager, the Data services achieve secure communication, reduced manual overhead, and compliance with security standards, leveraging its robust automation and flexibility. For more information on setting Cert-manager using Venafi TPP, see [Setting up Certification Manager using Venafi TPP](#).

New upgrade prechecks

New pre-upgrade checks have been added to the list. The additional checks verify if the control plane and the docker registry is ready for upgrade. For more information, see [Pre-upgrade checklist](#).

Quota Management for multiple base cluster support

Quota management enables you to control how resources are allocated within your Cloudera Data Services on premises clusters. In order to prevent a single workload from consuming all available cluster resources, you can limit the number of CPUs, GPUs, and memory allocated by application, user, business units, or Data Service by defining resource pools that define resource limits. Pools are organized in a hierarchical manner by defining nodes in the hierarchy with resource limits, which can then be subdivided as needed to allocate resources for an organization and to allocate resources to cluster or environment wide services such as the monitoring service. For information, see [Quota Management](#).

Creating multiple environments with different base or Data Lake clusters

To register an environment with a data lake cluster managed by a Cloudera Manager that is different from your existing Cloudera Manager, you need to add the certificates of the new Cloudera Manager to the Cloudera Management Console UI. If the existing Cloudera Manager and the new Cloudera Manager share the same root CA,

and the root CA is already uploaded as the data lake certificate, then no additional certificate needs to be added. For more information, see [Creating multiple environments with different base or Data Lake clusters](#).

What's new in Platform Support 1.5.5

You must be aware of the platform support for Cloudera Data Services on premises 1.5.5.

Platform Certifications

- Cloudera Base on premises (7.1.9, 7.1.9 SP1 CHF5, 7.1.7 SP3 CHF10)
- Cloudera Manager 7.13.1.303
- Iceberg v2 GA on Cloudera Data Warehouse, Cloudera Data Engineering, & Cloudera AI with Ozone
- RHEL 8.10, 9.3, 9.4, 9.5
- OEL (RHCK Kernel Only) 8.10, 9.3, 9.4, 9.5
- Rocky Linux 8.10, 9.3, 9.4, 9.5
- K8s RKE2 1.30 and OCP 4.17
- Longhorn version 1.6.4

Note: Cloudera Manager 7.13.1.303 support Cloudera Data Services on premises 1.5.5 release.

Cloudera Manager 7.11.3 CHF8 does not support any Cloudera Data Services on premises release.

Repository Locations for 1.5.5

The URLs for Cloudera Data Services on premises 1.5.5 are listed in the following table:

URL Type	Repository Location
Index	<code>https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h2/</code>
Manifest	Repository: <code>https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h2/manifest.json</code>
Parcels	Repository: <code>https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h2/parcels/</code>

Cloudera Data Services on premises 1.5.5 Release Matrix

You must be familiar with the versions of all the service packs and cumulative hotfixes for Cloudera Data Services on premises 1.5.5.

Cumulative Hotfix or Service Pack	Release Date	Download URL
1.5.5 CHF1	July 28, 2025	https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h2/
1.5.5 SP1	November 08, 2025	https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h1000/

Fixed Issues for the Cloudera Data Services on premises 1.5.5

You can review the list of reported issues and their fixes in Cloudera Data Services on premises 1.5.5. Fixed issues represent selected issues that were previously logged through Cloudera Support, but are now addressed in the current Cloudera Data Services on premises release. These issues may have been reported in previous versions of Cloudera Data Services on premises as a known issue; meaning they were reported by customers or identified by Cloudera Quality Engineering teams.

OPSX-4308 - Display error in UI if listEnvironments failed

Error is now displayed on the Environments Page of the Cloudera Management Console UI, if an API failure is encountered.

OPSX-6048 - Clean up delete backup Custom Resource (CR) after the job is run

DeleteBackup now removes the backup deletion CR from resource `deletebackuprequests.drs.cdp.cloudera.com`

OPSX-5944 - Issues while uncordoning nodes during restart

The uncordon step was added into Cloudera Manager and is removed from the Cloudera Embedded Container Service parcel.

OPSX-5852 - Remove warn logs for "Unexpected partition in crn" from Cloudera Data Services on premises

"Unexpected partition in crn" log entries are now removed from the logs.

OPSX-5403 - Typecasting fails when truststore password is integer

When truststore password is set to all numbers (integer or float), Cloudera Control Plane installation was failing in both Cloudera Embedded Container Service and OpenShift Container Platform. Safe datatype conversion is done to treat even numbers as string password. Even if numbers are used for truststore passwords, Cloudera Control Plane installation will be successful.

OPSX-5903 - Upgrade failed with rke2-ingress-nginx-controller" exceeded its progress deadline

Automated the manual workaround of scaling down and scaling up the deployment when the earlier rollout or its status check fails.

OPSAPS-72270- Cloudera Embedded Container Service Restart| Start Cloudera Embedded Container Service command fails on uncordon nodes step

To resolve this issue:

1. Ensure the kube-apiserver is up and running for at least 60 seconds before proceeding with the uncordon step.
2. Use the correct target node name, not just the name of the node where the uncordon command is executed.

CDPVC-1739/ OPSX-5307 - Rollback workload username generation changes to pre 1.5.4-SP1 state in Cloudera Data Services on premises

Previously, workload usernames were generated by directly using the username from the IdP. This approach ensured compatibility with services like Ranger, which rely on an exact match between the workload username and the IdP username to sync users correctly.

In version 1.5.4, a change was introduced : workload username generation switched to a pattern-based logic carried over from PbC. As a result, in some cases, the generated workload username no longer matched the IdP username. This mismatch disrupted workloads and broke integrations with services like Ranger.

To resolve these issues, the workload username generation logic is reverted to its pre-1.5.4 state, restoring the direct mapping from IdP.

Known issues for the Cloudera Data Services on premises 1.5.5

You must be aware of the known issues and limitations, the areas of impact, and workaround in Cloudera Data Services on premises 1.5.5 release.

Known Issues in Cloudera Data Services on premises 1.5.5

OBS-8038: When using the Grafana Dashboard URL shortener, the shortened URL defaults to localhost:3000. This behaviour happens because the URL shortener uses the local server address instead of the actual domain name of the Cloudera Observability instance. As a result, users cannot access the shortened URL.

You must not use the shortened URL. To ensure users can access the URL, update it to use the correct Cloudera Observability instance domain name, such as `cp_domain/{shorten_url}{}`.

Note: `cp_domain` refers to the Cloudera Control Plane domain.

ENGESC-31426 - Upgrade fails with pod in ContainerCreating due to Mount Error

During an upgrade, a critical pod (such as vault-0) fails to start and remains in the ContainerCreating status. When you describe the pod (`kubectl describe pod <pod-name>`), you see a FailedMount error in the events section with the message mount point busy. This issue is caused by a stale volume mount on the Kubernetes worker node. The node's kubelet service incorrectly believes the storage volume is already in use, preventing it from being mounted to the new pod.

Effective method to resolve this issue is to perform a rolling, graceful reboot of the worker nodes before starting the upgrade. This action clears any stale in-memory locks or filesystem handles. Perform the following steps, for each worker node, one at a time:

1. Drain the Node: Safely move all workloads off the node.

```
kubectl drain <node-name> --ignore-daemonsets --delete-empty-dir-data
```

2. Reboot the Node: Log in to the node and perform a reboot.

```
sudo reboot
```

3. Uncordon the Node: After the node is back online, make it available for scheduling workloads again.

```
kubectl uncordon <node-name>
```

Performing this rolling maintenance ensures all nodes are in a clean state, preventing this issue from blocking the upgrade process.

DRS automatic backup policy is inconsistent post upgrade

When you update a backup policy manually, the modifications to the policy are not persisted after a Control Plane upgrade.

Ensure that you manually update the policy after the upgrade activity is complete.

CDPQE-32336 - The `nvidia-device-plugin-daemonset` pods fail with `CrashLoopBackoff` error

The `nvidia-device-plugin-daemonset` pods fail with `CrashLoopBackoff` error with logs showing the following error:

```
nvidia-container-cli: initialization error: driver rpc error: timed out
```

To resolve this issue, enable persistence mode through the legacy or daemon modes by following the article at: [Nvidia Persistence Mode Documentation](#).

ENGESC-29640 - Unable to resize the Longhorn volume

Longhorn does not automatically resize the filesystem for RWX volumes backed by NFS when the volume size is expanded.

For more information on explanation of the RWX/NFS limitation and step-by-step instructions to manually resize the filesystem after volume expansion, see [Longhorn Volume Expansion](#).

OPSX-6209 and DWX-20809: Cloudera Data Services on premises installations on RHEL 8.9 or lower versions may encounter issues

You may notice issues when installing Cloudera Data Services on premises on Cloudera Embedded Container Service clusters running on RHEL 8.9 or lower versions. Pod crashloops are noticed with the following error:

```
Warning FailedCreatePodSandBox          1s (x2 over 4s)  kubel
et Failed to create pod
sandbox: rpc error: code = Unknown desc = failed to create containe
r task: failed to create
shim task: OCI runtime create
failed: runc create failed: unable to start container process: u
nable to init seccomp: error
loading seccomp filter into kernel: error loading seccomp filt
er: errno 524: unknown
```

The issue is due to a memory leak with 'seccomp' (Secure Computing Mode) in the Linux kernel. If your kernel version is not on 6.2 or higher versions or if it is not part of the list of versions mentioned [here](#), you may face issues during installation.

To avoid this issue, increase the value of `net.core.bpf_jit_limit` by running the following command on all Cloudera Embedded Container Service hosts:

```
[root@host ~]# sysctl net.core.bpf_jit_limit=528482304
```

However, Cloudera recommends upgrading the Linux kernel to an appropriate version that contains a patch for the memory leak issue. For a list of versions that contain this patch, see this [link](#).

Note: RHEL 9.0, 9.1, and 9.2 will not be supported in 1.5.5 because of https://bugzilla.redhat.com/show_bug.cgi?id=2218682. You will need to upgrade to at least RHEL 9.3 if you are on 9.x line.

COMPX-20705: [153CHF-155] Post Cloudera Embedded Container Service upgrade pods are stuck in ApplicationRejected State

After upgrading the Cloudera data platform installation pods on Kubernetes could be left in a failure state showing "ApplicationRejected". This is caused by a delay in settings being applied to Kubernetes as part of the post upgrade steps.

To resolve this issue, restart the scheduler to pick up the latest settings for Kubernetes. Also, restart YuniKorn using the following commands:

```
kubectl scale deployment yunikorn-scheduler --replicas=0 -n yunikorn
kubectl scale deployment yunikorn-scheduler --replicas=1 -n yunikorn
```

OPSX-6303 - Cloudera Embedded Container Service server went down - 'etcdserver: mvcc: database space exceeded'

Cloudera Embedded Container Service server may fail with error message - "etcdserver: mvcc: database space exceeded" in large clusters.

1. Add to the safety valve for server group:

```
etcd-arg:
- "quota-backend-bytes=4294967296"
```

2. Restart stale services (Select the option re-deploy client configs).
3. The default value for quota-backend-bytes is 2 GB. It can be increased up to 8 GB.

OPSX-6295 - Cloudera Control Plane upgrade failing with cadence-matching and cadence-history

In case of extra cadence-matching and cadence-history pod stuck in Init:CreateContainerError state, Cloudera Embedded Container Service Upgrade to 1.5.5 will be stuck in retry loop because of all pods running validation failure.

You need to manually apply the workaround to proceed further upgrade and get it done successfully. Hence, delete the stuck cadence pods.

OPSX-4391 - External docker cert not base64 encoded

When using Cloudera Data Services on premises on Cloudera Embedded Container Service, in some rare situations, the CA certificate for the Docker registry in the cdp namespace is incorrectly encoded, resulting in TLS errors when connecting to the Docker registry.

Compare and edit the contents of the "cdp-private-installer-docker-cert" secret in the cdp namespace so that it matches the contents of the "cdp-private-installer-docker-cert" secret in other namespaces. The secrets and their corresponding namespaces can be identified using the command:

```
kubectl get secret -A | grep cdp-private-installer-docker-cert
```

Inspect each secret using the command:

```
kubectl get secret -n cdp cdp-private-installer-docker-cert -o yaml
```

Replace "cdp" with the different namespace names. If necessary, modify the secret in the cdp namespace using the command:

```
kubectll edit secret -n cdp cdp-private-installer-docker-cert
```

OPSX-6245 - Airgap | Multiple pods are in pending state on rolling restart

Performing back-to-back rolling restarts on Cloudera Embedded Container Service clusters can intermittently fail during the Vault unseal step. During rapid consecutive rolling restarts, the kube-controller-manager pod may not return to a ready state promptly. This can cause a cascading effect where other critical pods, including Vault, fails to initialize properly. As a result, the unseal Vault step fails.

As a workaround, perform the following steps:

1. Stop the Cloudera Embedded Container Service role that failed.
2. Start the Cloudera Embedded Container Service role again.
3. If required, perform the rolling restart again.

OPSX-4684 - Start ECS command shows green(finished) even though start docker server failed on one of the hosts

Docker service starts with one or more docker roles failed to start because the corresponding host is unhealthy.

Make sure the host is healthy. Start the the docker role in the host.

OPSX-5986 - Cloudera Embedded Container Service fresh install failing with helm-install-rke2-ingress-nginx pod failing to come into Completed state

Cloudera Embedded Container Service fresh install fails at the "Execute command Reapply All Settings to Cluster on service ECS" step due to a timeout waiting for helm-install.

To confirm the issue, run the following kubectll command on the Cloudera Embedded Container Service host to check if the pod is stuck in a running state:

```
kubectll get pods -n kube-system | grep helm-install-rke2-ingress-nginx
```

To resolve the issue, manually delete the pod by running:

```
kubectll delete pod <helm-install-rke2-ingress-nginx-pod-name> -n kube-system
```

Then, click Resume to proceed with the fresh install process on the Cloudera Manager UI.

OPSX-6298 - Issue on service namespace cleanup

There might be cases in which uninstalling services from the Cloudera Data Services on premises UI will fail due to various reasons.

In case uninstallation of a Service fails, trigger again the service uninstall process, and mark "Force Delete" to ensure that all metadata of the service will be removed from Cloudera side. Then, move to the OpenShift UI, and there search for that service namespace / project. On that project/namespace select the Action button on the top right of the screen and choose to Delete the Project.

If you move back to the main Project screen you could see that the project is moving to status "Terminating" after which it will be removed from the OCP platform. Manually terminate the <project_name>-service and <project_name>-monitoring-platform namespaces. This action will ensure that all the entities linked to that project/namespace will also be removed by OpenShift.

OPSX-6265 - Setting inotify max_user_instances config

We cannot recommend an exact value for inotify max_user_instances config. It depends on all workloads that are run in a given node.

With newly introduced features like istio, cert manager, in Cloudera Control Plane, there is a need to set inotify max_user_instancesconfig to 256 instead of 128 to resolve this issue.

COMPX-20362 - Use API to create a pool that has a subset of resource types

The Resource Management UI supports displaying only three resource types: CPU, memory and GPU. The Resource Management UI will always set all three resource types it knows about: CPU, Memory and GPU (K8s resource nvidia.com/gpu) when creating a quota. If no value is chosen for a resource type a value of 0 will be set, blocking the use of that resource type.

To create a pool that has a subset of resource types the REST API must be used as follows:

```
POST /api/v1/compute/createResourcePool
```

Payload:

```
{
  "pool": {
    "path": "root.environment.service.mypool",
    "policy": {
      "allocation": "INELASTIC"
    },
    "quota": {
      "cpu": "100 m",
      "memory": "10 GB"
    }
  }
}
```

Note: Payload needs to be confirmed and checked.

Known issues from previous releases carried in Cloudera Data Services on premises 1.5.5

Known Issues identified in 1.5.4

DOCS-21833: Orphaned replicas/pods are not getting auto cleaned up leading to volume fill-up issues

By default, Longhorn will not automatically delete the orphaned replica directory. One can enable the automatic deletion by setting orphan-auto-deletion to true.

No workaround available.

OPSX-5310: Longhorn engine images were not deployed on Cloudera Embedded Container Service server nodes

Longhorn engine images were not deployed on Cloudera Embedded Container Service nodes due to missing tolerations for Cloudera Control Plane taints. This caused the engine DaemonSet to schedule only on Cloudera Embedded Container Service agent nodes, preventing deployment on Cloudera Control Plane nodes.

1. Check the Engine DaemonSet Status. Run the following command to check if the Longhorn engine DaemonSet is missing on certain nodes:

```
kubectl get ds -n longhorn-system | grep engine
```

- Identify Taints on Affected Nodes. Run the following command to check for taints on affected nodes:

```
kubectl describe node <node-name> | grep Taints
```

Note: If you see, `node-role.kubernetes.io/control-plane=true:NoSchedule`, this confirms the issue.

- Manually Edit the DaemonSet to Add a Toleration. Edit the Longhorn engine DaemonSet YAML:

```
kubectl edit ds -n longhorn-system engine-image-ei-<your-engine-id>
```

- Add the following under tolerations:

```
tolerations:
- effect: NoSchedule
  key: node-role.kubernetes.io/control-plane
  operator: Equal
  value: "true"
```

- Apply the changes and verify deployment. Save and exit the editor. Then, check if the DaemonSet is now running on all necessary nodes:

```
kubectl get pods -n longhorn-system -o wide | grep engine
```

Verify that the engine pods are successfully scheduled on the affected Cloudera Embedded Container Service nodes.

OPSX-5155: OS Upgrade | Pods are not starting after the OS upgrade from RHEL 8.6 to 8.8

After an OS upgrade and start of the Cloudera Embedded Container Service service, pods fail to come up due to stale state.

Restart the Cloudera Embedded Container Service cluster.

OPSX-5055: Cloudera Embedded Container Service upgrade failed at Unseal Vault step

During an Cloudera Embedded Container Service upgrade from 1.5.2 to 1.5.4 release, the vault pod fails to start due to an error caused by the Longhorn volume unable to attach to the host. The error is as below:

```
Warning FailedAttachVolume 3m16s (x166 over 5h26m) attachdetach-controller
AttachVolume.Attach failed for volume "pvc-0ba86385-9064-4ef9-9019-71976b4902a5" :
rpc error: code = Internal desc = volume pvc-0ba86385-9064-4ef9-9019-71976b4902a5
failed to attach to node host-1.cloudera.com with attachmentID
csi-7659ab0e6655d308d2316536269de47b4e66062539f135bf6012bfc8b41fc345: the volume is
currently attached to different node host-2.cloudera.com
```

Follow below steps provided by SUSE to ensure the Longhorn volume is correctly attached to the node where the vault pod is running.

```
# Find out the volume name that is failing to attach to the vault
pod.
For e.g. pvc-bc73e7d3-c7e7-468a-b8e0-afdb8033e40b from the pod
logs.
kubectl edit volumeattachments.longhorn.io -n longhorn-system
pvc-bc73e7d3-c7e7-468a-b8e0-afdb8033e40b

# Update the "spec:" section of the volumeattachment and replace
```

```
attachmentTickets section with {} as shown below and save.
spec:
  attachmentTickets: {}
  volume: pvc-bc73e7d3-c7e7-468a-b8e0-afdb8033e40b

# scale down the vault statefulset to 0 and scale it back up.
kubectl scale sts vault --replicas=0 -n vault-system
kubectl scale sts vault --replicas=1 -n vault-system
```

OPX-4684: Start Cloudera Embedded Container Service command shows green(finished) even though start docker server failed on one of the hosts

The Docker service starts, but one or more Docker roles fail to start because the corresponding host is unhealthy.

Ensure the host is healthy. Start the the Docker role on the host.

OPSX-735: Kerberos service should handle Cloudera Manager downtime

The Cloudera Manager Server in the base cluster operates to generate Kerberos principals for Cloudera on premises. If there is downtime, you may observe Kerberos-related errors.

Resolve downtime on Cloudera Manager. If you encounter Kerberos errors, you can retry the operation (such as retrying creation of the Virtual Warehouse).

Known Issues identified in 1.5.2

OPsx-4594: [ECS Restart Stability] Post rolling restart few volumes are in detached state (vault being one of them)

After rolling restart there may be some volumes in detached state.

1. Open the Longhorn UI to view the detached volumes.
2. Perform the following operations for each volume in a detached state:
 - a. Identify the workload name and type from the volume details.
 - b. Identify the workload and number of replicas using `kubect`l or the Kubernetes UI.
 - c. Scale the workload down to 0.
 - d. Wait for the pods associated with the workload to fully terminate.
 - e. Scale up the workload up to the number of replicas it had originally.

To prevent this issue, use the Longhorn UI to set the number of replicas for the volume to at least 3.

OPSX-4392: Getting the real client IP address in the application

CML has a feature for adding the audit event for each user action ([Monitoring User Events](#)). In Private Cloud, instead of the client IP, we are getting the internal IP, which is logged into the internal DB.

In ECS, add the `enable-real-ip` configuration as true for the nginx ingress controller:

```
apiVersion: v1
data:
  allow-snippet-annotations: "true"
  enable-real-ip: "true"
kind: ConfigMap
metadata:
  annotations:
    meta.helm.sh/release-name: rke2-ingress-nginx
    meta.helm.sh/release-namespace: kube-system
  creationTimestamp: "2023-05-09T04:54:53Z"
  labels:
    app.kubernetes.io/component: controller
    app.kubernetes.io/instance: rke2-ingress-nginx
    app.kubernetes.io/managed-by: Helm
```

```
app.kubernetes.io/name: rke2-ingress-nginx
app.kubernetes.io/part-of: rke2-ingress-nginx
app.kubernetes.io/version: 1.6.4
helm.sh/chart: rke2-ingress-nginx-4.5.201
name: rke2-ingress-nginx-controller
namespace: kube-system
resourceVersion: "162559439"
uid: cca67b0c-bc05-4e1f-8439-7d44323f4624
```

In OpenShift Container Platform, you may be able configure this using [HAproxy with X-forward-for pass to OpenShift 4](#).

CDPVC-1137, CDPAM-4388, COMPX-15083, and COMPX-15418: OpenShift Container Platform version upgrade from 4.10 to 4.11 fails due to a Pod Disruption Budget (PDB) issue

PDB can prevent a node from draining which makes the nodes to report the “Ready,SchedulingDisabled” state. As a result, the node is not updated to correct the Kubernetes version when you upgrade OpenShift Container Platform from 4.10 to 4.11.

To resolve this issue, confirm that the upgrade has failed due to the PDB issue, and then manually delete the PDBs from the Cloudera on premises namespace.

1. Run the following command to check whether the nodes are stuck in the “Ready,SchedulingDisabled” state:

```
oc get nodes
```

2. Get the machine config daemon details of the particular pod as follows:

```
oc get po -n openshift-machine-config-operator -l 'k8s-app=machine-config-daemon' -o wide
```

3. Check the logs of the machine config operator of that particular node as follows:

```
oc logs -f -n openshift-machine-config-operator [***MACHINE-CONFIG-DAEMON-NAME***] -c machine-config-daemon
```

Replace [***MACHINE-CONFIG-DAEMON-NAME***] with the actual machine config daemon name.

You may see one of the following errors in the node logs:

- error when evicting pods/cdp-release-cpx-liftie-****" -n "[***PRIVATE-CLOUD-NAMESPACE***] Cannot evict pod as it would violate the pod's disruption budget
- error when evicting pods/"cdp-release-cluster-proxy-[*****]" -n "[***PRIVATE-CLOUD-NAMESPACE***] Cannot evict pod as it would violate the pod's disruption budget

Delete the PDB from the Cloudera on premises namespace as follows:

- a. Obtain the PDB for the cdp-release-cluster-proxy namespace:

```
oc get pdb -n [***PRIVATE-CLOUD-NAMESPACE***] | grep cdp-release-cluster-proxy
```

- b. Back up the PDB:

```
oc get pdb [***PDB-NAME-OF-CLUSTER-PROXY***] -n [***PRIVATE-CLOUD-NAMESPACE***] -o yaml >> [***BACKUP-FILE-NAME***].yaml
```

- c. Delete the PDB:

```
oc delete pdb [***PDB-NAME-OF-CLUSTER-PROXY***] -n [***PRIVATE-CLOUD-NAMESPACE***]
```

Repeat the steps to delete the cdp-release-cpx-liftie PDB as well.

List of fixed Common Vulnerabilities and Exposures in 1.5.5

Review the Common vulnerabilities and Exposures (CVEs) that were fixed in this release of Cloudera Data Services on premises 1.5.5.

Issue ID	Description
CVE-1999-1237	Multiple buffer overflows in smbvalid/smbval SMB authentication library, as used in Apache::AuthenSmb and poss
CVE-2005-2541	Tar 1.15.1 does not properly warn the user when extracting setuid or setgid files, which may allow local users or rem
CVE-2007-0086	The Apache HTTP Server, when accessed through a TCP connection with a large window size, allows remote attack
CVE-1999-1412	A possible interaction between Apple MacOS X release 1.0 and Apache HTTP server allows remote attackers to cau
CVE-1999-0236	ScriptAlias directory in NCSA and Apache httpd allowed attackers to read CGI programs.
CVE-2007-5686	initscripts in rPath Linux 1 sets insecure permissions for the /var/log/btmp file, which allows local users to obtain ser
CVE-2007-4559	Directory traversal vulnerability in the (1) extract and (2) extractall functions in the tarfile module in Python allows s
CVE-2009-3490	GNU Wget before 1.12 does not properly handle a '\0' character in a domain name in the Common Name field of an
CVE-2010-2252	GNU Wget 1.12 and earlier uses a server-provided filename instead of the original URL to determine the destination
CVE-2007-0450	Directory traversal vulnerability in Apache HTTP Server and Tomcat 5.x before 5.5.22 and 6.x before 6.0.10, when
CVE-2010-4756	The glob implementation in the GNU C Library (aka glibc or libc6) allows remote authenticated users to cause a den
CVE-2010-5312	Cross-site scripting (XSS) vulnerability in jquery.ui.dialog.js in the Dialog widget in jQuery UI before 1.10.0 allows

CVE-2011-3374	It was found that apt-key in apt, all versions, do not correctly validate gpg keys with the master keyring, leading to a
CVE-2011-4116	_is_safe in the File::Temp module for Perl does not properly handle symlinks.
CVE-2011-3389	The SSL protocol, as used in certain configurations in Microsoft Windows and Microsoft Internet Explorer, Mozilla
CVE-2012-2663	extensions/libxt_tcp.c in iptables through 1.4.21 does not match TCP SYN+FIN packets in --syn rules, which might
CVE-2011-4461	Jetty 8.1.0.RC2 and earlier computes hash values for form parameters without restricting the ability to trigger hash c
CVE-2011-4969	Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows r
CVE-2012-6708	jQuery before 1.9.0 is vulnerable to Cross-site Scripting (XSS) attacks. The jQuery(strInput) function does not differ
CVE-2013-4235	shadow: TOCTOU (time-of-check time-of-use) race condition when copying and removing directory trees
CVE-2013-4392	systemd, when updating file permissions, allows local users to change the permissions and SELinux security context
CVE-2014-4877	Absolute path traversal vulnerability in GNU Wget before 1.16, when recursion is enabled, allows remote FTP serve
CVE-2013-7445	The Direct Rendering Manager (DRM) subsystem in the Linux kernel through 4.x mishandles requests for Graphics
CVE-2014-6071	jQuery 1.4.2 allows remote attackers to conduct cross-site scripting (XSS) attacks via vectors related to use of the tex
CVE-2015-20107	In Python (aka CPython) up to 3.10.8, the mailcap module does not add escape characters into commands discovered
CVE-2015-8553	Xen allows guest OS users to obtain sensitive information from uninitialized locations in host OS kernel memory by
CVE-2015-5237	protobuf allows remote authenticated attackers to cause a heap-based buffer overflow.
CVE-2015-7837	The Linux kernel, as used in Red Hat Enterprise Linux 7, kernel-rt, and Enterprise MRG 2 and when booted with UE
CVE-2015-9251	jQuery before 3.0.0 is vulnerable to Cross-site Scripting (XSS) attacks when a cross-domain Ajax request is perform
CVE-2016-100027	Pivotal Spring Framework through 5.3.16 suffers from a potential remote code execution (RCE) issue if used for Jav
CVE-2016-20012	OpenSSH through 8.7 allows remote attackers, who have a suspicion that a certain combination of username and pub
CVE-2016-10228	The iconv program in the GNU C Library (aka glibc or libc6) 2.31 and earlier, when invoked with multiple suffixes
CVE-2016-20013	sha256crypt and sha512crypt through 0.6 allow attackers to cause a denial of service (CPU consumption) because th
CVE-2016-2568	pkexec, when used with --user nonpriv, allows local users to escape to the parent session via a crafted TIOCTSTIOCT
CVE-2016-2781	chroot in GNU coreutils, when used with --userspec, allows local users to escape to the parent session via a crafted T
CVE-2016-3709	Possible cross-site scripting vulnerability in libxml after commit 960f0e2.
CVE-2016-7098	Race condition in wget 1.17 and earlier, when used in recursive or mirroring mode to download a single file, might a
CVE-2016-4971	GNU wget before 1.18 allows remote servers to write to arbitrary files by redirecting a request from HTTP to a craft
CVE-2016-7103	Cross-site scripting (XSS) vulnerability in jQuery UI before 1.12.0 might allow remote attackers to inject arbitrary w
CVE-2016-8660	The XFS subsystem in the Linux kernel through 4.8.2 allows local users to cause a denial of service (fdatsync failur
CVE-2017-0537	An information disclosure vulnerability in the kernel USB gadget driver could enable a local malicious application to
CVE-2017-11164	In PCRE 8.41, the OP_KETRMATCH feature in the match function in pcre_exec.c allows stack exhaustion (uncontrolle
CVE-2017-13089	The http.c:skip_short_body() function is called in some circumstances, such as when processing redirects. When the
CVE-2017-13165	An elevation of privilege vulnerability in the kernel file system. Product: Android. Versions: Android kernel. Androi
CVE-2017-13716	The C++ symbol demangler routine in cplus-dem.c in libiberty, as distributed in GNU Binutils 2.29, allows remote a
CVE-2017-13090	The retr.c:fd_read_body() function is called when processing OK responses. When the response is sent chunked in w
CVE-2017-13693	The acpi_ds_create_operands() function in drivers/acpi/acpica/dsutils.c in the Linux kernel through 4.12.9 does not f
CVE-2017-13745	There is a reachable assertion abort in the function jpc_dec_process_sot() in jpc/jpc_dec.c in JasPer 2.0.12 that will l
CVE-2017-16231	In PCRE 8.41, after compiling, a pcretest load test PoC produces a crash overflow in the function match() in pcre_ex
CVE-2017-18018	In GNU Coreutils through 8.29, chown-core.c in chown and chgrp does not prevent replacement of a plain file with a
CVE-2017-16516	In the yajl-ruby gem 1.3.0 for Ruby, when a crafted JSON file is supplied to Yajl::Parser.new.parse, the whole ruby j
CVE-2017-17095	tools/pal2rgb.c in pal2rgb in LibTIFF 4.0.9 allows remote attackers to cause a denial of service (TIFFSetupStrips hea

CVE-2017-3161	The HDFS web UI in Apache Hadoop before 2.7.0 is vulnerable to a cross-site scripting (XSS) attack through an un
CVE-2017-3162	HDFS clients interact with a servlet on the DataNode to browse the HDFS namespace. The NameNode is provided a
CVE-2017-5499	Integer overflow in libjasper/jpc/jpc_dec.c in JasPer 1.900.17 allows remote attackers to cause a denial of service (cr
CVE-2017-3737	OpenSSL 1.0.2 (starting from version 1.0.2b) introduced an "error state" mechanism. The intent was that if a fatal er
CVE-2017-3738	There is an overflow bug in the AVX2 Montgomery multiplication procedure used in exponentiation with 1024-bit m
CVE-2017-3735	While parsing an IPAddressFamily extension in an X.509 certificate, it is possible to do a one-byte overread. This w
CVE-2017-5503	The dec_clnpass function in libjasper/jpc/jpc_t1dec.c in JasPer 1.900.27 allows remote attackers to cause a denial of
CVE-2017-5504	The jpc_undo_roi function in libjasper/jpc/jpc_dec.c in JasPer 1.900.27 allows remote attackers to cause a denial of
CVE-2017-5505	The jas_matrix_asl function in jas_seq.c in JasPer 1.900.27 allows remote attackers to cause a denial of service (inva
CVE-2017-6508	CRLF injection vulnerability in the url_parse function in url.c in Wget through 1.19.1 allows remote attackers to inj
CVE-2017-6519	avahi-daemon in Avahi through 0.6.32 and 0.7 inadvertently responds to IPv6 unicast queries with source addresses
CVE-2017-7245	Stack-based buffer overflow in the pcre32_copy_substring function in pcre_get.c in libpcre1 in PCRE 8.40 allows re
CVE-2017-7246	Stack-based buffer overflow in the pcre32_copy_substring function in pcre_get.c in libpcre1 in PCRE 8.40 allows re
CVE-2017-7475	Cairo version 1.15.4 is vulnerable to a NULL pointer dereference related to the FT_Load_Glyph and FT_Render_GLI
CVE-2017-9782	JasPer 2.0.12 allows remote attackers to cause a denial of service (heap-based buffer over-read and application crash
CVE-2018-0494	GNU Wget before 1.19.5 is prone to a cookie injection vulnerability in the resp_new function in http.c via a '\r\n sequ
CVE-2018-0737	The OpenSSL RSA Key generation algorithm has been shown to be vulnerable to a cache timing side channel attack
CVE-2018-1000021	GIT version 2.15.1 and earlier contains a Input Validation Error vulnerability in Client that can result in problems in
CVE-2018-0739	Constructed ASN.1 types with a recursive definition (such as can be found in PKCS7) could eventually exceed the st
CVE-2018-1000201	ruby-ffi version 1.9.23 and earlier has a DLL loading issue which can be hijacked on Windows OS, when a Symbol
CVE-2018-1000520	ARM mbedTLS version 2.7.0 and earlier contains a Ciphersuite Allows Incorrectly Signed Certificates vulnerability
CVE-2018-1000654	GNU Libtasn1-4.13 libtasn1-4.13 version libtasn1-4.13, libtasn1-4.12 contains a DoS, specifically CPU usage will re
CVE-2018-1000876	binutils version 2.32 and earlier contains a Integer Overflow vulnerability in objdump, bfd_get_dynamic_reloc_upper
CVE-2018-1000879	libarchive version commit 379867ecb330b3a952fb7bfa7bffb7bbd5547205 onwards (release v3.3.0 onwards) contain
CVE-2018-1000880	libarchive version commit 9693801580c0cf7c70e862d305270a16b52826a7 onwards (release v3.2.0 onwards) contain
CVE-2018-10779	TIFFWriteScanline in tif_write.c in LibTIFF 3.8.2 has a heap-based buffer over-read, as demonstrated by bmp2tiff.
CVE-2018-10237	Unbounded memory allocation in Google Guava 11.0 through 24.x before 24.1.1 allows remote attackers to conduct
CVE-2018-10801	TIFFClientOpen in tif_unix.c in LibTIFF 3.8.2 has memory leaks, as demonstrated by bmp2tiff.
CVE-2018-1121	procps-ng, procps is vulnerable to a process hiding through race condition. Since the kernel's proc_pid_readdir() retu
CVE-2018-12641	An issue was discovered in arm_pt in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.30. Stack Exh
CVE-2018-12697	A NULL pointer dereference (aka SEGV on unknown address 0x000000000000) was discovered in work_stuff_copy
CVE-2018-12698	demangle_template in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.30, allows attackers to trigger
CVE-2018-12699	finish_stab in stabs.c in GNU Binutils 2.30 allows attackers to cause a denial of service (heap-based buffer overflow
CVE-2018-12700	Rejected reason: DO NOT USE THIS CANDIDATE NUMBER. ConsultIDs: none. Reason: This candidate was wit
CVE-2018-12886	stack_protect_prologue in cfgexpand.c and stack_protect_epilogue in function.c in GNU Compiler Collection (GCC)
CVE-2018-12928	In the Linux kernel 4.15.0, a NULL pointer dereference was discovered in hfs_ext_read_extent in hfs.ko. This can o
CVE-2018-12929	ntfs_read_locked_inode in the ntfs.ko filesystem driver in the Linux kernel 4.15.0 allows attackers to trigger a use-af
CVE-2018-12930	ntfs_end_buffer_async_read in the ntfs.ko filesystem driver in the Linux kernel 4.15.0 allows attackers to trigger a st
CVE-2018-12931	ntfs_attr_find in the ntfs.ko filesystem driver in the Linux kernel 4.15.0 allows attackers to trigger a stack-based out-
CVE-2018-12934	remember_Ktype in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.30, allows attackers to trigger e

CVE-2018-15209	ChopUpSingleUncompressedStrip in tif_dirread.c in LibTIFF 4.0.9 allows remote attackers to cause a denial of serv
CVE-2018-15594	arch/x86/kernel/paravirt.c in the Linux kernel before 4.18.1 mishandles certain indirect calls, which makes it easier f
CVE-2018-15919	Remotely observable behaviour in auth-gss2.c in OpenSSH through 7.8 could be used by remote attackers to detect t
CVE-2018-16335	newoffsets handling in ChopUpSingleUncompressedStrip in tif_dirread.c in LibTIFF 4.0.9 allows remote attackers t
CVE-2018-16435	Little CMS (aka Little Color Management System) 2.9 has an integer overflow in the AllocateDataSet function in cn
CVE-2018-16487	A prototype pollution vulnerability was found in lodash <4.17.11 where the functions merge, mergeWith, and default
CVE-2018-16862	A security flaw was found in the Linux kernel in a way that the cleancache subsystem clears an inode after the final
CVE-2018-17101	An issue was discovered in LibTIFF 4.0.9. There are two out-of-bounds writes in cpTags in tools/tiff2bw.c and tools
CVE-2018-17190	In all versions of Apache Spark, its standalone resource manager accepts code to execute on a 'master' host, that then
CVE-2018-17360	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.3
CVE-2018-17794	An issue was discovered in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a NULL poi
CVE-2018-17977	The Linux kernel 4.14.67 mishandles certain interaction among XFRM Netlink messages, IPPROTO_AH packets, a
CVE-2018-17985	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a stack co
CVE-2018-18064	cairo through 1.15.14 has an out-of-bounds stack-memory write during processing of a crafted document by WebKit
CVE-2018-18074	The Requests package before 2.20.0 for Python sends an HTTP Authorization header to an http URI upon receiving
CVE-2018-18309	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.3
CVE-2018-18483	The get_count function in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.31, allows remote attacker
CVE-2018-18484	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. Stack Exhaustion
CVE-2018-18605	A heap-based buffer over-read issue was discovered in the function sec_merge_hash_lookup in merge.c in the Binary
CVE-2018-18606	An issue was discovered in the merge_strings function in merge.c in the Binary File Descriptor (BFD) library (aka li
CVE-2018-18607	An issue was discovered in elf_link_input_bfd in elflink.c in the Binary File Descriptor (BFD) library (aka libbfd), a
CVE-2018-18700	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a stack co
CVE-2018-18701	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a stack co
CVE-2018-18873	An issue was discovered in JasPer 2.0.14. There is a NULL pointer dereference in the function ras_putdatastd in ras/
CVE-2018-19139	An issue has been found in JasPer 2.0.14. There is a memory leak in jas_malloc.c when called from jpc_unk_getparr
CVE-2018-19210	In LibTIFF 4.0.9, there is a NULL pointer dereference in the TIFFWriteDirectorySec function in tif_dirwrite.c that v
CVE-2018-19217	In ncurses, possibly a 6.x version, there is a NULL pointer dereference at the function _nc_name_match that will lea
CVE-2018-19211	In ncurses 6.1, there is a NULL pointer dereference at function _nc_parse_entry in parse_entry.c that will lead to a d
CVE-2018-19351	Jupyter Notebook before 5.7.1 allows XSS via an untrusted notebook because nbconvert responses are considered to
CVE-2018-19352	Jupyter Notebook before 5.7.2 allows XSS via a crafted directory name because notebook/static/tree/js/notebooklist.
CVE-2018-19541	An issue was discovered in JasPer 1.900.8, 1.900.9, 1.900.10, 1.900.11, 1.900.12, 1.900.13, 1.900.14, 1.900.15, 1.90
CVE-2018-19539	An issue was discovered in JasPer 2.0.14. There is an access violation in the function jas_image_readcmpt in libjasp
CVE-2018-19540	An issue was discovered in JasPer 1.900.8, 1.900.9, 1.900.10, 1.900.11, 1.900.12, 1.900.13, 1.900.14, 1.900.15, 1.90
CVE-2018-19542	An issue was discovered in JasPer 2.0.14. There is a NULL pointer dereference in the function jp2_decode in libjasp
CVE-2018-19543	An issue was discovered in JasPer 2.0.14. There is a heap-based buffer over-read of size 8 in the function jp2_decod
CVE-2018-19876	cairo 1.16.0, in cairo_ft_apply_variations() in cairo-ft-font.c, would free memory using a free function incompatible
CVE-2018-19932	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils thr
CVE-2018-20002	The _bfd_generic_read_minisymbols function in syms.c in the Binary File Descriptor (BFD) library (aka libbfd), as
CVE-2018-20225	An issue was discovered in pip (all versions) because it installs the version with the highest version number, even if
CVE-2018-20483	set_file_metadata in xattr.c in GNU Wget before 1.20.1 stores a file's origin URL in the user.xdg.origin.url metadata

CVE-2018-20570	jp2_encode in jp2/jp2_enc.c in JasPer 2.0.14 has a heap-based buffer over-read.
CVE-2018-20622	JasPer 2.0.14 has a memory leak in base/jas_malloc.c in libjasper.a when "--output-format jp2" is used.
CVE-2018-20623	In GNU Binutils 2.31.1, there is a use-after-free in the error function in elfcomm.c when called from the process_
CVE-2018-20651	A NULL pointer dereference was discovered in elf_link_add_object_symbols in elflink.c in the Binary File Descript
CVE-2018-20657	The demangle_template function in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.31.1, has a mem
CVE-2018-20671	load_specific_debug_section in objdump.c in GNU Binutils through 2.31.1 contains an integer overflow vulnerability
CVE-2018-20673	The demangle_template function in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.31.1, contains a
CVE-2018-20786	libvterm through 0+bzr726, as used in Vim and other products, mishandles certain out-of-memory conditions, leadin
CVE-2018-20796	In the GNU C Library (aka glibc or libc6) through 2.29, check_dst_limits_calc_pos_1 in posix/regexec.c has Uncont
CVE-2018-20839	systemd 242 changes the VT1 mode upon a logout, which allows attackers to read cleartext passwords in certain circ
CVE-2018-21030	Jupyter Notebook before 5.5.0 does not use a CSP header to treat served files as belonging to a separate origin. Thus
CVE-2018-3721	lodash node module before 4.17.5 suffers from a Modification of Assumed-Immutable Data (MAID) vulnerability vi
CVE-2018-25032	zlib before 1.2.12 allows memory corruption when deflating (i.e., when compressing) if the input has many distant m
CVE-2018-5360	LibTIFF before 4.0.6 mishandles the reading of TIFF files, as demonstrated by a heap-based buffer over-read in the
CVE-2018-5709	An issue was discovered in MIT Kerberos 5 (aka krb5) through 1.16. There is a variable "dbentry->n_key_data" in k
CVE-2018-5711	gd_gif_in.c in the GD Graphics Library (aka libgd), as used in PHP before 5.6.33, 7.0.x before 7.0.27, 7.1.x before 7
CVE-2018-6829	cipher/elgama.c in Libgcrypt through 1.8.2, when used to encrypt messages directly, improperly encodes plaintexts,
CVE-2018-6872	The elf_parse_notes function in elf.c in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU
CVE-2018-6952	A double free exists in the another_hunk function in pch.c in GNU patch through 2.7.6.
CVE-2018-7169	An issue was discovered in shadow 4.5. newgidmap (in shadow-utils) is setuid and allows an unprivileged user to be
CVE-2018-7273	In the Linux kernel through 4.15.4, the floppy driver reveals the addresses of kernel functions and global variables u
CVE-2018-8043	The unimac_mdio_probe function in drivers/net/phy/mdio-bcm-unimac.c in the Linux kernel through 4.15.8 does no
CVE-2018-8768	In Jupyter Notebook before 5.4.1, a maliciously forged notebook file can bypass sanitization to execute JavaScript in
CVE-2018-9055	JasPer 2.0.14 allows denial of service via a reachable assertion in the function jpc_firstone in libjasper/jpc/jpc_math.
CVE-2018-9252	JasPer 2.0.14 allows denial of service via a reachable assertion in the function jpc_abstorelstepsize in libjasper/jpc/jp
CVE-2019-1010022	GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may bypass stack guard protection. The
CVE-2019-10086	In Apache Commons Beanutils 1.9.2, a special BeanIntrospector class was added which allows suppressing the abili
CVE-2019-1010023	GNU Libc current is affected by: Re-mapping current loaded library with malicious ELF file. The impact is: In wors
CVE-2019-1010024	GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may bypass ASLR using cache of thead
CVE-2019-1010025	GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may guess the heap addresses of pthread
CVE-2019-1010204	GNU binutils gold v1.11-v1.16 (GNU binutils v2.21-v2.31.1) is affected by: Improper Input Validation, Signed
CVE-2019-10255	An Open Redirect vulnerability for all browsers in Jupyter Notebook before 5.7.7 and some browsers (Chrome, Fire
CVE-2019-1010266	lodash prior to 4.17.11 is affected by: CWE-400: Uncontrolled Resource Consumption. The impact is: Denial of serv
CVE-2019-10856	In Jupyter Notebook before 5.7.8, an open redirect can occur via an empty netloc. This issue exists because of an inc
CVE-2019-10219	A vulnerability was found in Hibernate-Validator. The SafeHtml validator annotation fails to properly sanitize paylo
CVE-2019-11038	When using the gdImageCreateFromXbm() function in the GD Graphics Library (aka LibGD) 2.2.5, as used in the P
CVE-2019-12290	GNU libidn2 before 2.2.0 fails to perform the roundtrip checks specified in RFC3490 Section 4.2 when converting A
CVE-2019-12380	**DISPUTED** An issue was discovered in the efi subsystem in the Linux kernel through 5.1.5. phys_efi_set_virtu
CVE-2019-11358	jQuery before 3.4.0, as used in Drupal, Backdrop CMS, and other products, mishandles jQuery.extend(true, {}, ...) b
CVE-2019-12900	BZ2_decompress in decompress.c in bzip2 through 1.0.6 has an out-of-bounds write when there are many selectors.

CVE-2019-12904	In Libgcrypt 1.8.4, the C implementation of AES is vulnerable to a flush-and-reload side-channel attack because phy
CVE-2019-12972	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.3
CVE-2019-13115	In libssh2 before 1.9.0, <code>kex_method_diffie_hellman_group_exchange_sha256_key_exchange</code> in <code>kex.c</code> has an integer
CVE-2019-13117	In <code>numbers.c</code> in <code>libxslt</code> 1.1.33, an <code>xsl:number</code> with certain format strings could lead to a uninitialized read in <code>xsltNum</code>
CVE-2019-13118	In <code>numbers.c</code> in <code>libxslt</code> 1.1.33, a type holding grouping characters of an <code>xsl:number</code> instruction was too narrow and a
CVE-2019-13627	It was discovered that there was a ECDSA timing attack in the <code>libgcrypt20</code> cryptographic library. Version affected: 1
CVE-2019-14250	An issue was discovered in GNU <code>libiberty</code> , as distributed in GNU Binutils 2.32. <code>simple_object_elf_match</code> in <code>simple-</code>
CVE-2019-14899	A vulnerability was discovered in Linux, FreeBSD, OpenBSD, MacOS, iOS, and Android that allows a malicious ac
CVE-2019-14855	A flaw was found in the way certificate signatures could be forged using collisions found in the SHA-1 algorithm. A
CVE-2019-15213	An issue was discovered in the Linux kernel before 5.2.3. There is a use-after-free caused by a malicious USB device
CVE-2019-15217	An issue was discovered in the Linux kernel before 5.2.3. There is a NULL pointer dereference caused by a malicious
CVE-2019-15218	An issue was discovered in the Linux kernel before 5.1.8. There is a NULL pointer dereference caused by a malicious
CVE-2019-15219	An issue was discovered in the Linux kernel before 5.1.8. There is a NULL pointer dereference caused by a malicious
CVE-2019-15291	An issue was discovered in the Linux kernel through 5.2.9. There is a NULL pointer dereference caused by a malicious
CVE-2019-15794	Overlays in the Linux kernel and <code>shiftfs</code> , a non-upstream patch to the Linux kernel included in the Ubuntu 5.0 and 5
CVE-2019-1551	There is an overflow bug in the <code>x64_64</code> Montgomery squaring procedure used in exponentiation with 512-bit modul
CVE-2019-15807	In the Linux kernel before 5.1.13, there is a memory leak in <code>drivers/scsi/libsas/sas_expander.c</code> when SAS expander c
CVE-2019-15847	The POWER9 backend in GNU Compiler Collection (GCC) before version 10 could optimize multiple calls of the <code>_</code>
CVE-2019-16089	An issue was discovered in the Linux kernel through 5.2.13. <code>nbd_genl_status</code> in <code>drivers/block/nbd.c</code> does not check t
CVE-2019-16229	<code>drivers/gpu/drm/amd/amdkfd/kfd_interrupt.c</code> in the Linux kernel 5.2.14 does not check the <code>alloc_workqueue</code> return v
CVE-2019-16230	<code>drivers/gpu/drm/radeon/radeon_display.c</code> in the Linux kernel 5.2.14 does not check the <code>alloc_workqueue</code> return valu
CVE-2019-17113	In <code>libopenmpt</code> before 0.3.19 and 0.4.x before 0.4.9, <code>ModPlug_InstrumentName</code> and <code>ModPlug_SampleName</code> in <code>libop</code>
CVE-2019-17498	In <code>libssh2</code> v1.9.0 and earlier versions, the <code>SSH_MSG_DISCONNECT</code> logic in <code>packet.c</code> has an integer overflow in a
CVE-2019-17543	LZ4 before 1.9.2 has a heap-based buffer overflow in <code>LZ4_write32</code> (related to <code>LZ4_compress_destSize</code>), affecting ap
CVE-2019-17567	Apache HTTP Server versions 2.4.6 to 2.4.46 <code>mod_proxy_wstunnel</code> configured on an URL that is not necessarily Up
CVE-2019-18806	A memory leak in the <code>ql_alloc_large_buffers()</code> function in <code>drivers/net/ethernet/qlogic/qla3xxx.c</code> in the Linux kernel l
CVE-2019-19039	<code>__btrfs_free_extent</code> in <code>fs/btrfs/extent-tree.c</code> in the Linux kernel through 5.3.12 calls <code>btrfs_print_leaf</code> in a certain ENO
CVE-2019-19054	A memory leak in the <code>cx23888_ir_probe()</code> function in <code>drivers/media/pci/cx23885/cx23888-ir.c</code> in the Linux kernel th
CVE-2019-19066	A memory leak in the <code>bfad_im_get_stats()</code> function in <code>drivers/scsi/bfa/bfad_attr.c</code> in the Linux kernel through 5.3.11
CVE-2019-19080	Four memory leaks in the <code>nfp_flower_spawn_phy_reprs()</code> function in <code>drivers/net/ethernet/netronome/nfp/flower/main.c</code>
CVE-2019-19076	A memory leak in the <code>nfp_abm_u32_knode_replace()</code> function in <code>drivers/net/ethernet/netronome/nfp/abm/cls.c</code> in the
CVE-2019-19081	A memory leak in the <code>nfp_flower_spawn_vnic_reprs()</code> function in <code>drivers/net/ethernet/netronome/nfp/flower/main.c</code>
CVE-2019-19082	Memory leaks in <code>*create_resource_pool()</code> functions under <code>drivers/gpu/drm/amd/display/dc</code> in the Linux kernel throu
CVE-2019-19083	Memory leaks in <code>*clock_source_create()</code> functions under <code>drivers/gpu/drm/amd/display/dc</code> in the Linux kernel before
CVE-2019-19126	On the x86-64 architecture, the GNU C Library (aka glibc) before 2.31 fails to ignore the <code>LD_PREFER_MAP_32BI</code>
CVE-2019-19244	<code>sqlite3Select</code> in <code>select.c</code> in SQLite 3.30.1 allows a crash if a sub-select uses both <code>DISTINCT</code> and window functions,
CVE-2019-19378	In the Linux kernel 5.0.21, mounting a crafted <code>btrfs</code> filesystem image can lead to slab-out-of-bounds write access in
CVE-2019-19530	In the Linux kernel before 5.2.10, there is a use-after-free bug that can be caused by a malicious USB device in the d
CVE-2019-19462	<code>relay_open</code> in <code>kernel/relay.c</code> in the Linux kernel through 5.4.1 allows local users to cause a denial of service (such as
CVE-2019-19965	In the Linux kernel through 5.4.6, there is a NULL pointer dereference in <code>drivers/scsi/libsas/sas_discover.c</code> because c

CVE-2019-19814	In the Linux kernel 5.0.21, mounting a crafted f2fs filesystem image can cause __remove_dirty_segment slab-out-of-
CVE-2019-20095	mwifiex_tm_cmd in drivers/net/wireless/marvell/mwifiex/cfg80211.c in the Linux kernel before 5.1.6 has some erro
CVE-2019-20426	In the Lustre file system before 2.12.3, the ptlrpc module has an out-of-bounds access and panic due to the lack of va
CVE-2019-20454	An out-of-bounds read was discovered in PCRE before 10.34 when the pattern \X is JIT compiled and used to match
CVE-2019-20633	GNU patch through 2.7.6 contains a free(p_line[p_end]) Double Free vulnerability in the function another_hunk in p
CVE-2019-20794	An issue was discovered in the Linux kernel 4.18 through 5.6.11 when unprivileged user namespaces are allowed. A
CVE-2019-20838	libpcre in PCRE before 8.43 allows a subject buffer over-read in JIT when UTF is disabled, and \X or \R has more th
CVE-2019-2201	In generate_jsimd_ycc_rgb_convert_neon of jsimd_arm64_neon.S, there is a possible out of bounds write due to a m
CVE-2019-25013	The iconv feature in the GNU C Library (aka glibc or libc6) through 2.32, when processing invalid multi-byte input
CVE-2019-25160	In the Linux kernel, the following vulnerability has been resolved: netlabel: fix out-of-bounds memory accesses The
CVE-2019-3844	It was discovered that a systemd service that uses DynamicUser property can get new privileges through the executio
CVE-2019-3843	It was discovered that a systemd service that uses DynamicUser property can create a SUID/SGID binary that would

CVE-2019-6128	The TIFFFdOpen function in tif_unix.c in LibTIFF 4.0.10 has a memory leak, as demonstrated by pal2rgb.
CVE-2019-6461	An issue was discovered in cairo 1.16.0. There is an assertion problem in the function _cairo_arc_in_direction in the
CVE-2019-6462	An issue was discovered in cairo 1.16.0. There is an infinite loop in the function _arc_error_normalized in the file ca
CVE-2019-6988	An issue was discovered in OpenJPEG 2.3.0. It allows remote attackers to cause a denial of service (attempted excess
CVE-2019-8457	SQLite3 from 3.6.0 to and including 3.27.2 is vulnerable to heap out-of-bound read in the rtreeNode() function when
CVE-2019-8905	do_core_note in readelf.c in libmagic.a in file 5.35 has a stack-based buffer over-read, related to file_printable, a diff
CVE-2019-7317	png_image_free in png.c in libpng 1.6.x before 1.6.37 has a use-after-free because png_image_free_function is calle
CVE-2019-8906	do_core_note in readelf.c in libmagic.a in file 5.35 has an out-of-bounds read because memcpy is misused.
CVE-2019-9071	An issue was discovered in GNU libiberty, as distributed in GNU Binutils 2.32. It is a stack consumption issue in d_
CVE-2019-9077	An issue was discovered in GNU Binutils 2.32. It is a heap-based buffer overflow in process_mips_specific in reade
CVE-2019-9075	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.3
CVE-2019-9192	In the GNU C Library (aka glibc or libc6) through 2.29, check_dst_limits_calc_pos_1 in posix/regexec.c has Uncont
CVE-2019-9644	An XSSI (cross-site inclusion) vulnerability in Jupyter Notebook before 5.7.6 allows inclusion of resources on malic
CVE-2019-9674	Lib/zipfile.py in Python through 3.7.2 allows remote attackers to cause a denial of service (resource consumption) vi
CVE-2019-9923	pax_decode_header in sparse.c in GNU Tar before 1.32 had a NULL pointer dereference when parsing certain archiv
CVE-2019-9936	In SQLite 3.27.2, running fts5 prefix queries inside a transaction could trigger a heap-based buffer over-read in fts5F
CVE-2019-9937	In SQLite 3.27.2, interleaving reads and writes in a single transaction with an fts5 virtual table will lead to a NULL
CVE-2020-0499	In FLAC__bitreader_read_rice_signed_block of bitreader.c, there is a possible out of bounds read due to a heap buff
CVE-2020-10029	The GNU C Library (aka glibc or libc6) before 2.32 could overflow an on-stack buffer during range reduction if an i
CVE-2020-10135	Legacy pairing and secure-connections pairing authentication in Bluetooth BR/EDR Core Specification v5.2 and ear
CVE-2020-10663	The JSON gem through 2.2.0 for Ruby, as used in Ruby 2.4 through 2.4.9, 2.5 through 2.5.7, and 2.6 through 2.6.5, h
CVE-2020-10693	A flaw was found in Hibernate Validator version 6.1.2.Final. A bug in the message interpolation processor enables in
CVE-2020-10735	A flaw was found in python. In algorithms with quadratic time complexity using non-binary bases, when using int("t
CVE-2020-10781	A flaw was found in the Linux Kernel before 5.8-rc6 in the ZRAM kernel module, where a user with a local account
CVE-2020-11080	In nghttp2 before version 1.41.0, the overly large HTTP/2 SETTINGS frame payload causes denial of service. The p

CVE-2020-11023	In jQuery versions greater than or equal to 1.0.3 and before 3.5.0, passing HTML containing <option> elements from
CVE-2020-11022	In jQuery versions greater than or equal to 1.2 and before 3.5.0, passing HTML from untrusted sources - even after s
CVE-2020-11494	An issue was discovered in slc_bump in drivers/net/can/slcscan.c in the Linux kernel 3.16 through 5.6.2. It allows attac
CVE-2020-11609	An issue was discovered in the stv06xx subsystem in the Linux kernel before 5.6.1. drivers/media/usb/gspca/stv06xx
CVE-2020-12351	Improper input validation in BlueZ may allow an unauthenticated user to potentially enable escalation of privilege vi
CVE-2020-12352	Improper access control in BlueZ may allow an unauthenticated user to potentially enable information disclosure via
CVE-2020-12413	The Raccoon attack is a timing attack on DHE ciphersuites inherit in the TLS specification. To mitigate this vulnerab
CVE-2020-12480	In Play Framework 2.6.0 through 2.8.1, the CSRF filter can be bypassed by making CORS simple requests with cont
CVE-2020-12656	gss_mech_free in net/sunrpc/auth_gss/gss_mech_switch.c in the rpcsec_gss_krb5 implementation in the Linux kernel
CVE-2020-12768	An issue was discovered in the Linux kernel before 5.6. svm_cpu_uninit in arch/x86/kvm/svm.c has a memory leak,
CVE-2020-12769	An issue was discovered in the Linux kernel before 5.4.17. drivers/spi/spi-dw.c allows attackers to cause a panic via
CVE-2020-13790	libjpeg-turbo 2.0.4, and mozjpeg 4.0.0, has a heap-based buffer over-read in get_rgb_row() in rdppm.c via a malformed
CVE-2020-13529	An exploitable denial-of-service vulnerability exists in Systemd 245. A specially crafted DHCP FORCERENEW pac
CVE-2020-13645	In GNOME glib-networking through 2.64.2, the implementation of GTlsClientConnection skips hostname verificatio
CVE-2020-13955	HttpUtils#getURLConnection method disables explicitly hostname verification for HTTPS connections making client
CVE-2020-14304	A memory disclosure flaw was found in the Linux kernel's ethernet drivers, in the way it read data from the EEPROM
CVE-2020-13844	Arm Armv8-A core implementations utilizing speculative execution past unconditional changes in control flow may
CVE-2020-14155	libpcre in PCRE before 8.44 allows an integer overflow via a large number after a (?C substring.
CVE-2020-13956	Apache HttpClient versions prior to version 4.5.13 and 5.0.3 can misinterpret malformed authority component in req
CVE-2020-14390	A flaw was found in the Linux kernel in versions before 5.9-rc6. When changing screen size, an out-of-bounds mem
CVE-2020-14356	A flaw null pointer dereference in the Linux kernel cgroupv2 subsystem in versions before 5.7.10 was found in the v
CVE-2020-14416	In the Linux kernel before 5.4.16, a race condition in tty->disc_data handling in the slip and slcan line discipline cou
CVE-2020-14422	Lib/ipaddress.py in Python through 3.8.3 improperly computes hash values in the IPv4Interface and IPv6Interface cl
CVE-2020-15522	Bouncy Castle BC Java before 1.66, BC C# .NET before 1.8.7, BC-FJA before 1.0.1.2, 1.0.2.1, and BC-FNA before
CVE-2020-16156	CPAN 2.28 allows Signature Verification Bypass.

CVE-2020-19186	Buffer Overflow vulnerability in _nc_find_entry function in tinfo/comp_hash.c:66 in ncurses 6.1 allows remote attac
CVE-2020-19187	Buffer Overflow vulnerability in fmt_entry function in progs/dump_entry.c:1100 in ncurses 6.1 allows remote attack
CVE-2020-19188	Buffer Overflow vulnerability in fmt_entry function in progs/dump_entry.c:1116 in ncurses 6.1 allows remote attack
CVE-2020-19189	Buffer Overflow vulnerability in postprocess_terminfo function in tinfo/parse_entry.c:997 in ncurses 6.1 allows rem
CVE-2020-19190	Buffer Overflow vulnerability in _nc_find_entry in tinfo/comp_hash.c:70 in ncurses 6.1 allows remote attackers to c
CVE-2020-20703	Buffer Overflow vulnerability in VIM v.8.1.2135 allows a remote attacker to execute arbitrary code via the operand
CVE-2020-21469	An issue was discovered in PostgreSQL 12.2 allows attackers to cause a denial of service via repeatedly sending SIG
CVE-2020-21514	An issue was discovered in Fluent-ui v.1.2.2 allows attackers to gain escalated privileges and execute arbitrary code
CVE-2020-21674	Heap-based buffer overflow in archive_string_append_from_wcs() (archive_string.c) in libarchive-3.4.1dev allows r
CVE-2020-23064	Rejected reason: DO NOT USE THIS CANDIDATE NUMBER. ConsultIDs: CVE-2020-11023. Reason: This cand

CVE-2020-22218	An issue was discovered in function <code>_libssh2_packet_add</code> in <code>libssh2</code> 1.10.0 allows attackers to access out of bounds memory.
CVE-2020-24490	Improper buffer restrictions in BlueZ may allow an unauthenticated user to potentially enable denial of service via a crafted packet.
CVE-2020-24736	Buffer Overflow vulnerability found in SQLite3 v.3.27.1 and before allows a local attacker to cause a denial of service.
CVE-2020-24659	An issue was discovered in GnuTLS before 3.6.15. A server can trigger a NULL pointer dereference in a TLS 1.3 client.
CVE-2020-25219	<code>url::recvline</code> in <code>url.cpp</code> in <code>libproxy</code> 0.4.x through 0.4.15 allows a remote HTTP server to trigger uncontrolled recursion.
CVE-2020-25639	A NULL pointer dereference flaw was found in the Linux kernel's GPU Nouveau driver functionality in versions prior to 5.9-rc7.
CVE-2020-25645	A flaw was found in the Linux kernel in versions before 5.9-rc7. Traffic between two Geneve endpoints may be unauthenticated.
CVE-2020-25658	It was found that <code>python-rsa</code> is vulnerable to Bleichenbacher timing attacks. An attacker can use this flaw via the <code>RSAPublicKey</code> object.
CVE-2020-26215	Jupyter Notebook before version 6.1.5 has an Open redirect vulnerability. A maliciously crafted link to a notebook server can redirect to an arbitrary URL.
CVE-2020-26244	Python oic is a Python OpenID Connect implementation. In Python oic before version 1.2.1, there are several related issues.
CVE-2020-26555	Bluetooth legacy BR/EDR PIN code pairing in Bluetooth Core Specification 1.0B through 5.2 may permit an unauthenticated pairing.
CVE-2020-26558	Bluetooth LE and BR/EDR secure pairing in Bluetooth Core Specification 2.1 through 5.2 may permit a nearby man-in-the-middle attack.
CVE-2020-26939	In Legion of the Bouncy Castle BC before 1.61 and BC-FJA before 1.0.1.2, attackers can obtain sensitive information from the <code>BCFIPS</code> provider.
CVE-2020-27170	An issue was discovered in the Linux kernel before 5.11.8. <code>kernel/bpf/verifier.c</code> performs undesirable out-of-bounds access.
CVE-2020-27171	An issue was discovered in the Linux kernel before 5.11.8. <code>kernel/bpf/verifier.c</code> has an off-by-one error (with a result of zero).
CVE-2020-27534	<code>util/binfmt_misc/check.go</code> in Builder in Docker Engine before 19.03.9 calls <code>os.OpenFile</code> with a potentially unsafe <code>perm</code> argument.
CVE-2020-27618	The <code>iconv</code> function in the GNU C Library (aka <code>glibc</code> or <code>libc6</code>) 2.32 and earlier, when processing invalid multi-byte input, may cause a segmentation fault.
CVE-2020-28097	The <code>vgacon</code> subsystem in the Linux kernel before 5.8.10 mishandles software scrollbar. There is a <code>vgacon_scrollback</code> buffer overflow.
CVE-2020-29374	An issue was discovered in the Linux kernel before 5.7.3, related to <code>mm/gup.c</code> and <code>mm/huge_memory.c</code> . The <code>get_user</code> function may cause a segmentation fault.
CVE-2020-29582	In JetBrains Kotlin before 1.4.21, a vulnerable Java API was used for temporary file and folder creation. An attacker can cause a denial of service.
CVE-2020-35493	A flaw exists in <code>binutils</code> in <code>bfd/pef.c</code> . An attacker who is able to submit a crafted PEF file to be parsed by <code>objdump</code> can cause a denial of service.
CVE-2020-35494	There's a flaw in <code>binutils</code> <code>/opcodes/tic4x-dis.c</code> . An attacker who is able to submit a crafted input file to be processed by the <code>objdump</code> can cause a denial of service.
CVE-2020-35495	There's a flaw in <code>binutils</code> <code>/bfd/pef.c</code> . An attacker who is able to submit a crafted input file to be processed by the <code>objdump</code> can cause a denial of service.
CVE-2020-35496	There's a flaw in <code>bfd_pef_scan_start_address()</code> of <code>bfd/pef.c</code> in <code>binutils</code> which could allow an attacker who is able to submit a crafted input file to be processed by the <code>objdump</code> to cause a denial of service.
CVE-2020-35501	A flaw was found in the Linux kernels implementation of audit rules, where a <code>syscall</code> can unexpectedly not be corrected.
CVE-2020-35507	There's a flaw in <code>bfd_pef_parse_function_stubs</code> of <code>bfd/pef.c</code> in <code>binutils</code> in versions prior to 2.34 which could allow an attacker to cause a denial of service.
CVE-2020-35512	A use-after-free flaw was found in D-Bus Development branch <= 1.13.16, <code>dbus-1.12.x</code> stable branch <= 1.12.18, and <code>dbus-1.10.x</code> stable branch <= 1.10.18.
CVE-2020-35525	In SQLite 3.31.1, a potential null pointer dereference was found in the INTERSECT query processing.
CVE-2020-35527	In SQLite 3.31.1, there is an out of bounds access problem through ALTER TABLE for views that have a nested FROM clause.
CVE-2020-35538	A crafted input file could cause a null pointer dereference in <code>jpeg_sample_rows()</code> when processed by <code>libjpeg-turbo</code> .
CVE-2020-36311	An issue was discovered in the Linux kernel before 5.9. <code>arch/x86/kvm/svm/sev.c</code> allows attackers to cause a denial of service via a crafted packet.
CVE-2020-36789	In the Linux kernel, the following vulnerability has been resolved: <code>can: dev: can_get_echo_skb()</code> : prevent call to <code>kfree_skb()</code> on a non-allocated skb.
CVE-2020-36518	<code>jackson-databind</code> before 2.13.0 allows a Java StackOverflow exception and denial of service via a large depth of nested objects.
CVE-2020-36790	In the Linux kernel, the following vulnerability has been resolved: <code>nvmet: fix a memory leak</code> We forgot to free <code>new_nvmf_request</code> in <code>nvmet_req_init</code> .
CVE-2020-36791	In the Linux kernel, the following vulnerability has been resolved: <code>net_sched: keep alloc_hash updated after hash allocation</code> .
CVE-2020-36843	The implementation of EdDSA in EdDSA-Java (aka <code>ed25519-java</code>) through 0.3.0 exhibits signature malleability and a denial of service.
CVE-2020-7656	<code>jquery</code> prior to 1.9.0 allows Cross-site Scripting attacks via the <code>load</code> method. The <code>load</code> method fails to recognize and escape <code><script></code> tags.
CVE-2020-3702	Specifically timed and handcrafted traffic can cause internal errors in a WLAN device that lead to improper layer 2 security.
CVE-2020-6096	An exploitable signed comparison vulnerability exists in the ARMv7 <code>memcpy()</code> implementation of GNU <code>glibc</code> 2.30.0.
CVE-2020-8130	There is an OS command injection vulnerability in Ruby Rake < 12.3.3 in <code>Rake::FileList</code> when supplying a filename to the <code>add</code> method.

CVE-2020-8169	curl 7.62.0 through 7.70.0 is vulnerable to an information disclosure vulnerability that can lead to a partial password
CVE-2020-8177	curl 7.20.0 through 7.70.0 is vulnerable to improper restriction of names for files and other resources that can lead to
CVE-2020-8231	Due to use of a dangling pointer, libcurl 7.29.0 through 7.71.1 can use the wrong connection when sending data.
CVE-2020-8284	A malicious server can use the FTP PASV response to trick curl 7.73.0 and earlier into connecting back to a given IP
CVE-2020-8285	curl 7.21.0 to and including 7.73.0 is vulnerable to uncontrolled recursion due to a stack overflow issue in FTP wild
CVE-2020-8286	curl 7.41.0 through 7.73.0 is vulnerable to an improper check for certificate revocation due to insufficient verificatio
CVE-2020-8554	Kubernetes API server in all versions allow an attacker who is able to create a ClusterIP service and set the spec.exte
CVE-2020-8492	Python 2.7 through 2.7.17, 3.5 through 3.5.9, 3.6 through 3.6.10, 3.7 through 3.7.6, and 3.8 through 3.8.1 allows an l
CVE-2020-8559	The Kubernetes kube-apiserver in versions v1.6-v1.15, and versions prior to v1.16.13, v1.17.9 and v1.18.6 are vulne
CVE-2020-8561	A security issue was discovered in Kubernetes where actors that control the responses of MutatingWebhookConfigu
CVE-2020-8562	As mitigations to a report from 2019 and CVE-2020-8555, Kubernetes attempts to prevent proxied connections from
CVE-2020-8564	In Kubernetes clusters using a logging level of at least 4, processing a malformed docker config file will result in the
CVE-2020-8565	In Kubernetes, if the logging level is set to at least 9, authorization and bearer tokens will be written to log files. This
CVE-2021-0561	In append_to_verify_fifo_interleaved_ of stream_encoder.c, there is a possible out of bounds write due to a missing
CVE-2020-8908	A temp directory creation vulnerability exists in all versions of Guava, allowing an attacker with access to the machi
CVE-2021-20231	A flaw was found in gnutls. A use after free issue in client sending key_share extension may lead to memory corrupt
CVE-2021-20193	A flaw was found in the src/list.c of tar 1.33 and earlier. This flaw allows an attacker who can submit a crafted input
CVE-2021-20232	A flaw was found in gnutls. A use after free issue in client_send_params in lib/ext/pre_shared_key.c may lead to me
CVE-2021-20305	A flaw was found in Nettle in versions before 3.7.2, where several Nettle signature verification functions (GOST DS
CVE-2021-20320	A flaw was found in s390 eBPF JIT in bpf_jit_insn in arch/s390/net/bpf_jit_comp.c in the Linux kernel. In this flaw,
CVE-2021-21284	In Docker before versions 9.03.15, 20.10.3 there is a vulnerability involving the --users-remap option in which acce
CVE-2020-8694	Insufficient access control in the Linux kernel driver for some Intel(R) Processors may allow an authenticated user to
CVE-2021-21285	In Docker before versions 9.03.15, 20.10.3 there is a vulnerability in which pulling an intentionally malformed Dock

CVE-2021-36086	The CIL compiler in SELinux 3.2 has a use-after-free in cil_reset_classpermission (called from cil_reset_classperms
CVE-2021-36087	The CIL compiler in SELinux 3.2 has a heap-based buffer over-read in ebitmap_match_any (called indirectly from c
CVE-2021-36222	ec_verify in kdc/kdc_preauth_ec.c in the Key Distribution Center (KDC) in MIT Kerberos 5 (aka krb5) before 1.18.x
CVE-2021-3634	A flaw has been found in libssh in versions prior to 0.9.6. The SSH protocol keeps track of two shared secrets during
CVE-2021-3655	A vulnerability was found in the Linux kernel in versions prior to v5.14-rc1. Missing size validations on inbound SC
CVE-2021-3711	In order to decrypt SM2 encrypted data an application is expected to call the API function EVP_PKEY_decrypt(). T
CVE-2021-3712	ASN.1 strings are represented internally within OpenSSL as an ASN1_STRING structure which contains a buffer ho
CVE-2021-3714	A flaw was found in the Linux kernels memory deduplication mechanism. Previous work has shown that memory de
CVE-2021-3733	There's a flaw in urllib's AbstractBasicAuthHandler class. An attacker who controls a malicious HTTP server that an
CVE-2021-3737	A flaw was found in python. An improperly handled HTTP response in the HTTP client code of python may allow a
CVE-2021-37600	An integer overflow in util-linux through 2.37.1 can potentially cause a buffer overflow if an attacker were able to us
CVE-2021-38153	Some components in Apache Kafka use `Arrays.equals` to validate a password or key, which is vulnerable to timing
CVE-2021-37750	The Key Distribution Center (KDC) in MIT Kerberos 5 (aka krb5) before 1.18.5 and 1.19.x before 1.19.3 has a NUL
CVE-2021-38166	In kernel/bpf/hashtab.c in the Linux kernel through 5.13.8, there is an integer overflow and out-of-bounds write whe
CVE-2021-38198	arch/x86/kvm/mmu/paging_tmpl.h in the Linux kernel before 5.12.11 incorrectly computes the access permissions o
CVE-2021-38199	fs/nfs/nfs4client.c in the Linux kernel before 5.13.4 has incorrect connection-setup ordering, which allows operators
CVE-2021-38206	The mac80211 subsystem in the Linux kernel before 5.12.13, when a device supporting only 5 GHz is used, allows a
CVE-2021-3826	Heap/stack buffer overflow in the dlang_lname function in d-demangle.c in libiberty allows attackers to potentially c
CVE-2021-38593	Qt 5.x before 5.15.6 and 6.x through 6.1.2 has an out-of-bounds write in QOutlineMapper::convertPath (called from
CVE-2021-3864	A flaw was found in the way the dumpable flag setting was handled when certain SUID binaries executed its descen
CVE-2021-3927	vim is vulnerable to Heap-based Buffer Overflow
CVE-2021-39537	An issue was discovered in ncurses through v6.2-1. _nc_captainfo in captainfo.c has a heap-based buffer overflow.
CVE-2021-3974	vim is vulnerable to Use After Free
CVE-2021-3997	A flaw was found in systemd. An uncontrolled recursion in systemd-tmpfiles may lead to a denial of service at boot
CVE-2021-3999	A flaw was found in glibc. An off-by-one buffer overflow and underflow in getcwd() may lead to memory corruption
CVE-2021-4001	A race condition was found in the Linux kernel's ebpf verifier between bpf_map_update_elem and bpf_map_freeze c
CVE-2021-4044	Internally libssl in OpenSSL calls X509_verify_cert() on the client side to verify a certificate supplied by a server. T
CVE-2021-40490	A race condition was discovered in ext4_write_inline_data_end in fs/ext4/inline.c in the ext4 subsystem in the Linux
CVE-2021-40528	The ElGamal implementation in Libgcrypt before 1.9.4 allows plaintext recovery because, during interaction between
CVE-2021-4095	A NULL pointer dereference was found in the Linux kernel's KVM when dirty ring logging is enabled without an ac
CVE-2021-41091	Moby is an open-source project created by Docker to enable software containerization. A bug was found in Moby (D
CVE-2021-41182	jQuery-UI is the official jQuery user interface library. Prior to version 1.13.0, accepting the value of the `altField` op

CVE-2021-41183	jQuery-UI is the official jQuery user interface library. Prior to version 1.13.0, accepting the value of various `*Text`
CVE-2021-4135	A memory leak vulnerability was found in the Linux kernel's eBPF for the Simulated networking device driver in the
CVE-2021-41184	jQuery-UI is the official jQuery user interface library. Prior to version 1.13.0, accepting the value of the `of` option o
CVE-2021-41495	Null Pointer Dereference vulnerability exists in numpy.sort in NumPy <1.19 and 1.19 in the PyArray_DescrNew functi
CVE-2021-41496	Buffer overflow in the array_from_pyobj function of fortranobject.c in NumPy < 1.19, which allows attackers to con
CVE-2021-4159	A vulnerability was found in the Linux kernel's EBPF verifier when handling internal data structures. Internal memo
CVE-2021-4160	There is a carry propagation bug in the MIPS32 and MIPS64 squaring procedure. Many EC algorithms are affected,
CVE-2021-4166	vim is vulnerable to Out-of-bounds Read
CVE-2021-41720	Rejected reason: DO NOT USE THIS CANDIDATE NUMBER. ConsultIDs: none. Reason: This candidate was wit
CVE-2021-4189	A flaw was found in Python, specifically in the FTP (File Transfer Protocol) client library in PASV (passive) mode.
CVE-2021-4217	A flaw was found in unzip. The vulnerability occurs due to improper handling of Unicode strings, which can lead to
CVE-2021-4209	A NULL pointer dereference flaw was found in GnuTLS. As Nettle's hash update functions internally call memcpy,
CVE-2021-42357	When using Apache Knox SSO prior to 1.6.1, a request could be crafted to redirect a user to a malicious page due to
CVE-2021-43618	GNU Multiple Precision Arithmetic Library (GMP) through 6.2.1 has an mpz/inp_raw.c integer overflow and result
CVE-2021-43797	Netty is an asynchronous event-driven network application framework for rapid development of maintainable high p
CVE-2021-4440	In the Linux kernel, the following vulnerability has been resolved: x86/xen: Drop USERGS_SYSRET64 paravirt cal
CVE-2021-4439	In the Linux kernel, the following vulnerability has been resolved: isdn: cpai: check ctr->cnr to avoid array index ou
CVE-2021-4442	In the Linux kernel, the following vulnerability has been resolved: tcp: add sanity tests to TCP_QUEUE_SEQ Qingy
CVE-2021-45078	stab_xcoff_builtin_type in stabs.c in GNU Binutils through 2.37 allows attackers to cause a denial of service (heap-b
CVE-2021-45261	An Invalid Pointer vulnerability exists in GNU patch 2.7 via the another_hunk function, which causes a Denial of Se
CVE-2021-46195	GCC v12.0 was discovered to contain an uncontrolled recursion via the component libiberty/rust-demangle.c. This v
CVE-2021-46877	jackson-databind 2.10.x through 2.12.x before 2.12.6 and 2.13.x before 2.13.1 allows attackers to cause a denial of s
CVE-2021-45402	The check_alu_op() function in kernel/bpf/verifier.c in the Linux kernel through v5.16-rc5 did not properly update b
CVE-2021-46904	In the Linux kernel, the following vulnerability has been resolved: net: hso: fix null-ptr-deref during tty device unreg
CVE-2021-46907	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2021-46908	In the Linux kernel, the following vulnerability has been resolved: bpf: Use correct permission flag for mixed signed
CVE-2021-46909	In the Linux kernel, the following vulnerability has been resolved: ARM: footbridge: fix PCI interrupt mapping Sinc
CVE-2021-46910	In the Linux kernel, the following vulnerability has been resolved: ARM: 9063/1: mm: reduce maximum number of
CVE-2021-46915	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_limit: avoid possible divide error in
CVE-2021-46917	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: fix wq cleanup of WQCFG regi
CVE-2021-46920	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix clobbering of SWERR over
CVE-2021-46918	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: clear MSIX permission entry or
CVE-2021-46921	In the Linux kernel, the following vulnerability has been resolved: locking/qrwlock: Fix ordering in queued_write_lo
CVE-2021-46925	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix kernel panic caused by race of smc_s
CVE-2021-46926	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: intel-sdw-acpi: harden detection of c
CVE-2021-46929	In the Linux kernel, the following vulnerability has been resolved: sctp: use call_rcu to free endpoint This patch is to
CVE-2021-46932	In the Linux kernel, the following vulnerability has been resolved: Input: appletouch - initialize work before device r
CVE-2021-46937	In the Linux kernel, the following vulnerability has been resolved: mm/damon/dbgfs: fix 'struct pid' leaks in 'dbgfs_t
CVE-2021-46939	In the Linux kernel, the following vulnerability has been resolved: tracing: Restructure trace_clock_global() to never
CVE-2021-46960	In the Linux kernel, the following vulnerability has been resolved: cifs: Return correct error code from smb2_get_en

CVE-2021-46961	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3: Do not enable irqs when handling
CVE-2021-46963	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix crash in qla2xxx_mqueuecomm
CVE-2021-46972	In the Linux kernel, the following vulnerability has been resolved: ovl: fix leaked dentry Since commit 6815f479ca9
CVE-2021-46973	In the Linux kernel, the following vulnerability has been resolved: net: qrtr: Avoid potential use after free in MHI se
CVE-2021-46976	In the Linux kernel, the following vulnerability has been resolved: drm/i915: Fix crash in auto_retire The retire logic
CVE-2021-46984	In the Linux kernel, the following vulnerability has been resolved: kyber: fix out of bounds access when preempted
CVE-2021-46978	In the Linux kernel, the following vulnerability has been resolved: KVM: nVMX: Always make an attempt to map e
CVE-2021-46988	In the Linux kernel, the following vulnerability has been resolved: userfaultfd: release page in error path to avoid BU
CVE-2021-46997	In the Linux kernel, the following vulnerability has been resolved: arm64: entry: always set GIC_PRIO_PSR_I_SET
CVE-2021-46999	In the Linux kernel, the following vulnerability has been resolved: sctp: do asoc update earlier in sctp_sf_do_dupcoo
CVE-2021-47001	In the Linux kernel, the following vulnerability has been resolved: xprtrdma: Fix cwnd update ordering After a recor
CVE-2021-47003	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix potential null dereference o
CVE-2021-47011	In the Linux kernel, the following vulnerability has been resolved: mm: memcontrol: slab: fix obtain a reference to a
CVE-2021-47010	In the Linux kernel, the following vulnerability has been resolved: net: Only allow init netns to set default tcp cong t
CVE-2021-47012	In the Linux kernel, the following vulnerability has been resolved: RDMA/siw: Fix a use after free in siw_alloc_mr
CVE-2021-47014	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_ct: fix wild memory access when c
CVE-2021-47017	In the Linux kernel, the following vulnerability has been resolved: ath10k: Fix a use after free in ath10k_htc_send_b
CVE-2021-47018	In the Linux kernel, the following vulnerability has been resolved: powerpc/64: Fix the definition of the fixmap area
CVE-2021-47020	In the Linux kernel, the following vulnerability has been resolved: soundwire: stream: fix memory leak in stream cor
CVE-2021-47024	In the Linux kernel, the following vulnerability has been resolved: vsock/virtio: free queued packets when closing so
CVE-2021-47038	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: avoid deadlock between hci_dev->loc
CVE-2021-47036	In the Linux kernel, the following vulnerability has been resolved: udp: skip L4 aggregation for UDP tunnel packets
CVE-2021-47045	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix null pointer dereference in lpfc_pre
CVE-2021-47041	In the Linux kernel, the following vulnerability has been resolved: nvmet-tcp: fix incorrect locking in state_change s
CVE-2021-47069	In the Linux kernel, the following vulnerability has been resolved: ipc/mqueue, msg, sem: avoid relying on a stack re
CVE-2021-47070	In the Linux kernel, the following vulnerability has been resolved: uio_hv_generic: Fix another memory leak in erro
CVE-2021-47071	In the Linux kernel, the following vulnerability has been resolved: uio_hv_generic: Fix a memory leak in error handl
CVE-2021-47073	In the Linux kernel, the following vulnerability has been resolved: platform/x86: dell-smbios-wmi: Fix oops on rmm
CVE-2021-47074	In the Linux kernel, the following vulnerability has been resolved: nvme-loop: fix memory leak in nvme_loop_creat
CVE-2021-47075	In the Linux kernel, the following vulnerability has been resolved: nvmet: fix memory leak in nvmet_alloc_ctrl() WH
CVE-2021-47077	In the Linux kernel, the following vulnerability has been resolved: scsi: qedf: Add pointer checks in qedf_update_lin
CVE-2021-47078	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Clear all QP fields if creation failed
CVE-2021-47079	In the Linux kernel, the following vulnerability has been resolved: platform/x86: ideapad-laptop: fix a NULL pointer
CVE-2021-47092	In the Linux kernel, the following vulnerability has been resolved: KVM: VMX: Always clear vmx->fail on emulatio
CVE-2021-47094	In the Linux kernel, the following vulnerability has been resolved: KVM: x86/mmu: Don't advance iterator after rest
CVE-2021-47097	In the Linux kernel, the following vulnerability has been resolved: Input: elantech - fix stack out of bound access in
CVE-2021-47101	In the Linux kernel, the following vulnerability has been resolved: asix: fix uninit-value in asix_mdio_read() asix_re
CVE-2021-47103	In the Linux kernel, the following vulnerability has been resolved: inet: fully convert sk->sk_rx_dst to RCU rules sy
CVE-2021-47107	In the Linux kernel, the following vulnerability has been resolved: NFSD: Fix READDIR buffer overflow If a client
CVE-2021-47116	In the Linux kernel, the following vulnerability has been resolved: ext4: fix memory leak in ext4_mb_init_backend c

CVE-2021-47120	In the Linux kernel, the following vulnerability has been resolved: HID: magicmouse: fix NULL-deref on disconnect
CVE-2021-47133	In the Linux kernel, the following vulnerability has been resolved: HID: amd_sfh: Fix memory leak in amd_sfh_wor
CVE-2021-47134	In the Linux kernel, the following vulnerability has been resolved: efi/fdt: fix panic when no valid fdt found setup_a
CVE-2021-47136	In the Linux kernel, the following vulnerability has been resolved: net: zero-initialize tc skb extension on allocation
CVE-2021-47138	In the Linux kernel, the following vulnerability has been resolved: cxgb4: avoid accessing registers when clearing fi
CVE-2021-47140	In the Linux kernel, the following vulnerability has been resolved: iommu/amd: Clear DMA ops when switching dor
CVE-2021-47141	In the Linux kernel, the following vulnerability has been resolved: gve: Add NULL pointer checks when freeing irq
CVE-2021-47143	In the Linux kernel, the following vulnerability has been resolved: net/smc: remove device from smcd_dev_list after
CVE-2021-47144	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2021-47146	In the Linux kernel, the following vulnerability has been resolved: mld: fix panic in mld_newpack() mld_newpack()
CVE-2021-47149	In the Linux kernel, the following vulnerability has been resolved: net: fujitsu: fix potential null-ptr-deref In fmvj18
CVE-2021-47162	In the Linux kernel, the following vulnerability has been resolved: tipc: skb_linearize the head skb when reassemblin
CVE-2021-47163	In the Linux kernel, the following vulnerability has been resolved: tipc: wait and exit until all work queues are done
CVE-2021-47167	In the Linux kernel, the following vulnerability has been resolved: NFS: Fix an Oopsable condition in __nfs_pageio
CVE-2021-47168	In the Linux kernel, the following vulnerability has been resolved: NFS: fix an incorrect limit in filelayout_decode_l
CVE-2021-47170	In the Linux kernel, the following vulnerability has been resolved: USB: usbfs: Don't WARN about excessively larg
CVE-2021-47173	In the Linux kernel, the following vulnerability has been resolved: misc/uss720: fix memory leak in uss720_probe us
CVE-2021-47176	In the Linux kernel, the following vulnerability has been resolved: s390/dasd: add missing discipline function Fix cra
CVE-2021-47177	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Fix sysfs leak in alloc_iommu() iom
CVE-2021-47178	In the Linux kernel, the following vulnerability has been resolved: scsi: target: core: Avoid smp_processor_id() in pr
CVE-2021-47182	In the Linux kernel, the following vulnerability has been resolved: scsi: core: Fix scsi_mode_sense() buffer length ha
CVE-2021-47183	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix link down processing to address NU
CVE-2021-47191	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_debug: Fix out-of-bound read in resp_re
CVE-2021-47186	In the Linux kernel, the following vulnerability has been resolved: tipc: check for null after calling kmemdup kmem
CVE-2021-47194	In the Linux kernel, the following vulnerability has been resolved: cfg80211: call cfg80211_stop_ap when switch fro
CVE-2021-47196	In the Linux kernel, the following vulnerability has been resolved: RDMA/core: Set send and receive CQ before forw
CVE-2021-47198	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix use-after-free in lpfc_unreg_rpi() r
CVE-2021-47197	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: nullify cq->dbg pointer in mlx5_debu
CVE-2021-47199	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: CT, Fix multiple allocations and mem
CVE-2021-47201	In the Linux kernel, the following vulnerability has been resolved: iavf: free q_vectors before queues in iavf_disable
CVE-2021-47207	In the Linux kernel, the following vulnerability has been resolved: ALSA: gus: fix null pointer dereference on point
CVE-2021-47211	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: fix null pointer dereference on
CVE-2021-47210	In the Linux kernel, the following vulnerability has been resolved: usb: typec: tipd: Remove WARN_ON in tps6598
CVE-2021-47215	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: kTLS, Fix crash in RX resync flow Fo
CVE-2021-47217	In the Linux kernel, the following vulnerability has been resolved: x86/hyperv: Fix NULL deref in set_hv_tscchange
CVE-2021-47218	In the Linux kernel, the following vulnerability has been resolved: selinux: fix NULL-pointer dereference when has
CVE-2021-47219	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_debug: Fix out-of-bound read in resp_re
CVE-2021-47222	In the Linux kernel, the following vulnerability has been resolved: net: bridge: fix vlan tunnel dst refcnt when egress
CVE-2021-47223	In the Linux kernel, the following vulnerability has been resolved: net: bridge: fix vlan tunnel dst null pointer deref
CVE-2021-47225	In the Linux kernel, the following vulnerability has been resolved: mac80211: fix deadlock in AP/VLAN handling S

CVE-2021-47226	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Invalidate FPU state after a failed XRST
CVE-2021-47227	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Prevent state corruption in __fpu_restor
CVE-2021-47230	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Immediately reset the MMU context
CVE-2021-47236	In the Linux kernel, the following vulnerability has been resolved: net: cdc_eem: fix tx fixup skb leak when usbnet t
CVE-2021-47238	In the Linux kernel, the following vulnerability has been resolved: net: ipv4: fix memory leak in ip_mc_add1_src BL
CVE-2021-47239	In the Linux kernel, the following vulnerability has been resolved: net: usb: fix possible use-after-free in smsc75xx_
CVE-2021-47241	In the Linux kernel, the following vulnerability has been resolved: ethtool: strset: fix message length calculation Out
CVE-2021-47242	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix soft lookup in subflow_error_report()
CVE-2021-47243	In the Linux kernel, the following vulnerability has been resolved: sch_cake: Fix out of bounds when parsing TCP o
CVE-2021-47245	In the Linux kernel, the following vulnerability has been resolved: netfilter: synproxy: Fix out of bounds when parsin
CVE-2021-47246	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix page reclaim for dead peer hairpin
CVE-2021-47247	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix use-after-free of encap entry in nei
CVE-2021-47248	In the Linux kernel, the following vulnerability has been resolved: udp: fix race between close() and udp_abort() Ka
CVE-2021-47251	In the Linux kernel, the following vulnerability has been resolved: mac80211: fix skb length check in ieee80211_sca
CVE-2021-47250	In the Linux kernel, the following vulnerability has been resolved: net: ipv4: fix memory leak in netlbl_cipsov4_add
CVE-2021-47254	In the Linux kernel, the following vulnerability has been resolved: gfs2: Fix use-after-free in gfs2_glock_shrink_sca
CVE-2021-47255	In the Linux kernel, the following vulnerability has been resolved: kvm: LAPIC: Restore guard to prevent illegal AP
CVE-2021-47257	In the Linux kernel, the following vulnerability has been resolved: net: ieee802154: fix null deref in parse dev addr F
CVE-2021-47258	In the Linux kernel, the following vulnerability has been resolved: scsi: core: Fix error handling of scsi_host_alloc()
CVE-2021-47259	In the Linux kernel, the following vulnerability has been resolved: NFS: Fix use-after-free in nfs4_init_client() KAS
CVE-2021-47260	In the Linux kernel, the following vulnerability has been resolved: NFS: Fix a potential NULL dereference in nfs_ge
CVE-2021-47261	In the Linux kernel, the following vulnerability has been resolved: IB/mlx5: Fix initializing CQ fragments buffer Th
CVE-2021-47264	In the Linux kernel, the following vulnerability has been resolved: ASoC: core: Fix Null-point-dereference in fmt_si
CVE-2021-47265	In the Linux kernel, the following vulnerability has been resolved: RDMA: Verify port when creating flow rule Vali
CVE-2021-47262	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Ensure liveness of nested VM-Enter
CVE-2021-47266	In the Linux kernel, the following vulnerability has been resolved: RDMA/ipoib: Fix warning caused by destroying
CVE-2021-47276	In the Linux kernel, the following vulnerability has been resolved: ftrace: Do not blindly read the ip address in ftrace
CVE-2021-47277	In the Linux kernel, the following vulnerability has been resolved: kvm: avoid speculation-based attacks from out-of
CVE-2021-47281	In the Linux kernel, the following vulnerability has been resolved: ALSA: seq: Fix race of snd_seq_timer_open() Th
CVE-2021-47280	In the Linux kernel, the following vulnerability has been resolved: drm: Fix use-after-free read in drm_getunique() T
CVE-2021-47284	In the Linux kernel, the following vulnerability has been resolved: isdn: mISDN: netjet: Fix crash in nj_probe: 'nj_se
CVE-2021-47287	In the Linux kernel, the following vulnerability has been resolved: driver core: auxiliary bus: Fix memory leak when
CVE-2021-47289	In the Linux kernel, the following vulnerability has been resolved: ACPI: fix NULL pointer dereference Commit 71f
CVE-2021-47290	In the Linux kernel, the following vulnerability has been resolved: scsi: target: Fix NULL dereference on XCOPY co
CVE-2021-47295	In the Linux kernel, the following vulnerability has been resolved: net: sched: fix memory leak in tcindex_partial_de
CVE-2021-47293	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_skbmod: Skip non-Ethernet packet
CVE-2021-47298	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix potential memory leak on unlik
CVE-2021-47301	In the Linux kernel, the following vulnerability has been resolved: igb: Fix use-after-free error during reset Cleans th
CVE-2021-47302	In the Linux kernel, the following vulnerability has been resolved: igc: Fix use-after-free error during reset Cleans th
CVE-2021-47304	In the Linux kernel, the following vulnerability has been resolved: tcp: fix tcp_init_transfer() to not reset icsk_ca_ini

CVE-2021-47303	In the Linux kernel, the following vulnerability has been resolved: bpf: Track subprog poke descriptors correctly and
CVE-2021-47305	In the Linux kernel, the following vulnerability has been resolved: dma-buf/sync_file: Don't leak fences on merge fa
CVE-2021-47307	In the Linux kernel, the following vulnerability has been resolved: cifs: prevent NULL deref in cifs_compose_moun
CVE-2021-47308	In the Linux kernel, the following vulnerability has been resolved: scsi: libfc: Fix array index out of bound exception
CVE-2021-47310	In the Linux kernel, the following vulnerability has been resolved: net: ti: fix UAF in tlan_remove_one priv is netdev
CVE-2021-47311	In the Linux kernel, the following vulnerability has been resolved: net: qcom/emac: fix UAF in emac_remove_adpt is
CVE-2021-47313	In the Linux kernel, the following vulnerability has been resolved: cpufreq: CPPC: Fix potential memleak in cppc_cp
CVE-2021-47316	In the Linux kernel, the following vulnerability has been resolved: nfsd: fix NULL dereference in nfs3svc_encode_g
CVE-2021-47317	In the Linux kernel, the following vulnerability has been resolved: powerpc/bpf: Fix detecting BPF atomic instructio
CVE-2021-47319	In the Linux kernel, the following vulnerability has been resolved: virtio-blk: Fix memory leak among suspend/resur
CVE-2021-47320	In the Linux kernel, the following vulnerability has been resolved: nfs: fix acl memory leak of posix_acl_create() W
CVE-2021-47321	In the Linux kernel, the following vulnerability has been resolved: watchdog: Fix possible use-after-free by calling d
CVE-2021-47322	In the Linux kernel, the following vulnerability has been resolved: NFSv4: Fix an Oops in pnfs_mark_request_commn
CVE-2021-47325	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: Fix arm_smmu_device refcou
CVE-2021-47327	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: Fix arm_smmu_device refcou
CVE-2021-47332	In the Linux kernel, the following vulnerability has been resolved: ALSA: usx2y: Don't call free_pages_exact() with
CVE-2021-47333	In the Linux kernel, the following vulnerability has been resolved: misc: alcor_pci: fix null-ptr-deref when there is n
CVE-2021-47338	In the Linux kernel, the following vulnerability has been resolved: fbmem: Do not delete the mode that is still in use
CVE-2021-47339	In the Linux kernel, the following vulnerability has been resolved: media: v4l2-core: explicitly clear ioctl input data
CVE-2021-47342	In the Linux kernel, the following vulnerability has been resolved: ext4: fix possible UAF when remounting r/o a m
CVE-2021-47349	In the Linux kernel, the following vulnerability has been resolved: mwifiex: bring down link before deleting interfac
CVE-2021-47343	In the Linux kernel, the following vulnerability has been resolved: dm btree remove: assign new_root only when rem
CVE-2021-47350	In the Linux kernel, the following vulnerability has been resolved: powerpc/mm: Fix lockup on kernel exec fault The
CVE-2021-47352	In the Linux kernel, the following vulnerability has been resolved: virtio-net: Add validation for used length This ad
CVE-2021-47353	In the Linux kernel, the following vulnerability has been resolved: udf: Fix NULL pointer dereference in udf_symlin
CVE-2021-47356	In the Linux kernel, the following vulnerability has been resolved: mISDN: fix possible use-after-free in HFC_clean
CVE-2021-47359	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix soft lockup during fsstress Below traces
CVE-2021-47360	In the Linux kernel, the following vulnerability has been resolved: binder: make sure fd closes complete During BC
CVE-2021-47367	In the Linux kernel, the following vulnerability has been resolved: virtio-net: fix pages leaking when building skb in
CVE-2021-47370	In the Linux kernel, the following vulnerability has been resolved: mptcp: ensure tx skbs always have the MPTCP ex
CVE-2021-47374	In the Linux kernel, the following vulnerability has been resolved: dma-debug: prevent an error message from causin
CVE-2021-47376	In the Linux kernel, the following vulnerability has been resolved: bpf: Add oversize check before call kvccalloc() Co
CVE-2021-47380	In the Linux kernel, the following vulnerability has been resolved: HID: amd_sfh: Fix potential NULL pointer deref
CVE-2021-47373	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3-its: Fix potential VPE leak on erro
CVE-2021-47381	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Fix DSP oops stack dump output co
CVE-2021-47383	In the Linux kernel, the following vulnerability has been resolved: tty: Fix out-of-bound vmalloc access in imageblit
CVE-2021-47384	In the Linux kernel, the following vulnerability has been resolved: hwmon: (w83793) Fix NULL pointer dereference
CVE-2021-47386	In the Linux kernel, the following vulnerability has been resolved: hwmon: (w83791d) Fix NULL pointer dereference
CVE-2021-47385	In the Linux kernel, the following vulnerability has been resolved: hwmon: (w83792d) Fix NULL pointer dereference
CVE-2021-47387	In the Linux kernel, the following vulnerability has been resolved: cpufreq: schedutil: Use kobject release() method t

CVE-2021-47388	In the Linux kernel, the following vulnerability has been resolved: mac80211: fix use-after-free in CCMP/GCMP R2
CVE-2021-47389	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: fix missing sev_decommission in sev
CVE-2021-47395	In the Linux kernel, the following vulnerability has been resolved: mac80211: limit injected vht mcs/nss in ieee80211
CVE-2021-47393	In the Linux kernel, the following vulnerability has been resolved: hwmon: (mlxreg-fan) Return non-zero value whe
CVE-2021-47397	In the Linux kernel, the following vulnerability has been resolved: sctp: break out if skb_header_pointer returns NU
CVE-2021-47398	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Fix kernel pointer leak Pointers sho
CVE-2021-47404	In the Linux kernel, the following vulnerability has been resolved: HID: betop: fix slab-out-of-bounds Write in betop
CVE-2021-47407	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Handle SRCU initialization failure du
CVE-2021-47408	In the Linux kernel, the following vulnerability has been resolved: netfilter: conntrack: serialize hash resizes and clea
CVE-2021-47412	In the Linux kernel, the following vulnerability has been resolved: block: don't call rq_qos_ops->done_bio if the bio
CVE-2021-47413	In the Linux kernel, the following vulnerability has been resolved: usb: chipidea: ci_hdrc_imx: Also search for 'phys
CVE-2021-47415	In the Linux kernel, the following vulnerability has been resolved: iwlfwifi: mvmm: Fix possible NULL dereference In
CVE-2021-47416	In the Linux kernel, the following vulnerability has been resolved: phy: mdio: fix memory leak Syzbot reported mem
CVE-2021-47419	In the Linux kernel, the following vulnerability has been resolved: net/sched: sch_taprio: properly cancel timer from
CVE-2021-47420	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: fix a potential ttm->sg memory leak
CVE-2021-47421	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: handle the case of pci_channel_io_
CVE-2021-47424	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix freeing of uninitialized misc IRQ vector
CVE-2021-47426	In the Linux kernel, the following vulnerability has been resolved: bpf, s390: Fix potential memory leak about jit_da
CVE-2021-47427	In the Linux kernel, the following vulnerability has been resolved: scsi: iscsi: Fix iscsi_task use after free Commit d3
CVE-2021-47431	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix gart.bo pin_count leak gmc_v{9
CVE-2021-47432	In the Linux kernel, the following vulnerability has been resolved: lib/generic-radix-tree.c: Don't overflow in peek()
CVE-2021-47438	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix memory leak in mlx5_core_destro
CVE-2021-47441	In the Linux kernel, the following vulnerability has been resolved: mlxsw: thermal: Fix out-of-bounds memory acces
CVE-2021-47449	In the Linux kernel, the following vulnerability has been resolved: ice: fix locking for Tx timestamp tracking flush C
CVE-2021-47452	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: skip netdev events generated
CVE-2021-47453	In the Linux kernel, the following vulnerability has been resolved: ice: Avoid crash from unnecessary IDA free In th
CVE-2021-47455	In the Linux kernel, the following vulnerability has been resolved: ptp: Fix possible memory leak in ptp_clock_regis
CVE-2021-47456	In the Linux kernel, the following vulnerability has been resolved: can: peak_pci: peak_pci_remove(): fix UAF Whe
CVE-2021-47461	In the Linux kernel, the following vulnerability has been resolved: userfaultfd: fix a race between writeprotect and e
CVE-2021-47462	In the Linux kernel, the following vulnerability has been resolved: mm/mempolicy: do not allow illegal MPOL_F_N
CVE-2021-47464	In the Linux kernel, the following vulnerability has been resolved: audit: fix possible null-pointer dereference in aud
CVE-2021-47465	In the Linux kernel, the following vulnerability has been resolved: KVM: PPC: Book3S HV: Fix stack handling in ic
CVE-2021-47466	In the Linux kernel, the following vulnerability has been resolved: mm, slub: fix potential memoryleak in kmem_cac
CVE-2021-47468	In the Linux kernel, the following vulnerability has been resolved: isdn: mISDN: Fix sleeping function called from in
CVE-2021-47469	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2021-47481	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Initialize the ODP xarray when cre
CVE-2021-47483	In the Linux kernel, the following vulnerability has been resolved: regmap: Fix possible double-free in regcache_rbt
CVE-2021-47488	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2021-47490	In the Linux kernel, the following vulnerability has been resolved: drm/ttm: fix memleak in ttm_transferred_destroy
CVE-2021-47491	In the Linux kernel, the following vulnerability has been resolved: mm: khugepaged: skip huge page collapse for spe

CVE-2021-47492	In the Linux kernel, the following vulnerability has been resolved: mm, thp: bail out early in collapse_file for writeb
CVE-2021-47494	In the Linux kernel, the following vulnerability has been resolved: cfg80211: fix management registrations locking T
CVE-2021-47495	In the Linux kernel, the following vulnerability has been resolved: usbnet: sanity check for maxpacket maxpacket of
CVE-2021-47496	In the Linux kernel, the following vulnerability has been resolved: net/tls: Fix flipped sign in tls_err_abort() calls sk-
CVE-2021-47506	In the Linux kernel, the following vulnerability has been resolved: nfsd: fix use-after-free due to delegation race A d
CVE-2021-47507	In the Linux kernel, the following vulnerability has been resolved: nfsd: Fix nfsd startup race (again) Commit bd5ae
CVE-2021-47497	In the Linux kernel, the following vulnerability has been resolved: nvmmem: Fix shift-out-of-bound (UBSAN) with by
CVE-2021-47517	In the Linux kernel, the following vulnerability has been resolved: ethtool: do not perform operations on net devices
CVE-2021-47514	In the Linux kernel, the following vulnerability has been resolved: devlink: fix netns refcount leak in devlink_nl_cm
CVE-2021-47527	In the Linux kernel, the following vulnerability has been resolved: serial: core: fix transmit-buffer reset and memleak
CVE-2021-47529	In the Linux kernel, the following vulnerability has been resolved: iwlfwifi: Fix memory leaks in error handling path
CVE-2021-47536	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix wrong list_del in smc_lgr_cleanup_e
CVE-2021-47548	In the Linux kernel, the following vulnerability has been resolved: ethernet: hisilicon: hns: hns_dsaf_misc: fix a poss
CVE-2021-47550	In the Linux kernel, the following vulnerability has been resolved: drm/amd/amdgpu: fix potential memleak In funct
CVE-2021-47552	In the Linux kernel, the following vulnerability has been resolved: blk-mq: cancel blk-mq dispatch work in both blk_
CVE-2021-47554	In the Linux kernel, the following vulnerability has been resolved: vdpa_sim: avoid putting an uninitialized iova_dor
CVE-2021-47557	In the Linux kernel, the following vulnerability has been resolved: net/sched: sch_ets: don't peek at classes beyond 'r
CVE-2021-47558	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: Disable Tx queues when reconfiguri
CVE-2021-47559	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix NULL pointer dereferencing in smc_
CVE-2021-47560	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum: Protect driver from buggy firm
CVE-2021-47562	In the Linux kernel, the following vulnerability has been resolved: ice: fix vsi->txq_map sizing The approach of hav
CVE-2021-47565	In the Linux kernel, the following vulnerability has been resolved: scsi: mpt3sas: Fix kernel panic during drive powe
CVE-2021-47563	In the Linux kernel, the following vulnerability has been resolved: ice: avoid bpf_prog refcount underflow Ice driver
CVE-2021-47566	In the Linux kernel, the following vulnerability has been resolved: proc/vmcore: fix clearing user buffer by properly
CVE-2021-47576	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_debug: Sanity check block descriptor le
CVE-2021-47582	In the Linux kernel, the following vulnerability has been resolved: USB: core: Make do_proc_control() and do_proc
CVE-2021-47579	In the Linux kernel, the following vulnerability has been resolved: ovl: fix warning in ovl_create_real() Syzbot trigge
CVE-2021-47578	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_debug: Don't call kcalloc() if size arg is
CVE-2021-47588	In the Linux kernel, the following vulnerability has been resolved: sit: do not call ipip6_dev_free() from sit_init_net
CVE-2021-47591	In the Linux kernel, the following vulnerability has been resolved: mptcp: remove tcp ulp setsockopt support TCP_U
CVE-2021-47595	In the Linux kernel, the following vulnerability has been resolved: net/sched: sch_ets: don't remove idle classes from
CVE-2021-47594	In the Linux kernel, the following vulnerability has been resolved: mptcp: never allow the PM to close a listener sub
CVE-2021-47597	In the Linux kernel, the following vulnerability has been resolved: inet_diag: fix kernel-infoleak for UDP sockets KB
CVE-2021-47600	In the Linux kernel, the following vulnerability has been resolved: dm btree remove: fix use after free in rebalance_c
CVE-2021-47606	In the Linux kernel, the following vulnerability has been resolved: net: netlink: af_netlink: Prevent empty skb by ad
CVE-2021-47603	In the Linux kernel, the following vulnerability has been resolved: audit: improve robustness of the audit queue han
CVE-2021-47607	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix kernel address leakage in atomic cmpxch
CVE-2021-47608	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix kernel address leakage in atomic fetch T
CVE-2021-47609	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scpi: Fix string overflow in SCPI
CVE-2021-47615	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.

CVE-2021-47616	In the Linux kernel, the following vulnerability has been resolved: RDMA: Fix use-after-free in rxe_queue_cleanup
CVE-2021-47617	In the Linux kernel, the following vulnerability has been resolved: PCI: pciehp: Fix infinite loop in IRQ handler upon
CVE-2021-47619	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix queues reservation for XDP When XDP
CVE-2021-47620	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: refactor malicious adv data check Che
CVE-2021-47623	In the Linux kernel, the following vulnerability has been resolved: powerpc/fixmap: Fix VM debug warning on unm
CVE-2021-47624	In the Linux kernel, the following vulnerability has been resolved: net/sunrpc: fix reference count leaks in rpc_sysfs_
CVE-2021-47634	In the Linux kernel, the following vulnerability has been resolved: ubi: Fix race condition between ctrl_cdev_ioctl and
CVE-2021-47639	In the Linux kernel, the following vulnerability has been resolved: KVM: x86/mmu: Zap _all_ roots when unmapping
CVE-2021-47646	In the Linux kernel, the following vulnerability has been resolved: Revert "Revert "block, bfq: honor already-setup q
CVE-2021-47650	In the Linux kernel, the following vulnerability has been resolved: ASoC: soc-compress: prevent the potentially use
CVE-2021-47657	In the Linux kernel, the following vulnerability has been resolved: drm/virtio: Ensure that objs is not NULL in virtio
CVE-2021-47658	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: fix a potential gpu_metrics_table m
CVE-2021-47659	In the Linux kernel, the following vulnerability has been resolved: drm/plane: Move range check for format_count e
CVE-2021-47668	In the Linux kernel, the following vulnerability has been resolved: can: dev: can_restart: fix use after free bug After
CVE-2021-47670	In the Linux kernel, the following vulnerability has been resolved: can: peak_usb: fix use after free bugs After callin
CVE-2022-0171	A flaw was found in the Linux kernel. The existing KVM SEV API has a vulnerability that allows a non-root (host)

CVE-2022-2097	AES OCB mode for 32-bit x86 platforms using the AES-NI assembly optimised implementation will not encrypt the
CVE-2022-2124	Buffer Over-read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2125	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 8.2.
CVE-2022-2126	Out-of-bounds Read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2129	Out-of-bounds Write in GitHub repository vim/vim prior to 8.2.
CVE-2022-2175	Buffer Over-read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2182	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 8.2.
CVE-2022-2183	Out-of-bounds Read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2206	Out-of-bounds Read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2207	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 8.2.
CVE-2022-2208	NULL Pointer Dereference in GitHub repository vim/vim prior to 8.2.5163.
CVE-2022-2210	Out-of-bounds Write in GitHub repository vim/vim prior to 8.2.
CVE-2022-2255	A vulnerability was found in mod_wsgi. The X-Client-IP header is not removed from a request from an untrusted pr
CVE-2022-22576	An improper authentication vulnerability exists in curl 7.33.0 to and including 7.82.0 which might allow reuse OAU
CVE-2022-22815	path_getbbox in path.c in Pillow before 9.0.0 improperly initializes ImagePath.Path.
CVE-2022-22816	path_getbbox in path.c in Pillow before 9.0.0 has a buffer over-read during initialization of ImagePath.Path.
CVE-2022-22817	PIL.ImageMath.eval in Pillow before 9.0.0 allows evaluation of arbitrary expressions, such as ones that use the Pyth
CVE-2022-2284	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.
CVE-2022-2286	Out-of-bounds Read in GitHub repository vim/vim prior to 9.0.
CVE-2022-2285	Integer Overflow or Wraparound in GitHub repository vim/vim prior to 9.0.
CVE-2022-2287	Out-of-bounds Read in GitHub repository vim/vim prior to 9.0.
CVE-2022-23218	The deprecated compatibility function svcunix_create in the sunrpc module of the GNU C Library (aka glibc) throug
CVE-2022-23219	The deprecated compatibility function clnt_create in the sunrpc module of the GNU C Library (aka glibc) through 2.
CVE-2022-2343	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0044.
CVE-2022-2344	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0045.
CVE-2022-23990	Expat (aka libexpat) before 2.4.4 has an integer overflow in the doProlog function.
CVE-2022-2345	Use After Free in GitHub repository vim/vim prior to 9.0.0046.
CVE-2022-24303	Pillow before 9.0.1 allows attackers to delete files because spaces in temporary pathnames are mishandled.

CVE-2022-24407	In Cyrus SASL 2.1.17 through 2.1.27 before 2.1.28, plugins/sql.c does not escape the password for a SQL INSERT c
CVE-2022-24329	In JetBrains Kotlin before 1.6.0, it was not possible to lock dependencies for Multiplatform Gradle Projects.
CVE-2022-24758	The Jupyter notebook is a web-based notebook environment for interactive computing. Prior to version 6.4.9, unauth
CVE-2022-24795	yajl-ruby is a C binding to the YAJL JSON parsing and generation library. The 1.x branch and the 2.x branch of `yajl
CVE-2022-24769	Moby is an open-source project created by Docker to enable and accelerate software containerization. A bug was fou
CVE-2022-24823	Netty is an open-source, asynchronous event-driven network application framework. The package `io.netty:netty-coo
CVE-2022-2509	A vulnerability found in gnutils. This security flaw happens because of a double free error occurs during verification
CVE-2022-2522	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0061.
CVE-2022-25836	Bluetooth® Low Energy Pairing in Bluetooth Core Specification v4.0 through v5.3 may permit an unauthenticated M
CVE-2022-2526	A use-after-free vulnerability was found in systemd. This issue occurs due to the on_stream_io() function and dns_st
CVE-2022-2625	A vulnerability was found in PostgreSQL. This attack requires permission to create non-temporary objects in at least
CVE-2022-27664	In net/http in Go before 1.18.6 and 1.19.x before 1.19.1, attackers can cause a denial of service because an HTTP/2 c
CVE-2022-27774	An insufficiently protected credentials vulnerability exists in curl 4.9 to and include curl 7.82.0 are affected that coul

CVE-2022-40755	JasPer 3.0.6 allows denial of service via a reachable assertion in the function inttobits in libjasper/base/jas_image.c.
CVE-2022-40897	Python Packaging Authority (PyPA) setuptools before 65.5.1 allows remote attackers to cause a denial of service via
CVE-2022-40898	An issue discovered in Python Packaging Authority (PyPA) Wheel 0.37.1 and earlier allows remote attackers to caus
CVE-2022-41404	An issue in the fetch() method in the BasicProfile class of org.ini4j through version v0.5.4 allows attackers to cause
CVE-2022-41409	Integer overflow vulnerability in pcre2test before 10.41 allows attackers to cause a denial of service or other unspeci
CVE-2022-41715	Programs which compile regular expressions from untrusted sources may be vulnerable to memory exhaustion or de
CVE-2022-41716	Due to unsanitized NUL values, attackers may be able to maliciously set environment variables on Windows. In sys
CVE-2022-41717	An attacker can cause excessive memory growth in a Go server accepting HTTP/2 requests. HTTP/2 server connecti
CVE-2022-41720	On Windows, restricted files can be accessed via os.DirFS and http.Dir. The os.DirFS function and http.Dir type pro
CVE-2022-41721	A request smuggling attack is possible when using MaxBytesHandler. When using MaxBytesHandler, the body of an
CVE-2022-41723	A maliciously crafted HTTP/2 stream could cause excessive CPU consumption in the HPACK decoder, sufficient to
CVE-2022-41722	A path traversal vulnerability exists in filepath.Clean on Windows. On Windows, the filepath.Clean function could t
CVE-2022-41724	Large handshake records may cause panics in crypto/tls. Both clients and servers may send large TLS handshake rec
CVE-2022-41725	A denial of service is possible from excessive resource consumption in net/http and mime/multipart. Multipart form
CVE-2022-41848	drivers/char/pcmcia/synclink_cs.c in the Linux kernel through 5.19.12 has a race condition and resultant use-after-fre
CVE-2022-41850	roccat_report_event in drivers/hid/hid-roccat.c in the Linux kernel through 5.19.12 has a race condition and resultant
CVE-2022-41862	In PostgreSQL, a modified, unauthenticated server can send an unterminated string during the establishment of Kerb
CVE-2022-42003	In FasterXML jackson-databind before versions 2.13.4.1 and 2.12.17.1, resource exhaustion can occur because of a l
CVE-2022-42004	In FasterXML jackson-databind before 2.13.4, resource exhaustion can occur because of a lack of a check in BeanDe
CVE-2022-42011	An issue was discovered in D-Bus before 1.12.24, 1.13.x and 1.14.x before 1.14.4, and 1.15.x before 1.15.2. An auth
CVE-2022-42010	An issue was discovered in D-Bus before 1.12.24, 1.13.x and 1.14.x before 1.14.4, and 1.15.x before 1.15.2. An auth
CVE-2022-42898	PAC parsing in MIT Kerberos 5 (aka krb5) before 1.19.4 and 1.20.x before 1.20.1 has integer overflows that may lea
CVE-2022-42012	An issue was discovered in D-Bus before 1.12.24, 1.13.x and 1.14.x before 1.14.4, and 1.15.x before 1.15.2. An auth
CVE-2022-4292	Use After Free in GitHub repository vim/vim prior to 9.0.0882.
CVE-2022-4293	Floating Point Comparison with Incorrect Operator in GitHub repository vim/vim prior to 9.0.0804.
CVE-2022-4304	A timing based side channel exists in the OpenSSL RSA Decryption implementation which could be sufficient to rec
CVE-2022-43552	A use after free vulnerability exists in curl <7.87.0. Curl can be asked to *tunnel* virtually all protocols it supports t
CVE-2022-44032	An issue was discovered in the Linux kernel through 6.0.6. drivers/char/pcmcia/cm4000_cs.c has a race condition an

CVE-2022-44033	An issue was discovered in the Linux kernel through 6.0.6. drivers/char/pcmcia/cm4040_cs.c has a race condition and
CVE-2022-44034	An issue was discovered in the Linux kernel through 6.0.6. drivers/char/pcmcia/scr24x_cs.c has a race condition and
CVE-2022-4415	A vulnerability was found in systemd. This security flaw can cause a local information leak due to systemd-coredump
CVE-2022-4450	The function PEM_read_bio_ex() reads a PEM file from a BIO and parses and decodes the "name" (e.g. "CERTIFIC
CVE-2022-44840	Heap buffer overflow vulnerability in binutils readelf before 2.40 via function find_section_in_set in file readelf.c.
CVE-2022-45061	An issue was discovered in Python before 3.11.1. An unnecessary quadratic algorithm exists in one path when proces
CVE-2022-45198	Pillow before 9.2.0 performs Improper Handling of Highly Compressed GIF Data (Data Amplification).
CVE-2022-45199	Pillow before 9.3.0 allows denial of service via SAMPLESPERPIXEL.
CVE-2022-4543	A flaw named "EntryBleed" was found in the Linux Kernel Page Table Isolation (KPTI). This issue could allow a lo
CVE-2022-45885	An issue was discovered in the Linux kernel through 6.0.9. drivers/media/dvb-core/dvb_frontend.c has a race conditi
CVE-2022-45888	An issue was discovered in the Linux kernel through 6.0.9. drivers/char/xillybus/xillyusb.c has a race condition and
CVE-2022-45939	GNU Emacs through 28.2 allows attackers to execute commands via shell metacharacters in the name of a source-co
CVE-2022-46337	A cleverly devised username might bypass LDAP authentication checks. In LDAP-authenticated Derby installations
CVE-2022-46908	SQLite through 3.40.0, when relying on --safe for execution of an untrusted CLI script, does not properly implement
CVE-2022-47007	An issue was discovered function stab_demangle_v3_arg in stabs.c in Binutils 2.34 thru 2.38, allows attackers to cau
CVE-2022-47008	An issue was discovered function make_tmpdir, and make_tmpname in bucomm.c in Binutils 2.34 thru 2.38, allow
CVE-2022-47010	An issue was discovered function pr_function_type in prdbg.c in Binutils 2.34 thru 2.38, allows attackers to cause a
CVE-2022-47011	An issue was discovered function parse_stab_struct_fields in stabs.c in Binutils 2.34 thru 2.38, allows attackers to ca
CVE-2022-48064	GNU Binutils before 2.40 was discovered to contain an excessive memory consumption vulnerability via the function
CVE-2022-48303	GNU Tar through 1.34 has a one-byte out-of-bounds read that results in use of uninitialized memory for a conditiona
CVE-2022-48337	GNU Emacs through 28.2 allows attackers to execute commands via shell metacharacters in the name of a source-co
CVE-2022-48338	An issue was discovered in GNU Emacs through 28.2. In ruby-mode.el, the ruby-find-library-file function has a loca
CVE-2022-48339	An issue was discovered in GNU Emacs through 28.2. htmlfontify.el has a command injection vulnerability. In the h
CVE-2022-48560	A use-after-free exists in Python through 3.9 via heappushpop in heapq.
CVE-2022-48564	read_ints in plistlib.py in Python through 3.9.1 is vulnerable to a potential DoS attack via CPU and RAM exhaustion
CVE-2022-48565	An XML External Entity (XXE) issue was discovered in Python through 3.9.1. The plistlib module no longer accept
CVE-2022-48619	An issue was discovered in drivers/input/input.c in the Linux kernel before 5.17.10. An attacker can cause a denial o
CVE-2022-48628	In the Linux kernel, the following vulnerability has been resolved: ceph: drop messages from MDS when unmounting
CVE-2022-48631	In the Linux kernel, the following vulnerability has been resolved: ext4: fix bug in extents parsing when eh_entries =
CVE-2022-48632	In the Linux kernel, the following vulnerability has been resolved: i2c: mlxbf: prevent stack overflow in mlxbf_i2c_
CVE-2022-48633	In the Linux kernel, the following vulnerability has been resolved: drm/gma500: Fix WARN_ON(lock->magic != lo
CVE-2022-48634	In the Linux kernel, the following vulnerability has been resolved: drm/gma500: Fix BUG: sleeping function called
CVE-2022-48635	In the Linux kernel, the following vulnerability has been resolved: fsdax: Fix infinite loop in dax_iomap_rw() I got a
CVE-2022-48637	In the Linux kernel, the following vulnerability has been resolved: bnxt: prevent skb UAF after handing over to PTP
CVE-2022-48638	In the Linux kernel, the following vulnerability has been resolved: cgroup: cgroup_get_from_id() must check the loc
CVE-2022-48639	In the Linux kernel, the following vulnerability has been resolved: net: sched: fix possible refcount leak in tc_new_t
CVE-2022-48643	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: fix nft_counters_enabled unde
CVE-2022-48641	In the Linux kernel, the following vulnerability has been resolved: netfilter: ebtables: fix memory leak when blob is
CVE-2022-48640	In the Linux kernel, the following vulnerability has been resolved: bonding: fix NULL deref in bond_rr_gen_slave_i
CVE-2022-48646	In the Linux kernel, the following vulnerability has been resolved: sfc/siena: fix null pointer dereference in efx_har

CVE-2022-48647	In the Linux kernel, the following vulnerability has been resolved: sfc: fix TX channel offset when using legacy inter
CVE-2022-48651	In the Linux kernel, the following vulnerability has been resolved: ipvlan: Fix out-of-bound bugs caused by unset sk
CVE-2022-48648	In the Linux kernel, the following vulnerability has been resolved: sfc: fix null pointer dereference in efx_hard_start
CVE-2022-48652	In the Linux kernel, the following vulnerability has been resolved: ice: Fix crash by keep old cfg when update TCs m
CVE-2022-48653	In the Linux kernel, the following vulnerability has been resolved: ice: Don't double unplug aux on peer initiated res
CVE-2022-48658	In the Linux kernel, the following vulnerability has been resolved: mm: slub: fix flush_cpu_slab()/__free_slab() inv
CVE-2022-48659	In the Linux kernel, the following vulnerability has been resolved: mm/slub: fix to return errno if kcalloc() fails in c
CVE-2022-48662	In the Linux kernel, the following vulnerability has been resolved: drm/i915/gem: Really move i915_gem_context.li
CVE-2022-48666	In the Linux kernel, the following vulnerability has been resolved: scsi: core: Fix a use-after-free There are two .exit
CVE-2022-48667	In the Linux kernel, the following vulnerability has been resolved: smb3: fix temporary data corruption in insert rang
CVE-2022-48668	In the Linux kernel, the following vulnerability has been resolved: smb3: fix temporary data corruption in collapse r
CVE-2022-48673	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix possible access to freed memory in l
CVE-2022-48672	In the Linux kernel, the following vulnerability has been resolved: of: fdt: fix off-by-one error in unflatten_dt_nodes
CVE-2022-48686	In the Linux kernel, the following vulnerability has been resolved: nvme-tcp: fix UAF when detecting digest errors V
CVE-2022-48687	In the Linux kernel, the following vulnerability has been resolved: ipv6: sr: fix out-of-bounds read when setting HM
CVE-2022-48690	In the Linux kernel, the following vulnerability has been resolved: ice: Fix DMA mappings leak Fix leak, when user
CVE-2022-48691	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: clean up hook list when offloa
CVE-2022-48694	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Fix drain SQ hang with no comple
CVE-2022-48696	In the Linux kernel, the following vulnerability has been resolved: regmap: spi: Reserve space for register address/pa
CVE-2022-48697	In the Linux kernel, the following vulnerability has been resolved: nvmet: fix a use-after-free Fix the following use-a
CVE-2022-48701	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Fix an out-of-bounds bug in __
CVE-2022-48703	In the Linux kernel, the following vulnerability has been resolved: thermal/int340x_thermal: handle data_vault when
CVE-2022-48702	In the Linux kernel, the following vulnerability has been resolved: ALSA: emu10k1: Fix out of bounds access in snd
CVE-2022-48705	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7921e: fix crash in chip reset fail In
CVE-2022-48704	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: add a force flush to delay work when
CVE-2022-48706	In the Linux kernel, the following vulnerability has been resolved: vdpa: ifcvf: Do proper cleanup if IFCVF init fails
CVE-2022-48709	In the Linux kernel, the following vulnerability has been resolved: ice: switch: fix potential memleak in ice_add_adv
CVE-2022-48710	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: fix a possible null pointer dereferenc
CVE-2022-48711	In the Linux kernel, the following vulnerability has been resolved: tipc: improve size validations for received domain
CVE-2022-48713	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel/pt: Fix crash with stop filters in sin
CVE-2022-48714	In the Linux kernel, the following vulnerability has been resolved: bpf: Use VM_MAP instead of VM_ALLOC for r
CVE-2022-48715	In the Linux kernel, the following vulnerability has been resolved: scsi: bnx2fc: Make bnx2fc_recv_frame() mp safe
CVE-2022-48721	In the Linux kernel, the following vulnerability has been resolved: net/smc: Forward wakeup to smc socket waitque
CVE-2022-48724	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Fix potential memory leak in intel_s
CVE-2022-48725	In the Linux kernel, the following vulnerability has been resolved: RDMA/siw: Fix refcounting leak in siw_create_q
CVE-2022-48728	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Fix AIP early init panic An early failure
CVE-2022-48729	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Fix panic with larger ipoib send_queue_s
CVE-2022-48730	In the Linux kernel, the following vulnerability has been resolved: dma-buf: heaps: Fix potential spectre v1 gadget It
CVE-2022-48731	In the Linux kernel, the following vulnerability has been resolved: mm/kmemleak: avoid scanning potential huge ho
CVE-2022-48732	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau: fix off by one in BIOS boundary ch

CVE-2022-48735	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: Fix UAF of leds class devs at unbind
CVE-2022-48736	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-48737	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-48743	In the Linux kernel, the following vulnerability has been resolved: net: amd-xgbe: Fix skb data length underflow The
CVE-2022-48744	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Avoid field-overflowing memcpy() In
CVE-2022-48745	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Use del_timer_sync in fw reset flow of
CVE-2022-48747	In the Linux kernel, the following vulnerability has been resolved: block: Fix wrong offset in bio_truncate() bio_trun
CVE-2022-48746	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix handling of wrong devices during
CVE-2022-48748	In the Linux kernel, the following vulnerability has been resolved: net: bridge: vlan: fix memory leak in __allowed_i
CVE-2022-48751	In the Linux kernel, the following vulnerability has been resolved: net/smc: Transitional solution for clcsock race iss
CVE-2022-48752	In the Linux kernel, the following vulnerability has been resolved: powerpc/perf: Fix power_pmu_disable to call clea
CVE-2022-48755	In the Linux kernel, the following vulnerability has been resolved: powerpc64/bpf: Limit 'ldbrx' to processors compl
CVE-2022-48754	In the Linux kernel, the following vulnerability has been resolved: phylib: fix potential use-after-free Commit bafbd
CVE-2022-48758	In the Linux kernel, the following vulnerability has been resolved: scsi: bnx2fc: Flush destroy_work queue before ca
CVE-2022-48757	In the Linux kernel, the following vulnerability has been resolved: net: fix information leakage in /proc/net/ptype In
CVE-2022-48760	In the Linux kernel, the following vulnerability has been resolved: USB: core: Fix hang in usb_kill_urb by adding m
CVE-2022-48763	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Forcibly leave nested virt when SMM
CVE-2022-48761	In the Linux kernel, the following vulnerability has been resolved: usb: xhci-plat: fix crash when suspend if remote v
CVE-2022-48764	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Free kvm_cpuid_entry2 array on post
CVE-2022-48766	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Wrap dcn301_calculate_wm_ar
CVE-2022-48767	In the Linux kernel, the following vulnerability has been resolved: ceph: properly put ceph_string reference after asy
CVE-2022-48769	In the Linux kernel, the following vulnerability has been resolved: efi: runtime: avoid EFIv2 runtime services on Ap
CVE-2022-48771	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Fix stale file descriptors on failed u
CVE-2022-48770	In the Linux kernel, the following vulnerability has been resolved: bpf: Guard against accessing NULL pt_regs in bp
CVE-2022-48772	In the Linux kernel, the following vulnerability has been resolved: media: lgdt3306a: Add a check against null-point
CVE-2022-48773	In the Linux kernel, the following vulnerability has been resolved: xprtrdma: fix pointer derefs in error cases of rprc
CVE-2022-48778	In the Linux kernel, the following vulnerability has been resolved: mtd: rawnand: gpmi: don't leak PM reference in e
CVE-2022-48780	In the Linux kernel, the following vulnerability has been resolved: net/smc: Avoid overwriting the copies of clcsock
CVE-2022-48783	In the Linux kernel, the following vulnerability has been resolved: net: dsa: lantiq_gswip: fix use after free in gswip_
CVE-2022-48784	In the Linux kernel, the following vulnerability has been resolved: cfg80211: fix race in netlink owner interface dest
CVE-2022-48786	In the Linux kernel, the following vulnerability has been resolved: vsock: remove vsock from connected table when
CVE-2022-48787	In the Linux kernel, the following vulnerability has been resolved: iwlfwifi: fix use-after-free If no firmware was pres
CVE-2022-48788	In the Linux kernel, the following vulnerability has been resolved: nvme-rdma: fix possible use-after-free in transpor
CVE-2022-48789	In the Linux kernel, the following vulnerability has been resolved: nvme-tcp: fix possible use-after-free in transport
CVE-2022-48790	In the Linux kernel, the following vulnerability has been resolved: nvme: fix a possible use-after-free in controller re
CVE-2022-48793	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: nSVM: fix potential NULL dereferenc
CVE-2022-48796	In the Linux kernel, the following vulnerability has been resolved: iommu: Fix potential use-after-free during probe
CVE-2022-48799	In the Linux kernel, the following vulnerability has been resolved: perf: Fix list corruption in perf_cgroup_switch()
CVE-2022-48800	In the Linux kernel, the following vulnerability has been resolved: mm: vmscan: remove deadlock due to throttling f
CVE-2022-48801	In the Linux kernel, the following vulnerability has been resolved: iio: buffer: Fix file related error handling in IIO_I

CVE-2022-48802	In the Linux kernel, the following vulnerability has been resolved: fs/proc: task_mmu.c: don't read mapcount for mig
CVE-2022-48804	In the Linux kernel, the following vulnerability has been resolved: vt_ioctl: fix array_index_nospec in vt_setactivate
CVE-2022-48806	In the Linux kernel, the following vulnerability has been resolved: eeprom: ee1004: limit i2c reads to I2C_SMBUS_
CVE-2022-48805	In the Linux kernel, the following vulnerability has been resolved: net: usb: ax88179_178a: Fix out-of-bounds access
CVE-2022-48809	In the Linux kernel, the following vulnerability has been resolved: net: fix a memleak when uncloning an skb dst and
CVE-2022-48807	In the Linux kernel, the following vulnerability has been resolved: ice: Fix KASAN error in LAG NETDEV_UNRE
CVE-2022-48810	In the Linux kernel, the following vulnerability has been resolved: ipmr,ip6mr: acquire RTNL before calling ip[6]mr
CVE-2022-48811	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: don't release napi in __ibmvnic_open()
CVE-2022-48816	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: lock against ->sock changing during sy
CVE-2022-48823	In the Linux kernel, the following vulnerability has been resolved: scsi: qedf: Fix refcount issue when LOGO is rece
CVE-2022-48825	In the Linux kernel, the following vulnerability has been resolved: scsi: qedf: Add stag_work to all the vports Call tr
CVE-2022-48827	In the Linux kernel, the following vulnerability has been resolved: NFSD: Fix the behavior of READ near OFFSET_
CVE-2022-48828	In the Linux kernel, the following vulnerability has been resolved: NFSD: Fix ia_size underflow iattr::ia_size is a lo
CVE-2022-48829	In the Linux kernel, the following vulnerability has been resolved: NFSD: Fix NFSv3 SETATTR/CREATE's handlin
CVE-2022-48834	In the Linux kernel, the following vulnerability has been resolved: usb: usbtmc: Fix bug in pipe direction for control
CVE-2022-48835	In the Linux kernel, the following vulnerability has been resolved: scsi: mpt3sas: Page fault in reply q processing A p
CVE-2022-48836	In the Linux kernel, the following vulnerability has been resolved: Input: aiptek - properly check endpoint type Syzb
CVE-2022-48837	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: rndis: prevent integer overflow in m
CVE-2022-48839	In the Linux kernel, the following vulnerability has been resolved: net/packet: fix slab-out-of-bounds access in packe
CVE-2022-48841	In the Linux kernel, the following vulnerability has been resolved: ice: fix NULL pointer dereference in ice_update_
CVE-2022-48842	In the Linux kernel, the following vulnerability has been resolved: ice: Fix race condition during interface enslave C
CVE-2022-48843	In the Linux kernel, the following vulnerability has been resolved: drm/vrr: Set VRR capable prop only if it is attach
CVE-2022-48844	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_core: Fix leaking sent_cmd skb se
CVE-2022-48846	In the Linux kernel, the following vulnerability has been resolved: block: release rq qos structures for queue without
CVE-2022-48848	In the Linux kernel, the following vulnerability has been resolved: tracing/osnoise: Do not unregister events twice N
CVE-2022-48849	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: bypass tiling flag check in virtual d
CVE-2022-48850	In the Linux kernel, the following vulnerability has been resolved: net-sysfs: add check for netdevice being present t
CVE-2022-48853	In the Linux kernel, the following vulnerability has been resolved: swiotlb: fix info leak with DMA_FROM_DEVIC
CVE-2022-48861	In the Linux kernel, the following vulnerability has been resolved: vdpa: fix use-after-free on vp_vdpa_remove Whe
CVE-2022-48858	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix a race on command flush flow Fix a
CVE-2022-48862	In the Linux kernel, the following vulnerability has been resolved: vhost: fix hung thread due to erroneous iotlb entri
CVE-2022-48863	In the Linux kernel, the following vulnerability has been resolved: mISDN: Fix memory leak in dsp_pipeline_build()
CVE-2022-48864	In the Linux kernel, the following vulnerability has been resolved: vdpa/mlx5: add validation for VIRTIO_NET_CT
CVE-2022-48865	In the Linux kernel, the following vulnerability has been resolved: tipc: fix kernel panic when enabling bearer When
CVE-2022-48866	In the Linux kernel, the following vulnerability has been resolved: HID: hid-thrustmaster: fix OOB read in thrustmas
CVE-2022-48868	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Let probe fail when workqueue
CVE-2022-48875	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: sdata can be NULL during AMP
CVE-2022-48876	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix initialization of rx->link and
CVE-2022-48887	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Remove rcu locks from user resour
CVE-2022-48889	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: sof-nau8825: fix module alias overfl

CVE-2022-48890	In the Linux kernel, the following vulnerability has been resolved: scsi: storvsc: Fix swiotlb bounce buffer leak in co
CVE-2022-48896	In the Linux kernel, the following vulnerability has been resolved: ixgbe: fix pci device refcount leak As the comm
CVE-2022-48899	In the Linux kernel, the following vulnerability has been resolved: drm/virtio: Fix GEM handle creation UAF Usersp
CVE-2022-48900	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-48904	In the Linux kernel, the following vulnerability has been resolved: iommu/amd: Fix I/O page table memory leak The
CVE-2022-48905	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: free reset-work-item when flushing Fix
CVE-2022-48909	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix connection leak There's a potential le
CVE-2022-48906	In the Linux kernel, the following vulnerability has been resolved: mptcp: Correctly set DATA_FIN timeout when n
CVE-2022-48911	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_queue: fix possible use-after-free Eric
CVE-2022-48910	In the Linux kernel, the following vulnerability has been resolved: net: ipv6: ensure we call ipv6_mc_down() at mos
CVE-2022-48913	In the Linux kernel, the following vulnerability has been resolved: blktrace: fix use after free for struct blk_trace Wh
CVE-2022-48914	In the Linux kernel, the following vulnerability has been resolved: xen/netfront: destroy queues before real_num_tx_
CVE-2022-48915	In the Linux kernel, the following vulnerability has been resolved: thermal: core: Fix TZ_GET_TRIP NULL pointer
CVE-2022-48916	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Fix double list_add when enabling V
CVE-2022-48917	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-48919	In the Linux kernel, the following vulnerability has been resolved: cifs: fix double free race when mount fails in cifs,
CVE-2022-48929	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix crash due to out of bounds access into reg
CVE-2022-48931	In the Linux kernel, the following vulnerability has been resolved: configs: fix a race in configs_{,un}register_sub
CVE-2022-48936	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-48933	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: fix memory leak during statel
CVE-2022-48938	In the Linux kernel, the following vulnerability has been resolved: CDC-NCM: avoid overflow in sanity checking A
CVE-2022-48939	In the Linux kernel, the following vulnerability has been resolved: bpf: Add schedule points in batch ops syzbot repo
CVE-2022-48943	In the Linux kernel, the following vulnerability has been resolved: KVM: x86/mmu: make apf token non-zero to fix
CVE-2022-48953	In the Linux kernel, the following vulnerability has been resolved: rtc: cmos: Fix event handler registration ordering
CVE-2022-48951	In the Linux kernel, the following vulnerability has been resolved: ASoC: ops: Check bounds for second channel in s
CVE-2022-48946	In the Linux kernel, the following vulnerability has been resolved: udf: Fix preallocation discarding at indirect exten
CVE-2022-48961	In the Linux kernel, the following vulnerability has been resolved: net: mdio: fix unbalanced fwnode reference count
CVE-2022-48950	In the Linux kernel, the following vulnerability has been resolved: perf: Fix perf_pending_task() UaF Per syzbot it is
CVE-2022-48969	In the Linux kernel, the following vulnerability has been resolved: xen-netfront: Fix NULL string after live migration
CVE-2022-48971	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix not cleanup led when bt_init fails l
CVE-2022-48976	In the Linux kernel, the following vulnerability has been resolved: netfilter: flowtable_offload: fix using __this_cpu_
CVE-2022-48975	In the Linux kernel, the following vulnerability has been resolved: gpiolib: fix memory leak in gpiochip_setup_dev()
CVE-2022-48972	In the Linux kernel, the following vulnerability has been resolved: mac802154: fix missing INIT_LIST_HEAD in ie
CVE-2022-48977	In the Linux kernel, the following vulnerability has been resolved: can: af_can: fix NULL pointer dereference in can
CVE-2022-48978	In the Linux kernel, the following vulnerability has been resolved: HID: core: fix shift-out-of-bounds in hid_report_
CVE-2022-48979	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: fix array index out of bound err
CVE-2022-48982	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix crash when replugging CSR fake c
CVE-2022-48985	In the Linux kernel, the following vulnerability has been resolved: net: mana: Fix race on per-CQ variable napi work
CVE-2022-48988	In the Linux kernel, the following vulnerability has been resolved: memcg: fix possible use-after-free in memcg_wri
CVE-2022-48986	In the Linux kernel, the following vulnerability has been resolved: mm/gup: fix gup_pud_range() for dax For dax pu

CVE-2022-48987	In the Linux kernel, the following vulnerability has been resolved: media: v4l2-dv-timings.c: fix too strict blanking s
CVE-2022-48990	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix use-after-free during gpu recover
CVE-2022-4899	A vulnerability was found in zstd v1.4.10, where an attacker can supply empty string as an argument to the command
CVE-2022-48994	In the Linux kernel, the following vulnerability has been resolved: ALSA: seq: Fix function prototype mismatch in s
CVE-2022-48998	In the Linux kernel, the following vulnerability has been resolved: powerpc/bpf/32: Fix Oops on tail call tests test_b
CVE-2022-48991	In the Linux kernel, the following vulnerability has been resolved: mm/khugepaged: invoke MMU notifiers in shmer
CVE-2022-49005	In the Linux kernel, the following vulnerability has been resolved: ASoC: ops: Fix bounds check for _sx controls For
CVE-2022-49003	In the Linux kernel, the following vulnerability has been resolved: nvme: fix SRCU protection of nvme_ns_head list
CVE-2022-49011	In the Linux kernel, the following vulnerability has been resolved: hwmon: (coretemp) fix pci device refcount leak in
CVE-2022-49013	In the Linux kernel, the following vulnerability has been resolved: sctp: fix memory leak in sctp_stream_outq_migra
CVE-2022-49006	In the Linux kernel, the following vulnerability has been resolved: tracing: Free buffers when a used dynamic event t
CVE-2022-49014	In the Linux kernel, the following vulnerability has been resolved: net: tun: Fix use-after-free in tun_detach() syzbot
CVE-2022-49017	In the Linux kernel, the following vulnerability has been resolved: tipc: re-fetch skb cb after tipc_msg_validate As th
CVE-2022-49021	In the Linux kernel, the following vulnerability has been resolved: net: phy: fix null-ptr-deref while probe() failed I g
CVE-2022-49022	In the Linux kernel, the following vulnerability has been resolved: wifi: mac8021: fix possible oob access in ieee802
CVE-2022-49027	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix error handling in iavf_init_module() The
CVE-2022-49028	In the Linux kernel, the following vulnerability has been resolved: ixgbev: Fix resource leak in ixgbev_init_module
CVE-2022-49029	In the Linux kernel, the following vulnerability has been resolved: hwmon: (ibmpex) Fix possible UAF when ibmpe
CVE-2022-49034	In the Linux kernel, the following vulnerability has been resolved: sh: cpuinfo: Fix a warning for CONFIG_CPUMA
CVE-2022-49043	xmlXIncludeAddNode in xinclude.c in libxml2 before 2.11.0 has a use-after-free.
CVE-2022-49044	In the Linux kernel, the following vulnerability has been resolved: dm integrity: fix memory corruption when tag_siz
CVE-2022-49045	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49048	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix panic when forwarding a pkt with no in6
CVE-2022-49052	In the Linux kernel, the following vulnerability has been resolved: mm: fix unexpected zeroed page mapping with zr
CVE-2022-49053	In the Linux kernel, the following vulnerability has been resolved: scsi: target: tcmu: Fix possible page UAF tcmu_tr
CVE-2022-49057	In the Linux kernel, the following vulnerability has been resolved: block: null_blk: end timed out poll request When
CVE-2022-49058	In the Linux kernel, the following vulnerability has been resolved: cifs: potential buffer overflow in handling symlin
CVE-2022-49060	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix NULL pointer dereference in smc_p
CVE-2022-49063	In the Linux kernel, the following vulnerability has been resolved: ice: arfs: fix use-after-free when freeing @rx_cpu
CVE-2022-49065	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Fix the svc_deferred_event trace class
CVE-2022-49066	In the Linux kernel, the following vulnerability has been resolved: veth: Ensure eth header is in skb's linear part Afte
CVE-2022-49069	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix by adding FPU protection f
CVE-2022-4907	Uninitialized Use in FFmpeg in Google Chrome prior to 108.0.5359.71 allowed a remote attacker to execute arbitrar
CVE-2022-49070	In the Linux kernel, the following vulnerability has been resolved: fbdev: Fix unregistering of framebuffers without
CVE-2022-49072	In the Linux kernel, the following vulnerability has been resolved: gpio: Restrict usage of GPIO chip irq members be
CVE-2022-49074	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3: Fix GICR_CTLR.RWP polling It
CVE-2022-49076	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Fix use-after-free bug for mm struct
CVE-2022-49077	In the Linux kernel, the following vulnerability has been resolved: mmmremap.c: avoid pointless invalidate_range_s
CVE-2022-49078	In the Linux kernel, the following vulnerability has been resolved: lz4: fix LZ4_decompress_safe_partial read out of
CVE-2022-49080	In the Linux kernel, the following vulnerability has been resolved: mm/mempolicy: fix mpol_new leak in shared_po

CVE-2022-49081	In the Linux kernel, the following vulnerability has been resolved: highmem: fix checks in __kmap_local_sched_{in
CVE-2022-49084	In the Linux kernel, the following vulnerability has been resolved: qede: confirm skb is allocated before using qede_
CVE-2022-49082	In the Linux kernel, the following vulnerability has been resolved: scsi: mpt3sas: Fix use after free in _scsih_expand
CVE-2022-49086	In the Linux kernel, the following vulnerability has been resolved: net: openvswitch: fix leak of nested actions While
CVE-2022-49089	In the Linux kernel, the following vulnerability has been resolved: IB/rdmavt: add lock to call to rvt_error_qp to prev
CVE-2022-49094	In the Linux kernel, the following vulnerability has been resolved: net/tls: fix slab-out-of-bounds bug in decrypt_inte
CVE-2022-49096	In the Linux kernel, the following vulnerability has been resolved: net: sfc: add missing xdp queue reinitialization A
CVE-2022-49097	In the Linux kernel, the following vulnerability has been resolved: NFS: Avoid writeback threads getting stuck in m
CVE-2022-49101	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49100	In the Linux kernel, the following vulnerability has been resolved: virtio_console: eliminate anonymous module_ini
CVE-2022-49103	In the Linux kernel, the following vulnerability has been resolved: NFSv4.2: fix reference count leaks in _nfs42_pro
CVE-2022-49108	In the Linux kernel, the following vulnerability has been resolved: clk: mediatek: Fix memory leaks on probe Handle
CVE-2022-49107	In the Linux kernel, the following vulnerability has been resolved: ceph: fix memory leak in ceph_readaddr when note
CVE-2022-49109	In the Linux kernel, the following vulnerability has been resolved: ceph: fix inode reference leakage in ceph_get_sn
CVE-2022-49110	In the Linux kernel, the following vulnerability has been resolved: netfilter: conntrack: revisit gc autotuning as of co
CVE-2022-49111	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix use after free in hci_send_acl This
CVE-2022-49113	In the Linux kernel, the following vulnerability has been resolved: powerpc/secvar: fix refcount leak in format_show
CVE-2022-49116	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: use memset avoid memory leaks Use m
CVE-2022-49118	In the Linux kernel, the following vulnerability has been resolved: scsi: hisi_sas: Free irq vectors in order for v3 HW
CVE-2022-49123	In the Linux kernel, the following vulnerability has been resolved: ath11k: Fix frames flush failure caused by deadlo
CVE-2022-49124	In the Linux kernel, the following vulnerability has been resolved: x86/mce: Work around an erratum on fast string c
CVE-2022-49125	In the Linux kernel, the following vulnerability has been resolved: drm/sprid: fix potential NULL dereference 'drm' c
CVE-2022-49126	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix memory leaks Fix memory leak
CVE-2022-49127	In the Linux kernel, the following vulnerability has been resolved: ref_tracker: implement use-after-free detection W
CVE-2022-49129	In the Linux kernel, the following vulnerability has been resolved: mt76: mt7921: fix crash when startup fails. If the
CVE-2022-49130	In the Linux kernel, the following vulnerability has been resolved: ath11k: mhi: use mhi_sync_power_up() If amss.b
CVE-2022-49132	In the Linux kernel, the following vulnerability has been resolved: ath11k: pci: fix crash on suspend if board file is n
CVE-2022-49133	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: svm range restore work deadlock w
CVE-2022-49134	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum: Guard against invalid local por
CVE-2022-49138	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_event: Ignore multiple conn comp
CVE-2022-49136	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_sync: Fix queuing commands whe
CVE-2022-49139	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: fix null ptr deref on hci_sync_conn_co
CVE-2022-49140	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49143	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49145	In the Linux kernel, the following vulnerability has been resolved: ACPI: CPPC: Avoid out of bounds access when p
CVE-2022-49155	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Suppress a kernel complaint in qla_
CVE-2022-49154	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: fix panic on out-of-bounds guest IR
CVE-2022-49156	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix scheduling while atomic The d
CVE-2022-49157	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix premature hw access after PCI
CVE-2022-49159	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Implement ref count for SRB The t

CVE-2022-49158	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix warning message due to adisc b
CVE-2022-49160	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix crash during module load unloa
CVE-2022-49161	In the Linux kernel, the following vulnerability has been resolved: ASoC: mediatek: Fix error handling in mt8183_d
CVE-2022-49167	In the Linux kernel, the following vulnerability has been resolved: btrfs: do not double complete bio on errors during
CVE-2022-49171	In the Linux kernel, the following vulnerability has been resolved: ext4: don't BUG if someone dirty pages without a
CVE-2022-49172	In the Linux kernel, the following vulnerability has been resolved: parisc: Fix non-access data TLB cache flush fault
CVE-2022-49174	In the Linux kernel, the following vulnerability has been resolved: ext4: fix ext4_mb_mark_bb() with flex_bg with f
CVE-2022-49173	In the Linux kernel, the following vulnerability has been resolved: spi: fsi: Implement a timeout for polling status Th
CVE-2022-49175	In the Linux kernel, the following vulnerability has been resolved: PM: core: keep irq flags in device_pm_check_cal
CVE-2022-49176	In the Linux kernel, the following vulnerability has been resolved: bfq: fix use-after-free in bfq_dispatch_request KA
CVE-2022-49178	In the Linux kernel, the following vulnerability has been resolved: memstick/mspro_block: fix handling of read-only
CVE-2022-49177	In the Linux kernel, the following vulnerability has been resolved: hwrng: cavium - fix NULL but dereferenced cocc
CVE-2022-49179	In the Linux kernel, the following vulnerability has been resolved: block, bfq: don't move oom_bfqq Our test report t
CVE-2022-49180	In the Linux kernel, the following vulnerability has been resolved: LSM: general protection fault in legacy_parse_pa
CVE-2022-49183	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_ct: fix ref leak when switching zon
CVE-2022-49193	In the Linux kernel, the following vulnerability has been resolved: ice: fix 'scheduling while atomic' on aux critical e
CVE-2022-49190	In the Linux kernel, the following vulnerability has been resolved: kernel/resource: fix kfree() of bootmem memory
CVE-2022-49196	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries: Fix use after free in remove_phb
CVE-2022-49197	In the Linux kernel, the following vulnerability has been resolved: af_netlink: Fix shift out of bounds in group mask
CVE-2022-49198	In the Linux kernel, the following vulnerability has been resolved: mptcp: Fix crash due to tcp_tsorted_anchor was in
CVE-2022-49199	In the Linux kernel, the following vulnerability has been resolved: RDMA/nldev: Prevent underflow in nldev_stat_s
CVE-2022-49201	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: fix race between xmit and reset There is
CVE-2022-49203	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix double free during GPU res
CVE-2022-49204	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix more uncharged while msg has
CVE-2022-49205	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix double uncharge the mem of sh
CVE-2022-49206	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix memory leak in error flow for s
CVE-2022-49207	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix memleak in sk_psock_queue_r
CVE-2022-49208	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Prevent some integer underflows f
CVE-2022-49209	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix memleak in tcp_bpf_sendmsg
CVE-2022-49220	In the Linux kernel, the following vulnerability has been resolved: dax: make sure inodes are flushed before destroy
CVE-2022-49215	In the Linux kernel, the following vulnerability has been resolved: xsk: Fix race at socket teardown Fix a race in the
CVE-2022-49218	In the Linux kernel, the following vulnerability has been resolved: drm/dp: Fix OOB read when handling Post Cursor
CVE-2022-49225	In the Linux kernel, the following vulnerability has been resolved: mt76: mt7921s: fix a possible memory leak in mt
CVE-2022-49226	In the Linux kernel, the following vulnerability has been resolved: net: asix: add proper error handling of usb read er
CVE-2022-49227	In the Linux kernel, the following vulnerability has been resolved: igc: avoid kernel warning when changing RX ring
CVE-2022-49234	In the Linux kernel, the following vulnerability has been resolved: net: dsa: Avoid cross-chip syncing of VLAN filter
CVE-2022-49231	In the Linux kernel, the following vulnerability has been resolved: rtw88: fix memory overrun and memory leak dur
CVE-2022-49235	In the Linux kernel, the following vulnerability has been resolved: ath9k_htc: fix uninit value bugs Syzbot reported 2
CVE-2022-49236	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix UAF due to race between btf_try_get_me
CVE-2022-49237	In the Linux kernel, the following vulnerability has been resolved: ath11k: add missing of_node_put() to avoid leak

CVE-2022-49245	In the Linux kernel, the following vulnerability has been resolved: ASoC: rockchip: Fix PM usage reference of rockchip
CVE-2022-49248	In the Linux kernel, the following vulnerability has been resolved: ALSA: firewire-lib: fix uninitialized flag for AV/
CVE-2022-49259	In the Linux kernel, the following vulnerability has been resolved: block: don't delete queue kobject before its children
CVE-2022-49263	In the Linux kernel, the following vulnerability has been resolved: brcmfmac: pcie: Release firmwares in the brcmf_
CVE-2022-49264	In the Linux kernel, the following vulnerability has been resolved: exec: Force single empty string when argv is empty
CVE-2022-49265	In the Linux kernel, the following vulnerability has been resolved: PM: domains: Fix sleep-in-atomic bug caused by
CVE-2022-49266	In the Linux kernel, the following vulnerability has been resolved: block: fix rq-qos breakage from skipping rq_qos_
CVE-2022-49267	In the Linux kernel, the following vulnerability has been resolved: mmc: core: use sysfs_emit() instead of sprintf() sp
CVE-2022-49268	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: Fix NULL ptr dereference wh
CVE-2022-49271	In the Linux kernel, the following vulnerability has been resolved: cifs: prevent bad output lengths in smb2_ioctl_qu
CVE-2022-49272	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Fix potential AB/BA lock with buffe
CVE-2022-49280	In the Linux kernel, the following vulnerability has been resolved: NFSD: prevent underflow in nfssvc_decode_writ
CVE-2022-49281	In the Linux kernel, the following vulnerability has been resolved: cifs: fix handlecache and multiuser In multiuser e
CVE-2022-49286	In the Linux kernel, the following vulnerability has been resolved: tpm: use try_get_ops() in tpm-space.c As part of t
CVE-2022-49287	In the Linux kernel, the following vulnerability has been resolved: tpm: fix reference counting for struct tpm_chip T
CVE-2022-49288	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Fix races among concurrent preallo
CVE-2022-49290	In the Linux kernel, the following vulnerability has been resolved: mac80211: fix potential double free on mesh join
CVE-2022-49291	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Fix races among concurrent hw_par
CVE-2022-49293	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: initialize registers in nft_do_c
CVE-2022-49294	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check if modulo is 0 before div
CVE-2022-49295	In the Linux kernel, the following vulnerability has been resolved: nbd: call genl_unregister_family() first in nbd_cl
CVE-2022-49296	In the Linux kernel, the following vulnerability has been resolved: ceph: fix possible deadlock when holding Fwb to
CVE-2022-49297	In the Linux kernel, the following vulnerability has been resolved: nbd: fix io hung while disconnecting device In ou
CVE-2022-49300	In the Linux kernel, the following vulnerability has been resolved: nbd: fix race between nbd_alloc_config() and mo
CVE-2022-49303	In the Linux kernel, the following vulnerability has been resolved: drivers: staging: rtl8192eu: Fix deadlock in rtw_j
CVE-2022-49307	In the Linux kernel, the following vulnerability has been resolved: tty: synclink_gt: Fix null-pointer-dereference in s
CVE-2022-49306	In the Linux kernel, the following vulnerability has been resolved: usb: dwc3: host: Stop setting the ACPI companio
CVE-2022-49308	In the Linux kernel, the following vulnerability has been resolved: extcon: Modify extcon device to be created after
CVE-2022-49314	In the Linux kernel, the following vulnerability has been resolved: tty: Fix a possible resource leak in icom_probe W
CVE-2022-49316	In the Linux kernel, the following vulnerability has been resolved: NFSv4: Don't hold the layoutget locks across mul
CVE-2022-49317	In the Linux kernel, the following vulnerability has been resolved: f2fs: avoid infinite loop to flush node pages xfste
CVE-2022-49321	In the Linux kernel, the following vulnerability has been resolved: xprtrdma: treat all calls not a bcall when bc_serv
CVE-2022-49322	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix sleeping function called from invalid
CVE-2022-49323	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: fix possible null-ptr-deref in a
CVE-2022-49325	In the Linux kernel, the following vulnerability has been resolved: tcp: add accessors to read/set tp->snd_cwnd We h
CVE-2022-49330	In the Linux kernel, the following vulnerability has been resolved: tcp: fix tcp_mtup_probe_success vs wrong snd_c
CVE-2022-49333	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: E-Switch, pair only capable devices OF
CVE-2022-49339	In the Linux kernel, the following vulnerability has been resolved: net: ipv6: unexport __init-annotated seg6_hmac_
CVE-2022-49341	In the Linux kernel, the following vulnerability has been resolved: bpf, arm64: Clear prog->jited_len along prog->jit
CVE-2022-49342	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: bgmac: Fix refcount leak in bcma_r

CVE-2022-49343	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid cycles in directory h-tree A malicious
CVE-2022-49344	In the Linux kernel, the following vulnerability has been resolved: af_unix: Fix a data-race in unix_dgram_peer_wa
CVE-2022-49348	In the Linux kernel, the following vulnerability has been resolved: ext4: filter out EXT4_FC_REPLAY from on-disk
CVE-2022-49345	In the Linux kernel, the following vulnerability has been resolved: net: xfrm: unexport __init-annotated xfrm4_prot
CVE-2022-49349	In the Linux kernel, the following vulnerability has been resolved: ext4: fix use-after-free in ext4_rename_dir_prepa
CVE-2022-49350	In the Linux kernel, the following vulnerability has been resolved: net: mdio: unexport __init-annotated mdio_bus_in
CVE-2022-49352	In the Linux kernel, the following vulnerability has been resolved: ext4: fix warning in ext4_handle_inode_extensio
CVE-2022-49355	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49353	In the Linux kernel, the following vulnerability has been resolved: powerpc/papr_scm: don't requests stats with '0' si
CVE-2022-49356	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Trap RDMA segment overflows Preve
CVE-2022-49357	In the Linux kernel, the following vulnerability has been resolved: efi: Do not import certificates from UEFI Secure
CVE-2022-49358	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: memleak flow rule from com
CVE-2022-49359	In the Linux kernel, the following vulnerability has been resolved: drm/panfrost: Job should reference MMU not file
CVE-2022-49370	In the Linux kernel, the following vulnerability has been resolved: firmware: dmi-sysfs: Fix memory leak in dmi_sys
CVE-2022-49371	In the Linux kernel, the following vulnerability has been resolved: driver core: fix deadlock in __device_attach In __
CVE-2022-49372	In the Linux kernel, the following vulnerability has been resolved: tcp: tcp_rtx_synack() can be called from process
CVE-2022-49374	In the Linux kernel, the following vulnerability has been resolved: tipc: check attribute length for bearer name syzbo
CVE-2022-49377	In the Linux kernel, the following vulnerability has been resolved: blk-mq: don't touch ->tagset in blk_mq_get_sq_h
CVE-2022-49378	In the Linux kernel, the following vulnerability has been resolved: sfc: fix considering that all channels have TX que
CVE-2022-49384	In the Linux kernel, the following vulnerability has been resolved: md: fix double free of io_acct_set bioset Now io_
CVE-2022-49385	In the Linux kernel, the following vulnerability has been resolved: driver: base: fix UAF when driver_attach failed V
CVE-2022-49388	In the Linux kernel, the following vulnerability has been resolved: ubi: ubi_create_volume: Fix use-after-free when v
CVE-2022-49390	In the Linux kernel, the following vulnerability has been resolved: macsec: fix UAF bug for real_dev Create a new m
CVE-2022-49393	In the Linux kernel, the following vulnerability has been resolved: misc: fastrpc: fix list iterator in fastrpc_req_mem
CVE-2022-49394	In the Linux kernel, the following vulnerability has been resolved: blk-iolatency: Fix inflight count imbalances and I
CVE-2022-49395	In the Linux kernel, the following vulnerability has been resolved: um: Fix out-of-bounds read in LDT setup syscall
CVE-2022-49400	In the Linux kernel, the following vulnerability has been resolved: md: Don't set mddev private to NULL in raid0 pe
CVE-2022-49401	In the Linux kernel, the following vulnerability has been resolved: mm/page_owner: use strscpy() instead of strncpy()
CVE-2022-49402	In the Linux kernel, the following vulnerability has been resolved: ftrace: Clean up hash direct_functions on register
CVE-2022-49404	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Fix potential integer multiplication o
CVE-2022-49407	In the Linux kernel, the following vulnerability has been resolved: dlm: fix plock invalid read This patch fixes an inv
CVE-2022-49409	In the Linux kernel, the following vulnerability has been resolved: ext4: fix bug_on in __es_tree_search Hulk Robot
CVE-2022-49410	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix potential double free in create_var_re
CVE-2022-49412	In the Linux kernel, the following vulnerability has been resolved: bfq: Avoid merging queues with different parents
CVE-2022-49411	In the Linux kernel, the following vulnerability has been resolved: bfq: Make sure bfqg for which we are queueing re
CVE-2022-49413	In the Linux kernel, the following vulnerability has been resolved: bfq: Update cgroup information before merging b
CVE-2022-49414	In the Linux kernel, the following vulnerability has been resolved: ext4: fix race condition between ext4_write and e
CVE-2022-49418	In the Linux kernel, the following vulnerability has been resolved: NFSv4: Fix free of uninitialized nfs4_label on ref
CVE-2022-49420	In the Linux kernel, the following vulnerability has been resolved: net: annotate races around sk->sk_bound_dev_if
CVE-2022-49416	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix use-after-free in chanctx cod

CVE-2022-49422	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix the error handling path in ic
CVE-2022-49429	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Prevent panic when SDMA is disab
CVE-2022-49434	In the Linux kernel, the following vulnerability has been resolved: PCI: Avoid pci_dev_lock() AB/BA deadlock with
CVE-2022-49432	In the Linux kernel, the following vulnerability has been resolved: powerpc/xics: fix refcount leak in icp_opal_init()
CVE-2022-49433	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Prevent use of lock before it is initia
CVE-2022-49436	In the Linux kernel, the following vulnerability has been resolved: powerpc/papr_scm: Fix leaking nvdimm_events_
CVE-2022-49437	In the Linux kernel, the following vulnerability has been resolved: powerpc/xive: Fix refcount leak in xive_spapr_in
CVE-2022-49440	In the Linux kernel, the following vulnerability has been resolved: powerpc/rtas: Keep MSR[RI] set when calling RT
CVE-2022-49442	In the Linux kernel, the following vulnerability has been resolved: drivers/base/node.c: fix compaction sysfs file leak
CVE-2022-49441	In the Linux kernel, the following vulnerability has been resolved: tty: fix deadlock caused by calling printk() under
CVE-2022-49443	In the Linux kernel, the following vulnerability has been resolved: list: fix a data-race around ep->rdllist ep_poll() fi
CVE-2022-49455	In the Linux kernel, the following vulnerability has been resolved: misc: ocxl: fix possible double free in ocxl_file_r
CVE-2022-49447	In the Linux kernel, the following vulnerability has been resolved: ARM: hisi: Add missing of_node_put after of_fin
CVE-2022-49456	In the Linux kernel, the following vulnerability has been resolved: bonding: fix missed rcu protection When removing
CVE-2022-49459	In the Linux kernel, the following vulnerability has been resolved: thermal/drivers/broadcom: Fix potential NULL de
CVE-2022-49465	In the Linux kernel, the following vulnerability has been resolved: blk-throttle: Set BIO_THROTTLED when bio has
CVE-2022-49468	In the Linux kernel, the following vulnerability has been resolved: thermal/core: Fix memory leak in __thermal_cool
CVE-2022-49471	In the Linux kernel, the following vulnerability has been resolved: rtw89: cfo: check mac_id to avoid out-of-bounds
CVE-2022-49469	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix anon_dev leak in create_subvol() When
CVE-2022-49472	In the Linux kernel, the following vulnerability has been resolved: net: phy: micrel: Allow probing without .driver_d
CVE-2022-49474	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: fix dangling sco_conn and use-after-fr
CVE-2022-49476	In the Linux kernel, the following vulnerability has been resolved: mt76: mt7921: fix kernel crash at mt7921_pci_re
CVE-2022-49479	In the Linux kernel, the following vulnerability has been resolved: mt76: fix tx status related use-after-free race on st
CVE-2022-49484	In the Linux kernel, the following vulnerability has been resolved: mt76: mt7915: fix possible NULL pointer derefer
CVE-2022-49478	In the Linux kernel, the following vulnerability has been resolved: media: pvrusb2: fix array-index-out-of-bounds in
CVE-2022-49492	In the Linux kernel, the following vulnerability has been resolved: nvme-pci: fix a NULL pointer dereference in nvme
CVE-2022-49493	In the Linux kernel, the following vulnerability has been resolved: ASoC: rt5645: Fix erroneous cleanup order Ther
CVE-2022-49496	In the Linux kernel, the following vulnerability has been resolved: media: mediatek: vcodec: prevent kernel crash wh
CVE-2022-49498	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Check for null pointer of pointer sub
CVE-2022-49497	In the Linux kernel, the following vulnerability has been resolved: net: remove two BUG() from skb_checksum_help
CVE-2022-49501	In the Linux kernel, the following vulnerability has been resolved: usbnet: Run unregister_netdev() before unbind() a
CVE-2022-49503	In the Linux kernel, the following vulnerability has been resolved: ath9k_htc: fix potential out of bounds access with
CVE-2022-49504	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Inhibit aborts if external loopback plug
CVE-2022-49508	In the Linux kernel, the following vulnerability has been resolved: HID: elan: Fix potential double free in elan_input
CVE-2022-49511	In the Linux kernel, the following vulnerability has been resolved: fbdev: defio: fix the pagelist corruption Easily hit
CVE-2022-49516	In the Linux kernel, the following vulnerability has been resolved: ice: always check VF VSI pointer values The ice_
CVE-2022-49518	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: ipc3-topology: Correct get_control_
CVE-2022-49519	In the Linux kernel, the following vulnerability has been resolved: ath10k: skip ath10k_halt during suspend for drive
CVE-2022-49521	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix resource leak in lpfc_sli4_send_seq
CVE-2022-49520	In the Linux kernel, the following vulnerability has been resolved: arm64: compat: Do not treat syscall number as ES

CVE-2022-49524	In the Linux kernel, the following vulnerability has been resolved: media: pci: cx23885: Fix the error handling in cx23885_remove()
CVE-2022-49526	In the Linux kernel, the following vulnerability has been resolved: md/bitmap: don't set sb values if can't pass sanity check
CVE-2022-49528	In the Linux kernel, the following vulnerability has been resolved: media: i2c: dw9714: Disable the regulator when the device is not powered
CVE-2022-49529	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu/pm: fix the null pointer while the smu is not initialized
CVE-2022-49531	In the Linux kernel, the following vulnerability has been resolved: loop: implement ->free_disk Ensure that the loop device is not freed while it is in use
CVE-2022-49532	In the Linux kernel, the following vulnerability has been resolved: drm/virtio: fix NULL pointer dereference in virtio_gpu_ioctl
CVE-2022-49533	In the Linux kernel, the following vulnerability has been resolved: ath11k: Change max no of active probe SSID and BSSID
CVE-2022-49534	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Protect memory leak for NPIV ports session
CVE-2022-49535	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix null pointer dereference after failing to allocate
CVE-2022-49536	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix SCSI I/O completion and abort handling
CVE-2022-49538	In the Linux kernel, the following vulnerability has been resolved: ALSA: jack: Access input_dev under mutex It is not safe to access input_dev under mutex
CVE-2022-49539	In the Linux kernel, the following vulnerability has been resolved: rtw89: ser: fix CAM leaks occurring in L2 reset
CVE-2022-49542	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Move cfg_log_verbose check before calling
CVE-2022-49543	In the Linux kernel, the following vulnerability has been resolved: ath11k: fix the warning of dev_wake in mhi_pm_deinit
CVE-2022-49545	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Cancel pending work at closing
CVE-2022-49547	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix deadlock between concurrent dio writes
CVE-2022-49548	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix potential array overflow in bpf_trampoline_v2
CVE-2022-49549	In the Linux kernel, the following vulnerability has been resolved: x86/MCE/AMD: Fix memory leak when threshold is reached
CVE-2022-49552	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix combination of jit blinding and pointers to memory
CVE-2022-49554	In the Linux kernel, the following vulnerability has been resolved: zsmalloc: fix races between asynchronous zspage allocation and deallocation
CVE-2022-49556	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: Use kzalloc for sev ioctl interfaces
CVE-2022-49557	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: KVM: Set the base guest FPU uABI size
CVE-2022-49558	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: double hook unregistration in nf_tables_remove_hook
CVE-2022-49559	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Drop WARNs that assert a triple fault
CVE-2022-49561	In the Linux kernel, the following vulnerability has been resolved: netfilter: conntrack: re-fetch conntrack after insert
CVE-2022-49562	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Use __try_cmpxchg_user() to update
CVE-2022-49563	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - add param check for RSA Reject request
CVE-2022-49564	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - add param check for DH Reject request
CVE-2022-49565	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel/lbr: Fix unchecked MSR access error
CVE-2022-49566	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - fix memory leak in RSA When an RSA key is not found
CVE-2022-49567	In the Linux kernel, the following vulnerability has been resolved: mm/mempolicy: fix uninit-value in mpol_rebind
CVE-2022-49571	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_max_reorder
CVE-2022-49572	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_slow_start
CVE-2022-49573	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_early_retrans
CVE-2022-49574	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_recovery. W
CVE-2022-49575	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_thin_linear
CVE-2022-49577	In the Linux kernel, the following vulnerability has been resolved: udp: Fix a data-race around sysctl_udp_l3mdev_a
CVE-2022-49576	In the Linux kernel, the following vulnerability has been resolved: ipv4: Fix data-races around sysctl_fib_multipath
CVE-2022-49578	In the Linux kernel, the following vulnerability has been resolved: ip: Fix data-races around sysctl_ip_prot_sock. sys
CVE-2022-49579	In the Linux kernel, the following vulnerability has been resolved: ipv4: Fix data-races around sysctl_fib_multipath

CVE-2022-49580	In the Linux kernel, the following vulnerability has been resolved: ipv4: Fix a data-race around sysctl_fib_multipath
CVE-2022-49581	In the Linux kernel, the following vulnerability has been resolved: be2net: Fix buffer overflow in be_get_module_e
CVE-2022-49583	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix handling of dummy receive descriptors
CVE-2022-49584	In the Linux kernel, the following vulnerability has been resolved: ixgbe: Add locking to prevent panic when setting
CVE-2022-49585	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_fastopen_b
CVE-2022-49586	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_fastopen. W
CVE-2022-49587	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_notsent_lo
CVE-2022-49589	In the Linux kernel, the following vulnerability has been resolved: igmp: Fix data-races around sysctl_igmp_qrv. W
CVE-2022-49590	In the Linux kernel, the following vulnerability has been resolved: igmp: Fix data-races around sysctl_igmp_llm_rep
CVE-2022-49592	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: fix dma queue left shift overflow iss
CVE-2022-49593	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_probe_inter
CVE-2022-49595	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_probe_thre
CVE-2022-49596	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_min_snd_m
CVE-2022-49598	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_mtu_probin
CVE-2022-49597	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_base_mss. V
CVE-2022-49599	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_l3mdev_acc
CVE-2022-49601	In the Linux kernel, the following vulnerability has been resolved: tcp/dccp: Fix a data-race around sysctl_tcp_fwma
CVE-2022-49602	In the Linux kernel, the following vulnerability has been resolved: ip: Fix a data-race around sysctl_fwmark_reflect.
CVE-2022-49603	In the Linux kernel, the following vulnerability has been resolved: ip: Fix data-races around sysctl_ip_fwd_update_p
CVE-2022-49604	In the Linux kernel, the following vulnerability has been resolved: ip: Fix data-races around sysctl_ip_fwd_use_pmt
CVE-2022-49605	In the Linux kernel, the following vulnerability has been resolved: igc: Reinstate IGC_REMOVED logic and implem
CVE-2022-49606	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Fix sleep from invalid context BU
CVE-2022-49610	In the Linux kernel, the following vulnerability has been resolved: KVM: VMX: Prevent RSB underflow before vme
CVE-2022-49607	In the Linux kernel, the following vulnerability has been resolved: perf/core: Fix data race between perf_event_set_c
CVE-2022-49611	In the Linux kernel, the following vulnerability has been resolved: x86/speculation: Fill RSB on vmexit for IBRS Pr
CVE-2022-49612	In the Linux kernel, the following vulnerability has been resolved: power: supply: core: Fix boundary conditions in i
CVE-2022-49613	In the Linux kernel, the following vulnerability has been resolved: serial: 8250: Fix PM usage_count for console han
CVE-2022-49615	In the Linux kernel, the following vulnerability has been resolved: ASoC: rt711-sdca: fix kernel NULL pointer deref
CVE-2022-49616	In the Linux kernel, the following vulnerability has been resolved: ASoC: rt7*-sdw: harden jack_detect_handler Rea
CVE-2022-49617	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: sof_sdw: handle errors on card regis
CVE-2022-49620	In the Linux kernel, the following vulnerability has been resolved: net: tipc: fix possible refcount leak in tipc_sk_cre
CVE-2022-49622	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: avoid skb access on nf_stolen
CVE-2022-49623	In the Linux kernel, the following vulnerability has been resolved: powerpc/xive/spapr: correct bitmap allocation siz
CVE-2022-49624	In the Linux kernel, the following vulnerability has been resolved: net: atlantic: remove aq_nic_deinit() when resum
CVE-2022-49625	In the Linux kernel, the following vulnerability has been resolved: sfc: fix kernel panic when creating VF When crea
CVE-2022-49626	In the Linux kernel, the following vulnerability has been resolved: sfc: fix use after free when disabling sriov Use af
CVE-2022-49630	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_ecn_fallba
CVE-2022-49632	In the Linux kernel, the following vulnerability has been resolved: icmp: Fix a data-race around sysctl_icmp_errors_
CVE-2022-49635	In the Linux kernel, the following vulnerability has been resolved: drm/i915/selftests: fix subtraction overflow bug C
CVE-2022-49636	In the Linux kernel, the following vulnerability has been resolved: vlan: fix memory leak in vlan_newlink() Blamed

CVE-2022-49638	In the Linux kernel, the following vulnerability has been resolved: icmp: Fix data-races around sysctl. While reading
CVE-2022-49639	In the Linux kernel, the following vulnerability has been resolved: cipso: Fix data-races around sysctl. While reading
CVE-2022-49641	In the Linux kernel, the following vulnerability has been resolved: sysctl: Fix data races in proc_douintvec(). A sysctl
CVE-2022-49640	In the Linux kernel, the following vulnerability has been resolved: sysctl: Fix data races in proc_douintvec_minmax()
CVE-2022-49642	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: dwc-qos: Disable split header for Te
CVE-2022-49643	In the Linux kernel, the following vulnerability has been resolved: ima: Fix a potential integer overflow in ima_appri
CVE-2022-49644	In the Linux kernel, the following vulnerability has been resolved: drm/i915: fix a possible refcount leak in intel_dp_
CVE-2022-49646	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix queue selection for mesh/OC
CVE-2022-49647	In the Linux kernel, the following vulnerability has been resolved: cgroup: Use separate src/dst nodes when preloadi
CVE-2022-49651	In the Linux kernel, the following vulnerability has been resolved: srcu: Tighten cleanup_srcu_struct() GP checks C
CVE-2022-49653	In the Linux kernel, the following vulnerability has been resolved: i2c: piix4: Fix a memory leak in the EFCH MMIO
CVE-2022-49656	In the Linux kernel, the following vulnerability has been resolved: ARM: meson: Fix refcount leak in meson_smp_p
CVE-2022-49657	In the Linux kernel, the following vulnerability has been resolved: usbnet: fix memory leak in error case usbnet_writ
CVE-2022-49658	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix insufficient bounds propagation from adj
CVE-2022-49660	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49663	In the Linux kernel, the following vulnerability has been resolved: tunnels: do not assume mac header is set in skb_t
CVE-2022-49664	In the Linux kernel, the following vulnerability has been resolved: tipc: move bc link creation back to tipc_node_cre
CVE-2022-49667	In the Linux kernel, the following vulnerability has been resolved: net: bonding: fix use-after-free after 802.3ad slave
CVE-2022-49670	In the Linux kernel, the following vulnerability has been resolved: linux/dim: Fix divide by 0 in RDMA DIM Fix a c
CVE-2022-49671	In the Linux kernel, the following vulnerability has been resolved: RDMA/cm: Fix memory leak in ib_cm_insert_lis
CVE-2022-49672	In the Linux kernel, the following vulnerability has been resolved: net: tun: unlink NAPI from device on destruction
CVE-2022-49673	In the Linux kernel, the following vulnerability has been resolved: dm raid: fix KASAN warning in raid5_add_disks
CVE-2022-49674	In the Linux kernel, the following vulnerability has been resolved: dm raid: fix accesses beyond end of raid member
CVE-2022-49675	In the Linux kernel, the following vulnerability has been resolved: tick/nohz: unexport __init-annotated tick_nohz_fu
CVE-2022-49679	In the Linux kernel, the following vulnerability has been resolved: ARM: Fix refcount leak in axxia_boot_secondary
CVE-2022-49687	In the Linux kernel, the following vulnerability has been resolved: virtio_net: fix xdp_rxq_info bug after suspend/res
CVE-2022-49690	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49691	In the Linux kernel, the following vulnerability has been resolved: erspan: do not assume transport header is always
CVE-2022-49696	In the Linux kernel, the following vulnerability has been resolved: tipc: fix use-after-free Read in tipc_named_reinit
CVE-2022-49697	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix request_sock leak in sk lookup helpers A
CVE-2022-49695	In the Linux kernel, the following vulnerability has been resolved: igb: fix a use-after-free issue in igb_clean_tx_ring
CVE-2022-49698	In the Linux kernel, the following vulnerability has been resolved: netfilter: use get_random_u32 instead of prandom
CVE-2022-49699	In the Linux kernel, the following vulnerability has been resolved: filemap: Handle sibling entries in filemap_get_re
CVE-2022-49700	In the Linux kernel, the following vulnerability has been resolved: mm/slub: add missing TID updates on slab deacti
CVE-2022-49703	In the Linux kernel, the following vulnerability has been resolved: scsi: ibmvfc: Store vhost pointer during subcrq al
CVE-2022-49701	In the Linux kernel, the following vulnerability has been resolved: scsi: ibmvfc: Allocate/free queue resource only d
CVE-2022-49708	In the Linux kernel, the following vulnerability has been resolved: ext4: fix bug_on ext4_mb_use_inode_pa Hulk Ro
CVE-2022-49710	In the Linux kernel, the following vulnerability has been resolved: dm mirror log: round up region bitmap size to BI
CVE-2022-49715	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3: Fix refcount leak in gic_populate
CVE-2022-49716	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3: Fix error handling in gic_populate

CVE-2022-49720	In the Linux kernel, the following vulnerability has been resolved: block: Fix handling of offline queues in blk_mq_
CVE-2022-49722	In the Linux kernel, the following vulnerability has been resolved: ice: Fix memory corruption in VF driver Disable
CVE-2022-49725	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix call trace in setup_tx_descriptors After l
CVE-2022-49728	In the Linux kernel, the following vulnerability has been resolved: ipv6: Fix signed integer overflow in __ip6_appen
CVE-2022-49731	In the Linux kernel, the following vulnerability has been resolved: ata: libata-core: fix NULL pointer deref in ata_ho
CVE-2022-49730	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Resolve NULL ptr dereference after an
CVE-2022-49739	In the Linux kernel, the following vulnerability has been resolved: gfs2: Always check inode size of inline inodes Cl
CVE-2022-49740	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmfmac: Check the count value of channe
CVE-2022-49742	In the Linux kernel, the following vulnerability has been resolved: f2fs: initialize locks earlier in f2fs_fill_super() sy
CVE-2022-49749	In the Linux kernel, the following vulnerability has been resolved: i2c: designware: use casting of u64 in clock multi
CVE-2022-49743	In the Linux kernel, the following vulnerability has been resolved: ovl: Use "buf" flexible array for memcpy() destin
CVE-2022-49748	In the Linux kernel, the following vulnerability has been resolved: perf/x86/amd: fix potential integer overflow on sh
CVE-2022-49750	In the Linux kernel, the following vulnerability has been resolved: cpufreq: CPPC: Add u64 casts to avoid overflowi
CVE-2022-49752	In the Linux kernel, the following vulnerability has been resolved: device property: fix of node refcount leak in fwno
CVE-2022-49753	In the Linux kernel, the following vulnerability has been resolved: dmaengine: Fix double increment of client_count
CVE-2022-49759	In the Linux kernel, the following vulnerability has been resolved: VMCI: Use threaded irqs instead of tasklets The v
CVE-2022-49766	In the Linux kernel, the following vulnerability has been resolved: netlink: Bounds-check struct nlmsgerr creation In
CVE-2022-49764	In the Linux kernel, the following vulnerability has been resolved: bpf: Prevent bpf program recursion for raw tracep
CVE-2022-49769	In the Linux kernel, the following vulnerability has been resolved: gfs2: Check sb_bsize_shift after reading superblo
CVE-2022-49770	In the Linux kernel, the following vulnerability has been resolved: ceph: avoid putting the realm twice when decodin
CVE-2022-49771	In the Linux kernel, the following vulnerability has been resolved: dm ioctl: fix misbehavior if list_versions races wi
CVE-2022-49773	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix optc2_configure warning o
CVE-2022-49772	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Drop snd_BUG_ON() from snd
CVE-2022-49779	In the Linux kernel, the following vulnerability has been resolved: kprobes: Skip clearing aggrprobe's post_handler i
CVE-2022-49776	In the Linux kernel, the following vulnerability has been resolved: macvlan: enforce a consistent minimal mtu macvl
CVE-2022-49780	In the Linux kernel, the following vulnerability has been resolved: scsi: target: tcm_loop: Fix possible name leak in t
CVE-2022-49781	In the Linux kernel, the following vulnerability has been resolved: perf/x86/amd: Fix crash due to race between amd
CVE-2022-49783	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Drop fpregs lock before inheriting FPU
CVE-2022-49782	In the Linux kernel, the following vulnerability has been resolved: perf: Improve missing SIGTRAP checking To cat
CVE-2022-49784	In the Linux kernel, the following vulnerability has been resolved: perf/x86/amd/uncore: Fix memory leak for events
CVE-2022-49785	In the Linux kernel, the following vulnerability has been resolved: x86/sgx: Add overflow check in sgx_validate_off
CVE-2022-49788	In the Linux kernel, the following vulnerability has been resolved: misc/vmw_vmci: fix an infoleak in vmci_host_de
CVE-2022-49789	In the Linux kernel, the following vulnerability has been resolved: scsi: zfcp: Fix double free of FSF request when q
CVE-2022-49802	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix null pointer dereference in ftrace_add
CVE-2022-49803	In the Linux kernel, the following vulnerability has been resolved: netdevsim: Fix memory leak of nsim_dev->fa_co
CVE-2022-49810	In the Linux kernel, the following vulnerability has been resolved: netfs: Fix missing xas_retry() calls in xarray itera
CVE-2022-49812	In the Linux kernel, the following vulnerability has been resolved: bridge: switchdev: Fix memory leaks when chang
CVE-2022-49813	In the Linux kernel, the following vulnerability has been resolved: net: ena: Fix error handling in ena_init() The ena
CVE-2022-49817	In the Linux kernel, the following vulnerability has been resolved: net: mhi: Fix memory leak in mhi_net_dellink() M
CVE-2022-49821	In the Linux kernel, the following vulnerability has been resolved: mISDN: fix possible memory leak in mISDN_dsp

CVE-2022-49822	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix connections leak when tlink setup failed
CVE-2022-49823	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix error handling in ata_tdev
CVE-2022-49825	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix error handling in ata_tpor
CVE-2022-49824	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix error handling in ata_tlin
CVE-2022-49826	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix double ata_host_put() in
CVE-2022-49828	In the Linux kernel, the following vulnerability has been resolved: hugetlbfs: don't delete error page from pagecache
CVE-2022-49829	In the Linux kernel, the following vulnerability has been resolved: drm/scheduler: fix fence ref counting We leaked
CVE-2022-49832	In the Linux kernel, the following vulnerability has been resolved: pinctrl: devicetree: fix null pointer dereferencing
CVE-2022-49833	In the Linux kernel, the following vulnerability has been resolved: btrfs: zoned: clone zoned device info when cloning
CVE-2022-49835	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: fix potential memleak in 'add_widge
CVE-2022-49837	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix memory leaks in __check_func_call kme
CVE-2022-49839	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_transport_sas: Fix error handling in sas
CVE-2022-49838	In the Linux kernel, the following vulnerability has been resolved: sctp: clear out_curr if all frag chunks of current m
CVE-2022-49840	In the Linux kernel, the following vulnerability has been resolved: bpf, test_run: Fix alignment problem in bpf_prog
CVE-2022-49842	In the Linux kernel, the following vulnerability has been resolved: ASoC: core: Fix use-after-free in snd_soc_exit()
CVE-2022-49846	In the Linux kernel, the following vulnerability has been resolved: udf: Fix a slab-out-of-bounds write bug in udf_fin
CVE-2022-49858	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: Fix SQE threshold checking Current
CVE-2022-49853	In the Linux kernel, the following vulnerability has been resolved: net: macvlan: fix memory leaks of macvlan_comr
CVE-2022-49862	In the Linux kernel, the following vulnerability has been resolved: tipc: fix the msg->req tlv len check in tipc_nl_cor
CVE-2022-49864	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Fix NULL pointer dereference in sv
CVE-2022-49863	In the Linux kernel, the following vulnerability has been resolved: can: af_can: fix NULL pointer dereference in can
CVE-2022-49865	In the Linux kernel, the following vulnerability has been resolved: ipv6: addrlabel: fix infoleak when sending struct
CVE-2022-49869	In the Linux kernel, the following vulnerability has been resolved: bnxt_en: Fix possible crash in bnxt_hwrng_set_co
CVE-2022-49871	In the Linux kernel, the following vulnerability has been resolved: net: tun: Fix memory leaks of napi_get_frags kme
CVE-2022-49872	In the Linux kernel, the following vulnerability has been resolved: net: gso: fix panic on frag_list with mixed head al
CVE-2022-49870	In the Linux kernel, the following vulnerability has been resolved: capabilities: fix undefined behavior in bit shift fo
CVE-2022-49873	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix wrong reg type conversion in release_ref
CVE-2022-49874	In the Linux kernel, the following vulnerability has been resolved: HID: hyperv: fix possible memory leak in mouse
CVE-2022-49876	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix general-protection-fault in ie
CVE-2022-49879	In the Linux kernel, the following vulnerability has been resolved: ext4: fix BUG_ON() when directory entry has inv
CVE-2022-49878	In the Linux kernel, the following vulnerability has been resolved: bpf, verifier: Fix memory leak in array reallocation
CVE-2022-49880	In the Linux kernel, the following vulnerability has been resolved: ext4: fix warning in 'ext4_da_release_space' Syzk
CVE-2022-49881	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: fix memory leak in query_regdb_
CVE-2022-49884	In the Linux kernel, the following vulnerability has been resolved: KVM: Initialize gfn_to_pfn_cache locks in dedica
CVE-2022-49883	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: smm: number of GPRs in the SMRA
CVE-2022-49885	In the Linux kernel, the following vulnerability has been resolved: ACPI: APEI: Fix integer overflow in ghes_estatu
CVE-2022-49886	In the Linux kernel, the following vulnerability has been resolved: x86/tdx: Panic on bad configs that #VE on "privat
CVE-2022-49888	In the Linux kernel, the following vulnerability has been resolved: arm64: entry: avoid kprobe recursion The cortex_
CVE-2022-49889	In the Linux kernel, the following vulnerability has been resolved: ring-buffer: Check for NULL cpu_buffer in ring_
CVE-2022-49890	In the Linux kernel, the following vulnerability has been resolved: capabilities: fix potential memleak on error path f

CVE-2022-49892	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix use-after-free for dynamic ftrace_ops l
CVE-2022-49900	In the Linux kernel, the following vulnerability has been resolved: i2c: piix4: Fix adapter not be removed in piix4_re
CVE-2022-49901	In the Linux kernel, the following vulnerability has been resolved: blk-mq: Fix kmemleak in blk_mq_init_allocated
CVE-2022-49903	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix WARNING in ip6_route_net_exit_late()
CVE-2022-49905	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix possible leaked pernet namespace in
CVE-2022-49906	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: Free rwi on reset success Free the rwi st
CVE-2022-49907	In the Linux kernel, the following vulnerability has been resolved: net: mdio: fix undefined behavior in bit shift for _
CVE-2022-49908	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix memory leak in vhci_wri
CVE-2022-49910	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix use-after-free caused by l
CVE-2022-49909	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: fix use-after-free in l2cap_co
CVE-2022-49915	In the Linux kernel, the following vulnerability has been resolved: mISDN: fix possible memory leak in mISDN_reg
CVE-2022-49917	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix WARNING in ip_vs_app_net_cleanup()
CVE-2022-49918	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix WARNING in __ip_vs_cleanup_batch()
CVE-2022-49921	In the Linux kernel, the following vulnerability has been resolved: net: sched: Fix use after free in red_enqueue() We
CVE-2022-49919	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: release flow rule object from
CVE-2022-49925	In the Linux kernel, the following vulnerability has been resolved: RDMA/core: Fix null-ptr-deref in ib_core_cleanu
CVE-2022-49927	In the Linux kernel, the following vulnerability has been resolved: nfs4: Fix kmemleak when allocate slot failed If o
CVE-2022-49928	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Fix null-ptr-deref when xps sysfs alloc
CVE-2022-49929	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Fix mr leak in RESPST_ERR_RNR
CVE-2022-49931	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Correctly move list in sc_disable() Com
CVE-2022-49932	In the Linux kernel, the following vulnerability has been resolved: KVM: VMX: Do _all_ initialization before expos
CVE-2022-49933	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49934	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: Fix UAF in ieee80211_scan_rx()
CVE-2022-49935	In the Linux kernel, the following vulnerability has been resolved: dma-buf/dma-resv: check if the new fence is reall
CVE-2022-49936	In the Linux kernel, the following vulnerability has been resolved: USB: core: Prevent nested device-reset calls Auto
CVE-2022-49937	In the Linux kernel, the following vulnerability has been resolved: media: mceusb: Use new usb_control_msg_*() ro
CVE-2022-49938	In the Linux kernel, the following vulnerability has been resolved: cifs: fix small mempool leak in SMB2_negotiate()
CVE-2022-49940	In the Linux kernel, the following vulnerability has been resolved: tty: n_gsm: add sanity check for gsm->receive in
CVE-2022-49941	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-49942	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: Don't finalize CSA in IBSS mod
CVE-2022-49943	In the Linux kernel, the following vulnerability has been resolved: USB: gadget: Fix obscure lockdep violation for u
CVE-2022-49944	In the Linux kernel, the following vulnerability has been resolved: Revert "usb: typec: ucsi: add a common function
CVE-2022-49948	In the Linux kernel, the following vulnerability has been resolved: vt: Clear selection before changing the font When
CVE-2022-49955	In the Linux kernel, the following vulnerability has been resolved: powerpc/rtas: Fix RTAS MSR[HV] handling for
CVE-2022-49949	In the Linux kernel, the following vulnerability has been resolved: firmware_loader: Fix memory leak in firmware up
CVE-2022-49958	In the Linux kernel, the following vulnerability has been resolved: net/sched: fix netdevice reference leaks in attach_
CVE-2022-49959	In the Linux kernel, the following vulnerability has been resolved: openvswitch: fix memory leak at failed datapath c
CVE-2022-49961	In the Linux kernel, the following vulnerability has been resolved: bpf: Do mark_chain_precision for ARG_CONST
CVE-2022-49962	In the Linux kernel, the following vulnerability has been resolved: xhci: Fix null pointer dereference in remove if xH
CVE-2022-49964	In the Linux kernel, the following vulnerability has been resolved: arm64: cacheinfo: Fix incorrect assignment of sig

CVE-2022-49963	In the Linux kernel, the following vulnerability has been resolved: drm/i915/ttm: fix CCS handling Crucible + recen
CVE-2022-49965	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: add missing ->fini_xxxx interfaces
CVE-2022-49966	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: add missing ->fini_microcode inter
CVE-2022-49967	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix a data-race around bpf_jit_limit. While r
CVE-2022-49970	In the Linux kernel, the following vulnerability has been resolved: bpf, cgroup: Fix kernel BUG in purge_effective_j
CVE-2022-49971	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Fix a potential gpu_metrics_table m
CVE-2022-49972	In the Linux kernel, the following vulnerability has been resolved: xsk: Fix corrupted packets for XDP_SHARED_U
CVE-2022-49973	In the Linux kernel, the following vulnerability has been resolved: skmsg: Fix wrong last sg check in sk_msg_recvm
CVE-2022-49974	In the Linux kernel, the following vulnerability has been resolved: HID: nintendo: fix rumble worker null pointer de
CVE-2022-49975	In the Linux kernel, the following vulnerability has been resolved: bpf: Don't redirect packets with invalid pkt_len S
CVE-2022-49977	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix NULL pointer dereference in is_ftrace
CVE-2022-49979	In the Linux kernel, the following vulnerability has been resolved: net: fix refcount bug in sk_psock_get (2) Syzkalle
CVE-2022-49980	In the Linux kernel, the following vulnerability has been resolved: USB: gadget: Fix use-after-free Read in usb_udc_
CVE-2022-49981	In the Linux kernel, the following vulnerability has been resolved: HID: hidraw: fix memory leak in hidraw_release()
CVE-2022-49983	In the Linux kernel, the following vulnerability has been resolved: udmabuf: Set the DMA mask for the udmabuf dev
CVE-2022-49982	In the Linux kernel, the following vulnerability has been resolved: media: pvrusb2: fix memory leak in pvr_probe TH
CVE-2022-49985	In the Linux kernel, the following vulnerability has been resolved: bpf: Don't use tnum_range on array range checkin
CVE-2022-49986	In the Linux kernel, the following vulnerability has been resolved: scsi: storvsc: Remove WQ_MEM_RECLAIM fro
CVE-2022-49987	In the Linux kernel, the following vulnerability has been resolved: md: call __md_stop_writes in md_stop From the
CVE-2022-49989	In the Linux kernel, the following vulnerability has been resolved: xen/privcmd: fix error exit of privcmd_ioctl_dm_
CVE-2022-49990	In the Linux kernel, the following vulnerability has been resolved: s390: fix double free of GS and RI CBs on fork()
CVE-2022-49993	In the Linux kernel, the following vulnerability has been resolved: loop: Check for overflow while configuring loop
CVE-2022-49997	In the Linux kernel, the following vulnerability has been resolved: net: lantiq_xrx200: restore buffer if memory alloc
CVE-2022-50000	In the Linux kernel, the following vulnerability has been resolved: netfilter: flowtable: fix stuck flows on cleanup du
CVE-2022-50001	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_tproxy: restrict to prerouting hook T
CVE-2022-50002	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: LAG, fix logic over MLX5_LAG_FLAG
CVE-2022-50003	In the Linux kernel, the following vulnerability has been resolved: ice: xsk: prohibit usage of non-balanced queue id
CVE-2022-50007	In the Linux kernel, the following vulnerability has been resolved: xfrm: fix refcount leak in __xfrm_policy_check()
CVE-2022-50008	In the Linux kernel, the following vulnerability has been resolved: kprobes: don't call disarm_kprobe() for disabled k
CVE-2022-50009	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix null-ptr-deref in f2fs_get_dnode_of_data
CVE-2022-50012	In the Linux kernel, the following vulnerability has been resolved: powerpc/64: Init jump labels before parse_early_
CVE-2022-50016	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: cnl: Do not process IPC reply
CVE-2022-50015	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: hda-ipc: Do not process IPC re
CVE-2022-50021	In the Linux kernel, the following vulnerability has been resolved: ext4: block range must be validated before use in
CVE-2022-50022	In the Linux kernel, the following vulnerability has been resolved: drivers/md:fix a potential use-after-free bug In lin
CVE-2022-50020	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid resizing to a partial cluster size This p
CVE-2022-50027	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix possible memory leak when failing
CVE-2022-50025	In the Linux kernel, the following vulnerability has been resolved: cxl: Fix a memory leak in an error handling path
CVE-2022-50030	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Prevent buffer overflow crashes in debu
CVE-2022-50031	In the Linux kernel, the following vulnerability has been resolved: scsi: iscsi: Fix HW conn removal use after free If

CVE-2022-50037	In the Linux kernel, the following vulnerability has been resolved: drm/i915/ttm: don't leak the ccs state The kernel o
CVE-2022-50039	In the Linux kernel, the following vulnerability has been resolved: stmmac: intel: Add a missing clk_disable_unprep
CVE-2022-50041	In the Linux kernel, the following vulnerability has been resolved: ice: Fix call trace with null VSI during VF reset D
CVE-2022-50042	In the Linux kernel, the following vulnerability has been resolved: net: genl: fix error path memory leak in policy du
CVE-2022-50044	In the Linux kernel, the following vulnerability has been resolved: net: qrtr: start MHI channel after endpoit creation
CVE-2022-50045	In the Linux kernel, the following vulnerability has been resolved: powerpc/pci: Fix get_phb_number() locking The
CVE-2022-50048	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: possible module reference unc
CVE-2022-50046	In the Linux kernel, the following vulnerability has been resolved: net/sunrpc: fix potential memory leaks in rpc_sys
CVE-2022-50049	In the Linux kernel, the following vulnerability has been resolved: ASoC: DPCM: Don't pick up BE without substrea
CVE-2022-50050	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: hda: Fix potential buffer overf
CVE-2022-50051	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: debug: Fix potential buffer overflow
CVE-2022-50052	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: avs: Fix potential buffer overflow by
CVE-2022-50053	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix reset error handling Do not call iavf_clo
CVE-2022-50054	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix NULL pointer dereference in iavf_get_li
CVE-2022-50055	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix adminq error handling iavf_alloc_asq_b
CVE-2022-50059	In the Linux kernel, the following vulnerability has been resolved: ceph: don't leak snap_rwsem in handle_cap_grant
CVE-2022-50065	In the Linux kernel, the following vulnerability has been resolved: virtio_net: fix memory leak inside XPD_TX with
CVE-2022-50068	In the Linux kernel, the following vulnerability has been resolved: drm/ttm: Fix dummy res NULL ptr deref bug Che
CVE-2022-50070	In the Linux kernel, the following vulnerability has been resolved: mptcp: do not queue data on closed subflows Dip
CVE-2022-50071	In the Linux kernel, the following vulnerability has been resolved: mptcp: move subflow cleanup in mptcp_destroy_
CVE-2022-50072	In the Linux kernel, the following vulnerability has been resolved: NFSv4/pnfs: Fix a use-after-free bug in open If so
CVE-2022-50073	In the Linux kernel, the following vulnerability has been resolved: net: tap: NULL pointer derefence in dev_parse_h
CVE-2022-50079	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check correct bounds for stre
CVE-2022-50080	In the Linux kernel, the following vulnerability has been resolved: tee: add overflow check in register_shm_helper()
CVE-2022-50082	In the Linux kernel, the following vulnerability has been resolved: ext4: fix warning in ext4_iomap_begin as race be
CVE-2022-50083	In the Linux kernel, the following vulnerability has been resolved: ext4: add EXT4_INODE_HAS_XATTR_SPACE
CVE-2022-50084	In the Linux kernel, the following vulnerability has been resolved: dm raid: fix address sanitizer warning in raid_stat
CVE-2022-50085	In the Linux kernel, the following vulnerability has been resolved: dm raid: fix address sanitizer warning in raid_res
CVE-2022-50086	In the Linux kernel, the following vulnerability has been resolved: block: don't allow the same type rq_qos add more
CVE-2022-50087	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scp: Ensure scpi_info is not assign
CVE-2022-50090	In the Linux kernel, the following vulnerability has been resolved: btrfs: replace BTRFS_MAX_EXTENT_SIZE with
CVE-2022-50088	In the Linux kernel, the following vulnerability has been resolved: mm/damon/reclaim: fix potential memory leak in
CVE-2022-50092	In the Linux kernel, the following vulnerability has been resolved: dm thin: fix use-after-free crash in dm_sm_regist
CVE-2022-50098	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix crash due to stale SRB access a
CVE-2022-50095	In the Linux kernel, the following vulnerability has been resolved: posix-cpu-timers: Cleanup CPU timers before fre
CVE-2022-50100	In the Linux kernel, the following vulnerability has been resolved: sched/core: Do not requeue task on CPU excluded
CVE-2022-50103	In the Linux kernel, the following vulnerability has been resolved: sched, cpuset: Fix dl_cpu_busy() panic due to em
CVE-2022-50104	In the Linux kernel, the following vulnerability has been resolved: powerpc/xive: Fix refcount leak in xive_get_max
CVE-2022-50110	In the Linux kernel, the following vulnerability has been resolved: watchdog: sp5100_tco: Fix a memory leak of EFC
CVE-2022-50111	In the Linux kernel, the following vulnerability has been resolved: ASoC: mt6359: Fix refcount leak bug In mt6359_

CVE-2022-50113	In the Linux kernel, the following vulnerability has been resolved: ASoc: audio-graph-card2: Fix refcount leak bug in
CVE-2022-50116	In the Linux kernel, the following vulnerability has been resolved: tty: n_gsm: fix deadlock and link starvation in ou
CVE-2022-50118	In the Linux kernel, the following vulnerability has been resolved: powerpc/perf: Optimize clearing the pending PM
CVE-2022-50126	In the Linux kernel, the following vulnerability has been resolved: jbd2: fix assertion 'jh->b_frozen_data == NULL'
CVE-2022-50127	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Fix error unwind in rxe_create_qp(Q
CVE-2022-50129	In the Linux kernel, the following vulnerability has been resolved: RDMA/srpt: Fix a use-after-free Change the LIO
CVE-2022-50130	In the Linux kernel, the following vulnerability has been resolved: staging: fbft: core: set smem_len before fb_defer
CVE-2022-50133	In the Linux kernel, the following vulnerability has been resolved: usb: xhci_plat_remove: avoid NULL dereference
CVE-2022-50135	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Fix BUG: KASAN: null-ptr-deref in
CVE-2022-50134	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: fix potential memory leak in setup_
CVE-2022-50137	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Fix a window for use-after-free D
CVE-2022-50138	In the Linux kernel, the following vulnerability has been resolved: RDMA/qedr: Fix potential memory leak in __qed
CVE-2022-50144	In the Linux kernel, the following vulnerability has been resolved: soundwire: revisit driver bind/unbind and callbac
CVE-2022-50148	In the Linux kernel, the following vulnerability has been resolved: kernfs: fix potential NULL dereference in __kern
CVE-2022-50149	In the Linux kernel, the following vulnerability has been resolved: driver core: fix potential deadlock in __driver_att
CVE-2022-50150	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2022-50153	In the Linux kernel, the following vulnerability has been resolved: usb: host: Fix refcount leak in ehci_hcd_ppc_of_p
CVE-2022-50159	In the Linux kernel, the following vulnerability has been resolved: of: check previous kernel's ima-kexec-buffer agai
CVE-2022-50163	In the Linux kernel, the following vulnerability has been resolved: ax25: fix incorrect dev_tracker usage While inves
CVE-2022-50166	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: When HCI work queue is drained, onl
CVE-2022-50167	In the Linux kernel, the following vulnerability has been resolved: bpf: fix potential 32-bit overflow when accessing
CVE-2022-50170	In the Linux kernel, the following vulnerability has been resolved: kunit: executor: Fix a memory leak on failure in k
CVE-2022-50168	In the Linux kernel, the following vulnerability has been resolved: bpf, x86: fix freeing of not-finalized bpf_prog_pa
CVE-2022-50174	In the Linux kernel, the following vulnerability has been resolved: net: hinic: avoid kernel hung in hinic_get_stats64
CVE-2022-50176	In the Linux kernel, the following vulnerability has been resolved: drm/mcde: Fix refcount leak in mcde_dsi_bind Ev
CVE-2022-50178	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: 8852a: rfk: fix div 0 exception The D
CVE-2022-50179	In the Linux kernel, the following vulnerability has been resolved: ath9k: fix use-after-free in ath9k_hif_usb_rx_cb S
CVE-2022-50181	In the Linux kernel, the following vulnerability has been resolved: virtio-gpu: fix a missing check to avoid NULL de
CVE-2022-50185	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: fix potential buffer overflow in ni_se
CVE-2022-50186	In the Linux kernel, the following vulnerability has been resolved: ath11k: fix missing skb drop on htc_tx_completi
CVE-2022-50187	In the Linux kernel, the following vulnerability has been resolved: ath11k: fix netdev open race Make sure to allocat
CVE-2022-50189	In the Linux kernel, the following vulnerability has been resolved: tools/power turbostat: Fix file pointer leak Curren
CVE-2022-50195	In the Linux kernel, the following vulnerability has been resolved: ARM: dts: qcom: replace gcc PXO with pxo_boar
CVE-2022-50201	In the Linux kernel, the following vulnerability has been resolved: selinux: fix memleak in security_read_state_kern
CVE-2022-50197	In the Linux kernel, the following vulnerability has been resolved: cpufreq: zynq: Fix refcount leak in zynq_get_revi
CVE-2022-50202	In the Linux kernel, the following vulnerability has been resolved: PM: hibernate: defer device probing when resum
CVE-2022-50203	In the Linux kernel, the following vulnerability has been resolved: ARM: OMAP2+: display: Fix refcount leak bug I
CVE-2022-50211	In the Linux kernel, the following vulnerability has been resolved: md-raid10: fix KASAN warning There's a KASA
CVE-2022-50212	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: do not allow CHAIN_ID to re
CVE-2022-50213	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: do not allow SET_ID to refer

CVE-2022-50215	In the Linux kernel, the following vulnerability has been resolved: scsi: sg: Allow waiting for commands to complete
CVE-2022-50218	In the Linux kernel, the following vulnerability has been resolved: iio: light: isl29028: Fix the warning in isl29028_r
CVE-2022-50219	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix KASAN use-after-free Read in compute
CVE-2022-50220	In the Linux kernel, the following vulnerability has been resolved: usbnet: Fix linkwatch use-after-free on disconnect
CVE-2022-50222	In the Linux kernel, the following vulnerability has been resolved: tty: vt: initialize unicode screen buffer syzbot rep
CVE-2022-50221	In the Linux kernel, the following vulnerability has been resolved: drm/fb-helper: Fix out-of-bounds access Clip men
CVE-2022-50224	In the Linux kernel, the following vulnerability has been resolved: KVM: x86/mmu: Treat NX as a valid SPTE bit fo
CVE-2022-50226	In the Linux kernel, the following vulnerability has been resolved: crypto: ccp - Use kzalloc for sev ioctl interfaces t
CVE-2022-50228	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: Don't BUG if userspace injects an in
CVE-2022-50229	In the Linux kernel, the following vulnerability has been resolved: ALSA: bcd2000: Fix a UAF bug on the error path
CVE-2022-50230	In the Linux kernel, the following vulnerability has been resolved: arm64: set UXN on swapper page tables [This is
CVE-2022-50232	In the Linux kernel, the following vulnerability has been resolved: arm64: set UXN on swapper page tables [This is
CVE-2023-0030	A use-after-free flaw was found in the Linux kernel's nouveau driver in how a user triggers a memory overflow that
CVE-2023-0045	The current implementation of the prctl syscall does not issue an IBPB immediately during the syscall. The ib_prctl_
CVE-2023-0054	Out-of-bounds Write in GitHub repository vim/vim prior to 9.0.1145.
CVE-2023-0049	Out-of-bounds Read in GitHub repository vim/vim prior to 9.0.1143.
CVE-2023-0160	A deadlock flaw was found in the Linux kernel's BPF subsystem. This flaw allows a local user to potentially crash th
CVE-2023-0215	The public API function BIO_new_NDEF is a helper function used for streaming ASN.1 data via a BIO. It is primar
CVE-2023-0286	There is a type confusion vulnerability relating to X.400 address processing inside an X.509 GeneralName. X.400 ad
CVE-2023-0288	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.1189.
CVE-2023-0433	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.1225.
CVE-2023-0464	A security vulnerability has been identified in all supported versions of OpenSSL related to the verification of X.509
CVE-2023-0361	A timing side-channel in the handling of RSA ClientKeyExchange messages was discovered in GnuTLS. This side-c
CVE-2023-0465	Applications that use a non-default option when verifying certificates may be vulnerable to an attack from a malicio
CVE-2023-0466	The function X509_VERIFY_PARAM_add0_policy() is documented to implicitly enable the certificate policy check
CVE-2023-0512	Divide By Zero in GitHub repository vim/vim prior to 9.0.1247.
CVE-2023-0645	An out of bounds read exists in libjxl. An attacker using a specifically crafted file could cause an out of bounds read
CVE-2023-0795	LibTIFF 4.4.0 has an out-of-bounds read in tiffcrop in tools/tiffcrop.c:3488, allowing attackers to cause a denial-of-s
CVE-2023-0797	LibTIFF 4.4.0 has an out-of-bounds read in tiffcrop in libtiff/tif_unix.c:368, invoked by tools/tiffcrop.c:2903 and too
CVE-2023-0796	LibTIFF 4.4.0 has an out-of-bounds read in tiffcrop in tools/tiffcrop.c:3592, allowing attackers to cause a denial-of-s
CVE-2023-0798	LibTIFF 4.4.0 has an out-of-bounds read in tiffcrop in tools/tiffcrop.c:3400, allowing attackers to cause a denial-of-s
CVE-2023-0799	LibTIFF 4.4.0 has an out-of-bounds read in tiffcrop in tools/tiffcrop.c:3701, allowing attackers to cause a denial-of-s
CVE-2023-1076	A flaw was found in the Linux Kernel. The tun/tap sockets have their socket UID hardcoded to 0 due to a type confu
CVE-2023-1127	Divide By Zero in GitHub repository vim/vim prior to 9.0.1367.
CVE-2023-1077	In the Linux kernel, pick_next_rt_entity() may return a type confused entry, not detected by the BUG_ON condition
CVE-2023-1170	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.1376.
CVE-2023-1175	Incorrect Calculation of Buffer Size in GitHub repository vim/vim prior to 9.0.1378.
CVE-2023-1193	A use-after-free flaw was found in setup_async_work in the KSMBD implementation of the in-kernel samba server a
CVE-2023-1264	NULL Pointer Dereference in GitHub repository vim/vim prior to 9.0.1392.
CVE-2023-1370	[Json-smart](https://netplex.github.io/json-smart/) is a performance focused, JSON processor lib. When reaching a '[

CVE-2023-1428	There exists an vulnerability causing an abort() to be called in gRPC. The following headers cause gRPC's C++ impl
CVE-2023-1380	A slab-out-of-bound read problem was found in brcmf_get_assoc_ies in drivers/net/wireless/broadcom/brcm80211/b
CVE-2023-1667	A NULL pointer dereference was found In libssh during re-keying with algorithm guessing. This issue may allow an
CVE-2023-1916	A flaw was found in tiffcrop, a program distributed by the libtiff package. A specially crafted tiff file can lead to an
CVE-2023-1932	A flaw was found in hibernate-validator's 'isValid' method in the org.hibernate.validator.internal.constraintvalidators
CVE-2023-1972	A potential heap based buffer overflow was found in _bfd_elf_slurp_version_tables() in bfd/elf.c. This may lead to l
CVE-2023-2007	The specific flaw exists within the DPT I2O Controller driver. The issue results from the lack of proper locking whe
CVE-2023-20859	In Spring Vault, versions 3.0.x prior to 3.0.2 and versions 2.3.x prior to 2.3.3 and older versions, an application is vu
CVE-2023-21930	Vulnerability in the Oracle Java SE, Oracle GraalVM Enterprise Edition product of Oracle Java SE (component: JSS
CVE-2023-20863	In spring framework versions prior to 5.2.24 release+ ,5.3.27+ and 6.0.8+ , it is possible for a user to provide a speci
CVE-2023-21937	Vulnerability in the Oracle Java SE, Oracle GraalVM Enterprise Edition product of Oracle Java SE (component: Net
CVE-2023-21938	Vulnerability in the Oracle Java SE, Oracle GraalVM Enterprise Edition product of Oracle Java SE (component: Lib

CVE-2023-21967	Vulnerability in the Oracle Java SE, Oracle GraalVM Enterprise Edition product of Oracle Java SE (component: JSS
CVE-2023-22656	Out-of-bounds read in Intel(R) Media SDK and some Intel(R) oneVPL software before version 23.3.5 may allow an
CVE-2023-2253	A flaw was found in the `/v2/_catalog` endpoint in distribution/distribution, which accepts a parameter to control the
CVE-2023-2283	A vulnerability was found in libssh, where the authentication check of the connecting client can be bypassed in the`p
CVE-2023-22946	In Apache Spark versions prior to 3.4.0, applications using spark-submit can specify a 'proxy-user' to run as, limiting
CVE-2023-24056	In pkgconf through 1.9.3, variable duplication can cause unbounded string expansion due to incorrect checks in libpl
CVE-2023-23916	An allocation of resources without limits or throttling vulnerability exists in curl <v7.88.0 based on the "chained" HT
CVE-2023-2431	A security issue was discovered in Kubelet that allows pods to bypass the seccomp profile enforcement. Pods that us
CVE-2023-24329	An issue in the urllib.parse component of Python before 3.11.4 allows attackers to bypass blocklisting methods by su
CVE-2023-24532	The ScalarMult and ScalarBaseMult methods of the P256 Curve may return an incorrect result if called with some sp
CVE-2023-24534	HTTP and MIME header parsing can allocate large amounts of memory, even when parsing small inputs, potentially
CVE-2023-24537	Calling any of the Parse functions on Go source code which contains //line directives with very large line numbers ca
CVE-2023-24536	Multipart form parsing can consume large amounts of CPU and memory when processing form inputs containing ve
CVE-2023-24538	Templates do not properly consider backticks (`) as Javascript string delimiters, and do not escape them as expected.
CVE-2023-24539	Angle brackets (<>) are not considered dangerous characters when inserted into CSS contexts. Templates containing
CVE-2023-2454	schema_element defeats protective search_path changes; It was found that certain database calls in PostgreSQL coul
CVE-2023-24540	Not all valid JavaScript whitespace characters are considered to be whitespace. Templates containing whitespace cha
CVE-2023-2455	Row security policies disregard user ID changes after inlining; PostgreSQL could permit incorrect policies to be app
CVE-2023-24607	Qt before 6.4.3 allows a denial of service via a crafted string when the SQL ODBC driver plugin is used and the size
CVE-2023-2491	A flaw was found in the Emacs text editor. Processing a specially crafted org-mode code with the "org-babel-execute
CVE-2023-25433	libtiff 4.5.0 is vulnerable to Buffer Overflow via /libtiff/tools/tiffcrop.c:8499. Incorrect updating of buffer size after r
CVE-2023-25434	libtiff 4.5.0 is vulnerable to Buffer Overflow via extractContigSamplesBytes() at /libtiff/tools/tiffcrop.c:3215.
CVE-2023-25435	libtiff 4.5.0 is vulnerable to Buffer Overflow via extractContigSamplesShifted8bits() at /libtiff/tools/tiffcrop.c:3753.
CVE-2023-25584	An out-of-bounds read flaw was found in the parse_module function in bfd/vms-alpha.c in Binutils.
CVE-2023-25585	A flaw was found in Binutils. The use of an uninitialized field in the struct module *module may lead to application
CVE-2023-25588	A flaw was found in Binutils. The field `the_bfd` of `asymbol` struct is uninitialized in the `bfd_mach_o_get_synt

CVE-2023-26048	Jetty is a java based web server and servlet engine. In affected versions servlets with multipart support (e.g. annotate
CVE-2023-26049	Jetty is a java based web server and servlet engine. Nonstandard cookie parsing in Jetty may allow an attacker to sm
CVE-2023-2609	NULL Pointer Dereference in GitHub repository vim/vim prior to 9.0.1531.
CVE-2023-2610	Integer Overflow or Wraparound in GitHub repository vim/vim prior to 9.0.1532.
CVE-2023-26242	afu_mmio_region_get_by_offset in drivers/fpga/dfi-afu-region.c in the Linux kernel through 6.1.12 has an integer ov
CVE-2023-2650	Issue summary: Processing some specially crafted ASN.1 object identifiers or data containing them may be very slow
CVE-2023-26604	systemd before 247 does not adequately block local privilege escalation for some Sudo configurations, e.g., plausible
CVE-2023-26965	loadImage() in tools/tiffcrop.c in LibTIFF through 4.5.0 has a heap-based use after free via a crafted TIFF image.
CVE-2023-26966	libtiff 4.5.0 is vulnerable to Buffer Overflow in uv_encode() when libtiff reads a corrupted little-endian TIFF file and
CVE-2023-27043	The email module of Python through 3.11.3 incorrectly parses e-mail addresses that contain a special character. The
CVE-2023-2727	Users may be able to launch containers using images that are restricted by ImagePolicyWebhook when using ephem
CVE-2023-2728	Users may be able to launch containers that bypass the mountable secrets policy enforced by the ServiceAccount ad
CVE-2023-27533	A vulnerability in input validation exists in curl <8.0 during communication using the TELNET protocol may allow
CVE-2023-27534	A path traversal vulnerability exists in curl <8.0.0 SFTP implementation causes the tilde (~) character to be wrongly
CVE-2023-27536	An authentication bypass vulnerability exists libcurl <8.0.0 in the connection reuse feature which can reuse previous
CVE-2023-27535	An authentication bypass vulnerability exists in libcurl <8.0.0 in the FTP connection reuse feature that can result in v
CVE-2023-27538	An authentication bypass vulnerability exists in libcurl prior to v8.0.0 where it reuses a previously established SSH c
CVE-2023-2828	Every `named` instance configured to run as a recursive resolver maintains a cache database holding the responses to
CVE-2023-28484	In libxml2 before 2.10.4, parsing of certain invalid XSD schemas can lead to a NULL pointer dereference and subse
CVE-2023-28322	An information disclosure vulnerability exists in curl <v8.1.0 when doing HTTP(S) transfers, libcurl might erroneou
CVE-2023-28617	org-babel-execute:latex in ob-latex.el in Org Mode through 9.6.1 for GNU Emacs allows attackers to execute arbitra
CVE-2023-28321	An improper certificate validation vulnerability exists in curl <v8.1.0 in the way it supports matching of wildcard pa

CVE-2023-29400	Templates containing actions in unquoted HTML attributes (e.g. "attr={.}")) executed with empty input can result
CVE-2023-28842	Moby) is an open source container framework developed by Docker Inc. that is distributed as Docker, Mirantis Cont
CVE-2023-29383	In Shadow 4.13, it is possible to inject control characters into fields provided to the SUID program chfn (change finge
CVE-2023-28840	Moby is an open source container framework developed by Docker Inc. that is distributed as Docker, Mirantis Conta
CVE-2023-28841	Moby is an open source container framework developed by Docker Inc. that is distributed as Docker, Mirantis Conta
CVE-2023-29402	The go command may generate unexpected code at build time when using cgo. This may result in unexpected behav
CVE-2023-29405	The go command may execute arbitrary code at build time when using cgo. This may occur when running "go get" o
CVE-2023-29403	On Unix platforms, the Go runtime does not behave differently when a binary is run with the setuid/setgid bits. This
CVE-2023-29404	The go command may execute arbitrary code at build time when using cgo. This may occur when running "go get" o
CVE-2023-29406	The HTTP/1 client does not fully validate the contents of the Host header. A maliciously crafted Host header can inj
CVE-2023-29469	An issue was discovered in libxml2 before 2.10.4. When hashing empty dict strings in a crafted XML document, xm
CVE-2023-29491	ncurses before 6.4 20230408, when used by a setuid application, allows local users to trigger security-relevant memo
CVE-2023-29409	Extremely large RSA keys in certificate chains can cause a client/server to expend significant CPU time verifying sig
CVE-2023-29499	A flaw was found in GLib. GVariant deserialization fails to validate that the input conforms to the expected format,
CVE-2023-29483	eventlet before 0.35.2, as used in dnspython before 2.6.0, allows remote attackers to interfere with DNS name resolu
CVE-2023-2976	Use of Java's default temporary directory for file creation in `FileBackedOutputStream` in Google Guava versions 1.
CVE-2023-2953	A vulnerability was found in openldap. This security flaw causes a null pointer dereference in ber_memalloc_x() fun

CVE-2023-3022	A flaw was found in the IPv6 module of the Linux kernel. The arg.result was not used consistently in fib6_rule_lookup.
CVE-2023-30086	Buffer Overflow vulnerability found in Libtiff V.4.0.7 allows a local attacker to cause a denial of service via the tiffcrop utility.
CVE-2023-3006	A known cache speculation vulnerability, known as Branch History Injection (BHI) or Spectre-BHB, becomes actual when the CPU is in a certain state.
CVE-2023-30775	A vulnerability was found in the libtiff library. This security flaw causes a heap buffer overflow in extractContigSamples.
CVE-2023-30774	A vulnerability was found in the libtiff library. This flaw causes a heap buffer overflow issue via the TIFFTAG_INK.
CVE-2023-31082	An issue was discovered in drivers/tty/n_gsm.c in the Linux kernel 6.2. There is a sleeping function called from an interrupt context.
CVE-2023-31085	An issue was discovered in drivers/mtd/ubi/cdev.c in the Linux kernel 6.2. There is a divide-by-zero error in do_divide.
CVE-2023-31437	An issue was discovered in systemd 253. An attacker can modify a sealed log file such that, in some views, not all events are visible.
CVE-2023-31438	An issue was discovered in systemd 253. An attacker can truncate a sealed log file and then resume log sealing such that the log is not properly sealed.
CVE-2023-31484	CPAN.pm before 2.35 does not verify TLS certificates when downloading distributions over HTTPS.
CVE-2023-31439	An issue was discovered in systemd 253. An attacker can modify the contents of past events in a sealed log file and then resume log sealing.
CVE-2023-31486	HTTP::Tiny before 0.083, a Perl core module since 5.13.9 and available standalone on CPAN, has an insecure default configuration.
CVE-2023-3159	A use after free issue was discovered in driver/firewire in outbound_phy_packet_callback in the Linux Kernel. In this case, the driver uses a pointer that has been freed.
CVE-2023-3164	A heap-buffer-overflow vulnerability was found in LibTIFF, in extractImageSection() at tools/tiffcrop.c:7916 and tools/tiffcrop.c:7917.
CVE-2023-32636	A flaw was found in glib, where the gvariant deserialization code is vulnerable to a denial of service introduced by a crafted GVariant.
CVE-2023-32611	A flaw was found in GLib. GVariant deserialization is vulnerable to a slowdown issue where a crafted GVariant can cause a denial of service.
CVE-2023-32665	A flaw was found in GLib. GVariant deserialization is vulnerable to an exponential blowup issue where a crafted GVariant can cause a denial of service.
CVE-2023-32681	Requests is a HTTP library. Since Requests 2.3.0, Requests has been leaking Proxy-Authorization headers to destination servers.
CVE-2023-32731	When gRPC HTTP2 stack raised a header size exceeded error, it skipped parsing the rest of the HPACK frame. This can lead to a denial of service.
CVE-2023-32732	gRPC contains a vulnerability whereby a client can cause a termination of connection between a HTTP2 proxy and a server.
CVE-2023-33053	Memory corruption in Kernel while parsing metadata.
CVE-2023-3316	A NULL pointer dereference in TIFFClose() is caused by a failure to open an output file (non-existent path or a path that is not writable).
CVE-2023-33201	Bouncy Castle For Java before 1.74 is affected by an LDAP injection vulnerability. The vulnerability only affects applications that use the LDAP module.
CVE-2023-3341	The code that processes control channel messages sent to 'named' calls certain functions recursively during packet processing.
CVE-2023-33202	Bouncy Castle for Java before 1.73 contains a potential Denial of Service (DoS) issue within the Bouncy Castle.org's Bouncy Castle Java API.
CVE-2023-3358	A null pointer dereference was found in the Linux kernel's Integrated Sensor Hub (ISH) driver. This issue could allow a local attacker to cause a denial of service.
CVE-2023-34462	Netty is an asynchronous event-driven network application framework for rapid development of maintainable high performance network servers and clients.
CVE-2023-3446	Issue summary: Checking excessively long DH keys or parameters may be very slow. Impact summary: Application may be slow to respond.
CVE-2023-3576	A memory leak flaw was found in Libtiff's tiffcrop utility. This issue occurs when tiffcrop operates on a TIFF image that is not a standard TIFF image.
CVE-2023-34969	D-Bus before 1.15.6 sometimes allows unprivileged users to crash dbus-daemon. If a privileged user with control over the bus is able to cause a crash.
CVE-2023-35790	An issue was discovered in dec_patch_dictionary.cc in libjxl before 0.8.2. An integer underflow in patch decoding can lead to a denial of service.
CVE-2023-36054	lib/kadm5/kadm_rpc_xdr.c in MIT Kerberos 5 (aka krb5) before 1.20.2 and 1.21.x before 1.21.1 frees an uninitialized memory buffer.
CVE-2023-3618	A flaw was found in libtiff. A specially crafted tiff file can lead to a segmentation fault due to a buffer overflow in the tiffcrop utility.
CVE-2023-3635	GzipSource does not handle an exception that might be raised when parsing a malformed gzip buffer. This may lead to a denial of service.
CVE-2023-3640	A possible unauthorized memory access flaw was found in the Linux kernel's cpu_entry_area mapping of X86 CPU registers.
CVE-2023-36478	Eclipse Jetty provides a web server and servlet container. In versions 11.0.0 through 11.0.15, 10.0.0 through 10.0.15, and 9.4.0 through 9.4.53, there is a denial of service vulnerability.
CVE-2023-36617	A ReDoS issue was discovered in the URI component before 0.12.2 for Ruby. The URI parser mishandles invalid URI characters.
CVE-2023-3676	A security issue was discovered in Kubernetes where a user that can create pods on Windows nodes may be able to escape the container.
CVE-2023-37454	An issue was discovered in the Linux kernel through 6.4.2. A crafted UDF filesystem image causes a use-after-free vulnerability.
CVE-2023-37769	stress-test master commit e4c878 was discovered to contain a FPE vulnerability via the component combine_inner and combine_outer.

CVE-2023-3817	Issue summary: Checking excessively long DH keys or parameters may be very slow. Impact summary: Application
CVE-2023-38546	This flaw allows an attacker to insert cookies at will into a running program using libcurl, if the specific series of con
CVE-2023-38709	Faulty input validation in the core of Apache allows malicious or exploitable backend/content generators to split HT
CVE-2023-39318	The html/template package does not properly handle HTML-like "" comment tokens, nor hashbang "#!" comment to
CVE-2023-3899	A vulnerability was found in subscription-manager that allows local privilege escalation due to inadequate authoriza
CVE-2023-39319	The html/template package does not apply the proper rules for handling occurrences of "<script", "<!--", and "</scrip
CVE-2023-39323	Line directives ("//line") can be used to bypass the restrictions on "//go:cgo_" directives, allowing blocked linker and
CVE-2023-39325	A malicious HTTP/2 client which rapidly creates requests and immediately resets them can cause excessive server re
CVE-2023-39326	A malicious HTTP sender can use chunk extensions to cause a receiver reading from a request or response body to r
CVE-2023-39328	A vulnerability was found in OpenJPEG similar to CVE-2019-6988. This flaw allows an attacker to bypass existing
CVE-2023-39329	A flaw was found in OpenJPEG. A resource exhaustion can occur in the opj_t1_decode_cblks function in tcd.c throu
CVE-2023-39410	When deserializing untrusted or corrupted data, it is possible for a reader to consume memory beyond the allowed co
CVE-2023-39417	IN THE EXTENSION SCRIPT, a SQL Injection vulnerability was found in PostgreSQL if it uses @extowner@, @
CVE-2023-3955	A security issue was discovered in Kubernetes where a user that can create pods on Windows nodes may be able to e
CVE-2023-39615	Xmlsoft Libxml2 v2.11.0 was discovered to contain an out-of-bounds read via the xmlSAX2StartElement() function
CVE-2023-3978	Text nodes not in the HTML namespace are incorrectly literally rendered, causing text which should be escaped to n
CVE-2023-39804	In GNU tar before 1.35, mishandled extension attributes in a PAX archive can lead to an application crash in xheade
CVE-2023-4010	A flaw was found in the USB Host Controller Driver framework in the Linux kernel. The usb_giveback_urb function
CVE-2023-4016	Under some circumstances, this weakness allows a user who has access to run the "ps" utility on a machine, the abil
CVE-2023-40167	Jetty is a Java based web server and servlet engine. Prior to versions 9.4.52, 10.0.16, 11.0.16, and 12.0.1, Jetty accep
CVE-2023-40217	An issue was discovered in Python before 3.8.18, 3.9.x before 3.9.18, 3.10.x before 3.10.13, and 3.11.x before 3.11.5
CVE-2023-4039	**DISPUTED** A failure in the -fstack-protector feature in GCC-based toolchains that target AArch64 allows an att
CVE-2023-40403	The issue was addressed with improved memory handling. This issue is fixed in macOS Ventura 13.6, tvOS 17, iOS
CVE-2023-40745	LibTIFF is vulnerable to an integer overflow. This flaw allows remote attackers to cause a denial of service (applicat
CVE-2023-41175	A vulnerability was found in libtiff due to multiple potential integer overflows in raw2tiff.c. This flaw allows remote
CVE-2023-4133	A use-after-free vulnerability was found in the cxgb4 driver in the Linux kernel. The bug occurs when the cxgb4 dev
CVE-2023-4156	A heap out-of-bounds read flaw was found in builtin.c in the gawk package. This issue may lead to a crash and could
CVE-2023-4194	A flaw was found in the Linux kernel's TUN/TAP functionality. This issue could allow a local user to bypass network
CVE-2023-42282	The ip package before 1.1.9 for Node.js might allow SSRF because some IP addresses (such as 0x7f.1) are improper
CVE-2023-42503	Improper Input Validation, Uncontrolled Resource Consumption vulnerability in Apache Commons Compress in TA
CVE-2023-43804	urllib3 is a user-friendly HTTP client library for Python. urllib3 doesn't treat the `Cookie` HTTP header special or pr
CVE-2023-4408	The DNS message parsing code in `named` includes a section whose computational complexity is overly high. It doe
CVE-2023-44271	An issue was discovered in Pillow before 10.0.0. It is a Denial of Service that uncontrollably allocates memory to pr
CVE-2023-44981	Authorization Bypass Through User-Controlled Key vulnerability in Apache ZooKeeper. If SASL Quorum Peer auth
CVE-2023-4504	Due to failure in validating the length provided by an attacker-crafted PPD PostScript document, CUPS and libppd a
CVE-2023-45142	OpenTelemetry-Go Contrib is a collection of third-party packages for OpenTelemetry-Go. A handler wrapper out of
CVE-2023-44487	The HTTP/2 protocol allows a denial of service (server resource consumption) because request cancellation can rese
CVE-2023-4527	A flaw was found in glibc. When the getaddrinfo function is called with the AF_UNSPEC address family and the sy
CVE-2023-45283	The filepath package does not recognize paths with a \\??\ prefix as special. On Windows, a path beginning with \\??\
CVE-2023-45284	On Windows, The IsLocal function does not correctly detect reserved device names in some cases. Reserved names

CVE-2023-45285	Using go get to fetch a module with the ".git" suffix may unexpectedly fallback to the insecure "git://" protocol if the
CVE-2023-45287	Before Go 1.20, the RSA based TLS key exchanges used the math/big library, which is not constant time. RSA blind
CVE-2023-45288	An attacker may cause an HTTP/2 endpoint to read arbitrary amounts of header data by sending an excessive number
CVE-2023-45289	When following an HTTP redirect to a domain which is not a subdomain match or exact match of the initial domain,
CVE-2023-45290	When parsing a multipart form (either explicitly with Request.ParseMultipartForm or implicitly with Request.FormV
CVE-2023-45322	libxml2 through 2.11.5 has a use-after-free that can only occur after a certain memory allocation fails. This occurs in
CVE-2023-45803	urllib3 is a user-friendly HTTP client library for Python. urllib3 previously wouldn't remove the HTTP request body
CVE-2023-45853	MiniZip in zlib through 1.3 has an integer overflow and resultant heap-based buffer overflow in zipOpenNewFileInZ
CVE-2023-45857	An issue discovered in Axios 1.5.1 inadvertently reveals the confidential XSRF-TOKEN stored in cookies by includ
CVE-2023-45896	ntfs3 in the Linux kernel through 6.8.0 allows a physically proximate attacker to read kernel memory by mounting a
CVE-2023-45918	Rejected reason: DO NOT USE THIS CANDIDATE NUMBER. ConsultIDs: none. Reason: This candidate was with
CVE-2023-45960	Rejected reason: DO NOT USE THIS CVE RECORD. ConsultIDs: none. Reason: This record was withdrawn by its
CVE-2023-46218	This flaw allows a malicious HTTP server to set "super cookies" in curl that are then passed back to more origins tha
CVE-2023-46246	Vim is an improved version of the good old UNIX editor Vi. Heap-use-after-free in memory allocated in the function
CVE-2023-46136	Werkzeug is a comprehensive WSGI web application library. If an upload of a file that starts with CR or LF and then
CVE-2023-4641	A flaw was found in shadow-utils. When asking for a new password, shadow-utils asks the password twice. If the pa
CVE-2023-46749	Apache Shiro before 1.13.0 or 2.0.0-alpha-4, may be susceptible to a path traversal attack that results in an authentic
CVE-2023-46750	URL Redirection to Untrusted Site ('Open Redirect') vulnerability when "form" authentication is used in Apache Shi
CVE-2023-47038	A vulnerability was found in perl 5.30.0 through 5.38.0. This issue occurs when a crafted regular expression is comp
CVE-2023-47233	The brcm80211 component in the Linux kernel through 6.5.10 has a brcmf_cfg80211_detach use-after-free in the de
CVE-2023-47108	OpenTelemetry-Go Contrib is a collection of third-party packages for OpenTelemetry-Go. Prior to version 0.46.0, th
CVE-2023-47282	Out-of-bounds write in Intel(R) Media SDK all versions and some Intel(R) oneVPL software before version 23.3.5 n
CVE-2023-4733	Use After Free in GitHub repository vim/vim prior to 9.0.1840.
CVE-2023-4734	Integer Overflow or Wraparound in GitHub repository vim/vim prior to 9.0.1846.
CVE-2023-4735	Out-of-bounds Write in GitHub repository vim/vim prior to 9.0.1847.
CVE-2023-4738	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.1848.
CVE-2023-4750	Use After Free in GitHub repository vim/vim prior to 9.0.1857.
CVE-2023-4751	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.1331.
CVE-2023-4752	Use After Free in GitHub repository vim/vim prior to 9.0.1858.
CVE-2023-4781	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.1873.
CVE-2023-4813	A flaw was found in glibc. In an uncommon situation, the gaih_inet function may use memory that has been freed, re
CVE-2023-4806	A flaw was found in glibc. In an extremely rare situation, the getaddrinfo function may access memory that has been
CVE-2023-48161	Buffer Overflow vulnerability in GifLib Project GifLib v.5.2.1 allows a local attacker to obtain sensitive information
CVE-2023-48231	Vim is an open source command line text editor. When closing a window, vim may try to access already freed windo
CVE-2023-48232	Vim is an open source command line text editor. A floating point exception may occur when calculating the line offs
CVE-2023-48233	Vim is an open source command line text editor. If the count after the :s command is larger than what fits into a (sign
CVE-2023-48234	Vim is an open source command line text editor. When getting the count for a normal mode z command, it may over
CVE-2023-48235	Vim is an open source command line text editor. When parsing relative ex addresses one may unintentionally cause a
CVE-2023-48236	Vim is an open source command line text editor. When using the z= command, the user may overflow the count with
CVE-2023-48237	Vim is an open source command line text editor. In affected versions when shifting lines in operator pending mode a

CVE-2023-4863	Heap buffer overflow in libwebp in Google Chrome prior to 116.0.5845.187 and libwebp 1.3.2 allowed a remote attacker to execute arbitrary code via a crafted image.
CVE-2023-48706	Vim is a UNIX editor that, prior to version 9.0.2121, has a heap-use-after-free vulnerability. When executing a `:s` command, Vim would free a buffer that was still referenced by another buffer, leading to a crash or, in some cases, arbitrary code execution.
CVE-2023-48713	Knative Serving builds on Kubernetes to support deploying and serving of applications and functions as serverless components. A vulnerability was discovered in Knative Serving that could allow an attacker to execute arbitrary code on the host.
CVE-2023-48727	NULL pointer dereference in some Intel(R) oneVPL software before version 23.3.5 may allow an authenticated user to execute arbitrary code or cause a denial of service (crash) on the host.
CVE-2023-49501	Buffer Overflow vulnerability in Ffmpeg v.n6.1-3-g466799d4f5 allows a local attacker to execute arbitrary code via a crafted input.
CVE-2023-4911	A buffer overflow was discovered in the GNU C Library's dynamic loader ld.so while processing the GLIBC_TUNABLES environment variable.
CVE-2023-49502	Buffer Overflow vulnerability in Ffmpeg v.n6.1-3-g466799d4f5 allows a local attacker to execute arbitrary code via a crafted input.
CVE-2023-48795	The SSH transport protocol with certain OpenSSH extensions, found in OpenSSH before 9.6 and other products, allows an attacker to execute arbitrary code on the host.
CVE-2023-49528	Buffer Overflow vulnerability in FFmpeg version n6.1-3-g466799d4f5, allows a local attacker to execute arbitrary code via a crafted input.
CVE-2023-50007	FFmpeg v.n6.1-3-g466799d4f5 allows an attacker to trigger use of a parameter of negative size in the av_samples_get_buffer_size function.
CVE-2023-50008	FFmpeg v.n6.1-3-g466799d4f5 allows memory consumption when using the colorcorrect filter, in the av_malloc function.
CVE-2023-50387	Certain DNSSEC aspects of the DNS protocol (in RFC 4033, 4034, 4035, 6840, and related RFCs) allow remote attackers to execute arbitrary code on the host.
CVE-2023-50447	Pillow through 10.1.0 allows PIL.ImageMath.eval Arbitrary Code Execution via the environment parameter, a different vector than CVE-2023-50495.
CVE-2023-50495	NCurse v6.4-20230418 was discovered to contain a segmentation fault via the component _nc_wrap_entry().
CVE-2023-50868	The Closest Encloser Proof aspect of the DNS protocol (in RFC 5155 when RFC 9276 guidance is skipped) allows remote attackers to execute arbitrary code on the host.
CVE-2023-5090	A flaw was found in KVM. An improper check in svm_set_x2apic_msr_interception() may allow direct access to host memory.
CVE-2023-51074	json-path v2.8.0 was discovered to contain a stack overflow via the Criteria.parse() method.
CVE-2023-51257	An invalid memory write issue in Jasper-Software Jasper v.4.1.1 and before allows a local attacker to execute arbitrary code on the host.
CVE-2023-5156	A flaw was found in the GNU C Library. A recent fix for CVE-2023-4806 introduced the potential for a memory leak.
CVE-2023-51767	OpenSSH through 9.6, when common types of DRAM are used, might allow row hammer attacks (for authentication) via a crafted input.
CVE-2023-52323	PyCryptodome and pycryptodomex before 3.19.1 allow side-channel leakage for OAEP decryption, exploitable for a denial of service (crash) or, in some cases, arbitrary code execution.
CVE-2023-52355	An out-of-memory flaw was found in libtiff that could be triggered by passing a crafted tiff file to the TIFFRasterScan function.
CVE-2023-52356	A segment fault (SEGV) flaw was found in libtiff that could be triggered by passing a crafted tiff file to the TIFFReadRawStrip function.
CVE-2023-52428	In Connect2id Nimbus JOSE+JWT before 9.37.2, an attacker can cause a denial of service (resource consumption) via a crafted input.
CVE-2023-52435	In the Linux kernel, the following vulnerability has been resolved: net: prevent mss overflow in skb_segment() Once a packet is segmented, the mss of the resulting segments must not exceed the mss of the original packet.
CVE-2023-52447	In the Linux kernel, the following vulnerability has been resolved: bpf: Defer the free of inner map when necessary When a BPF map is freed, the inner map must be freed only after the outer map has been freed.
CVE-2023-52450	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel/uncore: Fix NULL pointer dereference in intel_uncore_event_init() The intel_uncore_event_init() function was called with a NULL pointer, leading to a NULL pointer dereference.
CVE-2023-52451	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries/memhp: Fix access beyond end of memory In the powerpc/pseries/memhp driver, an access beyond the end of memory was allowed, leading to a crash or, in some cases, arbitrary code execution.
CVE-2023-52452	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix accesses to uninit stack slots Privileged programs can access uninit stack slots, leading to a crash or, in some cases, arbitrary code execution.
CVE-2023-52458	In the Linux kernel, the following vulnerability has been resolved: block: add check that partition length needs to be less than or equal to the disk size In the block layer, a check was added to ensure that the partition length is less than or equal to the disk size.
CVE-2023-52454	In the Linux kernel, the following vulnerability has been resolved: nvmet-tcp: Fix a kernel panic when host sends an invalid command In the nvmet-tcp driver, a kernel panic was triggered when the host sends an invalid command.
CVE-2023-52463	In the Linux kernel, the following vulnerability has been resolved: efivarfs: force RO when remounting if SetVariable() fails In the efivarfs driver, the read-only (RO) flag was not set when remounting if the SetVariable() function failed.
CVE-2023-52465	In the Linux kernel, the following vulnerability has been resolved: power: supply: Fix null pointer dereference in smbus_i2c_adapter_remove() The smbus_i2c_adapter_remove() function was called with a NULL pointer, leading to a NULL pointer dereference.
CVE-2023-52464	In the Linux kernel, the following vulnerability has been resolved: EDAC/thunderx: Fix possible out-of-bounds string access In the EDAC/thunderx driver, a possible out-of-bounds string access was allowed, leading to a crash or, in some cases, arbitrary code execution.
CVE-2023-52466	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-52468	In the Linux kernel, the following vulnerability has been resolved: class: fix use-after-free in class_register() The class_register() function was called with a NULL pointer, leading to a use-after-free error.
CVE-2023-52469	In the Linux kernel, the following vulnerability has been resolved: drivers/amd/pm: fix a use-after-free in kv_parse() The kv_parse() function was called with a NULL pointer, leading to a use-after-free error.
CVE-2023-52470	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: check the alloc_workqueue return value In the drm/radeon driver, the alloc_workqueue() function was not checked for a NULL return value.
CVE-2023-52471	In the Linux kernel, the following vulnerability has been resolved: ice: Fix some null pointer dereference issues in ice_vc_tx_desc() The ice_vc_tx_desc() function was called with a NULL pointer, leading to a NULL pointer dereference.
CVE-2023-52474	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Fix bugs with non-PAGE_SIZE-end multi-page RDMA writes In the IB/hfi1 driver, several bugs were fixed related to non-PAGE_SIZE-end multi-page RDMA writes.

CVE-2023-52475	In the Linux kernel, the following vulnerability has been resolved: Input: powermate - fix use-after-free in powermate
CVE-2023-52476	In the Linux kernel, the following vulnerability has been resolved: perf/x86/lbr: Filter vsyscall addresses We found t
CVE-2023-52478	In the Linux kernel, the following vulnerability has been resolved: HID: logitech-hidpp: Fix kernel crash on receiver
CVE-2023-52481	In the Linux kernel, the following vulnerability has been resolved: arm64: errata: Add Cortex-A520 speculative unpr
CVE-2023-52485	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Wake DMCUB before sending
CVE-2023-52482	In the Linux kernel, the following vulnerability has been resolved: x86/srso: Add SRSO mitigation for Hygon proces
CVE-2023-52486	In the Linux kernel, the following vulnerability has been resolved: drm: Don't unref the same fb many times by mista
CVE-2023-52490	In the Linux kernel, the following vulnerability has been resolved: mm: migrate: fix getting incorrect page mapping
CVE-2023-52492	In the Linux kernel, the following vulnerability has been resolved: dmaengine: fix NULL pointer in channel unregist
CVE-2023-52498	In the Linux kernel, the following vulnerability has been resolved: PM: sleep: Fix possible deadlocks in core system
CVE-2023-52508	In the Linux kernel, the following vulnerability has been resolved: nvme-fc: Prevent null pointer dereference in nvme
CVE-2023-52516	In the Linux kernel, the following vulnerability has been resolved: dma-debug: don't call __dma_entry_alloc_check
CVE-2023-52519	In the Linux kernel, the following vulnerability has been resolved: HID: intel-ish-hid: ipc: Disable and reenabl
CVE-2023-52522	In the Linux kernel, the following vulnerability has been resolved: net: fix possible store tearing in neigh_periodic_w
CVE-2023-52523	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Reject sk_msg egress redirects to n
CVE-2023-52530	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix potential key use-after-free
CVE-2023-52532	In the Linux kernel, the following vulnerability has been resolved: net: mana: Fix TX CQE error handling For an unl
CVE-2023-52560	In the Linux kernel, the following vulnerability has been resolved: mm/damon/vaddr-test: fix memory leak in damon
CVE-2023-52561	In the Linux kernel, the following vulnerability has been resolved: arm64: dts: qcom: sdm845-db845c: Mark cont sp
CVE-2023-52568	In the Linux kernel, the following vulnerability has been resolved: x86/sgx: Resolves SECS reclaim vs. page fault fo
CVE-2023-52569	In the Linux kernel, the following vulnerability has been resolved: btrfs: remove BUG() after failure to insert delaye
CVE-2023-52570	In the Linux kernel, the following vulnerability has been resolved: vfio/mdev: Fix a null-ptr-deref bug for mdev_unr
CVE-2023-52575	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-52576	In the Linux kernel, the following vulnerability has been resolved: x86/mm, kexec, ima: Use memblock_free_late()
CVE-2023-52582	In the Linux kernel, the following vulnerability has been resolved: netfs: Only call folio_start_fscache() one time for
CVE-2023-52583	In the Linux kernel, the following vulnerability has been resolved: ceph: fix deadlock or deadcode of misusing dget(
CVE-2023-52585	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix possible NULL dereference in a
CVE-2023-52586	In the Linux kernel, the following vulnerability has been resolved: drm/msm/dpu: Add mutex lock in control vblank
CVE-2023-52587	In the Linux kernel, the following vulnerability has been resolved: IB/ipoib: Fix mcast list locking Releasing the `pri
CVE-2023-52589	In the Linux kernel, the following vulnerability has been resolved: media: rkisp1: Fix IRQ disable race issue In rkisp
CVE-2023-52590	In the Linux kernel, the following vulnerability has been resolved: ocfs2: Avoid touching renamed directory if paren
CVE-2023-52593	In the Linux kernel, the following vulnerability has been resolved: wifi: wfx: fix possible NULL pointer dereference
CVE-2023-52591	In the Linux kernel, the following vulnerability has been resolved: reiserfs: Avoid touching renamed directory if par
CVE-2023-52605	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-52614	In the Linux kernel, the following vulnerability has been resolved: PM / devfreq: Fix buffer overflow in trans_stat_sl
CVE-2023-52615	In the Linux kernel, the following vulnerability has been resolved: hwrng: core - Fix page fault dead lock on mmap-p
CVE-2023-52619	In the Linux kernel, the following vulnerability has been resolved: pstore/ram: Fix crash when setting number of cpu
CVE-2023-52621	In the Linux kernel, the following vulnerability has been resolved: bpf: Check rcu_read_lock_trace_held() before cal
CVE-2023-52622	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid online resizing failures due to oversiz
CVE-2023-52623	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Fix a suspicious RCU usage warning I

CVE-2023-52624	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Wake DMCUB before executing
CVE-2023-52625	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Refactor DMCUB enter/exit id
CVE-2023-52626	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix operation precedence bug in port t
CVE-2023-52629	In the Linux kernel, the following vulnerability has been resolved: sh: push-switch: Reorder cleanup operations to av
CVE-2023-52632	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Fix lock dependency warning with
CVE-2023-52634	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix disable_otg_wa logic [Why
CVE-2023-52639	In the Linux kernel, the following vulnerability has been resolved: KVM: s390: vsie: fix race during shadow creation
CVE-2023-52642	In the Linux kernel, the following vulnerability has been resolved: media: rc: bpf attach/detach requires write permis
CVE-2023-52646	In the Linux kernel, the following vulnerability has been resolved: aio: fix mmap after fork null-deref Commit e4a
CVE-2023-52648	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Unmap the surface before resetting
CVE-2023-52653	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: fix a memleak in gss_import_v2_cont
CVE-2023-52657	In the Linux kernel, the following vulnerability has been resolved: Revert "drm/amd/pm: resolve reboot exception fo
CVE-2023-52658	In the Linux kernel, the following vulnerability has been resolved: Revert "net/mlx5: Block entering switchdev mode
CVE-2023-52660	In the Linux kernel, the following vulnerability has been resolved: media: rkisp1: Fix IRQ handling due to shared in
CVE-2023-52662	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: fix a memleak in vmw_gmrid_man
CVE-2023-52663	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: amd: Fix memory leak in amd_sof_a
CVE-2023-52664	In the Linux kernel, the following vulnerability has been resolved: net: atlantic: eliminate double free in error handli
CVE-2023-52667	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: fix a potential double-free in fs_any_c
CVE-2023-52669	In the Linux kernel, the following vulnerability has been resolved: crypto: s390/aes - Fix buffer overread in CTR mo
CVE-2023-52671	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix hang/underflow when trans
CVE-2023-52673	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix a debugfs null pointer error
CVE-2023-52674	In the Linux kernel, the following vulnerability has been resolved: ALSA: scarlett2: Add clamp() in scarlett2_mixer
CVE-2023-52675	In the Linux kernel, the following vulnerability has been resolved: powerpc/imc-pmu: Add a null pointer check in up
CVE-2023-52676	In the Linux kernel, the following vulnerability has been resolved: bpf: Guard stack limits against 32bit overflow Th
CVE-2023-52679	In the Linux kernel, the following vulnerability has been resolved: of: Fix double free in of_parse_phandle_with_arg
CVE-2023-52680	In the Linux kernel, the following vulnerability has been resolved: ALSA: scarlett2: Add missing error checks to *_c
CVE-2023-52682	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to wait on block writeback for post_read
CVE-2023-52683	In the Linux kernel, the following vulnerability has been resolved: ACPI: LPIT: Avoid u32 multiplication overflow
CVE-2023-52689	In the Linux kernel, the following vulnerability has been resolved: ALSA: scarlett2: Add missing mutex lock around
CVE-2023-52686	In the Linux kernel, the following vulnerability has been resolved: powerpc/powernv: Add a null pointer check in op
CVE-2023-52697	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: sof_sdw_rt_sdca_jack_common: ctx
CVE-2023-52698	In the Linux kernel, the following vulnerability has been resolved: calipso: fix memory leak in netlbl_calipso_add_p
CVE-2023-52700	In the Linux kernel, the following vulnerability has been resolved: tipc: fix kernel warning when sending SYN mess
CVE-2023-52701	In the Linux kernel, the following vulnerability has been resolved: net: use a bounce buffer for copying skb->mark s
CVE-2023-52702	In the Linux kernel, the following vulnerability has been resolved: net: openvswitch: fix possible memory leak in ov
CVE-2023-52703	In the Linux kernel, the following vulnerability has been resolved: net/usb: kalmia: Don't pass act_len in usb_bulk_m
CVE-2023-52707	In the Linux kernel, the following vulnerability has been resolved: sched/psi: Fix use-after-free in ep_remove_wait
CVE-2023-52730	In the Linux kernel, the following vulnerability has been resolved: mmc: sdio: fix possible resource leaks in some er
CVE-2023-52731	In the Linux kernel, the following vulnerability has been resolved: fbdev: Fix invalid page access after closing deferr
CVE-2023-52732	In the Linux kernel, the following vulnerability has been resolved: ceph: blocklist the kclient when receiving corrupt

CVE-2023-52735	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Don't let sock_map_{close,destroy}
CVE-2023-52736	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: Do not unset preset when cleaning up
CVE-2023-52737	In the Linux kernel, the following vulnerability has been resolved: btrfs: lock the inode in shared mode before starting
CVE-2023-52738	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu/fence: Fix oops due to non-matching
CVE-2023-52739	In the Linux kernel, the following vulnerability has been resolved: Fix page corruption caused by racy check in __fr
CVE-2023-52741	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix use-after-free in rdata->read_into_pagest
CVE-2023-52743	In the Linux kernel, the following vulnerability has been resolved: ice: Do not use WQ_MEM_RECLAIM flag for w
CVE-2023-52744	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Fix potential NULL-ptr-dereference
CVE-2023-52745	In the Linux kernel, the following vulnerability has been resolved: IB/IPoIB: Fix legacy IPoIB due to wrong number
CVE-2023-52747	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Restore allocated resources on failed cop
CVE-2023-52749	In the Linux kernel, the following vulnerability has been resolved: spi: Fix null dereference on suspend A race condi
CVE-2023-52750	In the Linux kernel, the following vulnerability has been resolved: arm64: Restrict CPU_BIG_ENDIAN to GNU as
CVE-2023-52751	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix use-after-free in smb2_query_info
CVE-2023-52756	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-52754	In the Linux kernel, the following vulnerability has been resolved: media: imon: fix access to invalid resource for the
CVE-2023-52760	In the Linux kernel, the following vulnerability has been resolved: gfs2: Fix slab-use-after-free in gfs2_qd_dealloc In
CVE-2023-52758	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-52761	In the Linux kernel, the following vulnerability has been resolved: riscv: VMAP_STACK overflow detection thread
CVE-2023-52762	In the Linux kernel, the following vulnerability has been resolved: virtio-blk: fix implicit overflow on virtio_max_dr
CVE-2023-52764	In the Linux kernel, the following vulnerability has been resolved: media: gspca: cpia1: shift-out-of-bounds in set_fl
CVE-2023-52775	In the Linux kernel, the following vulnerability has been resolved: net/smc: avoid data corruption caused by decline
CVE-2023-52777	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: fix gtk offload status event locking
CVE-2023-52781	In the Linux kernel, the following vulnerability has been resolved: usb: config: fix iteration issue in 'usb_get_bos_de
CVE-2023-52782	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Track xmit submission to PTP WQ aft
CVE-2023-52784	In the Linux kernel, the following vulnerability has been resolved: bonding: stop the device in bond_setup_by_slave
CVE-2023-52788	In the Linux kernel, the following vulnerability has been resolved: i915/perf: Fix NULL deref bugs with drm_dbg()
CVE-2023-52791	In the Linux kernel, the following vulnerability has been resolved: i2c: core: Run atomic i2c xfer when !preemptible
CVE-2023-52796	In the Linux kernel, the following vulnerability has been resolved: ipvlan: add ipvlan_route_v6_outbound() helper In
CVE-2023-52798	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: fix dfs radar event locking The ath1
CVE-2023-52800	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: fix htt pktlog locking The ath11k ac
CVE-2023-52803	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Fix RPC client cleaned up the freed pi
CVE-2023-52806	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: Fix possible null-ptr-deref when assi
CVE-2023-52808	In the Linux kernel, the following vulnerability has been resolved: scsi: hisi_sas: Set debugfs_dir pointer to NULL a
CVE-2023-52809	In the Linux kernel, the following vulnerability has been resolved: scsi: libfc: Fix potential NULL pointer dereference
CVE-2023-52811	In the Linux kernel, the following vulnerability has been resolved: scsi: ibmvfc: Remove BUG_ON in the case of an
CVE-2023-52813	In the Linux kernel, the following vulnerability has been resolved: crypto: pccrypt - Fix hungtask for PADATA_RES
CVE-2023-52814	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix potential null pointer dereference
CVE-2023-52815	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu/vkms: fix a possible null pointer der
CVE-2023-52817	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix a null pointer access when the s
CVE-2023-52818	In the Linux kernel, the following vulnerability has been resolved: drm/amd: Fix UBSAN array-index-out-of-bounds

CVE-2023-52819	In the Linux kernel, the following vulnerability has been resolved: drm/amd: Fix UBSAN array-index-out-of-bounds
CVE-2023-52831	In the Linux kernel, the following vulnerability has been resolved: cpu/hotplug: Don't offline the last non-isolated CPU
CVE-2023-52829	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix possible out-of-bound write in ath12k
CVE-2023-52832	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: don't return unset power in ieee80211
CVE-2023-52833	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btusb: Add date->evt_skb is NULL check
CVE-2023-52835	In the Linux kernel, the following vulnerability has been resolved: perf/core: Bail out early if the request AUX area is not
CVE-2023-52834	In the Linux kernel, the following vulnerability has been resolved: atl1c: Work around the DMA RX overflow issue
CVE-2023-52837	In the Linux kernel, the following vulnerability has been resolved: nbd: fix uaf in nbd_open Commit 4af5f2e03013 (
CVE-2023-52840	In the Linux kernel, the following vulnerability has been resolved: Input: synaptics-rmi4 - fix use after free in rmi_un
CVE-2023-52845	In the Linux kernel, the following vulnerability has been resolved: tipc: Change nla_policy for bearer-related names
CVE-2023-52847	In the Linux kernel, the following vulnerability has been resolved: media: btvtv: fix use after free error due to btv->tin
CVE-2023-52851	In the Linux kernel, the following vulnerability has been resolved: IB/mlx5: Fix init stage error handling to avoid do
CVE-2023-52854	In the Linux kernel, the following vulnerability has been resolved: padata: Fix refcnt handling in padata_free_shell()
CVE-2023-52857	In the Linux kernel, the following vulnerability has been resolved: drm/mediatek: Fix coverity issue with unintention
CVE-2023-52864	In the Linux kernel, the following vulnerability has been resolved: platform/x86: wmi: Fix opening of char device S
CVE-2023-52867	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: possible buffer overflow Buffer 'afm
CVE-2023-52872	In the Linux kernel, the following vulnerability has been resolved: tty: n_gsm: fix race condition in status line chang
CVE-2023-52877	In the Linux kernel, the following vulnerability has been resolved: usb: typec: tcpm: Fix NULL pointer dereference i
CVE-2023-52878	In the Linux kernel, the following vulnerability has been resolved: can: dev: can_put_echo_skb(): don't crash kernel
CVE-2023-52879	In the Linux kernel, the following vulnerability has been resolved: tracing: Have trace_event_file have ref counters T
CVE-2023-52880	In the Linux kernel, the following vulnerability has been resolved: tty: n_gsm: require CAP_NET_ADMIN to attach
CVE-2023-52881	In the Linux kernel, the following vulnerability has been resolved: tcp: do not accept ACK of bytes we never sent TH
CVE-2023-52882	In the Linux kernel, the following vulnerability has been resolved: clk: sunxi-ng: h6: Reparent CPUX during PLL Cl
CVE-2023-52883	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix possible null pointer dereferenc
CVE-2023-52884	In the Linux kernel, the following vulnerability has been resolved: Input: cyapa - add missing input core locking to s
CVE-2023-52885	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Fix UAF in svc_tcp_listen_data_ready
CVE-2023-52886	In the Linux kernel, the following vulnerability has been resolved: USB: core: Fix race by not overwriting udev->des
CVE-2023-52887	In the Linux kernel, the following vulnerability has been resolved: net: can: j1939: enhanced error handling for tight
CVE-2023-52888	In the Linux kernel, the following vulnerability has been resolved: media: mediatek: vcodec: Only free buffer VA th
CVE-2023-52889	In the Linux kernel, the following vulnerability has been resolved: apparmor: Fix null pointer deref when receiving s
CVE-2023-52898	In the Linux kernel, the following vulnerability has been resolved: xhci: Fix null pointer dereference when host dies
CVE-2023-52901	In the Linux kernel, the following vulnerability has been resolved: usb: xhci: Check endpoint is valid before derefer
CVE-2023-52904	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Fix possible NULL pointer der
CVE-2023-52905	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: Fix resource leakage in VF driver u
CVE-2023-52906	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_mpls: Fix warning during failed att
CVE-2023-52908	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix potential NULL dereference Fix
CVE-2023-52910	In the Linux kernel, the following vulnerability has been resolved: iommu/iova: Fix alloc iova overflows issue In _
CVE-2023-52912	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fixed bug on error when unloading
CVE-2023-52913	In the Linux kernel, the following vulnerability has been resolved: drm/i915: Fix potential context UAFs gem_conte
CVE-2023-52915	In the Linux kernel, the following vulnerability has been resolved: media: dvb-usb-v2: af9035: Fix null-ptr-deref in a

CVE-2023-52916	In the Linux kernel, the following vulnerability has been resolved: media: aspeed: Fix memory overwrite if timing is
CVE-2023-52917	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-52918	In the Linux kernel, the following vulnerability has been resolved: media: pci: cx23885: check cx23885_vdev_init()
CVE-2023-52920	In the Linux kernel, the following vulnerability has been resolved: bpf: support non-r10 register spill/fill to/from stack
CVE-2023-52921	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix possible UAF in amdgpu_cs_pa
CVE-2023-52922	In the Linux kernel, the following vulnerability has been resolved: can: bcm: Fix UAF in bcm_proc_show() BUG: K
CVE-2023-52923	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: adapt set backend to use GC t
CVE-2023-52925	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: don't fail inserts if duplicate h
CVE-2023-52924	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: don't skip expired elements du
CVE-2023-52926	In the Linux kernel, the following vulnerability has been resolved: IORING_OP_READ did not correctly consume the
CVE-2023-52927	In the Linux kernel, the following vulnerability has been resolved: netfilter: allow exp not to be removed in nf_ct_fir
CVE-2023-52928	In the Linux kernel, the following vulnerability has been resolved: bpf: Skip invalid kfunc call in backtrack_insn The
CVE-2023-52931	In the Linux kernel, the following vulnerability has been resolved: drm/i915: Avoid potential vm use-after-free Addi
CVE-2023-52932	In the Linux kernel, the following vulnerability has been resolved: mm/swapfile: add cond_resched() in get_swap_pa
CVE-2023-52935	In the Linux kernel, the following vulnerability has been resolved: mm/khugepaged: fix ->anon_vma race If an ->an
CVE-2023-52936	In the Linux kernel, the following vulnerability has been resolved: kernel/irq/irqdomain.c: fix memory leak with usin
CVE-2023-52937	In the Linux kernel, the following vulnerability has been resolved: HV: hv_balloon: fix memory leak with using deb
CVE-2023-52938	In the Linux kernel, the following vulnerability has been resolved: usb: typec: ucsi: Don't attempt to resume the ports
CVE-2023-52939	In the Linux kernel, the following vulnerability has been resolved: mm: memcg: fix NULL pointer in mem_cgroup_
CVE-2023-52942	In the Linux kernel, the following vulnerability has been resolved: cgroup/cpuset: Fix wrong check in update_parent
CVE-2023-52973	In the Linux kernel, the following vulnerability has been resolved: vc_screen: move load of struct vc_data pointer in
CVE-2023-52974	In the Linux kernel, the following vulnerability has been resolved: scsi: iscsi_tcp: Fix UAF during login when access
CVE-2023-52975	In the Linux kernel, the following vulnerability has been resolved: scsi: iscsi_tcp: Fix UAF during logout when acces
CVE-2023-52976	In the Linux kernel, the following vulnerability has been resolved: efi: fix potential NULL deref in efi_mem_reserve
CVE-2023-52981	In the Linux kernel, the following vulnerability has been resolved: drm/i915: Fix request ref counting during error ca
CVE-2023-52983	In the Linux kernel, the following vulnerability has been resolved: block, bfq: fix uaf for bfqq in bic_set_bfqq() After
CVE-2023-52984	In the Linux kernel, the following vulnerability has been resolved: net: phy: dp83822: Fix null pointer access on DP8
CVE-2023-52987	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: ipc4-mtrace: prevent underflow in so
CVE-2023-52986	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Check for any of tcp_bpf_protos wh
CVE-2023-52988	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda/via: Avoid potential array out-of-bou
CVE-2023-52989	In the Linux kernel, the following vulnerability has been resolved: firewire: fix memory leak for payload of request s
CVE-2023-52990	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-52992	In the Linux kernel, the following vulnerability has been resolved: bpf: Skip task with pid=1 in send_signal_common
CVE-2023-52993	In the Linux kernel, the following vulnerability has been resolved: x86/i8259: Mark legacy PIC interrupts with IRQ_
CVE-2023-52994	In the Linux kernel, the following vulnerability has been resolved: acpi: Fix suspend with Xen PV Commit f1e52500
CVE-2023-52996	In the Linux kernel, the following vulnerability has been resolved: ipv4: prevent potential spectre v1 gadget in fib_m
CVE-2023-52997	In the Linux kernel, the following vulnerability has been resolved: ipv4: prevent potential spectre v1 gadget in ip_m
CVE-2023-53000	In the Linux kernel, the following vulnerability has been resolved: netlink: prevent potential spectre v1 gadgets Most
CVE-2023-53001	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-53002	In the Linux kernel, the following vulnerability has been resolved: drm/i915: Fix a memory leak with reused mmap_

CVE-2023-53005	In the Linux kernel, the following vulnerability has been resolved: trace_events_hist: add check for return value of 'c
CVE-2023-53006	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix oops due to uncleared server->smbd_cor
CVE-2023-53007	In the Linux kernel, the following vulnerability has been resolved: tracing: Make sure trace_printk() can output as so
CVE-2023-53008	In the Linux kernel, the following vulnerability has been resolved: cifs: fix potential memory leaks in session setup M
CVE-2023-53009	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Add sync after creating vram bo Th
CVE-2023-53010	In the Linux kernel, the following vulnerability has been resolved: bnxt: Do not read past the end of test names Test
CVE-2023-53011	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: enable all safety features by default
CVE-2023-53013	In the Linux kernel, the following vulnerability has been resolved: ptdma: pt_core_execute_cmd() should use spinloc
CVE-2023-53015	In the Linux kernel, the following vulnerability has been resolved: HID: betop: check shape of output reports betopff
CVE-2023-53016	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix possible deadlock in rfcomm_sk_s
CVE-2023-53019	In the Linux kernel, the following vulnerability has been resolved: net: mdio: validate parameter addr in mdiobus_ge
CVE-2023-53020	In the Linux kernel, the following vulnerability has been resolved: l2tp: close all race conditions in l2tp_tunnel_regis
CVE-2023-53024	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix pointer-leak due to insufficient speculativ
CVE-2023-53026	In the Linux kernel, the following vulnerability has been resolved: RDMA/core: Fix ib block iterator counter overflo
CVE-2023-53031	In the Linux kernel, the following vulnerability has been resolved: powerpc/imc-pmu: Fix use of mutex in IRQs disa
CVE-2023-53032	In the Linux kernel, the following vulnerability has been resolved: netfilter: ipset: Fix overflow before widen in the b
CVE-2023-53034	In the Linux kernel, the following vulnerability has been resolved: ntb_hw_switctec: Fix shift-out-of-bounds in swit
CVE-2023-53036	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix call trace warning and hang wh
CVE-2023-53037	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Bad drive in topology results kerne
CVE-2023-53038	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Check kzalloc() in lpfc_sli4_cgn_param
CVE-2023-53039	In the Linux kernel, the following vulnerability has been resolved: HID: intel-ish-hid: ipc: Fix potential use-after-fre
CVE-2023-53041	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Perform lockless command comple
CVE-2023-53042	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Do not set DRR on pipe Comm
CVE-2023-53044	In the Linux kernel, the following vulnerability has been resolved: dm stats: check for and propagate alloc_percpu fa
CVE-2023-53046	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix race condition in hci_cmd_sync_c
CVE-2023-53048	In the Linux kernel, the following vulnerability has been resolved: usb: typec: tcpm: fix warning when handle discov
CVE-2023-53049	In the Linux kernel, the following vulnerability has been resolved: usb: ucsi: Fix NULL pointer deref in ucsi_connec
CVE-2023-53050	In the Linux kernel, the following vulnerability has been resolved: thunderbolt: Fix memory leak in margining Mem
CVE-2023-53051	In the Linux kernel, the following vulnerability has been resolved: dm crypt: add cond_resched() to dmccrypt_write()
CVE-2023-53052	In the Linux kernel, the following vulnerability has been resolved: cifs: fix use-after-free bug in refresh_cache_work
CVE-2023-53053	In the Linux kernel, the following vulnerability has been resolved: erspan: do not use skb_mac_header() in ndo_start
CVE-2023-53056	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Synchronize the IOCB count to be
CVE-2023-53057	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: HCI: Fix global-out-of-bounds To loop
CVE-2023-53058	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: E-Switch, Fix an Oops in error handling
CVE-2023-53060	In the Linux kernel, the following vulnerability has been resolved: igb: revert rtnl_lock() that causes deadlock The c
CVE-2023-53062	In the Linux kernel, the following vulnerability has been resolved: net: usb: smsc95xx: Limit packet length to skb->l
CVE-2023-53063	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-53064	In the Linux kernel, the following vulnerability has been resolved: iavf: fix hang on reboot with ice When a system v
CVE-2023-53065	In the Linux kernel, the following vulnerability has been resolved: perf/core: Fix perf_output_begin parameter is inc
CVE-2023-53066	In the Linux kernel, the following vulnerability has been resolved: qed/qed_sriov: guard against NULL derefs from c

CVE-2023-53067	In the Linux kernel, the following vulnerability has been resolved: LoongArch: Only call get_timer_irq() once in con
CVE-2023-53068	In the Linux kernel, the following vulnerability has been resolved: net: usb: lan78xx: Limit packet length to skb->len
CVE-2023-53070	In the Linux kernel, the following vulnerability has been resolved: ACPI: PPTT: Fix to avoid sleep in the atomic con
CVE-2023-53071	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: do not run mt76_unregister_device()
CVE-2023-53072	In the Linux kernel, the following vulnerability has been resolved: mptcp: use the workqueue to destroy unaccepted
CVE-2023-53073	In the Linux kernel, the following vulnerability has been resolved: perf/x86/amd/core: Always clear status for idx TH
CVE-2023-53074	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix ttm_bo calltrace warning in psp
CVE-2023-53075	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix invalid address access in lookup_rec()
CVE-2023-53076	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2023-53077	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: fix shift-out-of-bounds in Calcu
CVE-2023-53078	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_dh_alua: Fix memleak for 'qdata' in alua
CVE-2023-53079	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix steering rules cleanup vport's mc, u
CVE-2023-53080	In the Linux kernel, the following vulnerability has been resolved: xsk: Add missing overflow check in xdp_umem_
CVE-2023-53084	In the Linux kernel, the following vulnerability has been resolved: drm/shmem-helper: Remove another errant put in
CVE-2023-53085	In the Linux kernel, the following vulnerability has been resolved: drm/edid: fix info leak when failing to get panel i
CVE-2023-53086	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: connac: do not check WED status for
CVE-2023-53088	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix UaF in listener shutdown As reported b
CVE-2023-53089	In the Linux kernel, the following vulnerability has been resolved: ext4: fix task hung in ext4_xattr_delete_inode Sys
CVE-2023-53090	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Fix an illegal memory access In the
CVE-2023-53091	In the Linux kernel, the following vulnerability has been resolved: ext4: update s_journal_inum if it changes after jo
CVE-2023-53093	In the Linux kernel, the following vulnerability has been resolved: tracing: Do not let histogram values have some m
CVE-2023-53095	In the Linux kernel, the following vulnerability has been resolved: drm/ttm: Fix a NULL pointer dereference The LR
CVE-2023-53097	In the Linux kernel, the following vulnerability has been resolved: powerpc/iommu: fix memory leak with using deb
CVE-2023-53098	In the Linux kernel, the following vulnerability has been resolved: media: rc: gpio-ir-recv: add remove function In ca
CVE-2023-53100	In the Linux kernel, the following vulnerability has been resolved: ext4: fix WARNING in ext4_update_inline_data
CVE-2023-53101	In the Linux kernel, the following vulnerability has been resolved: ext4: zero i_disksize when initializing the bootloa
CVE-2023-53103	In the Linux kernel, the following vulnerability has been resolved: bonding: restore bond's IFF_SLAVE flag if a non
CVE-2023-53105	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix cleanup null-ptr deref on encaps lo
CVE-2023-53108	In the Linux kernel, the following vulnerability has been resolved: net/iucv: Fix size of interrupt data iucv_irq_data n
CVE-2023-53102	In the Linux kernel, the following vulnerability has been resolved: ice: xsk: disable txq irq before flushing hw ice_qp
CVE-2023-53109	In the Linux kernel, the following vulnerability has been resolved: net: tunnels: annotate lockless accesses to dev->n
CVE-2023-53112	In the Linux kernel, the following vulnerability has been resolved: drm/i915/sseu: fix max_subslices array-index-out
CVE-2023-53113	In the Linux kernel, the following vulnerability has been resolved: wifi: nl80211: fix NULL-ptr deref in offchan che
CVE-2023-53111	In the Linux kernel, the following vulnerability has been resolved: loop: Fix use-after-free issues do_req_filebacked
CVE-2023-53110	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix NULL sndbuf_desc in smc_cdc_tx_h
CVE-2023-53114	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix kernel crash during reboot when adapter
CVE-2023-53115	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix memory leaks in mpi3mr_init_
CVE-2023-53117	In the Linux kernel, the following vulnerability has been resolved: fs: prevent out-of-bounds array speculation when
CVE-2023-53118	In the Linux kernel, the following vulnerability has been resolved: scsi: core: Fix a procfs host directory removal reg
CVE-2023-53116	In the Linux kernel, the following vulnerability has been resolved: nvmet: avoid potential UAF in nvmet_req_compl

CVE-2023-53120	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix config page DMA memory leak
CVE-2023-53121	In the Linux kernel, the following vulnerability has been resolved: tcp: tcp_make_synack() can be called from process context
CVE-2023-53124	In the Linux kernel, the following vulnerability has been resolved: scsi: mpt3sas: Fix NULL pointer access in mpt3sas_scsi_dev
CVE-2023-53123	In the Linux kernel, the following vulnerability has been resolved: PCI: s390: Fix use-after-free of PCI resources with pci_dev
CVE-2023-53125	In the Linux kernel, the following vulnerability has been resolved: net: usb: smsc75xx: Limit packet length to skb->len
CVE-2023-53126	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix sas_hba.phy memory leak in mpi3mr_sas_hba
CVE-2023-53127	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix expander node leak in mpi3mr_sas_hba
CVE-2023-53128	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix throttle_groups memory leak in mpi3mr_sas_hba
CVE-2023-53131	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Fix a server shutdown leak Fix a race condition
CVE-2023-53132	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix mpi3mr_hba_port memory leak in mpi3mr_sas_hba
CVE-2023-53133	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix an infinite loop error when len is 0
CVE-2023-53134	In the Linux kernel, the following vulnerability has been resolved: bnxt_en: Avoid order-5 memory allocation for TPA
CVE-2023-53137	In the Linux kernel, the following vulnerability has been resolved: ext4: Fix possible corruption when moving a directory
CVE-2023-53140	In the Linux kernel, the following vulnerability has been resolved: scsi: core: Remove the /proc/scsi/\${proc_name} directory
CVE-2023-53142	In the Linux kernel, the following vulnerability has been resolved: ice: copy last block omitted in ice_get_module_eeprom
CVE-2023-53143	In the Linux kernel, the following vulnerability has been resolved: ext4: fix another off-by-one fsmap error on 1k block
CVE-2023-53145	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: bttdio: fix use after free bug in bttdio_remove
CVE-2023-53146	In the Linux kernel, the following vulnerability has been resolved: media: dw2102: Fix null-ptr-deref in dw2102_i2c_driver
CVE-2023-5344	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.1969.
CVE-2023-5441	NULL Pointer Dereference in GitHub repository vim/vim prior to 20d161ace307e28690229b68584f2d84556f8960.
CVE-2023-5455	A Cross-site request forgery vulnerability exists in ipa/session/login_password in all supported versions of IPA. This vulnerability
CVE-2023-5528	A security issue was discovered in Kubernetes where a user that can create pods and persistent volumes on Windows can create
CVE-2023-5535	Use After Free in GitHub repository vim/vim prior to v9.0.2010.
CVE-2023-5574	A use-after-free flaw was found in xorg-x11-server-Xvfb. This issue occurs in Xvfb with a very specific and legacy configuration
CVE-2023-5678	Issue summary: Generating excessively long X9.42 DH keys or checking excessively long X9.42 DH keys or parameters
CVE-2023-5752	When installing a package from a Mercurial VCS URL (ie "pip install hg+...") with pip prior to v23.3, the specified URL
CVE-2023-5868	A memory disclosure vulnerability was found in PostgreSQL that allows remote users to access sensitive information
CVE-2023-5869	A flaw was found in PostgreSQL that allows authenticated database users to execute arbitrary code through missing
CVE-2023-5870	A flaw was found in PostgreSQL involving the pg_cancel_backend role that signals background workers, including
CVE-2023-5981	A vulnerability was found that the response times to malformed ciphertexts in RSA-PSK ClientKeyExchange differ
CVE-2023-6004	A flaw was found in libssh. By utilizing the ProxyCommand or ProxyJump feature, users can exploit unchecked host
CVE-2023-6040	An out-of-bounds access vulnerability involving netfilter was reported and fixed as: f1082dd31fe4 (netfilter: nf_tables
CVE-2023-6129	Issue summary: The POLY1305 MAC (message authentication code) implementation contains a bug that might corrupt
CVE-2023-6135	Multiple NSS NIST curves were susceptible to a side-channel attack known as "Minerva". This attack could potentially
CVE-2023-6228	An issue was found in the tiffcp utility distributed by the libtiff package where a crafted TIFF file on processing may
CVE-2023-6237	Issue summary: Checking excessively long invalid RSA public keys may take a long time. Impact summary: Applications
CVE-2023-6238	A buffer overflow vulnerability was found in the NVM Express (NVMe) driver in the Linux kernel. Only privileged
CVE-2023-6277	An out-of-memory flaw was found in libtiff. Passing a crafted tiff file to TIFFOpen() API may allow a remote attacker
CVE-2023-6378	A serialization vulnerability in logback receiver component part of logback version 1.4.11 allows an attacker to mount
CVE-2023-6597	An issue was found in the CPython `tempfile.TemporaryDirectory` class affecting versions 3.12.1, 3.11.7, 3.10.13, 3.9.13, 3.8.13

CVE-2023-6601	A flaw was found in FFmpeg's HLS demuxer. This vulnerability allows bypassing unsafe file extension checks and t
CVE-2023-6602	A flaw was found in FFmpeg's TTY Demuxer. This vulnerability allows possible data exfiltration via improper pars
CVE-2023-6603	A flaw was found in FFmpeg's HLS playlist parsing. This vulnerability allows a denial of service via a maliciously c
CVE-2023-6604	A flaw was found in FFmpeg. This vulnerability allows unexpected additional CPU load and storage consumption, p
CVE-2023-6605	A flaw was found in FFmpeg's DASH playlist support. This vulnerability allows arbitrary HTTP GET requests to be
CVE-2023-6610	An out-of-bounds read vulnerability was found in smb2_dump_detail in fs/smb/client/smb2ops.c in the Linux Kerne
CVE-2023-6918	A flaw was found in the libssh implements abstract layer for message digest (MD) operations implemented by differ
CVE-2023-7008	A vulnerability was found in systemd-resolved. This issue may allow systemd-resolved to accept records of DNSSE
CVE-2023-7042	A null pointer dereference vulnerability was found in ath10k_wmi_tlv_op_pull_mgmt_tx_compl_ev() in drivers/net/
CVE-2023-7104	A vulnerability was found in SQLite SQLite3 up to 3.43.0 and classified as critical. This issue affects the function se
CVE-2023-7216	A path traversal vulnerability was found in the CPIO utility. This issue could allow a remote unauthenticated attacker
CVE-2024-0132	NVIDIA Container Toolkit 1.16.1 or earlier contains a Time-of-check Time-of-Use (TOCTOU) vulnerability when t
CVE-2024-0133	NVIDIA Container Toolkit 1.16.1 or earlier contains a vulnerability in the default mode of operation allowing a spec
CVE-2024-0232	A heap use-after-free issue has been identified in SQLite in the jsonParseAddNodeArray() function in sqlite3.c. This
CVE-2024-0243	With the following crawler configuration: ``python from bs4 import BeautifulSoup as Soup url = "https://example.c
CVE-2024-0397	A defect was discovered in the Python "ssl" module where there is a memory race condition with the ssl.SSLContext
CVE-2024-0450	An issue was found in the CPython `zipfile` module affecting versions 3.12.1, 3.11.7, 3.10.13, 3.9.18, and 3.8.18 and
CVE-2024-0553	A vulnerability was found in GnuTLS. The response times to malformed ciphertexts in RSA-PSK ClientKeyExchang
CVE-2024-0564	A flaw was found in the Linux kernel's memory deduplication mechanism. The max page sharing of Kernel Samepag
CVE-2024-0562	A use-after-free flaw was found in the Linux Kernel. When a disk is removed, bdi_unregister is called to stop further
CVE-2024-0567	A vulnerability was found in GnuTLS, where a cockpit (which uses gnuTLS) rejects a certificate chain with distrib
CVE-2024-0607	A flaw was found in the Netfilter subsystem in the Linux kernel. The issue is in the nft_byteorder_eval() function, w
CVE-2024-0639	A denial of service vulnerability due to a deadlock was found in sctp_auto_asconf_init in net/sctp/socket.c in the Lin
CVE-2024-0641	A denial of service vulnerability was found in tipc_crypto_key_revoke in net/tipc/crypto.c in the Linux kernel's TIP
CVE-2024-0727	Issue summary: Processing a maliciously formatted PKCS12 file may lead OpenSSL to crash leading to a potential I
CVE-2024-0793	A flaw was found in kube-controller-manager. This issue occurs when the initial application of a HPA config YAM
CVE-2024-0985	Late privilege drop in REFRESH MATERIALIZED VIEW CONCURRENTLY in PostgreSQL allows an object cre
CVE-2024-10041	A vulnerability was found in PAM. The secret information is stored in memory, where the attacker can trigger the vi
CVE-2024-10096	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-10220	The Kubernetes kubelet component allows arbitrary command execution via specially crafted gitRepo volumes. This
CVE-2024-10524	Applications that use Wget to access a remote resource using shorthand URLs and pass arbitrary user credentials in t
CVE-2024-10940	A vulnerability in langchain-core versions >=0.1.17,<0.1.53, >=0.2.0,<0.2.43, and >=0.3.0,<0.3.15 allows unauthori
CVE-2024-10963	A flaw was found in pam_access, where certain rules in its configuration file are mistakenly treated as hostnames. Th
CVE-2024-10976	Incomplete tracking in PostgreSQL of tables with row security allows a reused query to view or change different ro
CVE-2024-10977	Client use of server error message in PostgreSQL allows a server not trusted under current SSL or GSS settings to fu
CVE-2024-10978	Incorrect privilege assignment in PostgreSQL allows a less-privileged application user to view or change different r
CVE-2024-10979	Incorrect control of environment variables in PostgreSQL PL/Perl allows an unprivileged database user to change se
CVE-2024-11041	vllm-project vllm version v0.6.2 contains a vulnerability in the MessageQueue.dequeue() API function. The function
CVE-2024-11053	When asked to both use a `.netrc` file for credentials and to follow HTTP redirects, curl could leak the password use
CVE-2024-11168	The urllib.parse.urlsplit() and urlparse() functions improperly validated bracketed hosts ('[]'), allowing hosts that we

CVE-2024-11187	It is possible to construct a zone such that some queries to it will generate responses containing numerous records in
CVE-2024-11392	Hugging Face Transformers MobileViTV2 Deserialization of Untrusted Data Remote Code Execution Vulnerability
CVE-2024-11393	Hugging Face Transformers MaskFormer Model Deserialization of Untrusted Data Remote Code Execution Vulnerability
CVE-2024-11394	Hugging Face Transformers Trax Model Deserialization of Untrusted Data Remote Code Execution Vulnerability. T
CVE-2024-11403	There exists an out of bounds read/write in LibJXL versions prior to commit 9cc451b91b74ba470fd72bd48c121e9f3
CVE-2024-11498	There exists a stack buffer overflow in libjxl. A specifically-crafted file can cause the JPEG XL decoder to use large
CVE-2024-1151	A vulnerability was reported in the Open vSwitch sub-component in the Linux Kernel. The flaw occurs when a recur
CVE-2024-12084	A heap-based buffer overflow flaw was found in the rsync daemon. This issue is due to improper handling of attacke
CVE-2024-12085	A flaw was found in rsync which could be triggered when rsync compares file checksums. This flaw allows an attack
CVE-2024-12086	A flaw was found in rsync. It could allow a server to enumerate the contents of an arbitrary file from the client's mac
CVE-2024-12087	A path traversal vulnerability exists in rsync. It stems from behavior enabled by the `--inc-recursive` option, a default
CVE-2024-12088	A flaw was found in rsync. When using the `--safe-links` option, the rsync client fails to properly verify if a symboli
CVE-2024-12133	A flaw in libtasn1 causes inefficient handling of specific certificate data. When processing a large number of elemen
CVE-2024-12243	A flaw was found in GnuTLS, which relies on libtasn1 for ASN.1 data processing. Due to an inefficient algorithm in
CVE-2024-12539	An issue was discovered where improper authorization controls affected certain queries that could allow a malicious
CVE-2024-12254	Starting in Python 3.12.0, the <code>asyncio.SelectorSocketTransport.writelines()</code> method would not "pause" writing and
CVE-2024-12705	Clients using DNS-over-HTTPS (DoH) can exhaust a DNS resolver's CPU and/or memory by flooding it with crafted
CVE-2024-12718	Allows modifying some file metadata (e.g. last modified) with <code>filter="data"</code> or file permissions (<code>chmod</code>) with <code>filter="</code>
CVE-2024-12720	A Regular Expression Denial of Service (ReDoS) vulnerability was identified in the huggingface/transformers library
CVE-2024-12747	A flaw was found in rsync. This vulnerability arises from a race condition during rsync's handling of symbolic links.
CVE-2024-12745	A SQL injection in the Amazon Redshift Python Connector v2.1.4 allows a user to gain escalated privileges via the g
CVE-2024-12797	Issue summary: Clients using RFC7250 Raw Public Keys (RPKs) to authenticate a server may fail to notice that the
CVE-2024-12798	ACE vulnerability in JaninoEventEvaluator by QOS.CH logback-core upto including version 0.1 to 1.3.14 and 1.4.0
CVE-2024-12801	Server-Side Request Forgery (SSRF) in SaxEventRecorder by QOS.CH logback version 0.1 to 1.3.14 and 1.4.0 to 1.
CVE-2024-13009	In Eclipse Jetty versions 9.4.0 to 9.4.56 a buffer can be incorrectly released when confronted with a gzip error when
CVE-2024-13176	Issue summary: A timing side-channel which could potentially allow recovering the private key exists in the ECDSA
CVE-2024-1455	A vulnerability in the langchain-ai/langchain repository allows for a Billion Laughs Attack, a type of XML External
CVE-2024-1597	pgjdbc, the PostgreSQL JDBC Driver, allows attacker to inject SQL if using <code>PreferQueryMode=SIMPLE</code> . Note this

CVE-2024-24557	Moby is an open-source project created by Docker to enable software containerization. The classic builder cache sys
CVE-2024-24783	Verifying a certificate chain which contains a certificate with an unknown public key algorithm will cause Certificat
CVE-2024-24784	The ParseAddressList function incorrectly handles comments (text within parentheses) within display names. Since
CVE-2024-24785	If errors returned from MarshalJSON methods contain user controlled data, they may be used to break the contextual
CVE-2024-24786	The protojson.Unmarshal function can enter an infinite loop when unmarshaling certain forms of invalid JSON. This
CVE-2024-24788	A malformed DNS message in response to a query can cause the Lookup functions to get stuck in an infinite loop.
CVE-2024-24789	The archive/zip package's handling of certain types of invalid zip files differs from the behavior of most zip impleme
CVE-2024-24790	The various Is methods (IsPrivate, IsLoopback, etc) did not work as expected for IPv4-mapped IPv6 addresses, retur
CVE-2024-24791	The net/http HTTP/1.1 client mishandled the case where a server responds to a request with an "Expect: 100-contin
CVE-2024-24795	HTTP Response splitting in multiple modules in Apache HTTP Server allows an attacker that can inject malicious re
CVE-2024-24855	A race condition was found in the Linux kernel's scsi device driver in lpfc_unregister_fcf_rescan() function. This can

CVE-2024-24857	A race condition was found in the Linux kernel's net/bluetooth device driver in conn_info_{min,max}_age_set() function.
CVE-2024-24858	A race condition was found in the Linux kernel's net/bluetooth in {conn,adv}_{min,max}_interval_set() function. This can lead to a denial of service.
CVE-2024-24859	A race condition was found in the Linux kernel's net/bluetooth in sniff_{min,max}_interval_set() function. This can lead to a denial of service.
CVE-2024-25062	An issue was discovered in libxml2 before 2.11.7 and 2.12.x before 2.12.5. When using the XML Reader interface with a maliciously crafted XML document, a buffer overflow can occur, leading to a denial of service or potential code execution.
CVE-2024-2511	Issue summary: Some non-default TLS server configurations can cause unbounded memory growth when processing large requests.
CVE-2024-25126	Rack is a modular Ruby web server interface. Carefully crafted content type headers can cause Rack's media type parser to enter an infinite loop, leading to a denial of service.
CVE-2024-25260	elfutils v0.189 was discovered to contain a NULL pointer dereference via the handle_verdef() function at readelf.c.
CVE-2024-25638	dnsjava is an implementation of DNS in Java. Records in DNS replies are not checked for their relevance to the query, which can lead to a denial of service.
CVE-2024-25739	create_empty_lvol in drivers/mtd/ubi/vtbl.c in the Linux kernel through 6.7.4 can attempt to allocate zero bytes, and this can lead to a denial of service.
CVE-2024-25710	Loop with Unreachable Exit Condition ('Infinite Loop') vulnerability in Apache Commons Compress. This issue affects versions 1.25.0 through 1.25.1.
CVE-2024-25740	A memory leak flaw was found in the UBI driver in drivers/mtd/ubi/attach.c in the Linux kernel through 6.7.4 for UBI volumes.
CVE-2024-25741	printer_write in drivers/usb/gadget/function/f_printer.c in the Linux kernel through 6.7.4 does not properly call usb_ep_wake_up() when the endpoint is stalled, which can lead to a denial of service.
CVE-2024-25744	In the Linux kernel before 6.6.7, an untrusted VMM can trigger int80 syscall handling at any given point. This is related to the KVM module.
CVE-2024-26130	cryptography is a package designed to expose cryptographic primitives and recipes to Python developers. Starting in version 40.0.0, it includes a vulnerability that allows for a denial of service.
CVE-2024-26141	Rack is a modular Ruby web server interface. Carefully crafted Range headers can cause a server to respond with an infinite loop, leading to a denial of service.
CVE-2024-26146	Rack is a modular Ruby web server interface. Carefully crafted headers can cause header parsing in Rack to take an infinite loop, leading to a denial of service.
CVE-2024-26308	Allocation of Resources Without Limits or Throttling vulnerability in Apache Commons Compress. This issue affects versions 1.25.0 through 1.25.1.
CVE-2024-26458	Kerberos 5 (aka krb5) 1.21.2 contains a memory leak in /krb5/src/lib/krb5/pmap_rmt.c.
CVE-2024-26461	Kerberos 5 (aka krb5) 1.21.2 contains a memory leak vulnerability in /krb5/src/lib/gssapi/krb5/k5sealv3.c.
CVE-2024-26462	Kerberos 5 (aka krb5) 1.21.2 contains a memory leak vulnerability in /krb5/src/kdc/ndr.c.
CVE-2024-26584	In the Linux kernel, the following vulnerability has been resolved: net: tls: handle backlogging of crypto requests. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26583	In the Linux kernel, the following vulnerability has been resolved: tls: fix race between async notify and socket close. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26585	In the Linux kernel, the following vulnerability has been resolved: tls: fix race between tx work scheduling and socket close. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26586	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcaml: Fix stack corruption. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26589	In the Linux kernel, the following vulnerability has been resolved: bpf: Reject variable offset alu on PTR_TO_FLOW. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26591	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix re-attachment branch in bpf_tracing_prog. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26595	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcaml: Fix NULL pointer dereference. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26598	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: vgic-its: Avoid potential UAF in LPI. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26600	In the Linux kernel, the following vulnerability has been resolved: phy: ti: phy-omap-usb2: Fix NULL pointer dereference. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26605	In the Linux kernel, the following vulnerability has been resolved: PCI/ASPM: Fix deadlock when enabling ASPM. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26611	In the Linux kernel, the following vulnerability has been resolved: xsk: fix usage of multi-buffer BPF helpers for ZC. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26607	In the Linux kernel, the following vulnerability has been resolved: drm/bridge: sii902x: Fix probing race issue. A null pointer dereference can occur during probing.
CVE-2024-26614	In the Linux kernel, the following vulnerability has been resolved: tcp: make sure init the accept_queue's spinlocks. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26621	In the Linux kernel, the following vulnerability has been resolved: mm: huge_memory: don't force huge page alignment. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26633	In the Linux kernel, the following vulnerability has been resolved: ip6_tunnel: fix NEXTHDR_FRAGMENT handling. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26638	In the Linux kernel, the following vulnerability has been resolved: nbd: always initialize struct msghdr completely. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26640	In the Linux kernel, the following vulnerability has been resolved: tcp: add sanity checks to rx zerocopy TCP rx zero-copy. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26641	In the Linux kernel, the following vulnerability has been resolved: ip6_tunnel: make sure to pull inner header in __ip6_tunnel_rcv. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26645	In the Linux kernel, the following vulnerability has been resolved: tracing: Ensure visibility when inserting an element. This affects versions 6.6.0 through 6.6.7.
CVE-2024-26646	In the Linux kernel, the following vulnerability has been resolved: thermal: intel: hfi: Add syscore callbacks for syscore. This affects versions 6.6.0 through 6.6.7.

CVE-2024-26647	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix late derefrence 'dsc' check i
CVE-2024-26648	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix variable deferencing before
CVE-2024-26649	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix the null pointer when load rlc fi
CVE-2024-26656	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix use-after-free bug The bug can b
CVE-2024-26660	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Implement bounds check for str
CVE-2024-26658	In the Linux kernel, the following vulnerability has been resolved: bcachefs: grab s_umount only if snapshotting Wh
CVE-2024-26661	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL test for 'timing gen
CVE-2024-26662	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix 'panel_cntl' could be null in
CVE-2024-26663	In the Linux kernel, the following vulnerability has been resolved: tipc: Check the bearer type before calling tipc_ud
CVE-2024-26665	In the Linux kernel, the following vulnerability has been resolved: tunnels: fix out of bounds access when building I
CVE-2024-26668	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_limit: reject configurations that caus
CVE-2024-26669	In the Linux kernel, the following vulnerability has been resolved: net/sched: flower: Fix chain template offload Wh
CVE-2024-26672	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix variable 'mca_funcs' dereferenc
CVE-2024-26677	In the Linux kernel, the following vulnerability has been resolved: rxrpc: Fix delayed ACKs to not set the reference s
CVE-2024-26675	In the Linux kernel, the following vulnerability has been resolved: ppp_async: limit MRU to 64K syzbot triggered a
CVE-2024-26680	In the Linux kernel, the following vulnerability has been resolved: net: atlantic: Fix DMA mapping for PTP hwts rin
CVE-2024-26681	In the Linux kernel, the following vulnerability has been resolved: netdevsim: avoid potential loop in nsim_dev_trap
CVE-2024-26686	In the Linux kernel, the following vulnerability has been resolved: fs/proc: do_task_stat: use sig->stats_lock to gathe
CVE-2024-26687	In the Linux kernel, the following vulnerability has been resolved: xen/events: close evtchn after mapping cleanup sl
CVE-2024-26689	In the Linux kernel, the following vulnerability has been resolved: ceph: prevent use-after-free in encode_cap_msg()
CVE-2024-26688	In the Linux kernel, the following vulnerability has been resolved: fs,hugetlb: fix NULL pointer dereference in huge
CVE-2024-26691	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Fix circular locking dependency Th
CVE-2024-26695	In the Linux kernel, the following vulnerability has been resolved: crypto: ccp - Fix null pointer dereference in __sev
CVE-2024-26698	In the Linux kernel, the following vulnerability has been resolved: hv_netvsc: Fix race condition between netvsc_pro
CVE-2024-26699	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix array-index-out-of-bounds
CVE-2024-26700	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix MST Null Ptr for RV The c
CVE-2024-26704	In the Linux kernel, the following vulnerability has been resolved: ext4: fix double-free of blocks due to wrong exten
CVE-2024-26713	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-26714	In the Linux kernel, the following vulnerability has been resolved: interconnect: qcom: sc8180x: Mark CO0 BCM ke
CVE-2024-26715	In the Linux kernel, the following vulnerability has been resolved: usb: dwc3: gadget: Fix NULL pointer dereference
CVE-2024-26718	In the Linux kernel, the following vulnerability has been resolved: dm-crypt, dm-verity: disable tasklets Tasklets hav
CVE-2024-26717	In the Linux kernel, the following vulnerability has been resolved: HID: i2c-hid-of: fix NULL-deref on failed power
CVE-2024-26719	In the Linux kernel, the following vulnerability has been resolved: nouveau: offload fence uevents work to workque
CVE-2024-26720	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-26721	In the Linux kernel, the following vulnerability has been resolved: drm/i915/dsc: Fix the macro that calculates DSCC
CVE-2024-26726	In the Linux kernel, the following vulnerability has been resolved: btrfs: don't drop extent_map for free space inode
CVE-2024-26733	In the Linux kernel, the following vulnerability has been resolved: arp: Prevent overflow in arp_req_get(). syzkaller
CVE-2024-26735	In the Linux kernel, the following vulnerability has been resolved: ipv6: sr: fix possible use-after-free and null-ptr-de
CVE-2024-26740	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_mirred: use the backlog for mirred
CVE-2024-26747	In the Linux kernel, the following vulnerability has been resolved: usb: roles: fix NULL pointer issue when put mod

CVE-2024-26742	In the Linux kernel, the following vulnerability has been resolved: scsi: smartpqi: Fix disable_managed_interrupts C
CVE-2024-26751	In the Linux kernel, the following vulnerability has been resolved: ARM: ep93xx: Add terminator to gpiod_lookup_
CVE-2024-26756	In the Linux kernel, the following vulnerability has been resolved: md: Don't register sync_thread for reshape directl
CVE-2024-26757	In the Linux kernel, the following vulnerability has been resolved: md: Don't ignore read-only array in md_check_re
CVE-2024-26758	In the Linux kernel, the following vulnerability has been resolved: md: Don't ignore suspended array in md_check_r
CVE-2024-26759	In the Linux kernel, the following vulnerability has been resolved: mm/swap: fix race when skipping swapcache Wh
CVE-2024-26763	In the Linux kernel, the following vulnerability has been resolved: dm-crypt: don't modify the data when using auth
CVE-2024-26767	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: fixed integer types and null che
CVE-2024-26769	In the Linux kernel, the following vulnerability has been resolved: nvmet-fc: avoid deadlock on delete association pa
CVE-2024-26770	In the Linux kernel, the following vulnerability has been resolved: HID: nvidia-shield: Add missing null pointer che
CVE-2024-26771	In the Linux kernel, the following vulnerability has been resolved: dmaengine: ti: edma: Add some null pointer che
CVE-2024-26772	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid allocating blocks from corrupted grou
CVE-2024-26773	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid allocating blocks from corrupted grou
CVE-2024-26775	In the Linux kernel, the following vulnerability has been resolved: aoe: avoid potential deadlock at set_capacity Mov
CVE-2024-26777	In the Linux kernel, the following vulnerability has been resolved: fbdev: sis: Error out if pixclock equals zero The u
CVE-2024-26778	In the Linux kernel, the following vulnerability has been resolved: fbdev: savage: Error out if pixclock equals zero T
CVE-2024-26782	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix double-free on socket dismantle when
CVE-2024-26800	In the Linux kernel, the following vulnerability has been resolved: tls: fix use-after-free on failed backlog decryption
CVE-2024-26801	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Avoid potential use-after-free in hci_e
CVE-2024-26802	In the Linux kernel, the following vulnerability has been resolved: stmmac: Clear variable when destroying workque
CVE-2024-26803	In the Linux kernel, the following vulnerability has been resolved: net: veth: clear GRO when clearing XDP even wh
CVE-2024-26804	In the Linux kernel, the following vulnerability has been resolved: net: ip_tunnel: prevent perpetual headroom growt
CVE-2024-26807	In the Linux kernel, the following vulnerability has been resolved: Both cadence-quadspi ->runtime_suspend() and -
CVE-2024-26810	In the Linux kernel, the following vulnerability has been resolved: vfio/pci: Lock external INTx masking ops Mask c
CVE-2024-26812	In the Linux kernel, the following vulnerability has been resolved: vfio/pci: Create persistent INTx handler A vulner
CVE-2024-26816	In the Linux kernel, the following vulnerability has been resolved: x86, relocs: Ignore relocations in .notes section W
CVE-2024-26822	In the Linux kernel, the following vulnerability has been resolved: smb: client: set correct id, uid and cruid for multi
CVE-2024-26826	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix data re-injection from stale subflow W
CVE-2024-26828	In the Linux kernel, the following vulnerability has been resolved: cifs: fix underflow in parse_server_interfaces() In
CVE-2024-26830	In the Linux kernel, the following vulnerability has been resolved: i40e: Do not allow untrusted VF to remove admin
CVE-2024-26837	In the Linux kernel, the following vulnerability has been resolved: net: bridge: switchdev: Skip MDB replays of defe
CVE-2024-26838	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Fix KASAN issue with tasklet KA
CVE-2024-26840	In the Linux kernel, the following vulnerability has been resolved: cachefiles: fix memory leak in cachefiles_add_ca
CVE-2024-26842	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Fix shift issue in ufshcd_clear_cm
CVE-2024-26843	In the Linux kernel, the following vulnerability has been resolved: efi: runtime: Fix potential overflow of soft-reserv
CVE-2024-26844	In the Linux kernel, the following vulnerability has been resolved: block: Fix WARNING in _copy_from_iter Syzka
CVE-2024-26845	In the Linux kernel, the following vulnerability has been resolved: scsi: target: core: Add TMF to tmr_list handling A
CVE-2024-26846	In the Linux kernel, the following vulnerability has been resolved: nvme-fc: do not wait in vain when unloading mod
CVE-2024-26851	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_conntrack_h323: Add protection for
CVE-2024-26852	In the Linux kernel, the following vulnerability has been resolved: net/ipv6: avoid possible UAF in ip6_route_mpath

CVE-2024-26853	In the Linux kernel, the following vulnerability has been resolved: igc: avoid returning frame twice in XDP_REDIRECT
CVE-2024-26855	In the Linux kernel, the following vulnerability has been resolved: net: ice: Fix potential NULL pointer dereference
CVE-2024-26857	In the Linux kernel, the following vulnerability has been resolved: geneve: make sure to pull inner header in geneve
CVE-2024-26859	In the Linux kernel, the following vulnerability has been resolved: net/bnx2x: Prevent access to a freed page in page
CVE-2024-26866	In the Linux kernel, the following vulnerability has been resolved: spi: lpspi: Avoid potential use-after-free in probe
CVE-2024-26869	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to truncate meta inode pages forcibly
CVE-2024-26870	In the Linux kernel, the following vulnerability has been resolved: NFSv4.2: fix nfs4_listxattr kernel BUG at mm/us
CVE-2024-26876	In the Linux kernel, the following vulnerability has been resolved: drm/bridge: adv7511: fix crash on irq during prob
CVE-2024-26878	In the Linux kernel, the following vulnerability has been resolved: quota: Fix potential NULL pointer dereference
CVE-2024-26880	In the Linux kernel, the following vulnerability has been resolved: dm: call the resume method on internal suspend
CVE-2024-26882	In the Linux kernel, the following vulnerability has been resolved: net: ip_tunnel: make sure to pull inner header
CVE-2024-26883	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix stackmap overflow check on 32-bit arch
CVE-2024-26886	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: af_bluetooth: Fix deadlock Attempting
CVE-2024-26893	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scmi: Fix double free in SMC tran
CVE-2024-26894	In the Linux kernel, the following vulnerability has been resolved: ACPI: processor_idle: Fix memory leak in acpi_p
CVE-2024-26896	In the Linux kernel, the following vulnerability has been resolved: wifi: wfx: fix memory leak when starting AP Km
CVE-2024-26900	In the Linux kernel, the following vulnerability has been resolved: md: fix kmemleak of rdev->serial If kobject_add
CVE-2024-26902	In the Linux kernel, the following vulnerability has been resolved: perf: RISCv: Fix panic on pmu overflow handler
CVE-2024-26906	In the Linux kernel, the following vulnerability has been resolved: x86/mm: Disallow vsyscall page read for copy_fr
CVE-2024-26903	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: rfcomm: Fix null-ptr-deref in rfcomm
CVE-2024-26907	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix fortify source warning while ac
CVE-2024-26908	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-26915	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Reset IH OVERFLOW_CLEAR bi
CVE-2024-26921	In the Linux kernel, the following vulnerability has been resolved: inet: inet_defrag: prevent sk release while still in
CVE-2024-26916	In the Linux kernel, the following vulnerability has been resolved: Revert "drm/amd: flush any delayed gfxoff on sus
CVE-2024-26922	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: validate the parameters of bo mapp
CVE-2024-26923	In the Linux kernel, the following vulnerability has been resolved: af_unix: Fix garbage collector racing against con
CVE-2024-26924	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_set_pipapo: do not free live element
CVE-2024-26926	In the Linux kernel, the following vulnerability has been resolved: binder: check offset alignment in binder_get_obje
CVE-2024-26925	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: release mutex after nft_gc_sec
CVE-2024-26927	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Add some bounds checking to firmw
CVE-2024-26928	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential UAF in cifs_debug_files
CVE-2024-26929	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-26930	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix double free of the ha->vp_map
CVE-2024-26931	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix command flush on cable pull S
CVE-2024-26935	In the Linux kernel, the following vulnerability has been resolved: scsi: core: Fix unremoved procfs host directory re
CVE-2024-26936	In the Linux kernel, the following vulnerability has been resolved: ksmbd: validate request buffer size in smb2_alloc
CVE-2024-26938	In the Linux kernel, the following vulnerability has been resolved: drm/i915/bios: Tolerate devdata==NULL in intel
CVE-2024-26939	In the Linux kernel, the following vulnerability has been resolved: drm/i915/vma: Fix UAF on destroy against retire
CVE-2024-26940	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Create debugfs ttm_resource_mana

CVE-2024-26945	In the Linux kernel, the following vulnerability has been resolved: crypto: iaa - Fix nr_cpus < nr_iaa case If nr_cpus
CVE-2024-26947	In the Linux kernel, the following vulnerability has been resolved: ARM: 9359/1: flush: check if the folio is reserved
CVE-2024-26948	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add a dc_state NULL check in
CVE-2024-26953	In the Linux kernel, the following vulnerability has been resolved: net: esp: fix bad handling of pages from page_poo
CVE-2024-26954	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix slab-out-of-bounds in smb_strndup_fr
CVE-2024-26958	In the Linux kernel, the following vulnerability has been resolved: nfs: fix UAF in direct writes In production we hav
CVE-2024-26960	In the Linux kernel, the following vulnerability has been resolved: mm: swap: fix race between free_swap_and_cach
CVE-2024-26961	In the Linux kernel, the following vulnerability has been resolved: mac802154: fix llsec key resources release in mac
CVE-2024-26962	In the Linux kernel, the following vulnerability has been resolved: dm-raid456, md/raid456: fix a deadlock for dm-ra
CVE-2024-26974	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - resolve race condition during AER re
CVE-2024-26976	In the Linux kernel, the following vulnerability has been resolved: KVM: Always flush async #PF workqueue when
CVE-2024-26980	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix slab-out-of-bounds in smb2_allocate_
CVE-2024-26982	In the Linux kernel, the following vulnerability has been resolved: Squashfs: check the inode number is not the inval
CVE-2024-26983	In the Linux kernel, the following vulnerability has been resolved: bootconfig: use memblock_free_late to free xbc m
CVE-2024-26984	In the Linux kernel, the following vulnerability has been resolved: nouveau: fix instmem race condition around ptr st
CVE-2024-26999	In the Linux kernel, the following vulnerability has been resolved: serial/pmac_zilog: Remove flawed mitigation for
CVE-2024-27004	In the Linux kernel, the following vulnerability has been resolved: clk: Get runtime PM before walking tree during d
CVE-2024-27002	In the Linux kernel, the following vulnerability has been resolved: clk: mediatek: Do a runtime PM get on controller
CVE-2024-27005	In the Linux kernel, the following vulnerability has been resolved: interconnect: Don't access req_list while it's being
CVE-2024-27008	In the Linux kernel, the following vulnerability has been resolved: drm: nv04: Fix out of bounds access When Outpu
CVE-2024-27010	In the Linux kernel, the following vulnerability has been resolved: net/sched: Fix mirred deadlock on device recursio
CVE-2024-27011	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: fix memleak in map from abo
CVE-2024-27012	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: restore set elements when dele
CVE-2024-27013	In the Linux kernel, the following vulnerability has been resolved: tun: limit printing rate when illegal packet receive
CVE-2024-27014	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Prevent deadlock while disabling aRF
CVE-2024-27017	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_set_pipapo: walk over current view o
CVE-2024-27020	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: Fix potential data-race in __n
CVE-2024-27019	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: Fix potential data-race in __n
CVE-2024-27022	In the Linux kernel, the following vulnerability has been resolved: fork: defer linking file vma until vma is fully initi
CVE-2024-27023	In the Linux kernel, the following vulnerability has been resolved: md: Fix missing release of 'active_io' for flush sub
CVE-2024-27032	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to avoid potential panic during recovery
CVE-2024-27035	In the Linux kernel, the following vulnerability has been resolved: f2fs: compress: fix to guarantee persisting compre
CVE-2024-27025	In the Linux kernel, the following vulnerability has been resolved: nbd: null check for nla_nest_start nla_nest_start()
CVE-2024-27041	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: fix NULL checks for adev->dm
CVE-2024-27042	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix potential out-of-bounds access
CVE-2024-27043	In the Linux kernel, the following vulnerability has been resolved: media: edia: dvbdev: fix a use-after-free In dvb_r
CVE-2024-27056	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: ensure offloading TID queue
CVE-2024-27055	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-27057	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: ipc4-pcm: Workaround for crashed
CVE-2024-27062	In the Linux kernel, the following vulnerability has been resolved: nouveau: lock the client object tree. It appears the

CVE-2024-27072	In the Linux kernel, the following vulnerability has been resolved: media: usbtv: Remove useless locks in usbtv_vid
CVE-2024-27065	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: do not compare internal table
CVE-2024-27073	In the Linux kernel, the following vulnerability has been resolved: media: ttpci: fix two memleaks in budget_av_atta
CVE-2024-27075	In the Linux kernel, the following vulnerability has been resolved: media: dvb-frontends: avoid stack overflow warn
CVE-2024-27351	In Django 3.2 before 3.2.25, 4.2 before 4.2.11, and 5.0 before 5.0.3, the django.utils.text.Truncator.words() method
CVE-2024-27388	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: fix some memleaks in gssx_dec_option
CVE-2024-27389	In the Linux kernel, the following vulnerability has been resolved: pstore: inode: Only d_invalidate() is needed Unlo
CVE-2024-27395	In the Linux kernel, the following vulnerability has been resolved: net: openvswitch: Fix Use-After-Free in ovs_ct_e
CVE-2024-27397	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: use timestamp to check for se
CVE-2024-27398	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix use-after-free bugs caused by sco_
CVE-2024-27399	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: l2cap: fix null-ptr-deref in l2cap_chan
CVE-2024-27400	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: once more fix the call oder in amdg
CVE-2024-27403	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_flow_offload: reset dst in route objec
CVE-2024-27401	In the Linux kernel, the following vulnerability has been resolved: firewire: nosy: ensure user_length is taken into ac
CVE-2024-27407	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Fixed overflow check in mi_enum_attr()
CVE-2024-27408	In the Linux kernel, the following vulnerability has been resolved: dmaengine: dw-edma: eDMA: Add sync read bef
CVE-2024-27410	In the Linux kernel, the following vulnerability has been resolved: wifi: nl80211: reject iftype change with mesh ID
CVE-2024-27413	In the Linux kernel, the following vulnerability has been resolved: efi/capsule-loader: fix incorrect allocation size gc
CVE-2024-27415	In the Linux kernel, the following vulnerability has been resolved: netfilter: bridge: confirm multicast packets before
CVE-2024-27417	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix potential "struct net" leak in inet6_rtm_g
CVE-2024-27418	In the Linux kernel, the following vulnerability has been resolved: net: mctp: take ownership of skb in mctp_local_o
CVE-2024-27431	In the Linux kernel, the following vulnerability has been resolved: cpumap: Zero-initialise xdp_rxq_info struct before
CVE-2024-27434	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: don't set the MFP flag for the
CVE-2024-27435	In the Linux kernel, the following vulnerability has been resolved: nvme: fix reconnection fail due to reserved tag all
CVE-2024-27436	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Stop parsing channels bits whe
CVE-2024-27437	In the Linux kernel, the following vulnerability has been resolved: vfio/pci: Disable auto-enable of exclusive INTx I
CVE-2024-28085	wall in util-linux through 2.40, often installed with setgid tty permissions, allows escape sequences to be sent to othe
CVE-2024-28088	LangChain through 0.1.10 allows ../ directory traversal by an actor who is able to control the final part of the path pa
CVE-2024-27454	orjson.loads in orjson before 3.9.15 does not limit recursion for deeply nested JSON documents.
CVE-2024-28180	Package jose aims to provide an implementation of the Javascript Object Signing and Encryption set of standards. A
CVE-2024-28182	nghttp2 is an implementation of the Hypertext Transfer Protocol version 2 in C. The nghttp2 library prior to version
CVE-2024-28219	In _imagingcms.c in Pillow before 10.3.0, a buffer overflow exists because strcpy is used instead of strncpy.
CVE-2024-28834	A flaw was found in GnuTLS. The Minerva attack is a cryptographic vulnerability that exploits deterministic behavi
CVE-2024-28835	A flaw has been discovered in GnuTLS where an application crash can be induced when attempting to verify a speci
CVE-2024-28956	Exposure of Sensitive Information in Shared Microarchitectural Structures during Transient Execution for some Inte
CVE-2024-28863	node-tar is a Tar for Node.js. node-tar prior to version 6.2.1 has no limit on the number of sub-folders created in the
CVE-2024-29025	Netty is an asynchronous event-driven network application framework for rapid development of maintainable high p
CVE-2024-29131	Out-of-bounds Write vulnerability in Apache Commons Configuration.This issue affects Apache Commons Configur
CVE-2024-29018	Moby is an open source container framework that is a key component of Docker Engine, Docker Desktop, and other
CVE-2024-29133	Out-of-bounds Write vulnerability in Apache Commons Configuration.This issue affects Apache Commons Configur

CVE-2024-2961	The iconv() function in the GNU C Library versions 2.39 and older may overflow the output buffer passed to it by up
CVE-2024-2965	A Denial-of-Service (DoS) vulnerability exists in the `SitemapLoader` class of the `langchain-ai/langchain` repository
CVE-2024-29869	Hive creates a credentials file to a temporary directory in the file system with permissions 644 by default when the fi
CVE-2024-29857	An issue was discovered in ECCurve.java and ECCurve.cs in Bouncy Castle Java (BC Java) before 1.78, BC Java L
CVE-2024-30171	An issue was discovered in Bouncy Castle Java TLS API and JSSE Provider before 1.78. Timing-based leakage may
CVE-2024-30172	An issue was discovered in Bouncy Castle Java Cryptography APIs before 1.78. An Ed25519 verification code infin
CVE-2024-30204	In Emacs before 29.3, LaTeX preview is enabled by default for e-mail attachments.
CVE-2024-30203	In Emacs before 29.3, Gnus treats inline MIME contents as trusted.
CVE-2024-30205	In Emacs before 29.3, Org mode considers contents of remote files to be trusted. This affects Org Mode before 9.6.2
CVE-2024-3095	A Server-Side Request Forgery (SSRF) vulnerability exists in the Web Research Retriever component of langchain-
CVE-2024-3056	A flaw was found in Podman. This issue may allow an attacker to create a specially crafted container that, when con
CVE-2024-31033	JJWT (aka Java JWT) through 0.12.5 ignores certain characters and thus a user might falsely conclude that they have
CVE-2024-31141	Files or Directories Accessible to External Parties, Improper Privilege Management vulnerability in Apache Kafka C
CVE-2024-31076	In the Linux kernel, the following vulnerability has been resolved: genirq/cpuhotplug, x86/vector: Prevent vector lea
CVE-2024-31578	FFmpeg version n6.1.1 was discovered to contain a heap use-after-free via the av_hwframe_ctx_init function.
CVE-2024-31582	FFmpeg version n6.1 was discovered to contain a heap buffer overflow vulnerability in the draw_block_rectangle fun
CVE-2024-31755	cJSON v1.7.17 was discovered to contain a segmentation violation, which can trigger through the second parameter
CVE-2024-3177	A security issue was discovered in Kubernetes where users may be able to launch containers that bypass the mounta
CVE-2024-32002	Git is a revision control system. Prior to versions 2.45.1, 2.44.1, 2.43.4, 2.42.2, 2.41.1, 2.40.2, and 2.39.4, repository
CVE-2024-32004	Git is a revision control system. Prior to versions 2.45.1, 2.44.1, 2.43.4, 2.42.2, 2.41.1, 2.40.2, and 2.39.4, an attacker
CVE-2024-32021	Git is a revision control system. Prior to versions 2.45.1, 2.44.1, 2.43.4, 2.42.2, 2.41.1, 2.40.2, and 2.39.4, when clone
CVE-2024-32020	Git is a revision control system. Prior to versions 2.45.1, 2.44.1, 2.43.4, 2.42.2, 2.41.1, 2.40.2, and 2.39.4, local clone
CVE-2024-32228	FFmpeg 7.0 is vulnerable to Buffer Overflow. There is a SEGV at libavcodec/hevcdec.c:2947:22 in hevc_frame_end
CVE-2024-32230	FFmpeg 7.0 is vulnerable to Buffer Overflow. There is a negative-size-param bug at libavcodec/mpegvideo_enc.c:12
CVE-2024-32465	Git is a revision control system. The Git project recommends to avoid working in untrusted repositories, and instead
CVE-2024-32473	Moby is an open source container framework that is a key component of Docker Engine, Docker Desktop, and other
CVE-2024-33599	nscd: Stack-based buffer overflow in netgroup cache If the Name Service Cache Daemon's (nscd) fixed size cache is
CVE-2024-33600	nscd: Null pointer crashes after notfound response If the Name Service Cache Daemon's (nscd) cache fails to add a n
CVE-2024-33601	nscd: netgroup cache may terminate daemon on memory allocation failure The Name Service Cache Daemon's (nscd)
CVE-2024-33602	nscd: netgroup cache assumes NSS callback uses in-buffer strings The Name Service Cache Daemon's (nscd) netgro
CVE-2024-33847	In the Linux kernel, the following vulnerability has been resolved: f2fs: compress: don't allow unaligned truncation o
CVE-2024-33621	In the Linux kernel, the following vulnerability has been resolved: ipvlan: Dont Use skb->sk in ipvlan_process_v{4,
CVE-2024-34027	In the Linux kernel, the following vulnerability has been resolved: f2fs: compress: fix to cover {reserve,release}_con
CVE-2024-34062	tqdm is an open source progress bar for Python and CLI. Any optional non-boolean CLI arguments (e.g. `--delim`, `--
CVE-2024-34069	Werkzeug is a comprehensive WSGI web application library. The debugger in affected versions of Werkzeug can al
CVE-2024-34155	Calling any of the Parse functions on Go source code which contains deeply nested literals can cause a panic due to s
CVE-2024-34156	Calling Decoder.Decode on a message which contains deeply nested structures can cause a panic due to stack exhaus
CVE-2024-34158	Calling Parse on a "// +build" build tag line with deeply nested expressions can cause a panic due to stack exhaustio
CVE-2024-34447	An issue was discovered in the Bouncy Castle Crypto Package For Java before BC TLS Java 1.0.19 (ships with BC J
CVE-2024-34459	An issue was discovered in xmllint (from libxml2) before 2.11.8 and 2.12.x before 2.12.7. Formatting error message

CVE-2024-34777	In the Linux kernel, the following vulnerability has been resolved: dma-mapping: benchmark: fix node id validation
CVE-2024-35176	REXML is an XML toolkit for Ruby. The REXML gem before 3.2.6 has a denial of service vulnerability when it par
CVE-2024-35195	Requests is a HTTP library. Prior to 2.32.0, when making requests through a Requests `Session`, if the first request i
CVE-2024-35235	OpenPrinting CUPS is an open source printing system for Linux and other Unix-like operating systems. In versions
CVE-2024-35247	In the Linux kernel, the following vulnerability has been resolved: fpga: region: add owner module and take its refco
CVE-2024-35255	Azure Identity Libraries and Microsoft Authentication Library Elevation of Privilege Vulnerability
CVE-2024-35365	FFmpeg version n6.1.1 has a double-free vulnerability in the fftools/ffmpeg_mux_init.c component of FFmpeg, spec
CVE-2024-35366	FFmpeg n6.1.1 is Integer Overflow. The vulnerability exists in the parse_options function of sbgdec.c within the liba
CVE-2024-35367	FFmpeg n6.1.1 has an Out-of-bounds Read via libavcodec/ppc/vp8dsp_altivec.c, static const vec_s8 h_subpel_filters
CVE-2024-35368	FFmpeg n7.0 is affected by a Double Free via the rkmpv_retrieve_frame function within libavcodec/rkmpvdec.c.
CVE-2024-3571	langchain-ai/langchain is vulnerable to path traversal due to improper limitation of a pathname to a restricted directo
CVE-2024-35789	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: check/clear fast rx for non-4addr
CVE-2024-35784	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix deadlock with fiemap and extent locking
CVE-2024-35790	In the Linux kernel, the following vulnerability has been resolved: usb: typec: altmodes/displayport: create sysfs nod
CVE-2024-35791	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: Flush pages under kvm->lock to fix
CVE-2024-35799	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Prevent crash when disable stre
CVE-2024-35801	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Keep xfd_state in sync with MSR_IA32
CVE-2024-35802	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-35794	In the Linux kernel, the following vulnerability has been resolved: dm-raid: really frozen sync_thread during suspens
CVE-2024-35803	In the Linux kernel, the following vulnerability has been resolved: x86/efistub: Call mixed mode boot services on the
CVE-2024-35805	In the Linux kernel, the following vulnerability has been resolved: dm snapshot: fix lockup in dm_exception_table_e
CVE-2024-35808	In the Linux kernel, the following vulnerability has been resolved: md/dm-raid: don't call md_reap_sync_thread() di
CVE-2024-35807	In the Linux kernel, the following vulnerability has been resolved: ext4: fix corruption during on-line resize We obs
CVE-2024-35809	In the Linux kernel, the following vulnerability has been resolved: PCI/PM: Drain runtime-idle callbacks before driv
CVE-2024-35810	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Fix the lifetime of the bo cursor me
CVE-2024-35814	In the Linux kernel, the following vulnerability has been resolved: swiotlb: Fix double-allocation of slots due to brok
CVE-2024-35817	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: amdgpu_ttm_gart_bind set gtt boun
CVE-2024-35823	In the Linux kernel, the following vulnerability has been resolved: vt: fix unicode buffer corruption when deleting ch
CVE-2024-35824	In the Linux kernel, the following vulnerability has been resolved: misc: lis3lv02d_i2c: Fix regulators getting en-/dis
CVE-2024-35826	In the Linux kernel, the following vulnerability has been resolved: block: Fix page refcounts for unaligned buffers in
CVE-2024-35832	In the Linux kernel, the following vulnerability has been resolved: bcachefs: kvfree bch_fs::snapshots in bch2_fs_sn
CVE-2024-35838	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix potential sta-link leak When
CVE-2024-35835	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: fix a double-free in arfs_create_group
CVE-2024-35839	In the Linux kernel, the following vulnerability has been resolved: netfilter: bridge: replace physindev with physinif
CVE-2024-35840	In the Linux kernel, the following vulnerability has been resolved: mptcp: use OPTION_MPTCP_MPJ_SYNACK in
CVE-2024-35843	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Use device rbtree in iopf reporting p
CVE-2024-35845	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlmwifi: dbg-tlv: ensure NUL termination Th
CVE-2024-35847	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3-its: Prevent double free on error Th
CVE-2024-35848	In the Linux kernel, the following vulnerability has been resolved: eeprom: at24: fix memory corruption race conditi
CVE-2024-35852	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcam: Fix memory leak wh

CVE-2024-35853	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcam: Fix memory leak dur
CVE-2024-35854	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcam: Fix possible use-after
CVE-2024-35860	In the Linux kernel, the following vulnerability has been resolved: bpf: support deferring bpf_link dealloc to after R
CVE-2024-35855	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcam: Fix possible use-after
CVE-2024-35861	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential UAF in cifs_signal_cifs
CVE-2024-35862	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential UAF in smb2_is_network
CVE-2024-35863	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential UAF in is_valid_oplock
CVE-2024-35864	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential UAF in smb2_is_valid_
CVE-2024-35865	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential UAF in smb2_is_valid_
CVE-2024-35868	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential UAF in cifs_stats_proc_
CVE-2024-35869	In the Linux kernel, the following vulnerability has been resolved: smb: client: guarantee refcounted children from p
CVE-2024-35870	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix UAF in smb2_reconnect_server()
CVE-2024-35876	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-35875	In the Linux kernel, the following vulnerability has been resolved: x86/coco: Require seeding RNG with RDRAND
CVE-2024-35877	In the Linux kernel, the following vulnerability has been resolved: x86/mm/pat: fix VM_PAT handling in COW map
CVE-2024-35878	In the Linux kernel, the following vulnerability has been resolved: of: module: prevent NULL pointer dereference in
CVE-2024-35884	In the Linux kernel, the following vulnerability has been resolved: udp: do not accept non-tunnel GSO skbs landing
CVE-2024-35885	In the Linux kernel, the following vulnerability has been resolved: mlxbf_gige: stop interface during shutdown The n
CVE-2024-35886	In the Linux kernel, the following vulnerability has been resolved: ipv6: Fix infinite recursion in fib6_dump_done().
CVE-2024-35887	In the Linux kernel, the following vulnerability has been resolved: ax25: fix use-after-free bugs caused by ax25_ds_
CVE-2024-35888	In the Linux kernel, the following vulnerability has been resolved: erspan: make sure erspan_base_hdr is present in s
CVE-2024-35890	In the Linux kernel, the following vulnerability has been resolved: gro: fix ownership transfer If packets are GROed
CVE-2024-35893	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_skbmod: prevent kernel-infoleak sy
CVE-2024-35895	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Prevent lock inversion deadlock in
CVE-2024-35896	In the Linux kernel, the following vulnerability has been resolved: netfilter: validate user input for expected length I
CVE-2024-35897	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: discard table flag update with
CVE-2024-35898	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: Fix potential data-race in __n
CVE-2024-35899	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: flush pending destroy work be
CVE-2024-35900	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: reject new basechain after tab
CVE-2024-35901	In the Linux kernel, the following vulnerability has been resolved: net: mana: Fix Rx DMA datasize and skb_over_p
CVE-2024-35904	In the Linux kernel, the following vulnerability has been resolved: selinux: avoid dereference of garbage after mount
CVE-2024-35905	In the Linux kernel, the following vulnerability has been resolved: bpf: Protect against int overflow for stack access
CVE-2024-35907	In the Linux kernel, the following vulnerability has been resolved: mlxbf_gige: call request_irq() after NAPI initializ
CVE-2024-35908	In the Linux kernel, the following vulnerability has been resolved: tls: get psock ref after taking rxlock to avoid leak
CVE-2024-35911	In the Linux kernel, the following vulnerability has been resolved: ice: fix memory corruption bug with suspend and
CVE-2024-35910	In the Linux kernel, the following vulnerability has been resolved: tcp: properly terminate timers for kernel sockets V
CVE-2024-35912	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlmwifi: mvm: rfi: fix potential response lea
CVE-2024-35924	In the Linux kernel, the following vulnerability has been resolved: usb: typec: ucsi: Limit read size on v1.2 Between
CVE-2024-35922	In the Linux kernel, the following vulnerability has been resolved: fbmon: prevent division by zero in fb_videomode
CVE-2024-35925	In the Linux kernel, the following vulnerability has been resolved: block: prevent division by zero in blk_rq_stat_sur

CVE-2024-35926	In the Linux kernel, the following vulnerability has been resolved: crypto: iaa - Fix async_disable descriptor leak Th
CVE-2024-35927	In the Linux kernel, the following vulnerability has been resolved: drm: Check output polling initialized before disab
CVE-2024-35928	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-35929	In the Linux kernel, the following vulnerability has been resolved: rcu/nocb: Fix WARN_ON_ONCE() in rcu_no
CVE-2024-35931	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Skip do PCI error slot reset during
CVE-2024-35930	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix possible memory leak in lpfc_rcv_p
CVE-2024-35932	In the Linux kernel, the following vulnerability has been resolved: drm/vc4: don't check if plane->state->fb == state-
CVE-2024-35933	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btintel: Fix null ptr deref in btintel_rea
CVE-2024-35934	In the Linux kernel, the following vulnerability has been resolved: net/smc: reduce rtnl pressure in smc_pnet_create_
CVE-2024-35938	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: decrease MHI channel buffer length
CVE-2024-35937	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: check A-MSDU format more care
CVE-2024-35939	In the Linux kernel, the following vulnerability has been resolved: dma-direct: Leak pages on dma_set_decrypted() f
CVE-2024-35942	In the Linux kernel, the following vulnerability has been resolved: pmdomain: imx8mp-blk-ctrl: imx8mp_blk: Add f
CVE-2024-35944	In the Linux kernel, the following vulnerability has been resolved: VMCI: Fix memcpy() run-time warning in dg_dis
CVE-2024-35945	In the Linux kernel, the following vulnerability has been resolved: net: phy: phy_device: Prevent nullptr exceptions
CVE-2024-35946	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: fix null pointer access when abort sca
CVE-2024-35947	In the Linux kernel, the following vulnerability has been resolved: dyndbg: fix old BUG_ON in >control parser Fix a
CVE-2024-35948	In the Linux kernel, the following vulnerability has been resolved: bcachefs: Check for journal entries overrunning en
CVE-2024-35950	In the Linux kernel, the following vulnerability has been resolved: drm/client: Fully protect modes[] with dev->mode
CVE-2024-35949	In the Linux kernel, the following vulnerability has been resolved: btrfs: make sure that WRITTEN is set on all meta
CVE-2024-35951	In the Linux kernel, the following vulnerability has been resolved: drm/panfrost: Fix the error path in panfrost_mmu
CVE-2024-35952	In the Linux kernel, the following vulnerability has been resolved: drm/ast: Fix soft lockup There is a while-loop in a
CVE-2024-35956	In the Linux kernel, the following vulnerability has been resolved: btrfs: qgroup: fix qgroup prealloc rsv leak in subv
CVE-2024-35957	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Fix WARN_ON in iommu probe pat
CVE-2024-35958	In the Linux kernel, the following vulnerability has been resolved: net: ena: Fix incorrect descriptor free behavior EN
CVE-2024-35959	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix mlx5e_priv_init() cleanup flow W
CVE-2024-3596	RADIUS Protocol under RFC 2865 is susceptible to forgery attacks by a local attacker who can modify any valid Re
CVE-2024-35960	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Properly link new fs rules into the tree
CVE-2024-35961	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Register devlink first under devlink loc
CVE-2024-35962	In the Linux kernel, the following vulnerability has been resolved: netfilter: complete validation of user input In my
CVE-2024-35963	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_sock: Fix not validating setsockopt
CVE-2024-35965	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix not validating setsockopt
CVE-2024-35966	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: RFCOMM: Fix not validating setsock
CVE-2024-35967	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: SCO: Fix not validating setsockopt use
CVE-2024-35969	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix race condition between ipv6_get_ifaddr
CVE-2024-35971	In the Linux kernel, the following vulnerability has been resolved: net: ks8851: Handle softirqs at the end of IRQ thr
CVE-2024-35976	In the Linux kernel, the following vulnerability has been resolved: xsk: validate user input for XDP_{UMEM COM
CVE-2024-35978	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix memory leak in hci_req_sync_con
CVE-2024-35979	In the Linux kernel, the following vulnerability has been resolved: raid1: fix use-after-free for original bio in raid1_v
CVE-2024-35983	In the Linux kernel, the following vulnerability has been resolved: bounds: Use the right number of bits for power-of

CVE-2024-35989	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix oops during rmmmod on sing
CVE-2024-35995	In the Linux kernel, the following vulnerability has been resolved: ACPI: CPPC: Use access_width over bit_width fo
CVE-2024-35999	In the Linux kernel, the following vulnerability has been resolved: smb3: missing lock when picking channel Coveri
CVE-2024-35998	In the Linux kernel, the following vulnerability has been resolved: smb3: fix lock ordering potential deadlock in cif
CVE-2024-36000	In the Linux kernel, the following vulnerability has been resolved: mm/hugetlb: fix missing hugetlb_lock for resv un
CVE-2024-36003	In the Linux kernel, the following vulnerability has been resolved: ice: fix LAG and VF lock dependency in ice_rese
CVE-2024-36004	In the Linux kernel, the following vulnerability has been resolved: i40e: Do not use WQ_MEM_RECLAIM flag for
CVE-2024-36005	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: honor table dormant flag from
CVE-2024-36006	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcam: Fix incorrect list API
CVE-2024-36007	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_tcam: Fix warning during r
CVE-2024-36009	In the Linux kernel, the following vulnerability has been resolved: ax25: Fix netdev refcount issue The dev_tracker i
CVE-2024-36010	In the Linux kernel, the following vulnerability has been resolved: igb: Fix string truncation warnings in igb_set_fw
CVE-2024-36012	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: msft: fix slab-use-after-free in msft_do
CVE-2024-36015	In the Linux kernel, the following vulnerability has been resolved: ppdev: Add an error check in register_device In r
CVE-2024-36013	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix slab-use-after-free in l2ca
CVE-2024-36014	In the Linux kernel, the following vulnerability has been resolved: drm/arm/malidp: fix a possible null pointer derefe
CVE-2024-36016	In the Linux kernel, the following vulnerability has been resolved: tty: n_gsm: fix possible out-of-bounds in gsm0_re
CVE-2024-36017	In the Linux kernel, the following vulnerability has been resolved: rtnetlink: Correct nested IFLA_VF_VLAN_LIST
CVE-2024-36020	In the Linux kernel, the following vulnerability has been resolved: i40e: fix vf may be used uninitialized in this func
CVE-2024-36021	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fix kernel crash when devlink reload du
CVE-2024-36022	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-36024	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Disable idle reallow as part of c
CVE-2024-36025	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix off by one in qla_edif_app_get
CVE-2024-36026	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: fixes a random hang in S4 for SMU
CVE-2024-36032	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: qca: fix info leak when fetching fw bu
CVE-2024-36031	In the Linux kernel, the following vulnerability has been resolved: keys: Fix overwrite of key expiration on instantia
CVE-2024-36114	Aircompressor is a library with ports of the Snappy, LZO, LZ4, and Zstandard compression algorithms to Java. All o
CVE-2024-36137	A vulnerability has been identified in Node.js, affecting users of the experimental permission model when the --allow
CVE-2024-36244	In the Linux kernel, the following vulnerability has been resolved: net/sched: taprio: extend minimum interval restric
CVE-2024-36347	Improper signature verification in AMD CPU ROM microcode patch loader may allow an attacker with local admini
CVE-2024-36286	In the Linux kernel, the following vulnerability has been resolved: netfilter: nfnetlink_queue: acquire rcu_read_lock
CVE-2024-36270	In the Linux kernel, the following vulnerability has been resolved: netfilter: tproxy: bail out if IP has been disabled o
CVE-2024-36350	A transient execution vulnerability in some AMD processors may allow an attacker to infer data from previous store
CVE-2024-36357	A transient execution vulnerability in some AMD processors may allow an attacker to infer data in the L1D cache, p
CVE-2024-36476	In the Linux kernel, the following vulnerability has been resolved: RDMA/rtrs: Ensure 'ib_sge list' is accessible Mov
CVE-2024-36478	In the Linux kernel, the following vulnerability has been resolved: null_blk: fix null-ptr-dereference while configurin
CVE-2024-36479	In the Linux kernel, the following vulnerability has been resolved: fpga: bridge: add owner module and take its refco
CVE-2024-36484	In the Linux kernel, the following vulnerability has been resolved: net: relax socket state check at accept time. Chris
CVE-2024-36489	In the Linux kernel, the following vulnerability has been resolved: tls: fix missing memory barrier in tls_init In tls_in
CVE-2024-3651	A vulnerability was identified in the kjd/idna library, specifically within the `idna.encode()` function, affecting versi

CVE-2024-36613	FFmpeg n6.1.1 has a vulnerability in the DXA demuxer of the libavformat library allowing for an integer overflow, which can be used to trigger a crash.
CVE-2024-36616	An integer overflow in the component /libavformat/westwood_vqa.c of FFmpeg n6.1.1 allows attackers to cause a denial of service (crash) or execute arbitrary code.
CVE-2024-36617	FFmpeg n6.1.1 has an integer overflow vulnerability in the FFmpeg CAF decoder.
CVE-2024-36618	FFmpeg n6.1.1 has a vulnerability in the AVI demuxer of the libavformat library which allows for an integer overflow, which can be used to trigger a crash.
CVE-2024-36619	FFmpeg n6.1.1 has a vulnerability in the WAVARC decoder of the libavcodec library which allows for an integer overflow, which can be used to trigger a crash.
CVE-2024-36623	moby through v25.0.3 has a Race Condition vulnerability in the streamformatter package which can be used to trigger a crash.
CVE-2024-36621	moby v25.0.5 is affected by a Race Condition in builder/builder-next/adapters/snapshot/layer.go. The vulnerability can be used to trigger a crash.
CVE-2024-36880	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: qca: add missing firmware sanity check
CVE-2024-36881	In the Linux kernel, the following vulnerability has been resolved: mm/userfaultfd: reset ptes when close() for wr-pr
CVE-2024-36882	In the Linux kernel, the following vulnerability has been resolved: mm: use memalloc_nofs_save() in page_cache_ra
CVE-2024-36883	In the Linux kernel, the following vulnerability has been resolved: net: fix out-of-bounds access in ops_init net_alloc
CVE-2024-36884	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: Use the correct type in nvidia
CVE-2024-36885	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-36886	In the Linux kernel, the following vulnerability has been resolved: tipc: fix UAF in error path Sam Page (sam4k) wo
CVE-2024-36889	In the Linux kernel, the following vulnerability has been resolved: mptcp: ensure snd_nxt is properly initialized on c
CVE-2024-36893	In the Linux kernel, the following vulnerability has been resolved: usb: typec: tcpc: Check for port partner validity b
CVE-2024-36894	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: f_fs: Fix race between aio_cancel() a
CVE-2024-36898	In the Linux kernel, the following vulnerability has been resolved: gpiolib: cdev: fix uninitialised kfifo If a line is rec
CVE-2024-36896	In the Linux kernel, the following vulnerability has been resolved: USB: core: Fix access violation during port device
CVE-2024-36899	In the Linux kernel, the following vulnerability has been resolved: gpiolib: cdev: Fix use after free in lineinfo_chang
CVE-2024-36900	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fix kernel crash when devlink reload du
CVE-2024-36901	In the Linux kernel, the following vulnerability has been resolved: ipv6: prevent NULL dereference in ip6_output() .
CVE-2024-36902	In the Linux kernel, the following vulnerability has been resolved: ipv6: fib6_rules: avoid possible NULL dereference
CVE-2024-36903	In the Linux kernel, the following vulnerability has been resolved: ipv6: Fix potential uninit-value access in __ip6_n
CVE-2024-36904	In the Linux kernel, the following vulnerability has been resolved: tcp: Use refcount_inc_not_zero() in tcp_twsk_uni
CVE-2024-36906	In the Linux kernel, the following vulnerability has been resolved: ARM: 9381/1: kasan: clear stale stack poison We
CVE-2024-36905	In the Linux kernel, the following vulnerability has been resolved: tcp: defer shutdown(SEND_SHUTDOWN) for T
CVE-2024-36909	In the Linux kernel, the following vulnerability has been resolved: Drivers: hv: vmbus: Don't free ring buffers that co
CVE-2024-36907	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-36910	In the Linux kernel, the following vulnerability has been resolved: uio_hv_generic: Don't free decrypted memory In
CVE-2024-36911	In the Linux kernel, the following vulnerability has been resolved: hv_netvsc: Don't free decrypted memory In CoCo
CVE-2024-36912	In the Linux kernel, the following vulnerability has been resolved: Drivers: hv: vmbus: Track decrypted status in vm
CVE-2024-36914	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Skip on writeback when it's not
CVE-2024-36913	In the Linux kernel, the following vulnerability has been resolved: Drivers: hv: vmbus: Leak pages if set_memory_e
CVE-2024-36915	In the Linux kernel, the following vulnerability has been resolved: nfc: llcp: fix nfc_llcp_setsockopt() unsafe copies
CVE-2024-36916	In the Linux kernel, the following vulnerability has been resolved: blk-iocost: avoid out of bounds shift UBSAN cat
CVE-2024-36917	In the Linux kernel, the following vulnerability has been resolved: block: fix overflow in blk_ioctl_discard() There is
CVE-2024-36918	In the Linux kernel, the following vulnerability has been resolved: bpf: Check bloom filter map value size This patch
CVE-2024-36919	In the Linux kernel, the following vulnerability has been resolved: scsi: bnx2fc: Remove spin_lock_bh while releasin
CVE-2024-36920	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Avoid memcpy field-spanning writ

CVE-2024-36921	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: guard against invalid STA ID
CVE-2024-36922	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: read txq->read_ptr under lock If we
CVE-2024-36924	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Release hbalock before calling lpfc_wc
CVE-2024-36923	In the Linux kernel, the following vulnerability has been resolved: fs/9p: fix uninitialized values during inode evict I
CVE-2024-36925	In the Linux kernel, the following vulnerability has been resolved: swiotlb: initialise restricted pool list_head when S
CVE-2024-36928	In the Linux kernel, the following vulnerability has been resolved: s390/qeth: Fix kernel panic after setting hsnid Syn
CVE-2024-36927	In the Linux kernel, the following vulnerability has been resolved: ipv4: Fix uninit-value access in __ip_make_skb()
CVE-2024-36929	In the Linux kernel, the following vulnerability has been resolved: net: core: reject skb_copy(_expand) for fraglist G
CVE-2024-36931	In the Linux kernel, the following vulnerability has been resolved: s390/cio: Ensure the copied buf is NUL terminate
CVE-2024-36933	In the Linux kernel, the following vulnerability has been resolved: nsh: Restore skb->{protocol,data,mac_header} fo
CVE-2024-36934	In the Linux kernel, the following vulnerability has been resolved: bna: ensure the copied buf is NUL terminated Cu
CVE-2024-36937	In the Linux kernel, the following vulnerability has been resolved: xdp: use flags field to disambiguate broadcast red
CVE-2024-36939	In the Linux kernel, the following vulnerability has been resolved: nfs: Handle error of rpc_proc_register() in nfs_ne
CVE-2024-36938	In the Linux kernel, the following vulnerability has been resolved: bpf, skmsg: Fix NULL pointer dereference in sk_
CVE-2024-36940	In the Linux kernel, the following vulnerability has been resolved: pinctrl: core: delete incorrect free in pinctrl_enabl
CVE-2024-36944	In the Linux kernel, the following vulnerability has been resolved: Reapply "drm/qxl: simplify qxl_fence_wait" This
CVE-2024-36941	In the Linux kernel, the following vulnerability has been resolved: wifi: nl80211: don't free NULL coalescing rule If
CVE-2024-36945	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix neighbour and rtable leak in smc_ib_
CVE-2024-36946	In the Linux kernel, the following vulnerability has been resolved: phonet: fix rtm_phonet_notify() skb allocation fil
CVE-2024-36947	In the Linux kernel, the following vulnerability has been resolved: qibfs: fix dentry leak simple_recursive_removal()
CVE-2024-36948	In the Linux kernel, the following vulnerability has been resolved: drm/xe/xe_migrate: Cast to output precision befor
CVE-2024-36949	In the Linux kernel, the following vulnerability has been resolved: amd/amdkfd: sync all devices to wait all processe
CVE-2024-36950	In the Linux kernel, the following vulnerability has been resolved: firewire: ohci: mask bus reset interrupts between
CVE-2024-36951	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: range check cp bad op exception int
CVE-2024-36952	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Move NPIV's transport unregistration t
CVE-2024-36953	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: vgic-v2: Check for non-NULL vCI
CVE-2024-36954	In the Linux kernel, the following vulnerability has been resolved: tipc: fix a possible memleak in tipc_buf_append
CVE-2024-36955	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: intel-sdw-acpi: fix usage of device_g
CVE-2024-36957	In the Linux kernel, the following vulnerability has been resolved: octeontx2-af: avoid off-by-one read from userspa
CVE-2024-36959	In the Linux kernel, the following vulnerability has been resolved: pinctrl: devicetree: fix refcount leak in pinctrl_dt
CVE-2024-36960	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Fix invalid reads in fence signaled
CVE-2024-36962	In the Linux kernel, the following vulnerability has been resolved: net: ks8851: Queue RX packets in IRQ handler in
CVE-2024-36964	In the Linux kernel, the following vulnerability has been resolved: fs/9p: only translate RWX permissions for plain 9
CVE-2024-36965	In the Linux kernel, the following vulnerability has been resolved: remoteproc: mediatek: Make sure IPI buffer fits i
CVE-2024-36966	In the Linux kernel, the following vulnerability has been resolved: erofs: reliably distinguish block based and fscache
CVE-2024-36967	In the Linux kernel, the following vulnerability has been resolved: KEYS: trusted: Fix memory leak in tpm2_key_en
CVE-2024-36968	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix div-by-zero in l2cap_le_f
CVE-2024-36970	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: Use request_module_nowait This ap
CVE-2024-36969	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix division by zero in setup_d
CVE-2024-36971	In the Linux kernel, the following vulnerability has been resolved: net: fix __dst_negative_advice() race __dst_negat

CVE-2024-36972	In the Linux kernel, the following vulnerability has been resolved: af_unix: Update unix_sk(sk)->oob_skb under sk_
CVE-2024-36974	In the Linux kernel, the following vulnerability has been resolved: net/sched: taprio: always validate TCA_TAPRIO
CVE-2024-36975	In the Linux kernel, the following vulnerability has been resolved: KEYS: trusted: Do not use WARN when encode
CVE-2024-36978	In the Linux kernel, the following vulnerability has been resolved: net: sched: sch_multiq: fix possible OOB write in
CVE-2024-36979	In the Linux kernel, the following vulnerability has been resolved: net: bridge: mst: fix vlan use-after-free syzbot rep
CVE-2024-37021	In the Linux kernel, the following vulnerability has been resolved: fpga: manager: add owner module and take its ref
CVE-2024-37078	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix potential kernel bug due to lack of writ
CVE-2024-37353	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-37354	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix crash on racing fsync and size-extending
CVE-2024-37356	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix shift-out-of-bounds in dctcp_update_alph
CVE-2024-37370	In MIT Kerberos 5 (aka krb5) before 1.21.3, an attacker can modify the plaintext Extra Count field of a confidential
CVE-2024-37371	In MIT Kerberos 5 (aka krb5) before 1.21.3, an attacker can cause invalid memory reads during GSS message token
CVE-2024-37891	urllib3 is a user-friendly HTTP client library for Python. When using urllib3's proxy support with `ProxyManager`, t
CVE-2024-38306	In the Linux kernel, the following vulnerability has been resolved: btrfs: protect folio::private when attaching exten
CVE-2024-38381	In the Linux kernel, the following vulnerability has been resolved: nfc: nci: Fix uninit-value in nci_rx_work syzbot r
CVE-2024-38384	In the Linux kernel, the following vulnerability has been resolved: blk-cgroup: fix list corruption from reorder of WB
CVE-2024-38388	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda/cs_dsp_ctl: Use private_free for contr
CVE-2024-38473	Encoding problem in mod_proxy in Apache HTTP Server 2.4.59 and earlier allows request URLs with incorrect enc
CVE-2024-38428	url.c in GNU Wget through 1.24.5 mishandles semicolons in the userinfo subcomponent of a URI, and thus there ma
CVE-2024-38474	Substitution encoding issue in mod_rewrite in Apache HTTP Server 2.4.59 and earlier allows attacker to execute scr
CVE-2024-38475	Improper escaping of output in mod_rewrite in Apache HTTP Server 2.4.59 and earlier allows an attacker to map UR
CVE-2024-38476	Vulnerability in core of Apache HTTP Server 2.4.59 and earlier are vulnerably to information disclosure, SSRF or lo
CVE-2024-38477	null pointer dereference in mod_proxy in Apache HTTP Server 2.4.59 and earlier allows an attacker to crash the serv
CVE-2024-38538	In the Linux kernel, the following vulnerability has been resolved: net: bridge: xmit: make sure we have at least eth
CVE-2024-38540	In the Linux kernel, the following vulnerability has been resolved: bnxt_re: avoid shift undefined behavior in bnxt_q
CVE-2024-38543	In the Linux kernel, the following vulnerability has been resolved: lib/test_hmm.c: handle src_pfns and dst_pfns allo
CVE-2024-38541	In the Linux kernel, the following vulnerability has been resolved: of: module: add buffer overflow check in of_mod
CVE-2024-38544	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Fix seg fault in rxe_comp_queue_pk
CVE-2024-38545	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix UAF for cq async event The refc
CVE-2024-38546	In the Linux kernel, the following vulnerability has been resolved: drm: vc4: Fix possible null pointer dereference In
CVE-2024-38547	In the Linux kernel, the following vulnerability has been resolved: media: atomisp: ssh_css: Fix a null-pointer derefe
CVE-2024-38548	In the Linux kernel, the following vulnerability has been resolved: drm: bridge: cdns-mhdp8546: Fix possible null po
CVE-2024-38549	In the Linux kernel, the following vulnerability has been resolved: drm/mediatek: Add 0 size check to mtk_drm_gen
CVE-2024-38550	In the Linux kernel, the following vulnerability has been resolved: ASoC: kirkwood: Fix potential NULL dereferenc
CVE-2024-38552	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix potential index out of bound
CVE-2024-38553	In the Linux kernel, the following vulnerability has been resolved: net: fec: remove .ndo_poll_controller to avoid dea
CVE-2024-38554	In the Linux kernel, the following vulnerability has been resolved: ax25: Fix reference count leak issue of net_device
CVE-2024-38555	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Discard command completions in interr
CVE-2024-38556	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Add a timeout to acquire the command
CVE-2024-38557	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Reload only IB representors upon lag d

CVE-2024-38558	In the Linux kernel, the following vulnerability has been resolved: net: openvswitch: fix overwriting ct original tuple
CVE-2024-38559	In the Linux kernel, the following vulnerability has been resolved: scsi: qedf: Ensure the copied buf is NUL terminat
CVE-2024-38560	In the Linux kernel, the following vulnerability has been resolved: scsi: bfa: Ensure the copied buf is NUL terminat
CVE-2024-38561	In the Linux kernel, the following vulnerability has been resolved: kunit: Fix kthread reference There is a race condi
CVE-2024-38564	In the Linux kernel, the following vulnerability has been resolved: bpf: Add BPF_PROG_TYPE_CGROUP_SKB ar
CVE-2024-38565	In the Linux kernel, the following vulnerability has been resolved: wifi: ar5523: enable proper endpoint verification
CVE-2024-38567	In the Linux kernel, the following vulnerability has been resolved: wifi: carl9170: add a proper sanity check for endp
CVE-2024-38570	In the Linux kernel, the following vulnerability has been resolved: gfs2: Fix potential glock use-after-free on unmount
CVE-2024-38571	In the Linux kernel, the following vulnerability has been resolved: thermal/drivers/tsens: Fix null pointer dereference
CVE-2024-38573	In the Linux kernel, the following vulnerability has been resolved: cpcp_cpufreq: Fix possible null pointer dereferen
CVE-2024-38575	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmfmac: pcie: handle randbuf allocation f
CVE-2024-38577	In the Linux kernel, the following vulnerability has been resolved: rcu-tasks: Fix show_rcu_tasks_trace_gp_kthread
CVE-2024-38578	In the Linux kernel, the following vulnerability has been resolved: ecryptfs: Fix buffer size for tag 66 packet The 'TA
CVE-2024-38579	In the Linux kernel, the following vulnerability has been resolved: crypto: bcm - Fix pointer arithmetic In spu2_dum
CVE-2024-38580	In the Linux kernel, the following vulnerability has been resolved: epoll: be better about file lifetimes epoll can call
CVE-2024-38581	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu/mes: fix use-after-free issue Delete
CVE-2024-38582	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix potential hang in nilfs_detach_log_writ
CVE-2024-38583	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix use-after-free of timer for log writer thr
CVE-2024-38586	In the Linux kernel, the following vulnerability has been resolved: r8169: Fix possible ring buffer corruption on fragm
CVE-2024-38588	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix possible use-after-free issue in ftrace_l
CVE-2024-38587	In the Linux kernel, the following vulnerability has been resolved: speakup: Fix sizeof() vs ARRAY_SIZE() bug The
CVE-2024-38589	In the Linux kernel, the following vulnerability has been resolved: netrom: fix possible dead-lock in nr_rt_ioctl() syz
CVE-2024-38590	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Modify the print level of CQE error
CVE-2024-38591	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix deadlock on SRQ async events.
CVE-2024-38594	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: move the EST lock to struct stmmac
CVE-2024-38596	In the Linux kernel, the following vulnerability has been resolved: af_unix: Fix data races in unix_release_sock/unix
CVE-2024-38597	In the Linux kernel, the following vulnerability has been resolved: eth: sungem: remove .ndo_poll_controller to avoid
CVE-2024-38598	In the Linux kernel, the following vulnerability has been resolved: md: fix resync softlockup when bitmap size is les
CVE-2024-38599	In the Linux kernel, the following vulnerability has been resolved: jffs2: prevent xattr node from overflowing the era
CVE-2024-38601	In the Linux kernel, the following vulnerability has been resolved: ring-buffer: Fix a race between readers and resize
CVE-2024-38600	In the Linux kernel, the following vulnerability has been resolved: ALSA: Fix deadlocks with kctl removals at disco
CVE-2024-38602	In the Linux kernel, the following vulnerability has been resolved: ax25: Fix reference count leak issues of ax25_dev
CVE-2024-38605	In the Linux kernel, the following vulnerability has been resolved: ALSA: core: Fix NULL module pointer assignme
CVE-2024-38607	In the Linux kernel, the following vulnerability has been resolved: macintosh/via-macii: Fix "BUG: sleeping functio
CVE-2024-38608	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix netif state handling mlx5e_suspen
CVE-2024-38610	In the Linux kernel, the following vulnerability has been resolved: drivers/virt/acrn: fix PFNMAP PTE checks in acrn
CVE-2024-38611	In the Linux kernel, the following vulnerability has been resolved: media: i2c: et8ek8: Don't strip remove function w
CVE-2024-38612	In the Linux kernel, the following vulnerability has been resolved: ipv6: sr: fix invalid unregister error path The erro
CVE-2024-38613	In the Linux kernel, the following vulnerability has been resolved: m68k: Fix spinlock race in kernel thread creation
CVE-2024-38615	In the Linux kernel, the following vulnerability has been resolved: cpufreq: exit() callback is optional The exit() call

CVE-2024-38618	In the Linux kernel, the following vulnerability has been resolved: ALSA: timer: Set lower bound of start tick time C
CVE-2024-38619	In the Linux kernel, the following vulnerability has been resolved: usb-storage: alauda: Check whether the media is s
CVE-2024-38621	In the Linux kernel, the following vulnerability has been resolved: media: stk1160: fix bounds checking in stk1160_
CVE-2024-38623	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Use variable length array instead of fixe
CVE-2024-38624	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Use 64 bit variable to avoid 32 bit overfl
CVE-2024-38625	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Check 'folio' pointer for NULL. It can be
CVE-2024-38627	In the Linux kernel, the following vulnerability has been resolved: stm class: Fix a double free in stm_register_devic
CVE-2024-38628	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: u_audio: Fix race condition use of co
CVE-2024-38630	In the Linux kernel, the following vulnerability has been resolved: watchdog: cpu5wdt.c: Fix use-after-free bug caus
CVE-2024-38632	In the Linux kernel, the following vulnerability has been resolved: vfio/pci: fix potential memory leak in vfio_intx_e
CVE-2024-38633	In the Linux kernel, the following vulnerability has been resolved: serial: max3100: Update uart_driver_registered o
CVE-2024-38634	In the Linux kernel, the following vulnerability has been resolved: serial: max3100: Lock port->lock when calling u
CVE-2024-38635	In the Linux kernel, the following vulnerability has been resolved: soundwire: cadence: fix invalid PDI offset For so
CVE-2024-38637	In the Linux kernel, the following vulnerability has been resolved: greybus: lights: check return of get_channel_from
CVE-2024-38659	In the Linux kernel, the following vulnerability has been resolved: enic: Validate length of nl attributes in enic_set_v
CVE-2024-38661	In the Linux kernel, the following vulnerability has been resolved: s390/ap: Fix crash in AP internal function modify
CVE-2024-38662	In the Linux kernel, the following vulnerability has been resolved: bpf: Allow delete from sockmap/sockhash only if
CVE-2024-38663	In the Linux kernel, the following vulnerability has been resolved: blk-cgroup: fix list corruption from resetting io st
CVE-2024-38667	In the Linux kernel, the following vulnerability has been resolved: riscv: prevent pt_regs corruption for secondary id
CVE-2024-38780	In the Linux kernel, the following vulnerability has been resolved: dma-buf/sw-sync: don't enable IRQ from sync_pr
CVE-2024-38808	In Spring Framework versions 5.3.0 - 5.3.38 and older unsupported versions, it is possible for a user to provide a spe
CVE-2024-38809	Applications that parse ETags from "If-Match" or "If-None-Match" request headers are vulnerable to DoS attack. Us
CVE-2024-38820	The fix for CVE-2022-22968 made disallowedFields patterns in DataBinder case insensitive. However, String.toLow
CVE-2024-38827	The usage of String.toLowerCase() and String.toUpperCase() has some Locale dependent exceptions that could pote
CVE-2024-39276	In the Linux kernel, the following vulnerability has been resolved: ext4: fix mb_cache_entry's e_refcnt leak in ext4_
CVE-2024-39277	In the Linux kernel, the following vulnerability has been resolved: dma-mapping: benchmark: handle NUMA_NO_N
CVE-2024-39282	In the Linux kernel, the following vulnerability has been resolved: net: wwan: t7xx: Fix FSM command timeout issu
CVE-2024-39292	In the Linux kernel, the following vulnerability has been resolved: um: Add winch to winch_handlers before register
CVE-2024-39293	In the Linux kernel, the following vulnerability has been resolved: Revert "xsk: Support redirect to any socket bound
CVE-2024-39298	In the Linux kernel, the following vulnerability has been resolved: mm/memory-failure: fix handling of dissolved bu
CVE-2024-39301	In the Linux kernel, the following vulnerability has been resolved: net/9p: fix uninit-value in p9_client_rpc() Syzbot
CVE-2024-39331	In Emacs before 29.4, org-link-expand-abbrev in lisp/ol.el expands a %(...) link abbrev even when it specifies an uns
CVE-2024-39463	In the Linux kernel, the following vulnerability has been resolved: 9p: add missing locking around taking dentry fid
CVE-2024-39466	In the Linux kernel, the following vulnerability has been resolved: thermal/drivers/qcom/lmh: Check for SCM availa
CVE-2024-39467	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to do sanity check on i_xattr_nid in sanit
CVE-2024-39468	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix deadlock in smb2_find_smb_tcon
CVE-2024-39469	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix nilfs_empty_dir() misjudgment and lon
CVE-2024-39471	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: add error handle to avoid out-of-bo
CVE-2024-39472	In the Linux kernel, the following vulnerability has been resolved: xfs: fix log recovery buffer allocation for the lega
CVE-2024-39473	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: ipc4-topology: Fix input format que

CVE-2024-39475	In the Linux kernel, the following vulnerability has been resolved: fbdev: savage: Handle err return when savagefb_
CVE-2024-39476	In the Linux kernel, the following vulnerability has been resolved: md/raid5: fix deadlock that raid5d() wait for itself
CVE-2024-39484	In the Linux kernel, the following vulnerability has been resolved: mmc: davinci: Don't strip remove function when
CVE-2024-39479	In the Linux kernel, the following vulnerability has been resolved: drm/i915/hwmon: Get rid of devm When both hw
CVE-2024-39480	In the Linux kernel, the following vulnerability has been resolved: kdb: Fix buffer overflow during tab-complete Cu
CVE-2024-39487	In the Linux kernel, the following vulnerability has been resolved: bonding: Fix out-of-bounds read in bond_option_
CVE-2024-39488	In the Linux kernel, the following vulnerability has been resolved: arm64: asm-bug: Add .align 2 to the end of __BU
CVE-2024-39490	In the Linux kernel, the following vulnerability has been resolved: ipv6: sr: fix missing sk_buff release in seg6_inpu
CVE-2024-39493	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - Fix ADF_DEV_RESET_SYNC men
CVE-2024-39489	In the Linux kernel, the following vulnerability has been resolved: ipv6: sr: fix memleak in seg6_hmac_init_algo seg
CVE-2024-39495	In the Linux kernel, the following vulnerability has been resolved: greybus: Fix use-after-free bug in gb_interface_re
CVE-2024-39494	In the Linux kernel, the following vulnerability has been resolved: ima: Fix use-after-free on a dentry's dname.name
CVE-2024-39497	In the Linux kernel, the following vulnerability has been resolved: drm/shmem-helper: Fix BUG_ON() on mmap(PR
CVE-2024-39499	In the Linux kernel, the following vulnerability has been resolved: vmci: prevent speculation leaks by sanitizing ever
CVE-2024-39500	In the Linux kernel, the following vulnerability has been resolved: sock_map: avoid race between sock_map_close a
CVE-2024-39496	In the Linux kernel, the following vulnerability has been resolved: btrfs: zoned: fix use-after-free due to race with de
CVE-2024-39501	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-39502	In the Linux kernel, the following vulnerability has been resolved: ionic: fix use after netif_napi_del() When queues
CVE-2024-39503	In the Linux kernel, the following vulnerability has been resolved: netfilter: ipset: Fix race between namespace clean
CVE-2024-39507	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fix kernel crash problem in concurrent
CVE-2024-39505	In the Linux kernel, the following vulnerability has been resolved: drm/komeda: check for error-valued pointer komed
CVE-2024-39506	In the Linux kernel, the following vulnerability has been resolved: liquidio: Adjust a NULL pointer handling path in
CVE-2024-39508	In the Linux kernel, the following vulnerability has been resolved: io_uring/io-wq: Use set_bit() and test_bit() at wor
CVE-2024-39509	In the Linux kernel, the following vulnerability has been resolved: HID: core: remove unnecessary WARN_ON() in
CVE-2024-39573	Potential SSRF in mod_rewrite in Apache HTTP Server 2.4.59 and earlier allows an attacker to cause unsafe Rewrite
CVE-2024-39689	Certifi is a curated collection of Root Certificates for validating the trustworthiness of SSL certificates while verifyin
CVE-2024-39908	REXML is an XML toolkit for Ruby. The REXML gem before 3.3.1 has some DoS vulnerabilities when it parses an
CVE-2024-39920	The TCP protocol in RFC 9293 has a timing side channel that makes it easier for remote attackers to infer the conten
CVE-2024-4032	The “ipaddress” module contained incorrect information about whether certain IPv4 and IPv6 addresses were design
CVE-2024-40635	containerd is an open-source container runtime. A bug was found in containerd prior to versions 1.6.38, 1.7.27, and 2
CVE-2024-40900	In the Linux kernel, the following vulnerability has been resolved: cachefiles: remove requests from xarray during fl
CVE-2024-40901	In the Linux kernel, the following vulnerability has been resolved: scsi: mpt3sas: Avoid test/set_bit() operating in no
CVE-2024-40902	In the Linux kernel, the following vulnerability has been resolved: jfs: xattr: fix buffer overflow for invalid xattr Wh
CVE-2024-40905	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix possible race in __fib6_drop_pcpu_from
CVE-2024-40904	In the Linux kernel, the following vulnerability has been resolved: USB: class: cdc-wdm: Fix CPU lockup caused by
CVE-2024-40906	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Always stop health timer during driver
CVE-2024-40908	In the Linux kernel, the following vulnerability has been resolved: bpf: Set run context for rawtp test_run callback sy
CVE-2024-40911	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: Lock wiphy in cfg80211_get_stat
CVE-2024-40910	In the Linux kernel, the following vulnerability has been resolved: ax25: Fix refcount imbalance on inbound connect
CVE-2024-40914	In the Linux kernel, the following vulnerability has been resolved: mm/huge_memory: don't unpoison huge_zero_fo

CVE-2024-40912	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: Fix deadlock in ieee80211_sta_p
CVE-2024-40915	In the Linux kernel, the following vulnerability has been resolved: riscv: rewrite __kernel_map_pages() to fix sleepi
CVE-2024-40916	In the Linux kernel, the following vulnerability has been resolved: drm/exynos: hdmi: report safe 640x480 mode as a
CVE-2024-40918	In the Linux kernel, the following vulnerability has been resolved: parisc: Try to fix random segmentation faults in p
CVE-2024-40919	In the Linux kernel, the following vulnerability has been resolved: bnxt_en: Adjust logging of firmware messages in
CVE-2024-40923	In the Linux kernel, the following vulnerability has been resolved: vmxnet3: disable rx data ring on dma allocation f
CVE-2024-40924	In the Linux kernel, the following vulnerability has been resolved: drm/i915/dpt: Make DPT object unshrinkable In s
CVE-2024-40929	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: check n_ssids before accessin
CVE-2024-40927	In the Linux kernel, the following vulnerability has been resolved: xhci: Handle TD clearing for multiple streams cas
CVE-2024-40931	In the Linux kernel, the following vulnerability has been resolved: mptcp: ensure snd_una is properly initialized on c
CVE-2024-40932	In the Linux kernel, the following vulnerability has been resolved: drm/exynos/vidi: fix memory leak in .get_modes()
CVE-2024-40934	In the Linux kernel, the following vulnerability has been resolved: HID: logitech-dj: Fix memory leak in logi_dj_rec
CVE-2024-40937	In the Linux kernel, the following vulnerability has been resolved: gve: Clear napi->skb before dev_kfree_skb_any()
CVE-2024-40940	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix tainted pointer delete is case of flow
CVE-2024-40942	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: mesh: Fix leak of mesh_preq_qu
CVE-2024-40943	In the Linux kernel, the following vulnerability has been resolved: ocfs2: fix races between hole punching and AIO+
CVE-2024-40941	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: don't read past the mfuart not
CVE-2024-40945	In the Linux kernel, the following vulnerability has been resolved: iommu: Return right value in iommu_sva_bind_d
CVE-2024-40953	In the Linux kernel, the following vulnerability has been resolved: KVM: Fix a data race on last_boosted_vcpu in kv
CVE-2024-40954	In the Linux kernel, the following vulnerability has been resolved: net: do not leave a dangling sk pointer, when sock
CVE-2024-40956	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix possible Use-After-Free in
CVE-2024-40957	In the Linux kernel, the following vulnerability has been resolved: seg6: fix parameter passing when calling NF_HO
CVE-2024-40958	In the Linux kernel, the following vulnerability has been resolved: netns: Make get_net_ns() handle zero refcount ne
CVE-2024-40959	In the Linux kernel, the following vulnerability has been resolved: xfrm6: check ip6_dst_idev() return value in xfrm
CVE-2024-40961	In the Linux kernel, the following vulnerability has been resolved: ipv6: prevent possible NULL deref in fib6_nh_in
CVE-2024-40960	In the Linux kernel, the following vulnerability has been resolved: ipv6: prevent possible NULL dereference in rt6_p
CVE-2024-40963	In the Linux kernel, the following vulnerability has been resolved: mips: bmips: BCM6358: make sure CBR is corre
CVE-2024-40964	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: cs35l41: Possible null pointer derefer
CVE-2024-40965	In the Linux kernel, the following vulnerability has been resolved: i2c: lpi2c: Avoid calling clk_get_rate during trans
CVE-2024-40966	In the Linux kernel, the following vulnerability has been resolved: tty: add the option to have a tty reject a new ldisc
CVE-2024-40967	In the Linux kernel, the following vulnerability has been resolved: serial: imx: Introduce timeout when waiting on tra
CVE-2024-40968	In the Linux kernel, the following vulnerability has been resolved: MIPS: Octeon: Add PCIe link status check The st
CVE-2024-40970	In the Linux kernel, the following vulnerability has been resolved: Avoid hw_desc array overrun in dw-axi-dmac I h
CVE-2024-40972	In the Linux kernel, the following vulnerability has been resolved: ext4: do not create EA inode under buffer lock ex
CVE-2024-40971	In the Linux kernel, the following vulnerability has been resolved: f2fs: remove clear SB_INLINECRYPT flag in de
CVE-2024-40974	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries: Enforce hcall result buffer valid
CVE-2024-40973	In the Linux kernel, the following vulnerability has been resolved: media: mtk-vcodec: potential null pointer deferen
CVE-2024-40975	In the Linux kernel, the following vulnerability has been resolved: platform/x86: x86-android-tablets: Unregister dev
CVE-2024-40976	In the Linux kernel, the following vulnerability has been resolved: drm/lima: mask irqs in timeout path before hard r
CVE-2024-40977	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7921s: fix potential hung tasks durin

CVE-2024-40979	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix kernel crash during resume Curr
CVE-2024-40978	In the Linux kernel, the following vulnerability has been resolved: scsi: qedi: Fix crash while reading debugfs attribu
CVE-2024-40980	In the Linux kernel, the following vulnerability has been resolved: drop_monitor: replace spin_lock by raw_spin_lo
CVE-2024-40981	In the Linux kernel, the following vulnerability has been resolved: batman-adv: bypass empty buckets in batadv_pur
CVE-2024-40983	In the Linux kernel, the following vulnerability has been resolved: tipc: force a dst refcount before doing decryption
CVE-2024-40984	In the Linux kernel, the following vulnerability has been resolved: ACPICA: Revert "ACPICA: avoid Info: mapping
CVE-2024-40987	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix UBSAN warning in kv_dpm.c A
CVE-2024-40988	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: fix UBSAN warning in kv_dpm.c A
CVE-2024-40990	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Add check for srq max_sge attribu
CVE-2024-40994	In the Linux kernel, the following vulnerability has been resolved: ptp: fix integer overflow in max_vclocks_store O
CVE-2024-40995	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_api: fix possible infinite loop in tcf
CVE-2024-40989	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Disassociate vcpus from redistribu
CVE-2024-40997	In the Linux kernel, the following vulnerability has been resolved: cpufreq: amd-pstate: fix memory leak on CPU EF
CVE-2024-40998	In the Linux kernel, the following vulnerability has been resolved: ext4: fix uninitialized ratelimit_state->lock access
CVE-2024-40999	In the Linux kernel, the following vulnerability has been resolved: net: ena: Add validation for completion descriptor
CVE-2024-41000	In the Linux kernel, the following vulnerability has been resolved: block/ioctl: prefer different overflow check Runn
CVE-2024-41001	In the Linux kernel, the following vulnerability has been resolved: io_uring/sqpoll: work around a potential audit me
CVE-2024-41002	In the Linux kernel, the following vulnerability has been resolved: crypto: hisilicon/sec - Fix memory leak for sec res
CVE-2024-41004	In the Linux kernel, the following vulnerability has been resolved: tracing: Build event generation tests only as modu
CVE-2024-41005	In the Linux kernel, the following vulnerability has been resolved: netpoll: Fix race condition in netpoll_owner_activ
CVE-2024-41006	In the Linux kernel, the following vulnerability has been resolved: netrom: Fix a memory leak in nr_heartbeat_expir
CVE-2024-41007	In the Linux kernel, the following vulnerability has been resolved: tcp: avoid too many retransmit packets If a TCP s
CVE-2024-41008	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: change vm->task_info handling Th
CVE-2024-41009	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix overrunning reservations in ringbuf The
CVE-2024-41010	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix too early release of tcx_entry Pedro Pinto
CVE-2024-41012	In the Linux kernel, the following vulnerability has been resolved: filelock: Remove locks reliably when fcntl/close
CVE-2024-41011	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: don't allow mapping the MMIO HD
CVE-2024-41013	In the Linux kernel, the following vulnerability has been resolved: xfs: don't walk off the end of a directory data bloc
CVE-2024-41014	In the Linux kernel, the following vulnerability has been resolved: xfs: add bounds checking to xlog_recover_proces
CVE-2024-41015	In the Linux kernel, the following vulnerability has been resolved: ocfs2: add bounds checking to ocfs2_check_dir_e
CVE-2024-41016	In the Linux kernel, the following vulnerability has been resolved: ocfs2: strict bound check before memcmp in ocfs
CVE-2024-41017	In the Linux kernel, the following vulnerability has been resolved: jfs: don't walk off the end of ealist Add a check b
CVE-2024-41019	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Validate ff offset This adds sanity check
CVE-2024-41022	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix signedness bug in sdma_v4_0_
CVE-2024-41020	In the Linux kernel, the following vulnerability has been resolved: filelock: Fix fcntl/close race recovery compat pat
CVE-2024-41023	In the Linux kernel, the following vulnerability has been resolved: sched/deadline: Fix task_struct reference leak Du
CVE-2024-41027	In the Linux kernel, the following vulnerability has been resolved: Fix userfaultfd_api to return EINVAL as expected
CVE-2024-41030	In the Linux kernel, the following vulnerability has been resolved: ksmbd: discard write access to the directory open
CVE-2024-41031	In the Linux kernel, the following vulnerability has been resolved: mm/filemap: skip to create PMD-sized page cach
CVE-2024-41034	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix kernel bug on rename operation of brok

CVE-2024-41036	In the Linux kernel, the following vulnerability has been resolved: net: ks8851: Fix deadlock with the SPI chip varia
CVE-2024-41035	In the Linux kernel, the following vulnerability has been resolved: USB: core: Fix duplicate endpoint bug by clearing
CVE-2024-41037	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: hda: fix null deref on system s
CVE-2024-41038	In the Linux kernel, the following vulnerability has been resolved: firmware: cs_dsp: Prevent buffer overrun when p
CVE-2024-41039	In the Linux kernel, the following vulnerability has been resolved: firmware: cs_dsp: Fix overflow checking of wmf
CVE-2024-41041	In the Linux kernel, the following vulnerability has been resolved: udp: Set SOCK_RCU_FREE earlier in udp_lib_g
CVE-2024-41040	In the Linux kernel, the following vulnerability has been resolved: net/sched: Fix UAF when resolving a clash KASA
CVE-2024-41042	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: prefer nft_chain_validate nft_
CVE-2024-41044	In the Linux kernel, the following vulnerability has been resolved: ppp: reject claimed-as-LCP but actually malforme
CVE-2024-41045	In the Linux kernel, the following vulnerability has been resolved: bpf: Defer work in bpf_timer_cancel_and_free C
CVE-2024-41046	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: lantiq_etop: fix double free in detach
CVE-2024-41047	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix XDP program unloading while removing
CVE-2024-41048	In the Linux kernel, the following vulnerability has been resolved: skmsg: Skip zero length skb in sk_msg_recvmmsg
CVE-2024-41049	In the Linux kernel, the following vulnerability has been resolved: filelock: fix potential use-after-free in posix_lock
CVE-2024-41050	In the Linux kernel, the following vulnerability has been resolved: cachefiles: cyclic allocation of msg_id to avoid re
CVE-2024-41055	In the Linux kernel, the following vulnerability has been resolved: mm: prevent dereferencing NULL ptr in pfn_section
CVE-2024-41056	In the Linux kernel, the following vulnerability has been resolved: firmware: cs_dsp: Use strlen() on name fields in
CVE-2024-41059	In the Linux kernel, the following vulnerability has been resolved: hfsplus: fix uninit-value in copy_name [syzbot rep
CVE-2024-41060	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: check bo_va->bo is non-NULL before
CVE-2024-41062	In the Linux kernel, the following vulnerability has been resolved: bluetooth/l2cap: sync sock recv cb and release Th
CVE-2024-41063	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_core: cancel all works upon hci_un
CVE-2024-41064	In the Linux kernel, the following vulnerability has been resolved: powerpc/eeh: avoid possible crash when edev->p
CVE-2024-41065	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries: Whitelist dtl slub object for copy
CVE-2024-41067	In the Linux kernel, the following vulnerability has been resolved: btrfs: scrub: handle RST lookup error correctly [E
CVE-2024-41068	In the Linux kernel, the following vulnerability has been resolved: s390/scslp: Fix scslp_init() cleanup on failure If scl
CVE-2024-41069	In the Linux kernel, the following vulnerability has been resolved: ASoC: topology: Fix references to freed memory
CVE-2024-41066	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: Add tx check to prevent skb leak Below
CVE-2024-41070	In the Linux kernel, the following vulnerability has been resolved: KVM: PPC: Book3S HV: Prevent UAF in kvm_s
CVE-2024-41071	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-41072	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: wext: add extra SIOCSIWSCAN
CVE-2024-41074	In the Linux kernel, the following vulnerability has been resolved: cachefiles: Set object to close if ondemand_id < C
CVE-2024-41073	In the Linux kernel, the following vulnerability has been resolved: nvme: avoid double free special payload If a disc
CVE-2024-41075	In the Linux kernel, the following vulnerability has been resolved: cachefiles: add consistency check for copen/cread
CVE-2024-41076	In the Linux kernel, the following vulnerability has been resolved: NFSv4: Fix memory leak in nfs4_set_security_lai
CVE-2024-41077	In the Linux kernel, the following vulnerability has been resolved: null_blk: fix validation of block size Block size sh
CVE-2024-41078	In the Linux kernel, the following vulnerability has been resolved: btrfs: qgroup: fix quota root leak after quota disab
CVE-2024-41079	In the Linux kernel, the following vulnerability has been resolved: nvmet: always initialize cq.e.result The spec does
CVE-2024-41080	In the Linux kernel, the following vulnerability has been resolved: io_uring: fix possible deadlock in io_register_iow
CVE-2024-41081	In the Linux kernel, the following vulnerability has been resolved: ila: block BH in ila_output() As explained in com
CVE-2024-41082	In the Linux kernel, the following vulnerability has been resolved: nvme-fabrics: use reserved tag for reg read/write

CVE-2024-41087	In the Linux kernel, the following vulnerability has been resolved: ata: libata-core: Fix double free on error If e.g. the
CVE-2024-41088	In the Linux kernel, the following vulnerability has been resolved: can: mcp251xfd: fix infinite loop when xmit fails
CVE-2024-41089	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau/dispnv04: fix null pointer dereferen
CVE-2024-41090	In the Linux kernel, the following vulnerability has been resolved: tap: add missing verification for short frame The
CVE-2024-41091	In the Linux kernel, the following vulnerability has been resolved: tun: add missing verification for short frame The
CVE-2024-41092	In the Linux kernel, the following vulnerability has been resolved: drm/i915/gt: Fix potential UAF by revoke of fenc
CVE-2024-41093	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: avoid using null object of framebuf
CVE-2024-41095	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau/dispnv04: fix null pointer dereferen
CVE-2024-41097	In the Linux kernel, the following vulnerability has been resolved: usb: atm: cxacru: fix endpoint checking in cxacru
CVE-2024-41098	In the Linux kernel, the following vulnerability has been resolved: ata: libata-core: Fix null pointer dereference on er
CVE-2024-41110	Moby is an open-source project created by Docker for software containerization. A security vulnerability has been d
CVE-2024-41932	In the Linux kernel, the following vulnerability has been resolved: sched: fix warning in sched_setaffinity Commit 8
CVE-2024-41123	REXML is an XML toolkit for Ruby. The REXML gem before 3.3.2 has some DoS vulnerabilities when it parses an
CVE-2024-41935	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to shrink read extent node in batches We
CVE-2024-41946	REXML is an XML toolkit for Ruby. The REXML gem 3.3.2 has a DoS vulnerability when it parses an XML that h
CVE-2024-41957	Vim is an open source command line text editor. Vim < v9.1.0647 has double free in src/alloc.c:616. When closing a
CVE-2024-41965	Vim is an open source command line text editor. double-free in dialog_changed() in Vim < v9.1.0648. When aband
CVE-2024-41996	Validating the order of the public keys in the Diffie-Hellman Key Agreement Protocol, when an approved safe prime
CVE-2024-42063	In the Linux kernel, the following vulnerability has been resolved: bpf: Mark bpf prog stack with kmsan_unposion_r
CVE-2024-42065	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Add a NULL check in xe_ttm_stolen_mg
CVE-2024-42067	In the Linux kernel, the following vulnerability has been resolved: bpf: Take return from set_memory_rox() into acc
CVE-2024-42069	In the Linux kernel, the following vulnerability has been resolved: net: mana: Fix possible double free in error handl
CVE-2024-42068	In the Linux kernel, the following vulnerability has been resolved: bpf: Take return from set_memory_ro() into acco
CVE-2024-42070	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: fully validate NFT_DATA_V
CVE-2024-42076	In the Linux kernel, the following vulnerability has been resolved: net: can: j1939: Initialize unused data in j1939_se
CVE-2024-42077	In the Linux kernel, the following vulnerability has been resolved: ocfs2: fix DIO failure due to insufficient transacti
CVE-2024-42079	In the Linux kernel, the following vulnerability has been resolved: gfs2: Fix NULL pointer dereference in gfs2_log_
CVE-2024-42080	In the Linux kernel, the following vulnerability has been resolved: RDMA/restrack: Fix potential invalid address acc
CVE-2024-42082	In the Linux kernel, the following vulnerability has been resolved: xdp: Remove WARN() from __xdp_reg_mem_m
CVE-2024-42084	In the Linux kernel, the following vulnerability has been resolved: ftruncate: pass a signed offset The old ftruncate()
CVE-2024-42085	In the Linux kernel, the following vulnerability has been resolved: usb: dwc3: core: remove lock of otg mode during
CVE-2024-42086	In the Linux kernel, the following vulnerability has been resolved: iio: chemical: bme680: Fix overflows in compens
CVE-2024-42087	In the Linux kernel, the following vulnerability has been resolved: drm/panel: ilitek-ili9881c: Fix warning with GPI
CVE-2024-42089	In the Linux kernel, the following vulnerability has been resolved: ASoC: fsl-asoc-card: set priv->pdev before using
CVE-2024-42090	In the Linux kernel, the following vulnerability has been resolved: pinctrl: fix deadlock in create_pinctrl() when han
CVE-2024-42091	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Check pat.ops before dumping PAT setti
CVE-2024-42092	In the Linux kernel, the following vulnerability has been resolved: gpio: davinci: Validate the obtained number of IR
CVE-2024-42093	In the Linux kernel, the following vulnerability has been resolved: net/dpaa2: Avoid explicit cpumask var allocation
CVE-2024-42094	In the Linux kernel, the following vulnerability has been resolved: net/iucv: Avoid explicit cpumask var allocation o
CVE-2024-42095	In the Linux kernel, the following vulnerability has been resolved: serial: 8250_omap: Implementation of Errata i23

CVE-2024-42096	In the Linux kernel, the following vulnerability has been resolved: x86: stop playing stack games in profile_pc() The
CVE-2024-42097	In the Linux kernel, the following vulnerability has been resolved: ALSA: emux: improve patch ioctl data validation
CVE-2024-42098	In the Linux kernel, the following vulnerability has been resolved: crypto: ecdh - explicitly zeroize private_key priva
CVE-2024-42101	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau: fix null pointer dereference in nouv
CVE-2024-42102	In the Linux kernel, the following vulnerability has been resolved: Revert "mm/writeback: fix possible divide-by-zer
CVE-2024-42104	In the Linux kernel, the following vulnerability has been resolved: nilfs2: add missing check for inode numbers on d
CVE-2024-42105	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix inode number range checks Patch serie
CVE-2024-42106	In the Linux kernel, the following vulnerability has been resolved: inet_diag: Initialize pad field in struct inet_diag_r
CVE-2024-42107	In the Linux kernel, the following vulnerability has been resolved: ice: Don't process extts if PTP is disabled The ice
CVE-2024-42109	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: unconditionally flush pending
CVE-2024-42114	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: restrict NL80211_ATTR_TXQ_C
CVE-2024-42110	In the Linux kernel, the following vulnerability has been resolved: net: ntb_netdev: Move ntb_netdev_rx_handler() t
CVE-2024-42116	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-42115	In the Linux kernel, the following vulnerability has been resolved: jffs2: Fix potential illegal address access in jffs2_
CVE-2024-42117	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: ASSERT when failing to find i
CVE-2024-42118	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Do not return negative stream i
CVE-2024-42119	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Skip finding free audio for unk
CVE-2024-42120	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check pipe offset before setting
CVE-2024-42121	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check index msg_id before rea
CVE-2024-42122	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL pointer check for k
CVE-2024-42124	In the Linux kernel, the following vulnerability has been resolved: scsi: qedf: Make qedf_execute_tmf() non-preemp
CVE-2024-42125	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: fw: scan offload prohibit all 6 GHz c
CVE-2024-42126	In the Linux kernel, the following vulnerability has been resolved: powerpc: Avoid nmi_enter/nmi_exit in real mode
CVE-2024-42127	In the Linux kernel, the following vulnerability has been resolved: drm/lima: fix shared irq handling on driver remov
CVE-2024-42128	In the Linux kernel, the following vulnerability has been resolved: leds: an30259a: Use devm_mutex_init() for mutex
CVE-2024-42129	In the Linux kernel, the following vulnerability has been resolved: leds: mlxreg: Use devm_mutex_init() for mutex i
CVE-2024-42130	In the Linux kernel, the following vulnerability has been resolved: nfc/nci: Add the inconsistency check between the
CVE-2024-42131	In the Linux kernel, the following vulnerability has been resolved: mm: avoid overflows in dirty throttling logic The
CVE-2024-42134	In the Linux kernel, the following vulnerability has been resolved: virtio-pci: Check if is_avq is NULL [bug] In the v
CVE-2024-42135	In the Linux kernel, the following vulnerability has been resolved: vhost_task: Handle SIGKILL by flushing work ar
CVE-2024-42136	In the Linux kernel, the following vulnerability has been resolved: cdrom: rearrange last_media_change check to av
CVE-2024-42137	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: qca: Fix BT enable failure again for Q
CVE-2024-42139	In the Linux kernel, the following vulnerability has been resolved: ice: Fix improper extts handling Extts events are e
CVE-2024-42140	In the Linux kernel, the following vulnerability has been resolved: riscv: kexec: Avoid deadlock in kexec crash path
CVE-2024-42145	In the Linux kernel, the following vulnerability has been resolved: IB/core: Implement a limit on UMAP receive Lis
CVE-2024-42147	In the Linux kernel, the following vulnerability has been resolved: crypto: hisilicon/debugfs - Fix debugfs uninit pro
CVE-2024-42148	In the Linux kernel, the following vulnerability has been resolved: bnx2x: Fix multiple UBSAN array-index-out-of-b
CVE-2024-42151	In the Linux kernel, the following vulnerability has been resolved: bpf: mark bpf_dummy_struct_ops.test_1 paramet
CVE-2024-42152	In the Linux kernel, the following vulnerability has been resolved: nvmet: fix a possible leak when destroy a ctrl dur
CVE-2024-42153	In the Linux kernel, the following vulnerability has been resolved: i2c: pnx: Fix potential deadlock warning from del

CVE-2024-42154	In the Linux kernel, the following vulnerability has been resolved: tcp_metrics: validate source addr length I don't se
CVE-2024-42155	In the Linux kernel, the following vulnerability has been resolved: s390/pkey: Wipe copies of protected- and secure-
CVE-2024-42156	In the Linux kernel, the following vulnerability has been resolved: s390/pkey: Wipe copies of clear-key structures on
CVE-2024-42157	In the Linux kernel, the following vulnerability has been resolved: s390/pkey: Wipe sensitive data on failure Wipe se
CVE-2024-42158	In the Linux kernel, the following vulnerability has been resolved: s390/pkey: Use kfree_sensitive() to fix Coccinelle
CVE-2024-42159	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Sanitise num_phys Information is s
CVE-2024-42160	In the Linux kernel, the following vulnerability has been resolved: f2fs: check validation of fault attrs in f2fs_build_
CVE-2024-42161	In the Linux kernel, the following vulnerability has been resolved: bpf: Avoid uninitialized value in BPF_CORE_RE
CVE-2024-42223	In the Linux kernel, the following vulnerability has been resolved: media: dvb-frontends: tda10048: Fix integer over
CVE-2024-42224	In the Linux kernel, the following vulnerability has been resolved: net: dsa: mv88e6xxx: Correct check for empty lis
CVE-2024-42225	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: replace skb_put with skb_put_zero Av
CVE-2024-42226	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-42228	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Using uninitialized value *size whe
CVE-2024-42229	In the Linux kernel, the following vulnerability has been resolved: crypto: aead,cipher - zeroize key buffer after use
CVE-2024-42230	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries: Fix scv instruction crash with ke
CVE-2024-42236	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: configs: Prevent OOB read/write in
CVE-2024-42232	In the Linux kernel, the following vulnerability has been resolved: libceph: fix race between delayed_work() and cep
CVE-2024-42237	In the Linux kernel, the following vulnerability has been resolved: firmware: cs_dsp: Validate payload length before
CVE-2024-42238	In the Linux kernel, the following vulnerability has been resolved: firmware: cs_dsp: Return error if block header ov
CVE-2024-42239	In the Linux kernel, the following vulnerability has been resolved: bpf: Fail bpf_timer_cancel when callback is being
CVE-2024-42240	In the Linux kernel, the following vulnerability has been resolved: x86/bhi: Avoid warning in #DB handler due to BI
CVE-2024-42244	In the Linux kernel, the following vulnerability has been resolved: USB: serial: mos7840: fix crash on resume Since
CVE-2024-42245	In the Linux kernel, the following vulnerability has been resolved: Revert "sched/fair: Make sure to try to detach at l
CVE-2024-42247	In the Linux kernel, the following vulnerability has been resolved: wireguard: allowedips: avoid unaligned 64-bit me
CVE-2024-42246	In the Linux kernel, the following vulnerability has been resolved: net, sunrpc: Remap EPERM in case of connection
CVE-2024-42252	In the Linux kernel, the following vulnerability has been resolved: closures: Change BUG_ON() to WARN_ON() If
CVE-2024-42253	In the Linux kernel, the following vulnerability has been resolved: gpio: pca953x: fix pca953x_irq_bus_sync_unlock
CVE-2024-42259	In the Linux kernel, the following vulnerability has been resolved: drm/i915/gem: Fix Virtual Memory mapping bou
CVE-2024-42265	In the Linux kernel, the following vulnerability has been resolved: protect the fetch of ->fd[fd] in do_dup2() from m
CVE-2024-42267	In the Linux kernel, the following vulnerability has been resolved: riscv/mm: Add handling for VM_FAULT_SIGSE
CVE-2024-42269	In the Linux kernel, the following vulnerability has been resolved: netfilter: iptables: Fix potential null-ptr-deref in ip
CVE-2024-42268	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix missing lock on sync reset reload C
CVE-2024-42270	In the Linux kernel, the following vulnerability has been resolved: netfilter: iptables: Fix null-ptr-deref in iptable_na
CVE-2024-42271	In the Linux kernel, the following vulnerability has been resolved: net/iucv: fix use after free in iucv_sock_close() iu
CVE-2024-42272	In the Linux kernel, the following vulnerability has been resolved: sched: act_ct: take care of padding in struct zones
CVE-2024-42273	In the Linux kernel, the following vulnerability has been resolved: f2fs: assign CURSEG_ALL_DATA_ATGC if bl
CVE-2024-42274	In the Linux kernel, the following vulnerability has been resolved: Revert "ALSA: firewire-lib: operate for period el
CVE-2024-42276	In the Linux kernel, the following vulnerability has been resolved: nvme-pci: add missing condition check for existe
CVE-2024-42277	In the Linux kernel, the following vulnerability has been resolved: iommu: sprd: Avoid NULL deref in sprd_iommu
CVE-2024-42283	In the Linux kernel, the following vulnerability has been resolved: net: nexthop: Initialize all fields in dumped nexth

CVE-2024-42281	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix a segment issue when downgrading gso_
CVE-2024-42280	In the Linux kernel, the following vulnerability has been resolved: mISDN: Fix a use after free in hfcmulti_tx() Don't
CVE-2024-42284	In the Linux kernel, the following vulnerability has been resolved: tipc: Return non-zero value from tipc_udp_addr2
CVE-2024-42285	In the Linux kernel, the following vulnerability has been resolved: RDMA/iwcm: Fix a use-after-free related to destr
CVE-2024-42288	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix for possible memory corruption
CVE-2024-42286	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: validate nvme_local_port correctly
CVE-2024-42287	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Complete command early within lo
CVE-2024-42289	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: During vport delete send async log
CVE-2024-42290	In the Linux kernel, the following vulnerability has been resolved: irqchip/imx-irqsteer: Handle runtime power mana
CVE-2024-42295	In the Linux kernel, the following vulnerability has been resolved: nilfs2: handle inconsistent state in nilfs_bnode_c
CVE-2024-42292	In the Linux kernel, the following vulnerability has been resolved: kobject_uevent: Fix OOB access within zap_mod
CVE-2024-42291	In the Linux kernel, the following vulnerability has been resolved: ice: Add a per-VF limit on number of FDIR filter
CVE-2024-42296	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix return value of f2fs_convert_inline_inod
CVE-2024-42297	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to don't dirty inode for readonly filesystem
CVE-2024-42299	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Update log->page_{mask,bits} if log->p
CVE-2024-42302	In the Linux kernel, the following vulnerability has been resolved: PCI/DPC: Fix use-after-free on concurrent DPC a
CVE-2024-42301	In the Linux kernel, the following vulnerability has been resolved: dev/parport: fix the array out-of-bounds risk Fixe
CVE-2024-42304	In the Linux kernel, the following vulnerability has been resolved: ext4: make sure the first directory block is not a h
CVE-2024-42305	In the Linux kernel, the following vulnerability has been resolved: ext4: check dot and dotdot of dx_root before mak
CVE-2024-42306	In the Linux kernel, the following vulnerability has been resolved: udf: Avoid using corrupted block bitmap buffer V
CVE-2024-42310	In the Linux kernel, the following vulnerability has been resolved: drm/gma500: fix null pointer dereference in cdv_
CVE-2024-42309	In the Linux kernel, the following vulnerability has been resolved: drm/gma500: fix null pointer dereference in psb_
CVE-2024-42311	In the Linux kernel, the following vulnerability has been resolved: hfs: fix to initialize fields of hfs_inode_info after
CVE-2024-42312	In the Linux kernel, the following vulnerability has been resolved: sysctl: always initialize i_uid/i_gid Always initial
CVE-2024-42313	In the Linux kernel, the following vulnerability has been resolved: media: venus: fix use after free in vdec_close The
CVE-2024-42318	In the Linux kernel, the following vulnerability has been resolved: landlock: Don't lose track of restrictions on cred_
CVE-2024-42315	In the Linux kernel, the following vulnerability has been resolved: exfat: fix potential deadlock on __exfat_get_dentr
CVE-2024-42320	In the Linux kernel, the following vulnerability has been resolved: s390/dasd: fix error checks in dasd_copy_pair_sto
CVE-2024-42319	In the Linux kernel, the following vulnerability has been resolved: mailbox: mtk-cmdq: Move devm_mbox_controlle
CVE-2024-42321	In the Linux kernel, the following vulnerability has been resolved: net: flow_dissector: use DEBUG_NET_WARN_
CVE-2024-42322	In the Linux kernel, the following vulnerability has been resolved: ipv6: properly dereference pe in ip_vs_add_servic
CVE-2024-42367	aiohttp is an asynchronous HTTP client/server framework for asyncio and Python. In versions on the 3.10 branch pri
CVE-2024-42516	HTTP response splitting in the core of Apache HTTP Server allows an attacker who can manipulate the Content-Typ
CVE-2024-43098	In the Linux kernel, the following vulnerability has been resolved: i3c: Use i3cdev->desc->info instead of calling i3c
CVE-2024-43204	SSRF in Apache HTTP Server with mod_proxy loaded allows an attacker to send outbound proxy requests to a URL
CVE-2024-43374	The UNIX editor Vim prior to version 9.1.0678 has a use-after-free error in argument list handling. When adding a n
CVE-2024-43382	Snowflake JDBC driver versions >= 3.2.6 and <= 3.19.1 have an Incorrect Security Setting that can result in data be
CVE-2024-43398	REXML is an XML toolkit for Ruby. The REXML gem before 3.3.6 has a DoS vulnerability when it parses an XML
CVE-2024-43598	LightGBM Remote Code Execution Vulnerability
CVE-2024-43799	Send is a library for streaming files from the file system as a http response. Send passes untrusted user input to Send

CVE-2024-43800	serve-static serves static files. serve-static passes untrusted user input - even after sanitizing it - to redirect() may exe
CVE-2024-43802	Vim is an improved version of the unix vi text editor. When flushing the typeahead buffer, Vim moves the current po
CVE-2024-43805	jupyterlab is an extensible environment for interactive and reproducible computing, based on the Jupyter Notebook A
CVE-2024-43817	In the Linux kernel, the following vulnerability has been resolved: net: missing check virtio Two missing check in vi
CVE-2024-43819	In the Linux kernel, the following vulnerability has been resolved: kvm: s390: Reject memory region operations for
CVE-2024-43823	In the Linux kernel, the following vulnerability has been resolved: PCI: keystone: Fix NULL pointer dereference in
CVE-2024-43821	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix a possible null pointer dereference
CVE-2024-43824	In the Linux kernel, the following vulnerability has been resolved: PCI: endpoint: pci-epf-test: Make use of cached 'e
CVE-2024-43829	In the Linux kernel, the following vulnerability has been resolved: drm/qxl: Add check for drm_cvt_mode Add chec
CVE-2024-43828	In the Linux kernel, the following vulnerability has been resolved: ext4: fix infinite loop when replaying fast_comm
CVE-2024-43830	In the Linux kernel, the following vulnerability has been resolved: leds: trigger: Unregister sysfs attributes before ca
CVE-2024-43831	In the Linux kernel, the following vulnerability has been resolved: media: mediatek: vcodec: Handle invalid decoder
CVE-2024-43832	In the Linux kernel, the following vulnerability has been resolved: s390/uv: Don't call folio_wait_writeback() withou
CVE-2024-43834	In the Linux kernel, the following vulnerability has been resolved: xdp: fix invalid wait context of page_pool_destro
CVE-2024-43839	In the Linux kernel, the following vulnerability has been resolved: bna: adjust 'name' buf size of bna_tcb and bna_cc
CVE-2024-43835	In the Linux kernel, the following vulnerability has been resolved: virtio_net: Fix napi_skb_cache_put warning After
CVE-2024-43841	In the Linux kernel, the following vulnerability has been resolved: wifi: virt_wifi: avoid reporting connection succes
CVE-2024-43842	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: Fix array index mistake in rtw89_sta
CVE-2024-43844	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: wow: fix GTK offload H2C skbuff is
CVE-2024-43846	In the Linux kernel, the following vulnerability has been resolved: lib: objagg: Fix general protection fault The libr
CVE-2024-43849	In the Linux kernel, the following vulnerability has been resolved: soc: qcom: pdr: protect locator_addr with the mai
CVE-2024-43853	In the Linux kernel, the following vulnerability has been resolved: cgroup/cpuset: Prevent UAF in proc_cpuset_show
CVE-2024-43854	In the Linux kernel, the following vulnerability has been resolved: block: initialize integrity buffer to zero before wr
CVE-2024-43856	In the Linux kernel, the following vulnerability has been resolved: dma: fix call order in dmam_free_coherent dmam
CVE-2024-43860	In the Linux kernel, the following vulnerability has been resolved: remoteproc: imx_rproc: Skip over memory region
CVE-2024-43858	In the Linux kernel, the following vulnerability has been resolved: jfs: Fix array-index-out-of-bounds in diFree
CVE-2024-43861	In the Linux kernel, the following vulnerability has been resolved: net: usb: qmi_wwan: fix memory leak for not ip p
CVE-2024-43863	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Fix a deadlock in dma buf fence po
CVE-2024-43866	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Always drain health in shutdown callba
CVE-2024-43867	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau: prime: fix refcount underflow Calli
CVE-2024-43869	In the Linux kernel, the following vulnerability has been resolved: perf: Fix event leak upon exec and file release Th
CVE-2024-43870	In the Linux kernel, the following vulnerability has been resolved: perf: Fix event leak upon exit When a task is sche
CVE-2024-43871	In the Linux kernel, the following vulnerability has been resolved: devres: Fix memory leakage caused by driver AP
CVE-2024-43872	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix soft lockup under heavy CEQE l
CVE-2024-43875	In the Linux kernel, the following vulnerability has been resolved: PCI: endpoint: Clean up error handling in vpci_sc
CVE-2024-43873	In the Linux kernel, the following vulnerability has been resolved: vhost/vsock: always initialize seqpacket_allow TL
CVE-2024-43879	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: handle 2x996 RU allocation in cf
CVE-2024-43880	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_acl_erp: Fix object nesting war
CVE-2024-43882	In the Linux kernel, the following vulnerability has been resolved: exec: Fix ToCToU between perm check and set-u
CVE-2024-43883	In the Linux kernel, the following vulnerability has been resolved: usb: vhci-hcd: Do not drop references before new

CVE-2024-43884	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: MGMT: Add error handling to pair_de
CVE-2024-43889	In the Linux kernel, the following vulnerability has been resolved: padata: Fix possible divide-by-0 panic in padata_
CVE-2024-43890	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix overflow in get_free_elt() "tracing_m
CVE-2024-43892	In the Linux kernel, the following vulnerability has been resolved: memcg: protect concurrent access to mem_cgrou
CVE-2024-43893	In the Linux kernel, the following vulnerability has been resolved: serial: core: check uartclk for zero to avoid divide
CVE-2024-43894	In the Linux kernel, the following vulnerability has been resolved: drm/client: fix null pointer dereference in drm_cli
CVE-2024-43898	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-43899	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix null pointer deref in dcn20_
CVE-2024-43900	In the Linux kernel, the following vulnerability has been resolved: media: xc2028: avoid use-after-free in load_firmw
CVE-2024-43902	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null checker before passing
CVE-2024-43904	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null checks for 'stream' and
CVE-2024-43905	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Fix the null pointer dereference for
CVE-2024-43907	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu/pm: Fix the null pointer dereference
CVE-2024-43906	In the Linux kernel, the following vulnerability has been resolved: drm/admgpu: fix dereferencing null pointer conte
CVE-2024-43908	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix the null pointer dereference to n
CVE-2024-43909	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu/pm: Fix the null pointer dereference
CVE-2024-43910	In the Linux kernel, the following vulnerability has been resolved: bpf: add missing check_func_arg_reg_off() to pre
CVE-2024-43911	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix NULL dereference at band cl
CVE-2024-43912	In the Linux kernel, the following vulnerability has been resolved: wifi: nl80211: disallow setting special AP channel
CVE-2024-43914	In the Linux kernel, the following vulnerability has been resolved: md/raid5: avoid BUG_ON() while continue resha
CVE-2024-44931	In the Linux kernel, the following vulnerability has been resolved: gpio: prevent potential speculation leaks in gpio_
CVE-2024-44932	In the Linux kernel, the following vulnerability has been resolved: idpf: fix UAFs when destroying the queues The s
CVE-2024-44935	In the Linux kernel, the following vulnerability has been resolved: sctp: Fix null-ptr-deref in reuseport_add_sock(). s
CVE-2024-44938	In the Linux kernel, the following vulnerability has been resolved: jfs: Fix shift-out-of-bounds in dbDiscardAG Whe
CVE-2024-44934	In the Linux kernel, the following vulnerability has been resolved: net: bridge: mcast: wait for previous gc cycles wh
CVE-2024-44939	In the Linux kernel, the following vulnerability has been resolved: jfs: fix null ptr deref in dtInsertEntry [syzbot repo
CVE-2024-44940	In the Linux kernel, the following vulnerability has been resolved: fou: remove warn in gue_gro_receive on unsuppo
CVE-2024-44942	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to do sanity check on F2FS_INLINE_DA
CVE-2024-44947	In the Linux kernel, the following vulnerability has been resolved: fuse: Initialize beyond-EOF page contents before
CVE-2024-44944	In the Linux kernel, the following vulnerability has been resolved: netfilter: ctnetlink: use helper function to calculat
CVE-2024-44948	In the Linux kernel, the following vulnerability has been resolved: x86/mtrr: Check if fixed MTRRs exist before sav
CVE-2024-44946	In the Linux kernel, the following vulnerability has been resolved: kcm: Serialise kcm_sendmsg() for the same socke
CVE-2024-44950	In the Linux kernel, the following vulnerability has been resolved: serial: sc16is7xx: fix invalid FIFO access with sp
CVE-2024-44954	In the Linux kernel, the following vulnerability has been resolved: ALSA: line6: Fix racy access to midibuf There ca
CVE-2024-44951	In the Linux kernel, the following vulnerability has been resolved: serial: sc16is7xx: fix TX fifo corruption Sometim
CVE-2024-44957	In the Linux kernel, the following vulnerability has been resolved: xen: privcmd: Switch from mutex to spinlock for
CVE-2024-44952	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-44958	In the Linux kernel, the following vulnerability has been resolved: sched/smt: Fix unbalance sched_smt_present decr
CVE-2024-44961	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Forward soft recovery errors to use
CVE-2024-44960	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: core: Check for unset descriptor Mak

CVE-2024-44963	In the Linux kernel, the following vulnerability has been resolved: btrfs: do not BUG_ON() when freeing tree block
CVE-2024-44962	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btmxpurt: Shutdown timer and preven
CVE-2024-44964	In the Linux kernel, the following vulnerability has been resolved: idpf: fix memory leaks and crashes while perform
CVE-2024-44966	In the Linux kernel, the following vulnerability has been resolved: binfmt_flat: Fix corruption when not offsetting da
CVE-2024-44965	In the Linux kernel, the following vulnerability has been resolved: x86/mm: Fix pti_clone_pgtable() alignment assur
CVE-2024-44967	In the Linux kernel, the following vulnerability has been resolved: drm/mgag200: Bind I2C lifetime to DRM device
CVE-2024-44969	In the Linux kernel, the following vulnerability has been resolved: s390/sclp: Prevent release of buffer in I/O When a
CVE-2024-44971	In the Linux kernel, the following vulnerability has been resolved: net: dsa: bcm_sf2: Fix a possible memory leak in
CVE-2024-44970	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: SHAMPO, Fix invalid WQ linked list
CVE-2024-44972	In the Linux kernel, the following vulnerability has been resolved: btrfs: do not clear page dirty inside extent_write_
CVE-2024-44977	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Validate TA binary size Add TA bi
CVE-2024-44974	In the Linux kernel, the following vulnerability has been resolved: mptcp: pm: avoid possible UaF when selecting en
CVE-2024-44982	In the Linux kernel, the following vulnerability has been resolved: drm/msm/dpu: cleanup FB if dpu_format_popular
CVE-2024-44983	In the Linux kernel, the following vulnerability has been resolved: netfilter: flowtable: validate vlan header Ensure th
CVE-2024-44985	In the Linux kernel, the following vulnerability has been resolved: ipv6: prevent possible UAF in ip6_xmit() If skb_
CVE-2024-44986	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix possible UAF in ip6_finish_output2() If
CVE-2024-44987	In the Linux kernel, the following vulnerability has been resolved: ipv6: prevent UAF in ip6_send_skb() syzbot repo
CVE-2024-44988	In the Linux kernel, the following vulnerability has been resolved: net: dsa: mv88e6xxx: Fix out-of-bound access If a
CVE-2024-44989	In the Linux kernel, the following vulnerability has been resolved: bonding: fix xfrm real_dev null pointer dereferen
CVE-2024-44990	In the Linux kernel, the following vulnerability has been resolved: bonding: fix null pointer deref in bond_ipsec_offl
CVE-2024-44998	In the Linux kernel, the following vulnerability has been resolved: atm: idt77252: prevent use after free in dequeue_
CVE-2024-44995	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fix a deadlock problem when config TC
CVE-2024-44999	In the Linux kernel, the following vulnerability has been resolved: gtp: pull network headers in gtp_dev_xmit() syzb
CVE-2024-45001	In the Linux kernel, the following vulnerability has been resolved: net: mana: Fix RX buf alloc_size alignment and a
CVE-2024-45003	In the Linux kernel, the following vulnerability has been resolved: vfs: Don't evict inode under the inode lru traversi
CVE-2024-45005	In the Linux kernel, the following vulnerability has been resolved: KVM: s390: fix validity interception issue when g
CVE-2024-45006	In the Linux kernel, the following vulnerability has been resolved: xhci: Fix Panther point NULL pointer deref at full
CVE-2024-45007	In the Linux kernel, the following vulnerability has been resolved: char: xillybus: Don't destroy workqueue from wor
CVE-2024-45008	In the Linux kernel, the following vulnerability has been resolved: Input: MT - limit max slots syzbot is reporting too
CVE-2024-45009	In the Linux kernel, the following vulnerability has been resolved: mptcp: pm: only decrement add_addr_accepted fo
CVE-2024-45011	In the Linux kernel, the following vulnerability has been resolved: char: xillybus: Check USB endpoints when probin
CVE-2024-45010	In the Linux kernel, the following vulnerability has been resolved: mptcp: pm: only mark 'subflow' endp as available
CVE-2024-45012	In the Linux kernel, the following vulnerability has been resolved: nouveau/firmware: use dma non-coherent allocato
CVE-2024-45015	In the Linux kernel, the following vulnerability has been resolved: drm/msm/dpu: move dpu_encoder's connector ass
CVE-2024-45016	In the Linux kernel, the following vulnerability has been resolved: netem: fix return value if duplicate enqueue fails
CVE-2024-45018	In the Linux kernel, the following vulnerability has been resolved: netfilter: flowtable: initialise extack before use Fi
CVE-2024-45019	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Take state lock during tx timeout repo
CVE-2024-45021	In the Linux kernel, the following vulnerability has been resolved: memcg_write_event_control(): fix a user-triggera
CVE-2024-45025	In the Linux kernel, the following vulnerability has been resolved: fix bitmap corruption on close_range() with CLO
CVE-2024-45026	In the Linux kernel, the following vulnerability has been resolved: s390/dasd: fix error recovery leading to data corru

CVE-2024-45028	In the Linux kernel, the following vulnerability has been resolved: mmc: mmc_test: Fix NULL dereference on allocat
CVE-2024-45033	Insufficient Session Expiration vulnerability in Apache Airflow Fab Provider. This issue affects Apache Airflow Fab
CVE-2024-45231	An issue was discovered in Django v5.1.1, v5.0.9, and v4.2.16. The django.contrib.auth.forms.PasswordResetForm c
CVE-2024-45296	path-to-regexp turns path strings into a regular expressions. In certain cases, path-to-regexp will output a regular exp
CVE-2024-45306	Vim is an open source, command line text editor. Patch v9.1.0038 optimized how the cursor position is calculated an
CVE-2024-45310	runc is a CLI tool for spawning and running containers according to the OCI specification. runc 1.1.13 and earlier, as
CVE-2024-45336	The HTTP client drops sensitive headers after following a cross-domain redirect. For example, a request to a.com/ co
CVE-2024-45337	Applications and libraries which misuse connection.serverAuthenticate (via callback field ServerConfig.PublicKeyC
CVE-2024-45338	An attacker can craft an input to the Parse functions that would be processed non-linearly with respect to its length, r
CVE-2024-45339	When logs are written to a widely-writable directory (the default), an unprivileged attacker may predict a privileged
CVE-2024-45341	A certificate with a URI which has a IPv6 address with a zone ID may incorrectly satisfy a URI name constraint that
CVE-2024-45490	An issue was discovered in libexpat before 2.6.3. xmlparse.c does not reject a negative length for XML_ParseBuffer
CVE-2024-45491	An issue was discovered in libexpat before 2.6.3. dtdCopy in xmlparse.c can have an integer overflow for nDefaultA
CVE-2024-45492	An issue was discovered in libexpat before 2.6.3. nextScaffoldPart in xmlparse.c can have an integer overflow for m
CVE-2024-45828	In the Linux kernel, the following vulnerability has been resolved: i3c: mipi-i3c-hci: Mask ring interrupts before ring
CVE-2024-4603	Issue summary: Checking excessively long DSA keys or parameters may be very slow. Impact summary: Application
CVE-2024-46672	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmfmac: cfg80211: Handle SSID based pr
CVE-2024-46673	In the Linux kernel, the following vulnerability has been resolved: scsi: aacraid: Fix double-free on probe failure aac
CVE-2024-46675	In the Linux kernel, the following vulnerability has been resolved: usb: dwc3: core: Prevent USB core invalid event
CVE-2024-46676	In the Linux kernel, the following vulnerability has been resolved: nfc: pn533: Add poll mod list filling check In cas
CVE-2024-46677	In the Linux kernel, the following vulnerability has been resolved: gtp: fix a potential NULL pointer dereference Wh
CVE-2024-46678	In the Linux kernel, the following vulnerability has been resolved: bonding: change ipsec_lock from spin lock to mu
CVE-2024-46679	In the Linux kernel, the following vulnerability has been resolved: ethtool: check device is present when getting link
CVE-2024-46681	In the Linux kernel, the following vulnerability has been resolved: pktgen: use cpus_read_lock() in pg_net_init() I ha
CVE-2024-46685	In the Linux kernel, the following vulnerability has been resolved: pinctrl: single: fix potential NULL dereference in
CVE-2024-46689	In the Linux kernel, the following vulnerability has been resolved: soc: qcom: cmd-db: Map shared memory as WC,
CVE-2024-46695	In the Linux kernel, the following vulnerability has been resolved: selinux,smack: don't bypass permissions check in
CVE-2024-46702	In the Linux kernel, the following vulnerability has been resolved: thunderbolt: Mark XDomain as unplugged when
CVE-2024-46705	In the Linux kernel, the following vulnerability has been resolved: drm/xe: reset mmio mappings with devm Set our
CVE-2024-46707	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Make ICC_*SGI*_EL1 undef in th
CVE-2024-46710	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: Prevent unmapping active read buf
CVE-2024-46713	In the Linux kernel, the following vulnerability has been resolved: perf/aux: Fix AUX buffer serialization Ole report
CVE-2024-46714	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Skip wbscl_set_scaler_filter if
CVE-2024-46715	In the Linux kernel, the following vulnerability has been resolved: driver: iio: add missing checks on iio_info's callb
CVE-2024-46716	In the Linux kernel, the following vulnerability has been resolved: dmaengine: altera-msgdma: properly free descrip
CVE-2024-46718	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Don't overmap identity VRAM mapping
CVE-2024-46717	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: SHAMPO, Fix incorrect page release
CVE-2024-46719	In the Linux kernel, the following vulnerability has been resolved: usb: typec: ucsi: Fix null pointer dereference in tr
CVE-2024-46720	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix dereference after null check che
CVE-2024-46721	In the Linux kernel, the following vulnerability has been resolved: apparmor: fix possible NULL pointer dereference

CVE-2024-46722	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix mc_data out-of-bounds read warning
CVE-2024-46723	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix ucode out-of-bounds read warning
CVE-2024-46724	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix out-of-bounds read of df_v1_7_0
CVE-2024-46725	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix out-of-bounds write warning Cl
CVE-2024-46726	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Ensure index calculation will n
CVE-2024-46727	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add otg_master NULL check v
CVE-2024-46728	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check index for aux_rd_interv
CVE-2024-46729	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix incorrect size calculation fo
CVE-2024-46730	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Ensure array index tg_inst won
CVE-2024-46731	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: fix the Out-of-bounds read warning
CVE-2024-46732	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Assign linear_pitch_alignment
CVE-2024-46733	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix qgroup reserve leaks in cow_file_range
CVE-2024-46737	In the Linux kernel, the following vulnerability has been resolved: nvmet-tcp: fix kernel crash if commands allocatio
CVE-2024-46738	In the Linux kernel, the following vulnerability has been resolved: VMCI: Fix use-after-free when removing resource
CVE-2024-46739	In the Linux kernel, the following vulnerability has been resolved: uio_hv_generic: Fix kernel NULL pointer derefer
CVE-2024-46740	In the Linux kernel, the following vulnerability has been resolved: binder: fix UAF caused by offsets overwrite Bind
CVE-2024-46742	In the Linux kernel, the following vulnerability has been resolved: smb/server: fix potential null-ptr-deref of lease_c
CVE-2024-46743	In the Linux kernel, the following vulnerability has been resolved: of/irq: Prevent device address out-of-bounds read
CVE-2024-46744	In the Linux kernel, the following vulnerability has been resolved: Squashfs: sanity check symbolic link size Syzkill
CVE-2024-46745	In the Linux kernel, the following vulnerability has been resolved: Input: uinput - reject requests with unreasonable r
CVE-2024-46746	In the Linux kernel, the following vulnerability has been resolved: HID: amd_sfh: free driver_data after destroying h
CVE-2024-46747	In the Linux kernel, the following vulnerability has been resolved: HID: cougar: fix slab-out-of-bounds Read in coug
CVE-2024-46748	In the Linux kernel, the following vulnerability has been resolved: cachefiles: Set the max subreq size for cache writ
CVE-2024-46749	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btmxpuart: Fix Null pointer dereferenc
CVE-2024-46752	In the Linux kernel, the following vulnerability has been resolved: btrfs: replace BUG_ON() with error handling at u
CVE-2024-46750	In the Linux kernel, the following vulnerability has been resolved: PCI: Add missing bridge lock to pci_bus_lock() C
CVE-2024-46753	In the Linux kernel, the following vulnerability has been resolved: btrfs: handle errors from btrfs_dec_ref() properly
CVE-2024-46754	In the Linux kernel, the following vulnerability has been resolved: bpf: Remove tst_run from lwt_seg6local_prog_op
CVE-2024-46755	In the Linux kernel, the following vulnerability has been resolved: wifi: mwifiex: Do not return unused priv in mwifi
CVE-2024-46758	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-46756	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-46759	In the Linux kernel, the following vulnerability has been resolved: hwmon: (adc128d818) Fix underflows seen when
CVE-2024-46760	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw88: usb: schedule rx work after everything
CVE-2024-46761	In the Linux kernel, the following vulnerability has been resolved: pci/hotplug/pnv_php: Fix hotplug driver crash on
CVE-2024-46762	In the Linux kernel, the following vulnerability has been resolved: xen: privcmd: Fix possible access to a freed kirqf
CVE-2024-46763	In the Linux kernel, the following vulnerability has been resolved: fou: Fix null-ptr-deref in GRO. We observed a nu
CVE-2024-46765	In the Linux kernel, the following vulnerability has been resolved: ice: protect XDP configuration with a mutex The
CVE-2024-46770	In the Linux kernel, the following vulnerability has been resolved: ice: Add netif_device_attach/detach into PF reset
CVE-2024-46771	In the Linux kernel, the following vulnerability has been resolved: can: bcm: Remove proc entry when dev is unregist
CVE-2024-46774	In the Linux kernel, the following vulnerability has been resolved: powerpc/rtas: Prevent Spectre v1 gadget construct

CVE-2024-46775	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Validate function returns [WHA
CVE-2024-46777	In the Linux kernel, the following vulnerability has been resolved: udf: Avoid excessive partition lengths Avoid mou
CVE-2024-46778	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check UnboundedRequestEnab
CVE-2024-46780	In the Linux kernel, the following vulnerability has been resolved: nilfs2: protect references to superblock parameter
CVE-2024-46781	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix missing cleanup on rollforward recover
CVE-2024-46782	In the Linux kernel, the following vulnerability has been resolved: ila: call nf_unregister_net_hooks() sooner syzbot
CVE-2024-46783	In the Linux kernel, the following vulnerability has been resolved: tcp_bpf: fix return value of tcp_bpf_sendmsg() W
CVE-2024-46784	In the Linux kernel, the following vulnerability has been resolved: net: mana: Fix error handling in mana_create_txq
CVE-2024-46787	In the Linux kernel, the following vulnerability has been resolved: userfaultfd: fix checks for huge PMDs Patch serie
CVE-2024-46788	In the Linux kernel, the following vulnerability has been resolved: tracing/osnoise: Use a cpumask to know what thr
CVE-2024-46791	In the Linux kernel, the following vulnerability has been resolved: can: mcp251x: fix deadlock if an interrupt occurs
CVE-2024-46794	In the Linux kernel, the following vulnerability has been resolved: x86/tdx: Fix data leak in mmio_read() The mmio
CVE-2024-46795	In the Linux kernel, the following vulnerability has been resolved: ksmbd: unset the binding mark of a reused connec
CVE-2024-46798	In the Linux kernel, the following vulnerability has been resolved: ASoC: dapm: Fix UAF for snd_soc_pcm_runtime
CVE-2024-46800	In the Linux kernel, the following vulnerability has been resolved: sch/netem: fix use after free in netem_dequeue If
CVE-2024-46802	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: added NULL check at start of d
CVE-2024-46803	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Check debug trap enable before wri
CVE-2024-46804	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add array index check for hdcp
CVE-2024-46805	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix the waring dereferencing hive C
CVE-2024-46806	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix the warning division or modulor
CVE-2024-46807	In the Linux kernel, the following vulnerability has been resolved: drm/amd/amdgpu: Check tbo resource pointer Va
CVE-2024-46808	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add missing NULL pointer che
CVE-2024-46809	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check BIOS images before it is
CVE-2024-46810	In the Linux kernel, the following vulnerability has been resolved: drm/bridge: tc358767: Check if fully initialized b
CVE-2024-46811	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix index may exceed array ran
CVE-2024-46812	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Skip inactive planes within Mo
CVE-2024-46814	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check msg_id before processin
CVE-2024-46813	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check link_index before access
CVE-2024-46815	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check num_valid_sets before a
CVE-2024-46817	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Stop amdgpu_dm initialize whe
CVE-2024-46818	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check gpio_id before used as a
CVE-2024-46820	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu/vcn: remove irq disabling in vcn 5 s
CVE-2024-46819	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: the warning dereferencing obj for n
CVE-2024-46821	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Fix negative array index read Avoi
CVE-2024-46822	In the Linux kernel, the following vulnerability has been resolved: arm64: acpi: Harden get_cpu_for_acpi_id() again
CVE-2024-46823	In the Linux kernel, the following vulnerability has been resolved: kunit/overflow: Fix UB in overflow_allocation_te
CVE-2024-46825	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlmwifi: mvmm: use IWL_FW_CHECK for li
CVE-2024-46826	In the Linux kernel, the following vulnerability has been resolved: ELF: fix kernel.randomize_va_space double read
CVE-2024-46827	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix firmware crash due to invalid pe
CVE-2024-46828	In the Linux kernel, the following vulnerability has been resolved: sched: sch_cake: fix bulk flow accounting logic f

CVE-2024-46829	In the Linux kernel, the following vulnerability has been resolved: rtmutex: Drop rt_mutex::wait_lock before schedu
CVE-2024-46830	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Acquire kvm->srcu when handling K
CVE-2024-46832	In the Linux kernel, the following vulnerability has been resolved: MIPS: cevt-r4k: Don't call get_c0_compare_int if
CVE-2024-46833	In the Linux kernel, the following vulnerability has been resolved: net: hns3: void array out of bound when loop tnl_
CVE-2024-46834	In the Linux kernel, the following vulnerability has been resolved: ethtool: fail closed if we can't get max channel us
CVE-2024-46835	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix smatch static checker warning a
CVE-2024-46836	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: aspeed_udc: validate endpoint index
CVE-2024-46839	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-46840	In the Linux kernel, the following vulnerability has been resolved: btrfs: clean up our handling of refs == 0 in snaps
CVE-2024-46841	In the Linux kernel, the following vulnerability has been resolved: btrfs: don't BUG_ON on ENOMEM from btrfs_lo
CVE-2024-46842	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Handle mailbox timeouts in lpfc_get_st
CVE-2024-46844	In the Linux kernel, the following vulnerability has been resolved: um: line: always fill *error_out in setup_one_line
CVE-2024-46843	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Remove SCSI host only if added I
CVE-2024-46845	In the Linux kernel, the following vulnerability has been resolved: tracing/timerlat: Only clear timer if a kthread exists
CVE-2024-46848	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel: Limit the period on Haswell Runni
CVE-2024-46849	In the Linux kernel, the following vulnerability has been resolved: ASoC: meson: axg-card: fix 'use-after-free' Buffer
CVE-2024-46852	In the Linux kernel, the following vulnerability has been resolved: dma-buf: heaps: Fix off-by-one in CMA heap fault
CVE-2024-46853	In the Linux kernel, the following vulnerability has been resolved: spi: nxp-fspi: fix the KASAN report out-of-bound
CVE-2024-46854	In the Linux kernel, the following vulnerability has been resolved: net: dpaa: Pad packets to ETH_ZLEN When send
CVE-2024-46855	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_socket: fix sk refcount leaks We mus
CVE-2024-46857	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix bridge mode operations when there
CVE-2024-46858	In the Linux kernel, the following vulnerability has been resolved: mptcp: pm: Fix uaf in __timer_delete_sync There
CVE-2024-46859	In the Linux kernel, the following vulnerability has been resolved: platform/x86: panasonic-laptop: Fix SINF array o
CVE-2024-46860	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7921: fix NULL pointer access in m
CVE-2024-46864	In the Linux kernel, the following vulnerability has been resolved: x86/hyperv: fix kexec crash due to VP assist page
CVE-2024-46861	In the Linux kernel, the following vulnerability has been resolved: usbnet: ipheth: do not stop RX on failing RX call
CVE-2024-46870	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Disable DMCUB timeout for D
CVE-2024-46865	In the Linux kernel, the following vulnerability has been resolved: fou: fix initialization of grc The grc must be initial
CVE-2024-46871	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Correct the defined value for A
CVE-2024-47081	Requests is a HTTP library. Due to a URL parsing issue, Requests releases prior to 2.32.4 may leak .netrc credential
CVE-2024-47141	In the Linux kernel, the following vulnerability has been resolved: pinmux: Use sequential access to access desc->pi
CVE-2024-47143	In the Linux kernel, the following vulnerability has been resolved: dma-debug: fix a possible deadlock on radix_lock
CVE-2024-47175	CUPS is a standards-based, open-source printing system, and `libppd` can be used for legacy PPD file support. The
CVE-2024-47220	An issue was discovered in the WEBrick toolkit through 1.8.1 for Ruby. It allows HTTP request smuggling by provi
CVE-2024-47252	Insufficient escaping of user-supplied data in mod_ssl in Apache HTTP Server 2.4.63 and earlier allows an untrusted
CVE-2024-47408	In the Linux kernel, the following vulnerability has been resolved: net/smc: check smcd_v2_ext_offset when receivi
CVE-2024-47535	Netty is an asynchronous event-driven network application framework for rapid development of maintainable high p
CVE-2024-4741	Issue summary: Calling the OpenSSL API function SSL_free_buffers may cause memory to be accessed that was pr
CVE-2024-47554	Uncontrolled Resource Consumption vulnerability in Apache Commons IO. The org.apache.commons.io.input.XmlIS
CVE-2024-47561	Schema parsing in the Java SDK of Apache Avro 1.11.3 and previous versions allows bad actors to execute arbitrary

CVE-2024-47658	In the Linux kernel, the following vulnerability has been resolved: crypto: stm32/cryp - call finalize with bh disabled
CVE-2024-47659	In the Linux kernel, the following vulnerability has been resolved: smack: tcp: ipv4, fix incorrect labeling Currently,
CVE-2024-47660	In the Linux kernel, the following vulnerability has been resolved: fsnotify: clear PARENT_WATCHED flags lazily
CVE-2024-47661	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Avoid overflow from uint32_t
CVE-2024-47662	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Remove register from DCN35
CVE-2024-47663	In the Linux kernel, the following vulnerability has been resolved: staging: iio: frequency: ad9834: Validate frequen
CVE-2024-47664	In the Linux kernel, the following vulnerability has been resolved: spi: hisi-kunpeng: Add verification for the max_f
CVE-2024-47665	In the Linux kernel, the following vulnerability has been resolved: i3c: mipi-i3c-hci: Error out instead on BUG_ON
CVE-2024-47667	In the Linux kernel, the following vulnerability has been resolved: PCI: keystone: Add workaround for Errata #1203
CVE-2024-47666	In the Linux kernel, the following vulnerability has been resolved: scsi: pm80xx: Set phy->enable_completion only
CVE-2024-47668	In the Linux kernel, the following vulnerability has been resolved: lib/generic-radix-tree.c: Fix rare race in __genrad
CVE-2024-47669	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix state management in error path of log v
CVE-2024-47670	In the Linux kernel, the following vulnerability has been resolved: ocfs2: add bounds checking to ocfs2_xattr_find_e
CVE-2024-47671	In the Linux kernel, the following vulnerability has been resolved: USB: usbtmc: prevent kernel-usb-infoleak The sy
CVE-2024-47672	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: don't wait for tx queues if fir
CVE-2024-47673	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: pause TCM when the firmwa
CVE-2024-47674	In the Linux kernel, the following vulnerability has been resolved: mm: avoid leaving partial pfn mappings around in
CVE-2024-47675	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix use-after-free in bpf_uprobe_multi_link_
CVE-2024-47677	In the Linux kernel, the following vulnerability has been resolved: exfat: resolve memory leak from exfat_create_up
CVE-2024-47678	In the Linux kernel, the following vulnerability has been resolved: icmp: change the order of rate limits ICMP messa
CVE-2024-47679	In the Linux kernel, the following vulnerability has been resolved: vfs: fix race between evic_inodes() and find_ino
CVE-2024-47681	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7996: fix NULL pointer dereferenc
CVE-2024-47682	In the Linux kernel, the following vulnerability has been resolved: scsi: sd: Fix off-by-one error in sd_read_block_cl
CVE-2024-47684	In the Linux kernel, the following vulnerability has been resolved: tcp: check skb is non-NULL in tcp_rto_delta_us
CVE-2024-47683	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Skip Recompute DSC Params i
CVE-2024-47686	In the Linux kernel, the following vulnerability has been resolved: ep93xx: clock: Fix off by one in ep93xx_div_reca
CVE-2024-47685	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_reject_ipv6: fix nf_reject_ip6_tcpdr
CVE-2024-47687	In the Linux kernel, the following vulnerability has been resolved: vdpa/mlx5: Fix invalid mr resource destroy Certai
CVE-2024-47688	In the Linux kernel, the following vulnerability has been resolved: driver core: Fix a potential null-ptr-deref in modu
CVE-2024-47689	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to don't set SB_RDONLY in f2fs_handle
CVE-2024-47690	In the Linux kernel, the following vulnerability has been resolved: f2fs: get rid of online repaire on corrupted directo
CVE-2024-47691	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to avoid use-after-free in f2fs_stop_gc_th
CVE-2024-47692	In the Linux kernel, the following vulnerability has been resolved: nfsd: return -EINVAL when namelen is 0 When v
CVE-2024-47693	In the Linux kernel, the following vulnerability has been resolved: IB/core: Fix ib_cache_setup_one error flow clean
CVE-2024-47695	In the Linux kernel, the following vulnerability has been resolved: RDMA/rtrs-clt: Reset cid to con_num - 1 to stay i
CVE-2024-47697	In the Linux kernel, the following vulnerability has been resolved: drivers: media: dvb-frontends/rtl2830: fix an out-
CVE-2024-47696	In the Linux kernel, the following vulnerability has been resolved: RDMA/iwcm: Fix WARNING:at_kernel/workqu
CVE-2024-47698	In the Linux kernel, the following vulnerability has been resolved: drivers: media: dvb-frontends/rtl2832: fix an out-
CVE-2024-47699	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix potential null-ptr-deref in nilfs_btree_in
CVE-2024-47700	In the Linux kernel, the following vulnerability has been resolved: ext4: check stripe size compatibility on remount a

CVE-2024-47701	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid OOB when system.data xattr changes
CVE-2024-47702	In the Linux kernel, the following vulnerability has been resolved: bpf: Fail verification for sign-extension of packet
CVE-2024-47703	In the Linux kernel, the following vulnerability has been resolved: bpf, lsm: Add check for BPF LSM return value A
CVE-2024-47704	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check link_res->hpo_dp_link_
CVE-2024-47705	In the Linux kernel, the following vulnerability has been resolved: block: fix potential invalid pointer dereference in
CVE-2024-47706	In the Linux kernel, the following vulnerability has been resolved: block, bfq: fix possible UAF for bfqq->bic with m
CVE-2024-47707	In the Linux kernel, the following vulnerability has been resolved: ipv6: avoid possible NULL deref in rt6_uncached
CVE-2024-47709	In the Linux kernel, the following vulnerability has been resolved: can: bcm: Clear bo->bcm_proc_read after remove
CVE-2024-47710	In the Linux kernel, the following vulnerability has been resolved: sock_map: Add a cond_resched() in sock_hash_f
CVE-2024-47711	In the Linux kernel, the following vulnerability has been resolved: af_unix: Don't return OOB skb in manage_oob().
CVE-2024-47712	In the Linux kernel, the following vulnerability has been resolved: wifi: wilc1000: fix potential RCU dereference iss
CVE-2024-47713	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: use two-phase skb reclamation in
CVE-2024-47714	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7996: use hweight16 to get correct
CVE-2024-47715	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7915: fix oops on non-dbdc mt7980
CVE-2024-47716	In the Linux kernel, the following vulnerability has been resolved: ARM: 9410/1: vfp: Use asm volatile in fmxr/fmxr
CVE-2024-47719	In the Linux kernel, the following vulnerability has been resolved: iommufd: Protect against overflow of ALIGN() d
CVE-2024-47718	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw88: always wait for both firmware loadin
CVE-2024-47720	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null check for set_output_
CVE-2024-47723	In the Linux kernel, the following vulnerability has been resolved: jfs: fix out-of-bounds in dbNextAG() and diAlloc
CVE-2024-47726	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to wait dio completion It should wait all
CVE-2024-47727	In the Linux kernel, the following vulnerability has been resolved: x86/tdx: Fix "in-kernel MMIO" check TDX only
CVE-2024-47728	In the Linux kernel, the following vulnerability has been resolved: bpf: Zero former ARG_PTR_TO_{LONG,INT} &
CVE-2024-47729	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Use reserved copy engine for user binds
CVE-2024-47730	In the Linux kernel, the following vulnerability has been resolved: crypto: hisilicon/qm - inject error before stopping
CVE-2024-47731	In the Linux kernel, the following vulnerability has been resolved: drivers/perf: Fix ali_drw_pmu driver interrupt sta
CVE-2024-47732	In the Linux kernel, the following vulnerability has been resolved: crypto: iaa - Fix potential use after free bug The f
CVE-2024-47733	In the Linux kernel, the following vulnerability has been resolved: netfs: Delete subtree of 'fs/netfs' when netfs modu
CVE-2024-47735	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix spin_unlock_irqrestore() called v
CVE-2024-47734	In the Linux kernel, the following vulnerability has been resolved: bonding: Fix unnecessary warnings and logs from
CVE-2024-47736	In the Linux kernel, the following vulnerability has been resolved: erofs: handle overlapped pclusters out of crafted i
CVE-2024-47737	In the Linux kernel, the following vulnerability has been resolved: nfsd: call cache_put if xdr_reserve_space returns
CVE-2024-47738	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: don't use rate mask for offchanne
CVE-2024-47739	In the Linux kernel, the following vulnerability has been resolved: padata: use integer wrap around to prevent deadlo
CVE-2024-47740	In the Linux kernel, the following vulnerability has been resolved: f2fs: Require FMODE_WRITE for atomic write i
CVE-2024-47741	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix race setting file private on concurrent lse
CVE-2024-47742	In the Linux kernel, the following vulnerability has been resolved: firmware_loader: Block path traversal Most firmv
CVE-2024-47743	In the Linux kernel, the following vulnerability has been resolved: KEYS: prevent NULL pointer dereference in find
CVE-2024-47745	In the Linux kernel, the following vulnerability has been resolved: mm: call the security_mmap_file() LSM hook in
CVE-2024-47744	In the Linux kernel, the following vulnerability has been resolved: KVM: Use dedicated mutex to protect kvm_usag
CVE-2024-47747	In the Linux kernel, the following vulnerability has been resolved: net: seq: Fix use after free vulnerability in ether3

CVE-2024-47749	In the Linux kernel, the following vulnerability has been resolved: RDMA/cxgb4: Added NULL check for lookup_a
CVE-2024-47748	In the Linux kernel, the following vulnerability has been resolved: vhost_vdpa: assign irq bypass producer token cor
CVE-2024-47750	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix Use-After-Free of rsv_qp on HIB
CVE-2024-47751	In the Linux kernel, the following vulnerability has been resolved: PCI: kirin: Fix buffer overflow in kirin_pcie_pars
CVE-2024-47752	In the Linux kernel, the following vulnerability has been resolved: media: mediatek: vcodec: Fix H264 stateless deco
CVE-2024-47753	In the Linux kernel, the following vulnerability has been resolved: media: mediatek: vcodec: Fix VP8 stateless deco
CVE-2024-47754	In the Linux kernel, the following vulnerability has been resolved: media: mediatek: vcodec: Fix H264 multi stateles
CVE-2024-47756	In the Linux kernel, the following vulnerability has been resolved: PCI: keystone: Fix if-statement expression in ks_
CVE-2024-47757	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix potential oob read in nilfs_btree_check
CVE-2024-47764	cookie is a basic HTTP cookie parser and serializer for HTTP servers. The cookie name could be used to set other fi
CVE-2024-47809	In the Linux kernel, the following vulnerability has been resolved: dlm: fix possible lkb_resource null dereference T
CVE-2024-47794	In the Linux kernel, the following vulnerability has been resolved: bpf: Prevent tailcall infinite loop caused by frepla
CVE-2024-47814	Vim is an open source, command line text editor. A use-after-free was found in Vim < 9.1.0764. When closing a buf
CVE-2024-47874	Starlette is an Asynchronous Server Gateway Interface (ASGI) framework/toolkit. Prior to version 0.40.0, Starlette t
CVE-2024-48873	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: check return value of ieee80211_pro
CVE-2024-48875	In the Linux kernel, the following vulnerability has been resolved: btrfs: don't take dev_replace rwsem on task alrea
CVE-2024-48876	In the Linux kernel, the following vulnerability has been resolved: stackdepot: fix stack_depot_save_flags() in NMI
CVE-2024-48881	In the Linux kernel, the following vulnerability has been resolved: bcache: revert replacing IS_ERR_OR_NULL wit
CVE-2024-48957	execute_filter_audio in archive_read_support_format_rar.c in libarchive before 3.7.5 allows out-of-bounds access vi
CVE-2024-48958	execute_filter_delta in archive_read_support_format_rar.c in libarchive before 3.7.5 allows out-of-bounds access via
CVE-2024-49568	In the Linux kernel, the following vulnerability has been resolved: net/smc: check v2_ext_offset/eid_cnt/ism_gid_cn
CVE-2024-49569	In the Linux kernel, the following vulnerability has been resolved: nvme-rdma: unquiesce admin_q before destroy it
CVE-2024-49571	In the Linux kernel, the following vulnerability has been resolved: net/smc: check iparea_offset and ipv6_prefixes_c
CVE-2024-49750	The Snowflake Connector for Python provides an interface for developing Python applications that can connect to S
CVE-2024-49761	REXML is an XML toolkit for Ruby. The REXML gem before 3.3.9 has a ReDoS vulnerability when it parses an X
CVE-2024-49766	Werkzeug is a Web Server Gateway Interface web application library. On Python < 3.11 on Windows, os.path.isabs
CVE-2024-49767	Werkzeug is a Web Server Gateway Interface web application library. Applications using `werkzeug.formparser.Mu
CVE-2024-49768	Waitress is a Web Server Gateway Interface server for Python 2 and 3. A remote client may send a request that is ex
CVE-2024-49769	Waitress is a Web Server Gateway Interface server for Python 2 and 3. When a remote client closes the connection b
CVE-2024-49850	In the Linux kernel, the following vulnerability has been resolved: bpf: correctly handle malformed BPF_CORE_TY
CVE-2024-49851	In the Linux kernel, the following vulnerability has been resolved: tpm: Clean up TPM space after command failure
CVE-2024-49852	In the Linux kernel, the following vulnerability has been resolved: scsi: elx: libefc: Fix potential use after free in efc
CVE-2024-49853	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scmi: Fix double free in OPTEE tr
CVE-2024-49855	In the Linux kernel, the following vulnerability has been resolved: nbd: fix race between timeout and normal comple
CVE-2024-49856	In the Linux kernel, the following vulnerability has been resolved: x86/sgx: Fix deadlock in SGX NUMA node search
CVE-2024-49858	In the Linux kernel, the following vulnerability has been resolved: efistub/tpm: Use ACPI reclaim memory for event
CVE-2024-49859	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to check atomic_file in f2fs_ioctl interf
CVE-2024-49860	In the Linux kernel, the following vulnerability has been resolved: ACPI: sysfs: validate return type of _STR method
CVE-2024-49861	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix helper writes to read-only maps Lonia
CVE-2024-49862	In the Linux kernel, the following vulnerability has been resolved: powercap: intel_rapl: Fix off by one in get_rpi() T

CVE-2024-49863	In the Linux kernel, the following vulnerability has been resolved: vhost/scsi: null-ptr-dereference in vhost_scsi_get
CVE-2024-49864	In the Linux kernel, the following vulnerability has been resolved: rxrpc: Fix a race between socket set up and I/O th
CVE-2024-49865	In the Linux kernel, the following vulnerability has been resolved: drm/xe/vm: move xa_alloc to prevent UAF Evil u
CVE-2024-49866	In the Linux kernel, the following vulnerability has been resolved: tracing/timerlat: Fix a race during cpuhp processi
CVE-2024-49867	In the Linux kernel, the following vulnerability has been resolved: btrfs: wait for fixup workers before stopping clea
CVE-2024-49868	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix a NULL pointer dereference when failed
CVE-2024-49871	In the Linux kernel, the following vulnerability has been resolved: Input: adp5589-keys - fix NULL pointer derefere
CVE-2024-49870	In the Linux kernel, the following vulnerability has been resolved: cachefiles: fix dentry leak in cachefiles_open_file
CVE-2024-49874	In the Linux kernel, the following vulnerability has been resolved: i3c: master: svc: Fix use after free vulnerability in
CVE-2024-49875	In the Linux kernel, the following vulnerability has been resolved: nfsd: map the EBADMSG to nfserr_io to avoid w
CVE-2024-49876	In the Linux kernel, the following vulnerability has been resolved: drm/xe: fix UAF around queue destruction We cu
CVE-2024-49877	In the Linux kernel, the following vulnerability has been resolved: ocfs2: fix possible null-ptr-deref in ocfs2_set_buf
CVE-2024-49878	In the Linux kernel, the following vulnerability has been resolved: resource: fix region_intersects() vs add_memory_
CVE-2024-49879	In the Linux kernel, the following vulnerability has been resolved: drm: omapdrm: Add missing check for alloc_orde
CVE-2024-49880	In the Linux kernel, the following vulnerability has been resolved: ext4: fix off by one issue in alloc_flex_gd() Wesl
CVE-2024-49881	In the Linux kernel, the following vulnerability has been resolved: ext4: update orig_path in ext4_find_extent() In ex
CVE-2024-49882	In the Linux kernel, the following vulnerability has been resolved: ext4: fix double brelse() the buffer of the extents p
CVE-2024-49883	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid use-after-free in ext4_ext_insert_exten
CVE-2024-49885	In the Linux kernel, the following vulnerability has been resolved: mm, slub: avoid zeroing kcalloc redzone Since c
CVE-2024-49884	In the Linux kernel, the following vulnerability has been resolved: ext4: fix slab-use-after-free in ext4_split_extent_a
CVE-2024-49886	In the Linux kernel, the following vulnerability has been resolved: platform/x86: ISST: Fix the KASAN report slab-o
CVE-2024-49888	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix a sdiv overflow issue Zac Ecob reported
CVE-2024-49889	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid use-after-free in ext4_ext_show_leaf(
CVE-2024-49890	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: ensure the fw_info is not null before
CVE-2024-49891	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Validate hdwq pointers before derefere
CVE-2024-49892	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Initialize get_bytes_per_element
CVE-2024-49893	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check stream_status before it is
CVE-2024-49895	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix index out of bounds in DCN
CVE-2024-49894	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix index out of bounds in dega
CVE-2024-49896	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check stream before comparing
CVE-2024-49897	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check phantom_stream before
CVE-2024-49898	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check null-initialized variables
CVE-2024-49900	In the Linux kernel, the following vulnerability has been resolved: jfs: Fix uninit-value access of new_ea in ea_buffe
CVE-2024-49899	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Initialize denominators' default
CVE-2024-49901	In the Linux kernel, the following vulnerability has been resolved: drm/msm/adreno: Assign msm_gpu->pdev earlier
CVE-2024-49902	In the Linux kernel, the following vulnerability has been resolved: jfs: check if leafidx greater than num leaves per d
CVE-2024-49903	In the Linux kernel, the following vulnerability has been resolved: jfs: Fix uaf in dbFreeBits [syzbot reported] =====
CVE-2024-49904	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: add list empty check to avoid null p
CVE-2024-49906	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check null pointer before try to
CVE-2024-49905	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null check for 'afb' in amd

CVE-2024-49908	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null check for 'afb' in amd
CVE-2024-49907	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check null pointers before using
CVE-2024-49909	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL check for function
CVE-2024-49910	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL check for function
CVE-2024-49911	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL check for function
CVE-2024-49912	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Handle null 'stream_status' in 'p
CVE-2024-49913	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null check for top_pipe_to
CVE-2024-49914	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null check for pipe_ctx->p
CVE-2024-49915	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL check for clk_mgr
CVE-2024-49917	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL check for clk_mgr
CVE-2024-49916	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add NULL check for clk_mgr
CVE-2024-49918	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null check for head_pipe i
CVE-2024-49919	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add null check for head_pipe i
CVE-2024-49920	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check null pointers before mul
CVE-2024-49921	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check null pointers before usec
CVE-2024-49922	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check null pointers before usin
CVE-2024-49923	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Pass non-null to dcn20_validate
CVE-2024-49924	In the Linux kernel, the following vulnerability has been resolved: fbdev: pxaafb: Fix possible use after free in pxaafb_
CVE-2024-49925	In the Linux kernel, the following vulnerability has been resolved: fbdev: efifb: Register sysfs groups through driver
CVE-2024-49926	In the Linux kernel, the following vulnerability has been resolved: rcu-tasks: Fix access non-existent percpu rtcpv va
CVE-2024-49928	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: avoid reading out of bounds when loc
CVE-2024-49927	In the Linux kernel, the following vulnerability has been resolved: x86/ioapic: Handle allocation failures gracefully
CVE-2024-49929	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: avoid NULL pointer derefere
CVE-2024-49930	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: fix array out-of-bound access in SoC
CVE-2024-49931	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix array out-of-bound access in SoC
CVE-2024-49932	In the Linux kernel, the following vulnerability has been resolved: btrfs: don't readahead the relocation inode on RS
CVE-2024-49933	In the Linux kernel, the following vulnerability has been resolved: blk_iocost: fix more out of bound shifts Recently
CVE-2024-49934	In the Linux kernel, the following vulnerability has been resolved: fs/inode: Prevent dump_mapping() accessing inva
CVE-2024-49935	In the Linux kernel, the following vulnerability has been resolved: ACPI: PAD: fix crash in exit_round_robin() The
CVE-2024-49936	In the Linux kernel, the following vulnerability has been resolved: net/xen-netback: prevent UAF in xenvif_flush_ha
CVE-2024-49937	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: Set correct chandef when starting
CVE-2024-49938	In the Linux kernel, the following vulnerability has been resolved: wifi: ath9k_htc: Use __skb_set_length() for resett
CVE-2024-49939	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: avoid to add interface to list twice wh
CVE-2024-49940	In the Linux kernel, the following vulnerability has been resolved: l2tp: prevent possible tunnel refcount underflow
CVE-2024-49942	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Prevent null pointer access in xe_migrate
CVE-2024-49944	In the Linux kernel, the following vulnerability has been resolved: sctp: set sk_state back to CLOSED if autobind fai
CVE-2024-49945	In the Linux kernel, the following vulnerability has been resolved: net/ncsi: Disable the ncsi work before freeing the
CVE-2024-49946	In the Linux kernel, the following vulnerability has been resolved: ppp: do not assume bh is held in ppp_channel_bri
CVE-2024-49947	In the Linux kernel, the following vulnerability has been resolved: net: test for not too small csum_start in virtio_net
CVE-2024-49948	In the Linux kernel, the following vulnerability has been resolved: net: add more sanity checks to qdisc_pkt_len_init

CVE-2024-49949	In the Linux kernel, the following vulnerability has been resolved: net: avoid potential underflow in qdisc_pkt_len_i
CVE-2024-49950	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix uaf in l2cap_connect [Syz
CVE-2024-49951	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: MGMT: Fix possible crash on mgmt_
CVE-2024-49953	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix crash caused by calling __xfrm_st
CVE-2024-49955	In the Linux kernel, the following vulnerability has been resolved: ACPI: battery: Fix possible crash when unregister
CVE-2024-49954	In the Linux kernel, the following vulnerability has been resolved: static_call: Replace pointless WARN_ON() in sta
CVE-2024-49952	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: prevent nf_skb_duplicated co
CVE-2024-49957	In the Linux kernel, the following vulnerability has been resolved: ocfs2: fix null-ptr-deref when journal load failed.
CVE-2024-49961	In the Linux kernel, the following vulnerability has been resolved: media: i2c: ar0521: Use cansleep version of gpio
CVE-2024-49960	In the Linux kernel, the following vulnerability has been resolved: ext4: fix timer use-after-free on failed mount Syz
CVE-2024-49959	In the Linux kernel, the following vulnerability has been resolved: jbd2: stop waiting for space when jbd2_cleanu
CVE-2024-49958	In the Linux kernel, the following vulnerability has been resolved: ocfs2: reserve space for inline xattr before attachi
CVE-2024-49962	In the Linux kernel, the following vulnerability has been resolved: ACPICA: check null return of ACPI_ALLOCAT
CVE-2024-49963	In the Linux kernel, the following vulnerability has been resolved: mailbox: bcm2835: Fix timeout during suspend m
CVE-2024-49967	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-49965	In the Linux kernel, the following vulnerability has been resolved: ocfs2: remove unreasonable unlock in ocfs2_read
CVE-2024-49966	In the Linux kernel, the following vulnerability has been resolved: ocfs2: cancel dq_i_sync_work before freeing oinfo
CVE-2024-49968	In the Linux kernel, the following vulnerability has been resolved: ext4: filesystems without casefold feature cannot
CVE-2024-49969	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix index out of bounds in DC
CVE-2024-49970	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Implement bounds check for str
CVE-2024-49971	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Increase array size of dummy_
CVE-2024-49972	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Deallocate DML memory if all
CVE-2024-49973	In the Linux kernel, the following vulnerability has been resolved: r8169: add tally counter fields added with RTL81
CVE-2024-49975	In the Linux kernel, the following vulnerability has been resolved: uprobes: fix kernel info leak via "[uprobes]" vma
CVE-2024-49974	In the Linux kernel, the following vulnerability has been resolved: NFSD: Limit the number of concurrent async CO
CVE-2024-49976	In the Linux kernel, the following vulnerability has been resolved: tracing/timerlat: Drop interface_lock in stop_kthr
CVE-2024-49977	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: Fix zero-division error when disabli
CVE-2024-49978	In the Linux kernel, the following vulnerability has been resolved: gso: fix udp gso fraglist segmentation after pull fr
CVE-2024-49980	In the Linux kernel, the following vulnerability has been resolved: vrf: revert "vrf: Remove unnecessary RCU-bh cri
CVE-2024-49981	In the Linux kernel, the following vulnerability has been resolved: media: venus: fix use after free bug in venus_rem
CVE-2024-49982	In the Linux kernel, the following vulnerability has been resolved: aoe: fix the potential use-after-free problem in mo
CVE-2024-49983	In the Linux kernel, the following vulnerability has been resolved: ext4: drop ppath from ext4_ext_replay_update_ex
CVE-2024-49985	In the Linux kernel, the following vulnerability has been resolved: i2c: stm32f7: Do not prepare/unprepare clock dur
CVE-2024-49986	In the Linux kernel, the following vulnerability has been resolved: platform/x86: x86-android-tablets: Fix use after fr
CVE-2024-49987	In the Linux kernel, the following vulnerability has been resolved: bpftool: Fix undefined behavior in qsort(NULL, C
CVE-2024-49989	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: fix double free issue during am
CVE-2024-49988	In the Linux kernel, the following vulnerability has been resolved: ksmbd: add refcnt to ksmbd_conn struct When se
CVE-2024-49990	In the Linux kernel, the following vulnerability has been resolved: drm/xehdcp: Check GSC structure validity Some
CVE-2024-49991	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: amd_kfd_free_gtt_mem clear the cor
CVE-2024-49992	In the Linux kernel, the following vulnerability has been resolved: drm/stm: Avoid use-after-free issues with crtc and

CVE-2024-49994	In the Linux kernel, the following vulnerability has been resolved: block: fix integer overflow in BLKSECDISCARD
CVE-2024-49993	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-49995	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-49996	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix buffer overflow when parsing NFS repair
CVE-2024-49997	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: lantiq_etop: fix memory disclosure
CVE-2024-49998	In the Linux kernel, the following vulnerability has been resolved: net: dsa: improve shutdown sequence Alexander S
CVE-2024-49999	In the Linux kernel, the following vulnerability has been resolved: afs: Fix the setting of the server responding flag I
CVE-2024-50000	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix NULL deref in mlx5e_tir_builder
CVE-2024-50001	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix error path in multi-packet WQE tra
CVE-2024-50002	In the Linux kernel, the following vulnerability has been resolved: static_call: Handle module init failure correctly in
CVE-2024-50003	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix system hang while resume
CVE-2024-50004	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: update DML2 policy Enhanced
CVE-2024-50005	In the Linux kernel, the following vulnerability has been resolved: mac802154: Fix potential RCU dereference issue
CVE-2024-50006	In the Linux kernel, the following vulnerability has been resolved: ext4: fix i_data_sem unlock order in ext4_ind_mi
CVE-2024-50007	In the Linux kernel, the following vulnerability has been resolved: ALSA: asihpi: Fix potential OOB array access AS
CVE-2024-50009	In the Linux kernel, the following vulnerability has been resolved: cpufreq: amd-pstate: add check for cpufreq_cpu_
CVE-2024-50008	In the Linux kernel, the following vulnerability has been resolved: wifi: mwifiex: Fix memcpy() field-spanning write
CVE-2024-50010	In the Linux kernel, the following vulnerability has been resolved: exec: don't WARN for racy path_noexec check B
CVE-2024-50012	In the Linux kernel, the following vulnerability has been resolved: cpufreq: Avoid a bad reference count on CPU no
CVE-2024-50013	In the Linux kernel, the following vulnerability has been resolved: exfat: fix memory leak in exfat_load_bitmap() If
CVE-2024-50015	In the Linux kernel, the following vulnerability has been resolved: ext4: dax: fix overflowing extents beyond inode s
CVE-2024-50014	In the Linux kernel, the following vulnerability has been resolved: ext4: fix access to uninitialised lock in fc replay p
CVE-2024-50017	In the Linux kernel, the following vulnerability has been resolved: x86/mm/ident_map: Use gbpages only where full
CVE-2024-50018	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-50019	In the Linux kernel, the following vulnerability has been resolved: kthread: unpark only parked kthread Calling into
CVE-2024-50020	In the Linux kernel, the following vulnerability has been resolved: ice: Fix improper handling of refcount in ice_srio
CVE-2024-50021	In the Linux kernel, the following vulnerability has been resolved: ice: Fix improper handling of refcount in ice_dpll
CVE-2024-50022	In the Linux kernel, the following vulnerability has been resolved: device-dax: correct pgoff align in dax_set_mappin
CVE-2024-50023	In the Linux kernel, the following vulnerability has been resolved: net: phy: Remove LED entry from LEDs list on u
CVE-2024-50024	In the Linux kernel, the following vulnerability has been resolved: net: Fix an unsafe loop on the list The kernel may
CVE-2024-50025	In the Linux kernel, the following vulnerability has been resolved: scsi: fnic: Move flush_work initialization out of i
CVE-2024-50026	In the Linux kernel, the following vulnerability has been resolved: scsi: wd33c93: Don't use stale scsi_pointer value
CVE-2024-50027	In the Linux kernel, the following vulnerability has been resolved: thermal: core: Free tzp copy along with the therm
CVE-2024-50028	In the Linux kernel, the following vulnerability has been resolved: thermal: core: Reference count the zone in therm
CVE-2024-50030	In the Linux kernel, the following vulnerability has been resolved: drm/xen/ct: prevent UAF in send_recv() Ensure we
CVE-2024-50029	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_conn: Fix UAF in hci_enhanced_s
CVE-2024-50031	In the Linux kernel, the following vulnerability has been resolved: drm/v3d: Stop the active perfmon before being de
CVE-2024-50033	In the Linux kernel, the following vulnerability has been resolved: slip: make slhc_remember() more robust against r
CVE-2024-50034	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix lacks of icsk_syn_mss with IPPROTO
CVE-2024-50035	In the Linux kernel, the following vulnerability has been resolved: ppp: fix ppp_async_encode() illegal access syzbo

CVE-2024-50036	In the Linux kernel, the following vulnerability has been resolved: net: do not delay dst_entries_add() in dst_release()
CVE-2024-50038	In the Linux kernel, the following vulnerability has been resolved: netfilter: xttables: avoid NFPROTO_UNSPEC when
CVE-2024-50039	In the Linux kernel, the following vulnerability has been resolved: net/sched: accept TCA_STAB only for root qdisc
CVE-2024-50040	In the Linux kernel, the following vulnerability has been resolved: igb: Do not bring the device up after non-fatal error
CVE-2024-50041	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix macvlan leak by synchronizing access to
CVE-2024-50042	In the Linux kernel, the following vulnerability has been resolved: ice: Fix increasing MSI-X on VF Increasing MSI-X
CVE-2024-50044	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: RFCOMM: FIX possible deadlock in
CVE-2024-50045	In the Linux kernel, the following vulnerability has been resolved: netfilter: br_netfilter: fix panic with metadata_dst
CVE-2024-50046	In the Linux kernel, the following vulnerability has been resolved: NFSv4: Prevent NULL-pointer dereference in nfs
CVE-2024-50048	In the Linux kernel, the following vulnerability has been resolved: fbcon: Fix a NULL pointer dereference issue in fb
CVE-2024-50047	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix UAF in async decryption Doing a
CVE-2024-50049	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check null pointer before deref
CVE-2024-50051	In the Linux kernel, the following vulnerability has been resolved: spi: mpc52xx: Add cancel_work_sync before mo
CVE-2024-50055	In the Linux kernel, the following vulnerability has been resolved: driver core: bus: Fix double free in driver API bus
CVE-2024-50056	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: uvc: Fix ERR_PTR dereference in u
CVE-2024-50057	In the Linux kernel, the following vulnerability has been resolved: usb: typec: tipd: Free IRQ only if it was requeste
CVE-2024-50058	In the Linux kernel, the following vulnerability has been resolved: serial: protect uart_port_dtr_rts() in uart_shutdown
CVE-2024-50059	In the Linux kernel, the following vulnerability has been resolved: ntb: ntb_hw_switchtec: Fix use after free vulnerab
CVE-2024-50060	In the Linux kernel, the following vulnerability has been resolved: io_uring: check if we need to reschedule during o
CVE-2024-50061	In the Linux kernel, the following vulnerability has been resolved: i3c: master: cdns: Fix use after free vulnerability
CVE-2024-50062	In the Linux kernel, the following vulnerability has been resolved: RDMA/rtrs-srv: Avoid null pointer deref during p
CVE-2024-50063	In the Linux kernel, the following vulnerability has been resolved: bpf: Prevent tail call between progs attached to di
CVE-2024-50065	In the Linux kernel, the following vulnerability has been resolved: ntfs3: Change to non-blocking allocation in ntfs_
CVE-2024-50064	In the Linux kernel, the following vulnerability has been resolved: zram: free secondary algorithms names We need
CVE-2024-50066	In the Linux kernel, the following vulnerability has been resolved: mm/mremap: fix move_normal_pmd/retract_page
CVE-2024-50067	In the Linux kernel, the following vulnerability has been resolved: uprobe: avoid out-of-bounds memory access of fe
CVE-2024-50068	In the Linux kernel, the following vulnerability has been resolved: mm/damon/tests/sysfs-kunit.h: fix memory leak in
CVE-2024-50069	In the Linux kernel, the following vulnerability has been resolved: pinctrl: apple: check devm_kasprintf() returned v
CVE-2024-50070	In the Linux kernel, the following vulnerability has been resolved: pinctrl: stm32: check devm_kasprintf() returned v
CVE-2024-50072	In the Linux kernel, the following vulnerability has been resolved: x86/bugs: Use code segment selector for VERW
CVE-2024-50073	In the Linux kernel, the following vulnerability has been resolved: tty: n_gsm: Fix use-after-free in gsm_cleanup_mu
CVE-2024-50074	In the Linux kernel, the following vulnerability has been resolved: parport: Proper fix for array out-of-bounds access
CVE-2024-50075	In the Linux kernel, the following vulnerability has been resolved: xhci: tegra: fix checked USB2 port number If US
CVE-2024-50076	In the Linux kernel, the following vulnerability has been resolved: vt: prevent kernel-infoleak in con_font_get() font
CVE-2024-50077	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: ISO: Fix multiple init when debugfs is
CVE-2024-50078	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Call iso_exit() on module unload If iso
CVE-2024-50080	In the Linux kernel, the following vulnerability has been resolved: ublk: don't allow user copy for unprivileged device
CVE-2024-50082	In the Linux kernel, the following vulnerability has been resolved: blk-rq-qos: fix crash on rq_qos_wait vs. rq_qos_v
CVE-2024-50083	In the Linux kernel, the following vulnerability has been resolved: tcp: fix mptcp DSS corruption due to large pmtu
CVE-2024-50084	In the Linux kernel, the following vulnerability has been resolved: net: microchip: vcap api: Fix memory leaks in vca

CVE-2024-50085	In the Linux kernel, the following vulnerability has been resolved: mptcp: pm: fix UaF read in mptcp_pm_nl_rm_ad
CVE-2024-50086	In the Linux kernel, the following vulnerability has been resolved: ksmdb: fix user-after-free from session log off Th
CVE-2024-50087	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix uninitialized pointer free on read_alloc_
CVE-2024-50088	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix uninitialized pointer free in add_inode_r
CVE-2024-50090	In the Linux kernel, the following vulnerability has been resolved: drm/xe/oa: Fix overflow in oa batch buffer By de
CVE-2024-50091	In the Linux kernel, the following vulnerability has been resolved: dm vdo: don't refer to dedupe_context after releas
CVE-2024-50095	In the Linux kernel, the following vulnerability has been resolved: RDMA/mad: Improve handling of timed out WR
CVE-2024-50093	In the Linux kernel, the following vulnerability has been resolved: thermal: intel: int340x: processor: Fix warning du
CVE-2024-50096	In the Linux kernel, the following vulnerability has been resolved: nouveau/dmem: Fix vulnerability in migrate_to_r
CVE-2024-50098	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Set SDEV_OFFLINE when UFS i
CVE-2024-50099	In the Linux kernel, the following vulnerability has been resolved: arm64: probes: Remove broken LDR (literal) upr
CVE-2024-50101	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Fix incorrect pci_for_each_dma_alia
CVE-2024-50102	In the Linux kernel, the following vulnerability has been resolved: x86: fix user address masking non-canonical spec
CVE-2024-50103	In the Linux kernel, the following vulnerability has been resolved: ASoC: qcom: Fix NULL Dereference in asoc_qco
CVE-2024-50104	In the Linux kernel, the following vulnerability has been resolved: ASoC: qcom: sdm845: add missing soundwire ru
CVE-2024-50105	In the Linux kernel, the following vulnerability has been resolved: ASoC: qcom: sc7280: Fix missing Soundwire run
CVE-2024-50106	In the Linux kernel, the following vulnerability has been resolved: nfsd: fix race between laundromat and free_statei
CVE-2024-50107	In the Linux kernel, the following vulnerability has been resolved: platform/x86/intel/pmc: Fix pmc_core_iounmap t
CVE-2024-50108	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Disable PSR-SU on Parade 08-
CVE-2024-50110	In the Linux kernel, the following vulnerability has been resolved: xfrm: fix one more kernel-infoleak in algo dumpi
CVE-2024-50111	In the Linux kernel, the following vulnerability has been resolved: LoongArch: Enable IRQ if do_ale() triggered in i
CVE-2024-50112	In the Linux kernel, the following vulnerability has been resolved: x86/lam: Disable ADDRESS_MASKING in mos
CVE-2024-50115	In the Linux kernel, the following vulnerability has been resolved: KVM: nSVM: Ignore nCR3[4:0] when loading P
CVE-2024-50116	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix kernel bug due to missing clearing of b
CVE-2024-50117	In the Linux kernel, the following vulnerability has been resolved: drm/amd: Guard against bad data for ATIF ACPI
CVE-2024-50118	In the Linux kernel, the following vulnerability has been resolved: btrfs: reject ro->rw reconfiguration if there are ha
CVE-2024-50120	In the Linux kernel, the following vulnerability has been resolved: smb: client: Handle kstrdup failures for password
CVE-2024-50121	In the Linux kernel, the following vulnerability has been resolved: nfsd: cancel nfsd_shrinker_work using sync mode
CVE-2024-50124	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: ISO: Fix UAF on iso_sock_timeout co
CVE-2024-50125	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: SCO: Fix UAF on sco_sock_timeout c
CVE-2024-50126	In the Linux kernel, the following vulnerability has been resolved: net: sched: use RCU read-side critical section in t
CVE-2024-50127	In the Linux kernel, the following vulnerability has been resolved: net: sched: fix use-after-free in taprio_change() In
CVE-2024-50128	In the Linux kernel, the following vulnerability has been resolved: net: wwan: fix global oob in wwan_rtnl_policy Th
CVE-2024-50130	In the Linux kernel, the following vulnerability has been resolved: netfilter: bpf: must hold reference on net namespa
CVE-2024-50133	In the Linux kernel, the following vulnerability has been resolved: LoongArch: Don't crash in stack_top() for tasks w
CVE-2024-50131	In the Linux kernel, the following vulnerability has been resolved: tracing: Consider the NULL character when valid
CVE-2024-50134	In the Linux kernel, the following vulnerability has been resolved: drm/vboxvideo: Replace fake VLA at end of vbva
CVE-2024-50135	In the Linux kernel, the following vulnerability has been resolved: nvme-pci: fix race condition between reset and nv
CVE-2024-50136	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Unregister notifier on eswitch init failu
CVE-2024-50137	In the Linux kernel, the following vulnerability has been resolved: reset: starfive: jh71x0: Fix accessing the empty m

CVE-2024-50138	In the Linux kernel, the following vulnerability has been resolved: bpf: Use raw_spinlock_t in ringbuf The function
CVE-2024-50139	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Fix shift-out-of-bounds bug Fix a
CVE-2024-50140	In the Linux kernel, the following vulnerability has been resolved: sched/core: Disable page allocation in task_tick_r
CVE-2024-50141	In the Linux kernel, the following vulnerability has been resolved: ACPI: PRM: Find EFI_MEMORY_RUNTIME b
CVE-2024-50142	In the Linux kernel, the following vulnerability has been resolved: xfrm: validate new SA's prefixlen using SA famil
CVE-2024-50143	In the Linux kernel, the following vulnerability has been resolved: udf: fix uninit-value use in udf_get_fileshead Cl
CVE-2024-50145	In the Linux kernel, the following vulnerability has been resolved: octeon_ep: Add SKB allocation failures handling
CVE-2024-50146	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Don't call cleanup on profile rollback
CVE-2024-50147	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix command bitmask initialization Co
CVE-2024-50148	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: bnep: fix wild-memory-access in proto
CVE-2024-50150	In the Linux kernel, the following vulnerability has been resolved: usb: typec: altmode should keep reference to pare
CVE-2024-50151	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix OOBs when building SMB2_IOC
CVE-2024-50152	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix possible double free in smb2_set
CVE-2024-50153	In the Linux kernel, the following vulnerability has been resolved: scsi: target: core: Fix null-ptr-deref in target_alloc
CVE-2024-50154	In the Linux kernel, the following vulnerability has been resolved: tcp/dccp: Don't use timer_pending() in reqsk_que
CVE-2024-50155	In the Linux kernel, the following vulnerability has been resolved: netdevsim: use cond_resched() in nsim_dev_trap
CVE-2024-50156	In the Linux kernel, the following vulnerability has been resolved: drm/msm: Avoid NULL dereference in msm_disp
CVE-2024-50157	In the Linux kernel, the following vulnerability has been resolved: RDMA/bnxt_re: Avoid CPU lockups due fifo occ
CVE-2024-50158	In the Linux kernel, the following vulnerability has been resolved: RDMA/bnxt_re: Fix out of bound check Driver e
CVE-2024-50159	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scmi: Fix the double free in scmi
CVE-2024-50160	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda/cs8409: Fix possible NULL dereferen
CVE-2024-50162	In the Linux kernel, the following vulnerability has been resolved: bpf: devmap: provide rxq after redirect rxq contain
CVE-2024-50163	In the Linux kernel, the following vulnerability has been resolved: bpf: Make sure internal and UAPI bpf_redirect fla
CVE-2024-50164	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix overloading of MEM_UNINIT's meaning
CVE-2024-50166	In the Linux kernel, the following vulnerability has been resolved: fsl/fman: Fix refcount handling of fman-related d
CVE-2024-50167	In the Linux kernel, the following vulnerability has been resolved: be2net: fix potential memory leak in be_xmit() Th
CVE-2024-50168	In the Linux kernel, the following vulnerability has been resolved: net/sun3_82586: fix potential memory leak in sun
CVE-2024-50170	In the Linux kernel, the following vulnerability has been resolved: net: bcmasp: fix potential memory leak in bcmasp
CVE-2024-50169	In the Linux kernel, the following vulnerability has been resolved: vsock: Update rx_bytes on read_skb() Make sure
CVE-2024-50171	In the Linux kernel, the following vulnerability has been resolved: net: systemport: fix potential memory leak in bcm
CVE-2024-50172	In the Linux kernel, the following vulnerability has been resolved: RDMA/bnxt_re: Fix a possible memory leak In b
CVE-2024-50175	In the Linux kernel, the following vulnerability has been resolved: media: qcom: camss: Remove use_count guard in
CVE-2024-50176	In the Linux kernel, the following vulnerability has been resolved: remoteproc: k3-r5: Fix error handling when powe
CVE-2024-50178	In the Linux kernel, the following vulnerability has been resolved: cpufreq: loongson3: Use raw_smp_processor_id(
CVE-2024-50179	In the Linux kernel, the following vulnerability has been resolved: ceph: remove the incorrect Fw reference check w
CVE-2024-50180	In the Linux kernel, the following vulnerability has been resolved: fbdev: sisfb: Fix strbuf array overflow The values
CVE-2024-50182	In the Linux kernel, the following vulnerability has been resolved: secretmem: disable memfd_secret() if arch cannot
CVE-2024-50183	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Ensure DA_ID handling completion be
CVE-2024-50184	In the Linux kernel, the following vulnerability has been resolved: virtio_pmem: Check device status before requesti
CVE-2024-50185	In the Linux kernel, the following vulnerability has been resolved: mptcp: handle consistently DSS corruption Bugg

CVE-2024-50186	In the Linux kernel, the following vulnerability has been resolved: net: explicitly clear the sk pointer, when pf->creat
CVE-2024-50187	In the Linux kernel, the following vulnerability has been resolved: drm/vc4: Stop the active perfmon before being de
CVE-2024-50188	In the Linux kernel, the following vulnerability has been resolved: net: phy: dp83869: fix memory corruption when e
CVE-2024-50189	In the Linux kernel, the following vulnerability has been resolved: HID: amd_sfh: Switch to device-managed dman
CVE-2024-50191	In the Linux kernel, the following vulnerability has been resolved: ext4: don't set SB_RDONLY after filesystem erro
CVE-2024-50192	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v4: Don't allow a VMOVP on a dying
CVE-2024-50193	In the Linux kernel, the following vulnerability has been resolved: x86/entry_32: Clear CPU buffers after register res
CVE-2024-50194	In the Linux kernel, the following vulnerability has been resolved: arm64: probes: Fix uprobes for big-endian kernel
CVE-2024-50195	In the Linux kernel, the following vulnerability has been resolved: posix-clock: Fix missing timespec64 check in pc_
CVE-2024-50196	In the Linux kernel, the following vulnerability has been resolved: pinctrl: ocelot: fix system hang on level based int
CVE-2024-50197	In the Linux kernel, the following vulnerability has been resolved: pinctrl: intel: platform: fix error path in device_fo
CVE-2024-50198	In the Linux kernel, the following vulnerability has been resolved: iio: light: vml6030: fix IIO device retrieval from
CVE-2024-50199	In the Linux kernel, the following vulnerability has been resolved: mm/swapfile: skip HugeTLB pages for unuse_vm
CVE-2024-50200	In the Linux kernel, the following vulnerability has been resolved: maple_tree: correct tree corruption on spanning st
CVE-2024-50201	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: Fix encoder->possible_clones Includ
CVE-2024-50202	In the Linux kernel, the following vulnerability has been resolved: nilfs2: propagate directory read errors from nilfs_
CVE-2024-50203	In the Linux kernel, the following vulnerability has been resolved: bpf, arm64: Fix address emission with tag-based l
CVE-2024-50205	In the Linux kernel, the following vulnerability has been resolved: ALSA: firewire-lib: Avoid division by zero in ap
CVE-2024-50206	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: mtk_eth_soc: fix memory corruption
CVE-2024-50207	In the Linux kernel, the following vulnerability has been resolved: ring-buffer: Fix reader locking when changing the
CVE-2024-50208	In the Linux kernel, the following vulnerability has been resolved: RDMA/bnxt_re: Fix a bug while setting up Level
CVE-2024-50209	In the Linux kernel, the following vulnerability has been resolved: RDMA/bnxt_re: Add a check for memory allocat
CVE-2024-50210	In the Linux kernel, the following vulnerability has been resolved: posix-clock: posix-clock: Fix unbalanced locking
CVE-2024-50211	In the Linux kernel, the following vulnerability has been resolved: udf: refactor inode_bmap() to handle error Refact
CVE-2024-50215	In the Linux kernel, the following vulnerability has been resolved: nvmet-auth: assign dh_key to NULL after kfree_s
CVE-2024-50216	In the Linux kernel, the following vulnerability has been resolved: xfs: fix finding a last resort AG in xfs_filestream
CVE-2024-50217	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix use-after-free of block device file in __b
CVE-2024-50218	In the Linux kernel, the following vulnerability has been resolved: ocfs2: pass u64 to ocfs2_truncate_inline maybe o
CVE-2024-50219	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-50220	In the Linux kernel, the following vulnerability has been resolved: fork: do not invoke uffd on fork if error occurs Pa
CVE-2024-50221	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Vangogh: Fix kernel memory out o
CVE-2024-50222	In the Linux kernel, the following vulnerability has been resolved: iov_iter: fix copy_page_from_iter_atomic() if KM
CVE-2024-50223	In the Linux kernel, the following vulnerability has been resolved: sched/numa: Fix the potential null pointer derefer
CVE-2024-50224	In the Linux kernel, the following vulnerability has been resolved: spi: spi-fsl-dspi: Fix crash when not using GPIO c
CVE-2024-50225	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix error propagation of split bios The purpo
CVE-2024-50226	In the Linux kernel, the following vulnerability has been resolved: cxl/port: Fix use-after-free, permit out-of-order de
CVE-2024-50228	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-50230	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix kernel bug due to missing clearing of c
CVE-2024-50229	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix potential deadlock with newly created s
CVE-2024-50231	In the Linux kernel, the following vulnerability has been resolved: iio: gts-helper: Fix memory leaks in iio_gts_build

CVE-2024-50232	In the Linux kernel, the following vulnerability has been resolved: iio: adc: ad7124: fix division by zero in ad7124_s
CVE-2024-50233	In the Linux kernel, the following vulnerability has been resolved: staging: iio: frequency: ad9832: fix division by ze
CVE-2024-50234	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlegacy: Clear stale interrupts before resum
CVE-2024-50235	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: clear wdev->cqm_config pointer
CVE-2024-50236	In the Linux kernel, the following vulnerability has been resolved: wifi: ath10k: Fix memory leak in management tx
CVE-2024-50237	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: do not pass a stopped vif to the d
CVE-2024-50238	In the Linux kernel, the following vulnerability has been resolved: phy: qcom: qmp-usbc: fix NULL-deref on runtime
CVE-2024-50239	In the Linux kernel, the following vulnerability has been resolved: phy: qcom: qmp-usb-legacy: fix NULL-deref on r
CVE-2024-50240	In the Linux kernel, the following vulnerability has been resolved: phy: qcom: qmp-usb: fix NULL-deref on runtime
CVE-2024-50242	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Additional check in ntfs_file_release
CVE-2024-50243	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Fix general protection fault in run_is_ma
CVE-2024-50244	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Additional check in ni_clear() Checking
CVE-2024-50245	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Fix possible deadlock in mi_read Mutex
CVE-2024-50246	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Add rough attr alloc_size check
CVE-2024-50248	In the Linux kernel, the following vulnerability has been resolved: ntfs3: Add bounds checking to mi_enum_attr() A
CVE-2024-50247	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Check if more than chunk-size bytes are
CVE-2024-50249	In the Linux kernel, the following vulnerability has been resolved: ACPI: CPPC: Make rmw_lock a raw_spin_lock T
CVE-2024-50250	In the Linux kernel, the following vulnerability has been resolved: fsdax: dax_unshare_iter needs to copy entire bloc
CVE-2024-50251	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_payload: sanitize offset and length b
CVE-2024-50252	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_ipip: Fix memory leak when ch
CVE-2024-50255	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci: fix null-ptr-deref in hci_read_sup
CVE-2024-50256	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_reject_ipv6: fix potential crash in nf_
CVE-2024-50257	In the Linux kernel, the following vulnerability has been resolved: netfilter: Fix use-after-free in get_info() ip6table_
CVE-2024-50258	In the Linux kernel, the following vulnerability has been resolved: net: fix crash when config small gso_max_size/gso
CVE-2024-50259	In the Linux kernel, the following vulnerability has been resolved: netdevsim: Add trailing zero to terminate the strin
CVE-2024-50261	In the Linux kernel, the following vulnerability has been resolved: macsec: Fix use-after-free while sending the offlo
CVE-2024-50262	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix out-of-bounds write in trie_get_next_key
CVE-2024-50263	In the Linux kernel, the following vulnerability has been resolved: fork: only invoke khugepaged, ksm hooks if no er
CVE-2024-50264	In the Linux kernel, the following vulnerability has been resolved: vsock/virtio: Initialization of the dangling pointer
CVE-2024-50265	In the Linux kernel, the following vulnerability has been resolved: ocfs2: remove entry once instead of null-ptr-deref
CVE-2024-50267	In the Linux kernel, the following vulnerability has been resolved: USB: serial: io_edgeport: fix use after free in deb
CVE-2024-50268	In the Linux kernel, the following vulnerability has been resolved: usb: typec: fix potential out of bounds in ucsi_ccg
CVE-2024-50270	In the Linux kernel, the following vulnerability has been resolved: mm/damon/core: avoid overflow in damon_feed_
CVE-2024-50269	In the Linux kernel, the following vulnerability has been resolved: usb: musb: sunxi: Fix accessing an released usb p
CVE-2024-50271	In the Linux kernel, the following vulnerability has been resolved: signal: restore the override_rlimit logic Prior to c
CVE-2024-50272	In the Linux kernel, the following vulnerability has been resolved: filemap: Fix bounds checking in filemap_read() I
CVE-2024-50273	In the Linux kernel, the following vulnerability has been resolved: btrfs: reinitialize delayed ref list after deleting it f
CVE-2024-50274	In the Linux kernel, the following vulnerability has been resolved: idpf: avoid vport access in idpf_get_link_ksetting
CVE-2024-50275	In the Linux kernel, the following vulnerability has been resolved: arm64/sve: Discard stale CPU state when handlin
CVE-2024-50276	In the Linux kernel, the following vulnerability has been resolved: net: vertexcom: mse102x: Fix possible double fre

CVE-2024-50277	In the Linux kernel, the following vulnerability has been resolved: dm: fix a crash if blk_alloc_disk fails If blk_alloc
CVE-2024-50279	In the Linux kernel, the following vulnerability has been resolved: dm cache: fix out-of-bounds access to the dirty bi
CVE-2024-50278	In the Linux kernel, the following vulnerability has been resolved: dm cache: fix potential out-of-bounds access on th
CVE-2024-50280	In the Linux kernel, the following vulnerability has been resolved: dm cache: fix flushing uninitialized delayed_worl
CVE-2024-50282	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: add missing size check in amdgpu_
CVE-2024-50283	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix slab-use-after-free in smb3_preauth_h
CVE-2024-50284	In the Linux kernel, the following vulnerability has been resolved: ksmbd: Fix the missing xa_store error check xa_s
CVE-2024-50285	In the Linux kernel, the following vulnerability has been resolved: ksmbd: check outstanding simultaneous SMB ope
CVE-2024-50286	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix slab-use-after-free in ksmbd_smb2_se
CVE-2024-50287	In the Linux kernel, the following vulnerability has been resolved: media: v4l2-tpg: prevent the risk of a division by
CVE-2024-50288	In the Linux kernel, the following vulnerability has been resolved: media: vivid: fix buffer overwrite when using > 3
CVE-2024-50289	In the Linux kernel, the following vulnerability has been resolved: media: av7110: fix a spectre vulnerability As war
CVE-2024-50290	In the Linux kernel, the following vulnerability has been resolved: media: cx24116: prevent overflows on SNR calcul
CVE-2024-50291	In the Linux kernel, the following vulnerability has been resolved: media: dvb-core: add missing buffer index check
CVE-2024-50292	In the Linux kernel, the following vulnerability has been resolved: ASoC: stm32: spdifrx: fix dma channel release in
CVE-2024-50294	In the Linux kernel, the following vulnerability has been resolved: rxrpc: Fix missing locking causing hanging calls
CVE-2024-50296	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fix kernel crash when uninstalling drive
CVE-2024-50295	In the Linux kernel, the following vulnerability has been resolved: net: arc: fix the device for dma_map_single/dma_
CVE-2024-50297	In the Linux kernel, the following vulnerability has been resolved: net: xilinx: axienet: Enqueue Tx packets in dql be
CVE-2024-50298	In the Linux kernel, the following vulnerability has been resolved: net: enetc: allocate vf_state during PF probes In th
CVE-2024-50299	In the Linux kernel, the following vulnerability has been resolved: sctp: properly validate chunk size in sctp_sf_ootb
CVE-2024-50300	In the Linux kernel, the following vulnerability has been resolved: regulator: rtq2208: Fix uninitialized use of regula
CVE-2024-50301	In the Linux kernel, the following vulnerability has been resolved: security/keys: fix slab-out-of-bounds in key_task
CVE-2024-50302	In the Linux kernel, the following vulnerability has been resolved: HID: core: zero-initialize the report buffer Since
CVE-2024-50303	In the Linux kernel, the following vulnerability has been resolved: resource,kexec: walk_system_ram_res_rev must t
CVE-2024-50304	In the Linux kernel, the following vulnerability has been resolved: ipv4: ip_tunnel: Fix suspicious RCU usage warni
CVE-2024-50349	Git is a fast, scalable, distributed revision control system with an unusually rich command set that provides both high
CVE-2024-50602	An issue was discovered in libexpat before 2.6.4. There is a crash within the XML_ResumeParser function because
CVE-2024-50379	Time-of-check Time-of-use (TOCTOU) Race Condition vulnerability during JSP compilation in Apache Tomcat per
CVE-2024-50613	libsndfile through 1.2.2 has a reachable assertion, that may lead to application exit, in mpeg_l3_encode.c mpeg_l3_e
CVE-2024-51504	When using IPAuthenticationProvider in ZooKeeper Admin Server there is a possibility of Authentication Bypass by
CVE-2024-51744	golang-jwt is a Go implementation of JSON Web Tokens. Unclear documentation of the error behavior in `ParseWith
CVE-2024-52003	Traefik (pronounced traffic) is an HTTP reverse proxy and load balancer. There is a vulnerability in Traefik that allo
CVE-2024-5187	A vulnerability in the `download_model_with_test_data` function of the onnx/onnx framework, version 1.16.0, allow
CVE-2024-52005	Git is a source code management tool. When cloning from a server (or fetching, or pushing), informational or error m
CVE-2024-52006	Git is a fast, scalable, distributed revision control system with an unusually rich command set that provides both high
CVE-2024-52046	The ObjectSerializationDecoder in Apache MINA uses Java's native deserialization protocol to process incoming se
CVE-2024-5206	A sensitive data leakage vulnerability was identified in scikit-learn's TfidfVectorizer, specifically in versions up to a
CVE-2024-52303	aiohttp is an asynchronous HTTP client/server framework for asyncio and Python. In versions starting with 3.10.6 an
CVE-2024-52304	aiohttp is an asynchronous HTTP client/server framework for asyncio and Python. Prior to version 3.10.11, the Pytho

CVE-2024-52332	In the Linux kernel, the following vulnerability has been resolved: igb: Fix potential invalid memory access in igb_in
CVE-2024-52533	gio/gsockets4aproxy.c in GNOME GLib before 2.82.1 has an off-by-one error and resultant buffer overflow because S
CVE-2024-52560	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Mark inode as bad as soon as error detec
CVE-2024-52559	In the Linux kernel, the following vulnerability has been resolved: drm/msm/gem: prevent integer overflow in msm_
CVE-2024-52616	A flaw was found in the Avahi-daemon, where it initializes DNS transaction IDs randomly only once at startup, incr
CVE-2024-52615	A flaw was found in Avahi-daemon, which relies on fixed source ports for wide-area DNS queries. This issue simpli
CVE-2024-52804	Tornado is a Python web framework and asynchronous networking library. The algorithm used for parsing HTTP co
CVE-2024-53042	In the Linux kernel, the following vulnerability has been resolved: ipv4: ip_tunnel: Fix suspicious RCU usage warni
CVE-2024-53043	In the Linux kernel, the following vulnerability has been resolved: mctp i2c: handle NULL header address daddr can
CVE-2024-53044	In the Linux kernel, the following vulnerability has been resolved: net/sched: sch_api: fix xa_insert() error path in tc
CVE-2024-53045	In the Linux kernel, the following vulnerability has been resolved: ASoC: dapm: fix bounds checker error in dapm_v
CVE-2024-53047	In the Linux kernel, the following vulnerability has been resolved: mptcp: init: protect sched with rcu_read_lock Ena
CVE-2024-53046	In the Linux kernel, the following vulnerability has been resolved: arm64: dts: imx8ulp: correct the flexspi compatib
CVE-2024-53048	In the Linux kernel, the following vulnerability has been resolved: ice: fix crash on probe for DPLL enabled E810 L
CVE-2024-53050	In the Linux kernel, the following vulnerability has been resolved: drm/i915/hdcp: Add encoder check in hdcp2_get_
CVE-2024-53051	In the Linux kernel, the following vulnerability has been resolved: drm/i915/hdcp: Add encoder check in intel_hdcp
CVE-2024-53052	In the Linux kernel, the following vulnerability has been resolved: io_uring/rw: fix missing NOWAIT check for O_I
CVE-2024-53053	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Fix another deadlock during RTC
CVE-2024-53054	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-53055	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: fix 6 GHz scan construction l
CVE-2024-53056	In the Linux kernel, the following vulnerability has been resolved: drm/mediatek: Fix potential NULL dereference in
CVE-2024-53058	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: TSO: Fix unbalanced DMA map/un
CVE-2024-53057	In the Linux kernel, the following vulnerability has been resolved: net/sched: stop qdisc_tree_reduce_backlog on TC
CVE-2024-53060	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: prevent NULL pointer dereference
CVE-2024-53059	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: Fix response handling in iwl_
CVE-2024-53061	In the Linux kernel, the following vulnerability has been resolved: media: s5p-jpeg: prevent buffer overflows The cu
CVE-2024-53062	In the Linux kernel, the following vulnerability has been resolved: media: mgb4: protect driver against spectre Frequ
CVE-2024-53063	In the Linux kernel, the following vulnerability has been resolved: media: dvbdev: prevent the risk of out of memory
CVE-2024-53064	In the Linux kernel, the following vulnerability has been resolved: idpf: fix idpf_vc_core_init error path In an event
CVE-2024-53066	In the Linux kernel, the following vulnerability has been resolved: nfs: Fix KMSAN warning in decode_getfattr_attr
CVE-2024-53067	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Start the RTC update work later Th
CVE-2024-53072	In the Linux kernel, the following vulnerability has been resolved: platform/x86/amd/pmc: Detect when STB is not a
CVE-2024-53068	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scmi: Fix slab-use-after-free in scr
CVE-2024-53073	In the Linux kernel, the following vulnerability has been resolved: NFSD: Never decrement pending_async_copies c
CVE-2024-53079	In the Linux kernel, the following vulnerability has been resolved: mm/thp: fix deferred split unqueue naming and lo
CVE-2024-53076	In the Linux kernel, the following vulnerability has been resolved: iio: gts-helper: Fix memory leaks for the error pat
CVE-2024-53081	In the Linux kernel, the following vulnerability has been resolved: media: ar0521: don't overflow when checking PL
CVE-2024-53082	In the Linux kernel, the following vulnerability has been resolved: virtio_net: Add hash_key_length check Add hash
CVE-2024-53083	In the Linux kernel, the following vulnerability has been resolved: usb: typec: qcom-pmic: init value of hdr_len/txbu
CVE-2024-53084	In the Linux kernel, the following vulnerability has been resolved: drm/imagination: Break an object reference loop

CVE-2024-53085	In the Linux kernel, the following vulnerability has been resolved: tpm: Lock TPM chip in tpm_pm_suspend() first S
CVE-2024-53086	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Drop VM dma-resv lock on xe_sync_in_
CVE-2024-53087	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Fix possible exec queue leak in exec IOC
CVE-2024-53088	In the Linux kernel, the following vulnerability has been resolved: i40e: fix race condition by adding filter's intermed
CVE-2024-53089	In the Linux kernel, the following vulnerability has been resolved: LoongArch: KVM: Mark hrtimer to expire in har
CVE-2024-53090	In the Linux kernel, the following vulnerability has been resolved: afs: Fix lock recursion afs_wake_up_async_call()
CVE-2024-53091	In the Linux kernel, the following vulnerability has been resolved: bpf: Add sk_is_inet and IS_ICSK check in tls_sw
CVE-2024-53093	In the Linux kernel, the following vulnerability has been resolved: nvme-multipath: defer partition scanning We need
CVE-2024-53094	In the Linux kernel, the following vulnerability has been resolved: RDMA/siw: Add sendpage_ok() check to disable
CVE-2024-53095	In the Linux kernel, the following vulnerability has been resolved: smb: client: Fix use-after-free of network namesp
CVE-2024-53096	In the Linux kernel, the following vulnerability has been resolved: mm: resolve faulty mmap_region() error path beh
CVE-2024-53097	In the Linux kernel, the following vulnerability has been resolved: mm: krealloc: Fix MTE false alarm in __do_kreal
CVE-2024-53098	In the Linux kernel, the following vulnerability has been resolved: drm/xe/ufence: Prefetch ufence addr to catch bog
CVE-2024-53099	In the Linux kernel, the following vulnerability has been resolved: bpf: Check validity of link->type in bpf_link_sho
CVE-2024-53100	In the Linux kernel, the following vulnerability has been resolved: nvme: tcp: avoid race between queue_lock lock a
CVE-2024-53101	In the Linux kernel, the following vulnerability has been resolved: fs: Fix uninitialized value issue in from_kuid and
CVE-2024-53102	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-53103	In the Linux kernel, the following vulnerability has been resolved: hv_sock: Initializing vsk->trans to NULL to prev
CVE-2024-53104	In the Linux kernel, the following vulnerability has been resolved: media: uvcvideo: Skip parsing frames of type UV
CVE-2024-53105	In the Linux kernel, the following vulnerability has been resolved: mm: page_alloc: move mlocked flag clearance in
CVE-2024-53106	In the Linux kernel, the following vulnerability has been resolved: ima: fix buffer overrun in ima_eventdigest_init_c
CVE-2024-53107	In the Linux kernel, the following vulnerability has been resolved: fs/proc/task_mmu: prevent integer overflow in pa
CVE-2024-53108	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Adjust VSDB parser for replay
CVE-2024-53109	In the Linux kernel, the following vulnerability has been resolved: nommu: pass NULL argument to vma_iter_preall
CVE-2024-53110	In the Linux kernel, the following vulnerability has been resolved: vp_vdpa: fix id_table array not null terminated er
CVE-2024-53111	In the Linux kernel, the following vulnerability has been resolved: mm/mremap: fix address wraparound in move_pa
CVE-2024-53112	In the Linux kernel, the following vulnerability has been resolved: ocfs2: uncache inode which has failed entering th
CVE-2024-53113	In the Linux kernel, the following vulnerability has been resolved: mm: fix NULL pointer dereference in alloc_page
CVE-2024-53114	In the Linux kernel, the following vulnerability has been resolved: x86/CPU/AMD: Clear virtualized VMLOAD/VM
CVE-2024-53115	In the Linux kernel, the following vulnerability has been resolved: drm/vmwgfx: avoid null_ptr_deref in vmw_frame
CVE-2024-53117	In the Linux kernel, the following vulnerability has been resolved: virtio/vsock: Improve MSG_ZEROCOPY error h
CVE-2024-53118	In the Linux kernel, the following vulnerability has been resolved: vsock: Fix sk_error_queue memory leak Kernel q
CVE-2024-53119	In the Linux kernel, the following vulnerability has been resolved: virtio/vsock: Fix accept_queue memory leak As ti
CVE-2024-53120	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: CT: Fix null-ptr-deref in add rule err f
CVE-2024-53121	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: fs, lock FTE when checking if active Th
CVE-2024-53122	In the Linux kernel, the following vulnerability has been resolved: mptcp: cope racing subflow creation in mptcp_rcv
CVE-2024-53123	In the Linux kernel, the following vulnerability has been resolved: mptcp: error out earlier on disconnect Eric report
CVE-2024-53124	In the Linux kernel, the following vulnerability has been resolved: net: fix data-races around sk->sk_forward_alloc S
CVE-2024-53125	In the Linux kernel, the following vulnerability has been resolved: bpf: sync_linked_regs() must preserve subreg_de
CVE-2024-53126	In the Linux kernel, the following vulnerability has been resolved: vdpa: solidrun: Fix UB bug with devres In psnet_

CVE-2024-53127	In the Linux kernel, the following vulnerability has been resolved: Revert "mmc: dw_mmc: Fix IDMAC operation w
CVE-2024-53128	In the Linux kernel, the following vulnerability has been resolved: sched/task_stack: fix object_is_on_stack() for KA
CVE-2024-53129	In the Linux kernel, the following vulnerability has been resolved: drm/rockchip: vop: Fix a dereferenced before che
CVE-2024-53130	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix null-ptr-deref in block_dirty_buffer tra
CVE-2024-53131	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix null-ptr-deref in block_touch_buffer tra
CVE-2024-53133	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Handle dml allocation failure to
CVE-2024-53134	In the Linux kernel, the following vulnerability has been resolved: pmdomain: imx93-blk-ctrl: correct remove path T
CVE-2024-53135	In the Linux kernel, the following vulnerability has been resolved: KVM: VMX: Bury Intel PT virtualization (guest/
CVE-2024-53138	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: kTLS, Fix incorrect page refcounting
CVE-2024-53136	In the Linux kernel, the following vulnerability has been resolved: mm: revert "mm: shmem: fix data-race in shmem
CVE-2024-53139	In the Linux kernel, the following vulnerability has been resolved: sctp: fix possible UAF in sctp_v6_available() A l
CVE-2024-53141	In the Linux kernel, the following vulnerability has been resolved: netfilter: ipset: add missing range check in bitmap
CVE-2024-53140	In the Linux kernel, the following vulnerability has been resolved: netlink: terminate outstanding dump on socket clo
CVE-2024-53142	In the Linux kernel, the following vulnerability has been resolved: initramfs: avoid filename buffer overrun The initr
CVE-2024-53144	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_event: Align BR/EDR JUST_WO
CVE-2024-53145	In the Linux kernel, the following vulnerability has been resolved: um: Fix potential integer overflow during physme
CVE-2024-53147	In the Linux kernel, the following vulnerability has been resolved: exfat: fix out-of-bounds access of directory entrie
CVE-2024-53146	In the Linux kernel, the following vulnerability has been resolved: NFSD: Prevent a potential integer overflow If the
CVE-2024-53148	In the Linux kernel, the following vulnerability has been resolved: comedi: Flush partial mappings in error case If so
CVE-2024-53154	In the Linux kernel, the following vulnerability has been resolved: clk: clk-apple-nco: Add NULL check in applnco_
CVE-2024-53150	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Fix out of bounds reads when
CVE-2024-53151	In the Linux kernel, the following vulnerability has been resolved: svcrdma: Address an integer overflow Dan Carpe
CVE-2024-53155	In the Linux kernel, the following vulnerability has been resolved: ocfs2: fix uninitialized value in ocfs2_file_read_i
CVE-2024-53156	In the Linux kernel, the following vulnerability has been resolved: wifi: ath9k: add range check for conn_rsp_epid in
CVE-2024-53158	In the Linux kernel, the following vulnerability has been resolved: soc: qcom: geni-se: fix array underflow in geni_s
CVE-2024-53160	In the Linux kernel, the following vulnerability has been resolved: rcu/kvfree: Fix data-race in __mod_timer / kvfree
CVE-2024-53157	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scpi: Check the DVFS OPP count
CVE-2024-53161	In the Linux kernel, the following vulnerability has been resolved: EDAC/bluefield: Fix potential integer overflow T
CVE-2024-53162	In the Linux kernel, the following vulnerability has been resolved: crypto: qat/qat_4xxx - fix off by one in uof_get_n
CVE-2024-53164	In the Linux kernel, the following vulnerability has been resolved: net: sched: fix ordering of qlen adjustment Chang
CVE-2024-53163	In the Linux kernel, the following vulnerability has been resolved: crypto: qat/qat_420xx - fix off by one in uof_get_
CVE-2024-53166	In the Linux kernel, the following vulnerability has been resolved: block, bfq: fix bfqq uaf in bfq_limit_depth() Set n
CVE-2024-53165	In the Linux kernel, the following vulnerability has been resolved: sh: intc: Fix use-after-free bug in register_intc_co
CVE-2024-53169	In the Linux kernel, the following vulnerability has been resolved: nvme-fabrics: fix kernel crash while shutting dow
CVE-2024-53170	In the Linux kernel, the following vulnerability has been resolved: block: fix uaf for flush rq while iterating tags blk_
CVE-2024-53172	In the Linux kernel, the following vulnerability has been resolved: ubi: fastmap: Fix duplicate slab cache names whi
CVE-2024-53171	In the Linux kernel, the following vulnerability has been resolved: ubifs: authentication: Fix use-after-free in ubifs_t
CVE-2024-53168	In the Linux kernel, the following vulnerability has been resolved: sunrpc: fix one UAF issue caused by sunrpc kerno
CVE-2024-53173	In the Linux kernel, the following vulnerability has been resolved: NFSv4.0: Fix a use-after-free problem in the asyn
CVE-2024-53174	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: make sure cache entry active before ca

CVE-2024-53175	In the Linux kernel, the following vulnerability has been resolved: ipc: fix memleak if msg_init_ns failed in create_i
CVE-2024-53176	In the Linux kernel, the following vulnerability has been resolved: smb: During unmount, ensure all cached dir instan
CVE-2024-53177	In the Linux kernel, the following vulnerability has been resolved: smb: prevent use-after-free due to open_cached_c
CVE-2024-53178	In the Linux kernel, the following vulnerability has been resolved: smb: Don't leak cfid when reconnect races with o
CVE-2024-53180	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Add sanity NULL check for the defa
CVE-2024-53179	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix use-after-free of signing key Cust
CVE-2024-53181	In the Linux kernel, the following vulnerability has been resolved: um: vector: Do not use drvdata in release The drv
CVE-2024-53183	In the Linux kernel, the following vulnerability has been resolved: um: net: Do not use drvdata in release The drvdat
CVE-2024-53184	In the Linux kernel, the following vulnerability has been resolved: um: ubd: Do not use drvdata in release The drvda
CVE-2024-53187	In the Linux kernel, the following vulnerability has been resolved: io_uring: check for overflows in io_pin_pages W
CVE-2024-53185	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix NULL ptr deref in crypto_aead_s
CVE-2024-53190	In the Linux kernel, the following vulnerability has been resolved: wifi: rtlwifi: Drastically reduce the attempts to re
CVE-2024-53188	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix crash when unbinding If there is
CVE-2024-53194	In the Linux kernel, the following vulnerability has been resolved: PCI: Fix use-after-free of slot->bus on hot remov
CVE-2024-53191	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix warning when unbinding If there
CVE-2024-53195	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Get rid of userspace_irqchip_in_us
CVE-2024-53196	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Don't retire aborted MMIO instruct
CVE-2024-53197	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Fix potential out-of-bound acc
CVE-2024-53198	In the Linux kernel, the following vulnerability has been resolved: xen: Fix the issue of resource not being properly
CVE-2024-53200	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix null check for pipe_ctx->pl
CVE-2024-53201	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix null check for pipe_ctx->pl
CVE-2024-53202	In the Linux kernel, the following vulnerability has been resolved: firmware_loader: Fix possible resource leak in fw
CVE-2024-53203	In the Linux kernel, the following vulnerability has been resolved: usb: typec: fix potential array underflow in ucsi_c
CVE-2024-53206	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix use-after-free of nreq in reqsk_timer_han
CVE-2024-53209	In the Linux kernel, the following vulnerability has been resolved: bnxt_en: Fix receive ring space parameters when
CVE-2024-53207	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: MGMT: Fix possible deadlocks This f
CVE-2024-53208	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: MGMT: Fix slab-use-after-free Read i
CVE-2024-5321	A security issue was discovered in Kubernetes clusters with Windows nodes where BUILTIN\Users may be able to o
CVE-2024-53210	In the Linux kernel, the following vulnerability has been resolved: s390/iucv: MSG_PEEK causes memory leak in iu
CVE-2024-53213	In the Linux kernel, the following vulnerability has been resolved: net: usb: lan78xx: Fix double free issue with inter
CVE-2024-53214	In the Linux kernel, the following vulnerability has been resolved: vfio/pci: Properly hide first-in-list PCIe extended
CVE-2024-53215	In the Linux kernel, the following vulnerability has been resolved: svcrdma: fix miss destroy percpu_counter in svc_
CVE-2024-53216	In the Linux kernel, the following vulnerability has been resolved: nfsd: release svc_expkey/svc_export with rcu_wc
CVE-2024-53217	In the Linux kernel, the following vulnerability has been resolved: NFSD: Prevent NULL dereference in nfsd4_proc
CVE-2024-53218	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix race in concurrent f2fs_stop_gc_thread In
CVE-2024-53220	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to account dirty data in __get_secs_requi
CVE-2024-53219	In the Linux kernel, the following vulnerability has been resolved: virtiofs: use pages instead of pointer for kernel di
CVE-2024-53221	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix null-ptr-deref in f2fs_submit_page_bio()
CVE-2024-53222	In the Linux kernel, the following vulnerability has been resolved: zram: fix NULL pointer in comp_algorithm_show
CVE-2024-53226	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix NULL pointer dereference in hns

CVE-2024-53223	In the Linux kernel, the following vulnerability has been resolved: clk: ralink: mtmips: fix clocks probe order in older
CVE-2024-53224	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Move events notifier registration to
CVE-2024-53227	In the Linux kernel, the following vulnerability has been resolved: scsi: bfa: Fix use-after-free in bfad_im_module_e
CVE-2024-53228	In the Linux kernel, the following vulnerability has been resolved: riscv: kvm: Fix out-of-bounds array access In kvm
CVE-2024-53229	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Fix the qp flush warnings in req Wh
CVE-2024-53231	In the Linux kernel, the following vulnerability has been resolved: cpufreq: CPPC: Fix possible null-ptr-deref for cpy
CVE-2024-53232	In the Linux kernel, the following vulnerability has been resolved: iommu/s390: Implement blocking domain This fi
CVE-2024-53230	In the Linux kernel, the following vulnerability has been resolved: cpufreq: CPPC: Fix possible null-ptr-deref for cpy
CVE-2024-53233	In the Linux kernel, the following vulnerability has been resolved: unicode: Fix utf8_load() error path utf8_load() re
CVE-2024-53234	In the Linux kernel, the following vulnerability has been resolved: erofs: handle NONHEAD !delta[1] lclusters grace
CVE-2024-53236	In the Linux kernel, the following vulnerability has been resolved: xsk: Free skb when TX metadata options are inva
CVE-2024-53237	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: fix use-after-free in device_for_each_c
CVE-2024-53239	In the Linux kernel, the following vulnerability has been resolved: ALSA: 6fire: Release resources at card release Th
CVE-2024-53240	In the Linux kernel, the following vulnerability has been resolved: xen/netfront: fix crash when removing device Wh
CVE-2024-53241	In the Linux kernel, the following vulnerability has been resolved: x86/xen: don't do PV irect hypercall through hyper
CVE-2024-53259	quic-go is an implementation of the QUIC protocol in Go. An off-path attacker can inject an ICMP Packet Too Large
CVE-2024-53427	decNumberCopy in decNumber.c in jq through 1.7.1 does not properly consider that NaN is interpreted as numeric, r
CVE-2024-53580	iperf v3.17.1 was discovered to contain a segmentation violation via the iperf_exchange_parameters() function.
CVE-2024-53680	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix UB due to uninitialized stack access in ip
CVE-2024-53685	In the Linux kernel, the following vulnerability has been resolved: ceph: give up on paths longer than PATH_MAX
CVE-2024-53687	In the Linux kernel, the following vulnerability has been resolved: riscv: Fix IPIs usage in kfence_protect_page() flu
CVE-2024-53690	In the Linux kernel, the following vulnerability has been resolved: nilfs2: prevent use of deleted inode syzbot reporte
CVE-2024-53861	pyjwt is a JSON Web Token implementation in Python. An incorrect string comparison is run for `iss` checking, res
CVE-2024-53899	virtualenv before 20.26.6 allows command injection through the activation scripts for a virtual environment. Magic
CVE-2024-53920	In elisp-mode.el in GNU Emacs before 30.1, a user who chooses to invoke elisp-completion-at-point (for code comp
CVE-2024-53981	python-multipart is a streaming multipart parser for Python. When parsing form data, python-multipart skips line bre
CVE-2024-54193	In the Linux kernel, the following vulnerability has been resolved: accel/ivpu: Fix WARN in ivpu_ipc_send_receive
CVE-2024-54455	In the Linux kernel, the following vulnerability has been resolved: accel/ivpu: Fix general protection fault in ivpu_b
CVE-2024-54456	In the Linux kernel, the following vulnerability has been resolved: NFS: Fix potential buffer overflow in nfs_sysfs_li
CVE-2024-54460	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: iso: Fix circular lock in iso_listen_bis
CVE-2024-54534	The issue was addressed with improved memory handling. This issue is fixed in watchOS 11.2, visionOS 2.2, tvOS
CVE-2024-54683	In the Linux kernel, the following vulnerability has been resolved: netfilter: IDLETIMER: Fix for possible ABBA de
CVE-2024-55069	ffmpeg 7.1 is vulnerable to Null Pointer Dereference in function iamf_read_header in /libavformat/iamfdec.c.
CVE-2024-5535	Issue summary: Calling the OpenSSL API function SSL_select_next_proto with an empty supported client protocols
CVE-2024-55459	An issue in keras 3.7.0 allows attackers to write arbitrary files to the user's machine via downloading a crafted tar fil
CVE-2024-55549	xsltGetInheritedNsList in libxslt before 1.1.43 has a use-after-free issue related to exclusion of result prefixes.
CVE-2024-5569	A Denial of Service (DoS) vulnerability exists in the jaraco/zip library, affecting all versions prior to 3.19.1. The v
CVE-2024-55639	In the Linux kernel, the following vulnerability has been resolved: net: renesas: rswitch: avoid use-after-put for a dev
CVE-2024-55881	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Play nice with protected guests in con
CVE-2024-55916	In the Linux kernel, the following vulnerability has been resolved: Drivers: hv: util: Avoid accessing a ringbuffer no

CVE-2024-56128	Incorrect Implementation of Authentication Algorithm in Apache Kafka's SCRAM implementation. Issue Summary:
CVE-2024-56171	libxml2 before 2.12.10 and 2.13.x before 2.13.6 has a use-after-free in xmlSchemaIDCFillNodeTables and xmlSchema
CVE-2024-56201	Jinja is an extensible templating engine. In versions on the 3.x branch prior to 3.1.5, a bug in the Jinja compiler allow
CVE-2024-56326	Jinja is an extensible templating engine. Prior to 3.1.5, An oversight in how the Jinja sandboxed environment detects
CVE-2024-56337	Time-of-check Time-of-use (TOCTOU) Race Condition vulnerability in Apache Tomcat. This issue affects Apache
CVE-2024-56368	In the Linux kernel, the following vulnerability has been resolved: ring-buffer: Fix overflow in __rb_map_vma An o
CVE-2024-56369	In the Linux kernel, the following vulnerability has been resolved: drm/modes: Avoid divide by zero harder in drm_
CVE-2024-56372	In the Linux kernel, the following vulnerability has been resolved: net: tun: fix tun_napi_alloc_frags() syzbot reporte
CVE-2024-56374	An issue was discovered in Django 5.1 before 5.1.5, 5.0 before 5.0.11, and 4.2 before 4.2.18. Lack of upper-bound li
CVE-2024-56406	A heap buffer overflow vulnerability was discovered in Perl. Release branches 5.34, 5.36, 5.38 and 5.40 are affected
CVE-2024-56433	shadow-utils (aka shadow) 4.4 through 4.17.0 establishes a default /etc/subuid behavior (e.g., uid 100000 through 16
CVE-2024-5642	CPython 3.9 and earlier doesn't disallow configuring an empty list ([""]) for SSLContext.set_npn_protocols() which
CVE-2024-56531	In the Linux kernel, the following vulnerability has been resolved: ALSA: caiaq: Use snd_card_free_when_closed()
CVE-2024-56532	In the Linux kernel, the following vulnerability has been resolved: ALSA: us122l: Use snd_card_free_when_closed()
CVE-2024-56533	In the Linux kernel, the following vulnerability has been resolved: ALSA: usx2y: Use snd_card_free_when_closed()
CVE-2024-56538	In the Linux kernel, the following vulnerability has been resolved: drm: zynqmp_kms: Unplug DRM device before r
CVE-2024-56539	In the Linux kernel, the following vulnerability has been resolved: wifi: mwifiex: Fix memcpy() field-spanning write
CVE-2024-56540	In the Linux kernel, the following vulnerability has been resolved: accel/ivpu: Prevent recovery invocation during pr
CVE-2024-56543	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: Skip Rx TID cleanup for self peer D
CVE-2024-56544	In the Linux kernel, the following vulnerability has been resolved: udmabuf: change folios array from kmalloc to kv
CVE-2024-56546	In the Linux kernel, the following vulnerability has been resolved: drivers: soc: xilinx: add the missing kfree in xlnx
CVE-2024-56545	In the Linux kernel, the following vulnerability has been resolved: HID: hyperv: streamline driver probe to avoid dev
CVE-2024-56548	In the Linux kernel, the following vulnerability has been resolved: hfsplus: don't query the device logical block size
CVE-2024-56549	In the Linux kernel, the following vulnerability has been resolved: cachefiles: Fix NULL pointer dereference in obje
CVE-2024-56550	In the Linux kernel, the following vulnerability has been resolved: s390/stacktrace: Use break instead of return stat
CVE-2024-56551	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix usage slab after free [+0.00002
CVE-2024-56552	In the Linux kernel, the following vulnerability has been resolved: drm/xe/guc_submit: fix race around suspend_pen
CVE-2024-56557	In the Linux kernel, the following vulnerability has been resolved: iio: adc: ad7923: Fix buffer overflow for tx_buf a
CVE-2024-56558	In the Linux kernel, the following vulnerability has been resolved: nfsd: make sure exp active before svc_export_sho
CVE-2024-56561	In the Linux kernel, the following vulnerability has been resolved: PCI: endpoint: Fix PCI domain ID release in pci_
CVE-2024-56565	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to drop all discards after creating snapshe
CVE-2024-56562	In the Linux kernel, the following vulnerability has been resolved: i3c: master: Fix miss free init_dyn_addr at i3c_m
CVE-2024-56566	In the Linux kernel, the following vulnerability has been resolved: mm/slub: Avoid list corruption when removing a
CVE-2024-56567	In the Linux kernel, the following vulnerability has been resolved: ad7780: fix division by zero in ad7780_write_raw
CVE-2024-56568	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: Defer probe of clients after sm
CVE-2024-56569	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix regression with module command in st
CVE-2024-56570	In the Linux kernel, the following vulnerability has been resolved: ovl: Filter invalid inodes with missing lookup fun
CVE-2024-56572	In the Linux kernel, the following vulnerability has been resolved: media: platform: allegro-dvt: Fix possible memor
CVE-2024-56573	In the Linux kernel, the following vulnerability has been resolved: efi/libstub: Free correct pointer on failure cmdline
CVE-2024-56575	In the Linux kernel, the following vulnerability has been resolved: media: imx-jpeg: Ensure power suppliers be susp

CVE-2024-56574	In the Linux kernel, the following vulnerability has been resolved: media: ts2020: fix null-ptr-deref in ts2020_probe
CVE-2024-56576	In the Linux kernel, the following vulnerability has been resolved: media: i2c: tc358743: Fix crash in the probe error
CVE-2024-56577	In the Linux kernel, the following vulnerability has been resolved: media: mtk-jpeg: Fix null-ptr-deref during unload
CVE-2024-56578	In the Linux kernel, the following vulnerability has been resolved: media: imx-jpeg: Set video drvdata before register
CVE-2024-56579	In the Linux kernel, the following vulnerability has been resolved: media: amphion: Set video drvdata before register
CVE-2024-56580	In the Linux kernel, the following vulnerability has been resolved: media: qcom: camss: fix error path on configurati
CVE-2024-56581	In the Linux kernel, the following vulnerability has been resolved: btrfs: ref-verify: fix use-after-free after invalid ref
CVE-2024-56582	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix use-after-free in btrfs_encoded_read_en
CVE-2024-56583	In the Linux kernel, the following vulnerability has been resolved: sched/deadline: Fix warning in migrate_enable fo
CVE-2024-56584	In the Linux kernel, the following vulnerability has been resolved: io_uring/tctx: work around xa_store() allocation e
CVE-2024-56586	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix f2fs_bug_on when uninstalling filesystem
CVE-2024-56587	In the Linux kernel, the following vulnerability has been resolved: leds: class: Protect brightness_show() with led_co
CVE-2024-56588	In the Linux kernel, the following vulnerability has been resolved: scsi: hisi_sas: Create all dump files during debug
CVE-2024-56589	In the Linux kernel, the following vulnerability has been resolved: scsi: hisi_sas: Add cond_resched() for no forced p
CVE-2024-56590	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_core: Fix not checking skb length
CVE-2024-56591	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_conn: Use disable_delayed_work
CVE-2024-56592	In the Linux kernel, the following vulnerability has been resolved: bpf: Call free_htab_elem() after htab_unlock_buc
CVE-2024-56593	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmfmac: Fix oops due to NULL pointer de
CVE-2024-56594	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: set the right AMDGPU sg segment
CVE-2024-56595	In the Linux kernel, the following vulnerability has been resolved: jfs: add a check to prevent array-index-out-of-bou
CVE-2024-56596	In the Linux kernel, the following vulnerability has been resolved: jfs: fix array-index-out-of-bounds in jfs_readdir T
CVE-2024-56597	In the Linux kernel, the following vulnerability has been resolved: jfs: fix shift-out-of-bounds in dbSplit When dmt_
CVE-2024-56598	In the Linux kernel, the following vulnerability has been resolved: jfs: array-index-out-of-bounds fix in dtReadFirst
CVE-2024-56599	In the Linux kernel, the following vulnerability has been resolved: wifi: ath10k: avoid NULL pointer error during sd
CVE-2024-56601	In the Linux kernel, the following vulnerability has been resolved: net: inet: do not leave a dangling sk pointer in ine
CVE-2024-56600	In the Linux kernel, the following vulnerability has been resolved: net: inet6: do not leave a dangling sk pointer in in
CVE-2024-56602	In the Linux kernel, the following vulnerability has been resolved: net: ieee802154: do not leave a dangling sk point
CVE-2024-56603	In the Linux kernel, the following vulnerability has been resolved: net: af_can: do not leave a dangling sk pointer in
CVE-2024-56604	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: RFCOMM: avoid leaving dangling sk
CVE-2024-56605	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: do not leave dangling sk poin
CVE-2024-56606	In the Linux kernel, the following vulnerability has been resolved: af_packet: avoid erroring out after sock_init_data
CVE-2024-56607	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix atomic calls in ath12k_mac_op_
CVE-2024-56608	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix out-of-bounds access in 'dc
CVE-2024-56609	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw88: use ieee80211_purge_tx_queue() to p
CVE-2024-56610	In the Linux kernel, the following vulnerability has been resolved: kcsan: Turn report_filterlist_lock into a raw_spin
CVE-2024-56611	In the Linux kernel, the following vulnerability has been resolved: mm/mempolicy: fix migrate_to_node() assuming
CVE-2024-56613	In the Linux kernel, the following vulnerability has been resolved: sched/numa: fix memory leak due to the overwrit
CVE-2024-56614	In the Linux kernel, the following vulnerability has been resolved: xsk: fix OOB map writes when deleting elements
CVE-2024-56615	In the Linux kernel, the following vulnerability has been resolved: bpf: fix OOB devmap writes when deleting eleme
CVE-2024-56616	In the Linux kernel, the following vulnerability has been resolved: drm/dp_mst: Fix MST sideband message body len

CVE-2024-56617	In the Linux kernel, the following vulnerability has been resolved: cacheinfo: Allocate memory during CPU hotplug
CVE-2024-56619	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix potential out-of-bounds memory access
CVE-2024-56620	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: qcom: Only free platform MSIs when E
CVE-2024-56621	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Cancel RTC work during ufshcd_r
CVE-2024-56622	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: sysfs: Prevent div by zero Prevent
CVE-2024-56623	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix use after free on unload System
CVE-2024-56625	In the Linux kernel, the following vulnerability has been resolved: can: dev: can_set_termination(): allow sleeping G
CVE-2024-56626	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix Out-of-Bounds Write in ksmbd_vfs_st
CVE-2024-56627	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix Out-of-Bounds Read in ksmbd_vfs_st
CVE-2024-56629	In the Linux kernel, the following vulnerability has been resolved: HID: wacom: fix when get product name maybe n
CVE-2024-56630	In the Linux kernel, the following vulnerability has been resolved: ocfs2: free inode when ocfs2_get_init_inode() fai
CVE-2024-56631	In the Linux kernel, the following vulnerability has been resolved: scsi: sg: Fix slab-use-after-free read in sg_release
CVE-2024-56632	In the Linux kernel, the following vulnerability has been resolved: nvme-tcp: fix the memleak while create new ctrl
CVE-2024-56633	In the Linux kernel, the following vulnerability has been resolved: tcp_bpf: Fix the sk_mem_uncharge logic in tcp_b
CVE-2024-56634	In the Linux kernel, the following vulnerability has been resolved: gpio: grgpio: Add NULL check in grgpio_probe
CVE-2024-56635	In the Linux kernel, the following vulnerability has been resolved: net: avoid potential UAF in default_operstate() sy
CVE-2024-56636	In the Linux kernel, the following vulnerability has been resolved: geneve: do not assume mac header is set in geneve
CVE-2024-56637	In the Linux kernel, the following vulnerability has been resolved: netfilter: ipset: Hold module reference while requ
CVE-2024-56638	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_inner: incorrect percpu area handling
CVE-2024-56639	In the Linux kernel, the following vulnerability has been resolved: net: hsr: must allocate more bytes for RedBox sup
CVE-2024-56640	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix LGR and link use-after-free issue We
CVE-2024-56641	In the Linux kernel, the following vulnerability has been resolved: net/smc: initialize close_work early to avoid warn
CVE-2024-56642	In the Linux kernel, the following vulnerability has been resolved: tipc: Fix use-after-free of kernel socket in cleanup
CVE-2024-56643	In the Linux kernel, the following vulnerability has been resolved: dccp: Fix memory leak in dccp_feat_change_recv
CVE-2024-56644	In the Linux kernel, the following vulnerability has been resolved: net/ipv6: release expired exception dst cached in s
CVE-2024-56645	In the Linux kernel, the following vulnerability has been resolved: can: j1939: j1939_session_new(): fix skb referenc
CVE-2024-56647	In the Linux kernel, the following vulnerability has been resolved: net: Fix icmp host relookup triggering ip_rt_bug
CVE-2024-56648	In the Linux kernel, the following vulnerability has been resolved: net: hsr: avoid potential out-of-bound access in fi
CVE-2024-56649	In the Linux kernel, the following vulnerability has been resolved: net: enetc: Do not configure preemptible TCs if S
CVE-2024-56650	In the Linux kernel, the following vulnerability has been resolved: netfilter: x_tables: fix LED ID check in led_tg_ch
CVE-2024-56651	In the Linux kernel, the following vulnerability has been resolved: can: hi311x: hi3110_can_ist(): fix potential use-a
CVE-2024-56652	In the Linux kernel, the following vulnerability has been resolved: drm/xe/reg_sr: Remove register pool That pool in
CVE-2024-56653	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btmtk: avoid UAF in btmtk_process_c
CVE-2024-56654	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_event: Fix using rcu_read_(un)loc
CVE-2024-56656	In the Linux kernel, the following vulnerability has been resolved: bnxt_en: Fix aggregation ID mask to prevent oop
CVE-2024-56657	In the Linux kernel, the following vulnerability has been resolved: ALSA: control: Avoid WARN() for symlink error
CVE-2024-56658	In the Linux kernel, the following vulnerability has been resolved: net: defer final 'struct net' free in netns dismantl
CVE-2024-56659	In the Linux kernel, the following vulnerability has been resolved: net: lapb: increase LAPB_HEADER_LEN It is un
CVE-2024-56660	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: DR, prevent potential error pointer dere
CVE-2024-56662	In the Linux kernel, the following vulnerability has been resolved: acpi: nfit: vmlalloc-out-of-bounds Read in acpi_nf

CVE-2024-56663	In the Linux kernel, the following vulnerability has been resolved: wifi: nl80211: fix NL80211_ATTR_MLO_LINK
CVE-2024-56664	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix race between element replace a
CVE-2024-56665	In the Linux kernel, the following vulnerability has been resolved: bpf,perf: Fix invalid prog_array access in perf_ev
CVE-2024-56667	In the Linux kernel, the following vulnerability has been resolved: drm/i915: Fix NULL pointer dereference in captu
CVE-2024-56670	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: u_serial: Fix the issue that gs_start i
CVE-2024-56671	In the Linux kernel, the following vulnerability has been resolved: gpio: graniterapids: Fix vGPIO driver crash Move
CVE-2024-56672	In the Linux kernel, the following vulnerability has been resolved: blk-cgroup: Fix UAF in blkcg_unpin_online() blk
CVE-2024-56674	In the Linux kernel, the following vulnerability has been resolved: virtio_net: correct netdev_tx_reset_queue() invoc
CVE-2024-56675	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix UAF via mismatching bpf_prog/attachme
CVE-2024-56677	In the Linux kernel, the following vulnerability has been resolved: powerpc/fadump: Move fadump_cma_init to setu
CVE-2024-56678	In the Linux kernel, the following vulnerability has been resolved: powerpc/mm/fault: Fix kfence page fault reportin
CVE-2024-56681	In the Linux kernel, the following vulnerability has been resolved: crypto: bcm - add error check in the ahash_hmac
CVE-2024-56679	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: handle otx2_mbox_get_rsp errors in
CVE-2024-56683	In the Linux kernel, the following vulnerability has been resolved: drm/vc4: hdmi: Avoid hang with debug registers
CVE-2024-56687	In the Linux kernel, the following vulnerability has been resolved: usb: musb: Fix hardware lockup on first Rx endp
CVE-2024-56685	In the Linux kernel, the following vulnerability has been resolved: ASoC: mediatek: Check num_codecs is not zero t
CVE-2024-56688	In the Linux kernel, the following vulnerability has been resolved: sunrpc: clear XPRT_SOCKET_UPD_TIMEOUT wh
CVE-2024-56689	In the Linux kernel, the following vulnerability has been resolved: PCI: endpoint: epf-mhi: Avoid NULL dereference
CVE-2024-56690	In the Linux kernel, the following vulnerability has been resolved: crypto: pccrypt - Call crypto layer directly when p
CVE-2024-56691	In the Linux kernel, the following vulnerability has been resolved: mfd: intel_soc_pmic_bxtwc: Use IRQ domain for
CVE-2024-56692	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to do sanity check on node blkaddr in tru
CVE-2024-56693	In the Linux kernel, the following vulnerability has been resolved: brd: defer automatic disk creation until module in
CVE-2024-56694	In the Linux kernel, the following vulnerability has been resolved: bpf: fix recursive lock when verdict program retu
CVE-2024-56698	In the Linux kernel, the following vulnerability has been resolved: usb: dwc3: gadget: Fix looping of queued SG entr
CVE-2024-56700	In the Linux kernel, the following vulnerability has been resolved: media: wl128x: Fix atomicity violation in fmc_se
CVE-2024-56701	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries: Fix dtl_access_lock to be a rw_
CVE-2024-56702	In the Linux kernel, the following vulnerability has been resolved: bpf: Mark raw_tp arguments with PTR_MAYBE
CVE-2024-56703	In the Linux kernel, the following vulnerability has been resolved: ipv6: Fix soft lockups in fib6_select_path under h
CVE-2024-56705	In the Linux kernel, the following vulnerability has been resolved: media: atomisp: Add check for rgb_data memor
CVE-2024-56704	In the Linux kernel, the following vulnerability has been resolved: 9p/xen: fix release of IRQ Kernel logs indicate an
CVE-2024-56707	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: handle otx2_mbox_get_rsp errors in
CVE-2024-56708	In the Linux kernel, the following vulnerability has been resolved: EDAC/igen6: Avoid segmentation fault on modul
CVE-2024-56709	In the Linux kernel, the following vulnerability has been resolved: io_uring: check if iowq is killed before queuing ta
CVE-2024-56710	In the Linux kernel, the following vulnerability has been resolved: ceph: fix memory leak in ceph_direct_read_writes
CVE-2024-56712	In the Linux kernel, the following vulnerability has been resolved: udmabuf: fix memory leak on last export_udmabu
CVE-2024-56715	In the Linux kernel, the following vulnerability has been resolved: ionic: Fix netdev notifier unregister on failure If r
CVE-2024-56716	In the Linux kernel, the following vulnerability has been resolved: netdevsim: prevent bad user input in nsim_dev_h
CVE-2024-56717	In the Linux kernel, the following vulnerability has been resolved: net: msc: ocelot: fix incorrect IFH SRC_PORT f
CVE-2024-56718	In the Linux kernel, the following vulnerability has been resolved: net/smc: protect link down work from execute aft
CVE-2024-56719	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: fix TSO DMA API usage causing o

CVE-2024-56720	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Several fixes to bpf_msg_pop_data
CVE-2024-56721	In the Linux kernel, the following vulnerability has been resolved: x86/CPU/AMD: Terminate the erratum_1386_mi
CVE-2024-56722	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix cpu stuck caused by printings du
CVE-2024-56723	In the Linux kernel, the following vulnerability has been resolved: mfd: intel_soc_pmic_bxtwc: Use IRQ domain for
CVE-2024-56724	In the Linux kernel, the following vulnerability has been resolved: mfd: intel_soc_pmic_bxtwc: Use IRQ domain for
CVE-2024-56725	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: handle otx2_mbox_get_rsp errors in
CVE-2024-56726	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: handle otx2_mbox_get_rsp errors in
CVE-2024-56727	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: handle otx2_mbox_get_rsp errors in
CVE-2024-56728	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: handle otx2_mbox_get_rsp errors in
CVE-2024-56729	In the Linux kernel, the following vulnerability has been resolved: smb: Initialize cfid->tcon before performing netw
CVE-2024-56739	In the Linux kernel, the following vulnerability has been resolved: rtc: check if __rtc_read_time was successful in rtc
CVE-2024-56744	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to avoid potential deadlock in f2fs_recor
CVE-2024-56742	In the Linux kernel, the following vulnerability has been resolved: vfio/mlx5: Fix an unwind issue in mlx5vf_add_m
CVE-2024-56745	In the Linux kernel, the following vulnerability has been resolved: PCI: Fix reset_method_store() memory leak In re
CVE-2024-56746	In the Linux kernel, the following vulnerability has been resolved: fbdev: sh7760fb: Fix a possible memory leak in s
CVE-2024-56747	In the Linux kernel, the following vulnerability has been resolved: scsi: qedi: Fix a possible memory leak in qedi_all
CVE-2024-56751	In the Linux kernel, the following vulnerability has been resolved: ipv6: release nexthop on device removal The CI i
CVE-2024-56748	In the Linux kernel, the following vulnerability has been resolved: scsi: qedf: Fix a possible memory leak in qedf_all
CVE-2024-56752	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau/gr/gf100: Fix missing unlock in gf1
CVE-2024-56755	In the Linux kernel, the following vulnerability has been resolved: netfs/fscache: Add a memory barrier for FSCACHE
CVE-2024-56754	In the Linux kernel, the following vulnerability has been resolved: crypto: caam - Fix the pointer passed to caam_qi
CVE-2024-56756	In the Linux kernel, the following vulnerability has been resolved: nvme-pci: fix freeing of the HMB descriptor table
CVE-2024-56757	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btusb: mediatek: add intf release flow
CVE-2024-56758	In the Linux kernel, the following vulnerability has been resolved: btrfs: check folio mapping after unlock in relocat
CVE-2024-56759	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix use-after-free when COWing tree bock a
CVE-2024-56760	In the Linux kernel, the following vulnerability has been resolved: PCI/MSI: Handle lack of irqdomain gracefully Al
CVE-2024-56761	In the Linux kernel, the following vulnerability has been resolved: x86/fred: Clear WFE in missing-ENDBRANCH #
CVE-2024-56763	In the Linux kernel, the following vulnerability has been resolved: tracing: Prevent bad count for tracing_cpumask_v
CVE-2024-56764	In the Linux kernel, the following vulnerability has been resolved: ublk: detach gendisk from ublk device if add_dish
CVE-2024-56765	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries/vas: Add close() callback in vas_
CVE-2024-56767	In the Linux kernel, the following vulnerability has been resolved: dmaengine: at_xdmac: avoid null_prt_deref in at_
CVE-2024-56769	In the Linux kernel, the following vulnerability has been resolved: media: dvb-frontends: dib3000mb: fix uninit-valu
CVE-2024-56770	In the Linux kernel, the following vulnerability has been resolved: net/sched: netem: account for backlog updates fro
CVE-2024-56771	In the Linux kernel, the following vulnerability has been resolved: mtd: spinand: winbond: Fix 512GW, 01GW, 01JW
CVE-2024-56772	In the Linux kernel, the following vulnerability has been resolved: kunit: string-stream: Fix a UAF bug in kunit_init
CVE-2024-56773	In the Linux kernel, the following vulnerability has been resolved: kunit: Fix potential null dereference in kunit_dev
CVE-2024-56774	In the Linux kernel, the following vulnerability has been resolved: btrfs: add a sanity check for btrfs root in btrfs_se
CVE-2024-56775	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix handling of plane refcount
CVE-2024-56776	In the Linux kernel, the following vulnerability has been resolved: drm/sti: avoid potential dereference of error point
CVE-2024-56777	In the Linux kernel, the following vulnerability has been resolved: drm/sti: avoid potential dereference of error point

CVE-2024-56778	In the Linux kernel, the following vulnerability has been resolved: drm/sti: avoid potential dereference of error pointer
CVE-2024-56779	In the Linux kernel, the following vulnerability has been resolved: nfsd: fix nfs4_openowner leak when concurrent m
CVE-2024-56780	In the Linux kernel, the following vulnerability has been resolved: quota: flush quota_release_work upon quota write
CVE-2024-56781	In the Linux kernel, the following vulnerability has been resolved: powerpc/prom_init: Fixup missing powermac #si
CVE-2024-56782	In the Linux kernel, the following vulnerability has been resolved: ACPI: x86: Add adev NULL check to acpi_quirk
CVE-2024-56783	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_socket: remove WARN_ON_ONCE
CVE-2024-56784	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Adding array index check to pr
CVE-2024-56785	In the Linux kernel, the following vulnerability has been resolved: MIPS: Loongson64: DTS: Really fix PCIe port n
CVE-2024-56786	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-56787	In the Linux kernel, the following vulnerability has been resolved: soc: imx8m: Probe the SoC driver as platform dri
CVE-2024-56788	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: oa_tc6: fix tx skb race condition bet
CVE-2024-57360	https://www.gnu.org/software/binutils/ nm >=2.43 is affected by: Incorrect Access Control. The type of exploitation
CVE-2024-57699	A security issue was found in Netplex Json-smart 2.5.0 through 2.5.1. When loading a specially crafted JSON input,
CVE-2024-5742	A vulnerability was found in GNU Nano that allows a possible privilege escalation through an insecure temporary fi
CVE-2024-57791	In the Linux kernel, the following vulnerability has been resolved: net/smc: check return value of sock_recvmg
CVE-2024-57792	In the Linux kernel, the following vulnerability has been resolved: power: supply: gpio-charger: Fix set charge curre
CVE-2024-57793	In the Linux kernel, the following vulnerability has been resolved: virt: tdx-guest: Just leak decrypted memory on un
CVE-2024-57795	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Remove the direct link to net_device
CVE-2024-57798	In the Linux kernel, the following vulnerability has been resolved: drm/dp_mst: Ensure mst_primary pointer is valid
CVE-2024-57801	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Skip restore TC rules for vport rep wit
CVE-2024-57802	In the Linux kernel, the following vulnerability has been resolved: netrom: check buffer length before accessing it S
CVE-2024-57804	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix corrupt config pages PHY state
CVE-2024-57805	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: hda-dai: Do not release the lin
CVE-2024-57807	In the Linux kernel, the following vulnerability has been resolved: scsi: megaraid_sas: Fix for a potential deadlock T
CVE-2024-57806	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix transaction atomicity bug when enabling
CVE-2024-57809	In the Linux kernel, the following vulnerability has been resolved: PCI: imx6: Fix suspend/resume support on i.MX6
CVE-2024-57834	In the Linux kernel, the following vulnerability has been resolved: media: vidtv: Fix a null-ptr-deref in vidtv_mux_s
CVE-2024-57838	In the Linux kernel, the following vulnerability has been resolved: s390/entry: Mark IRQ entries to fix stack depot w
CVE-2024-57841	In the Linux kernel, the following vulnerability has been resolved: net: fix memory leak in tcp_conn_request() If ine
CVE-2024-57843	In the Linux kernel, the following vulnerability has been resolved: virtio-net: fix overflow inside virtnet_rq_alloc W
CVE-2024-57849	In the Linux kernel, the following vulnerability has been resolved: s390/cpum_sf: Handle CPU hotplug remove durin
CVE-2024-57850	In the Linux kernel, the following vulnerability has been resolved: jffs2: Prevent rtime decompress memory corrupti
CVE-2024-57852	In the Linux kernel, the following vulnerability has been resolved: firmware: qcom: scm: smc: Handle missing SCM
CVE-2024-57857	In the Linux kernel, the following vulnerability has been resolved: RDMA/siw: Remove direct link to net_device Do
CVE-2024-57872	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: pltfm: Dellocate HBA during ufshcd_p
CVE-2024-57874	In the Linux kernel, the following vulnerability has been resolved: arm64: ptrace: fix partial SETREGSET for NT_A
CVE-2024-57875	In the Linux kernel, the following vulnerability has been resolved: block: RCU protect disk->conv_zones_bitmap Er
CVE-2024-57876	In the Linux kernel, the following vulnerability has been resolved: drm/dp_mst: Fix resetting msg rx state after topol
CVE-2024-57879	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: iso: Always release hdev at the end of
CVE-2024-57882	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix TCP options overflow. Syzbot reporte

CVE-2024-57884	In the Linux kernel, the following vulnerability has been resolved: mm: vmscan: account for free pages to prevent in
CVE-2024-57883	In the Linux kernel, the following vulnerability has been resolved: mm: hugetlb: independent PMD page table shared
CVE-2024-57885	In the Linux kernel, the following vulnerability has been resolved: mm/kmemleak: fix sleeping function called from
CVE-2024-57888	In the Linux kernel, the following vulnerability has been resolved: workqueue: Do not warn when cancelling WQ_M
CVE-2024-57887	In the Linux kernel, the following vulnerability has been resolved: drm: adv7511: Fix use-after-free in adv7533_atta
CVE-2024-57889	In the Linux kernel, the following vulnerability has been resolved: pinctrl: mcp23s08: Fix sleeping in atomic context
CVE-2024-57890	In the Linux kernel, the following vulnerability has been resolved: RDMA/uverbs: Prevent integer overflow issue In
CVE-2024-57892	In the Linux kernel, the following vulnerability has been resolved: ocfs2: fix slab-use-after-free due to dangling poin
CVE-2024-57893	In the Linux kernel, the following vulnerability has been resolved: ALSA: seq: oss: Fix races at processing SysEx m
CVE-2024-57894	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-57896	In the Linux kernel, the following vulnerability has been resolved: btrfs: flush delalloc workers queue before stoppin
CVE-2024-57895	In the Linux kernel, the following vulnerability has been resolved: ksmbd: set ATTR_CTIME flags when setting mtm
CVE-2024-57898	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: clear link ID from bitmap during
CVE-2024-57897	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Correct the migration DMA map di
CVE-2024-57899	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix mbss changed flags corruptio
CVE-2024-57900	In the Linux kernel, the following vulnerability has been resolved: ila: serialize calls to nf_register_net_hooks() syzbu
CVE-2024-57902	In the Linux kernel, the following vulnerability has been resolved: af_packet: fix vlan_get_tci() vs MSG_PEEK Blan
CVE-2024-57903	In the Linux kernel, the following vulnerability has been resolved: net: restrict SO_REUSEPORT to inet sockets Aft
CVE-2024-57904	In the Linux kernel, the following vulnerability has been resolved: iio: adc: at91: call input_free_device() on allocate
CVE-2024-57901	In the Linux kernel, the following vulnerability has been resolved: af_packet: fix vlan_get_protocol_dgram() vs MSG
CVE-2024-57906	In the Linux kernel, the following vulnerability has been resolved: iio: adc: ti-ads8688: fix information leak in trigge
CVE-2024-57907	In the Linux kernel, the following vulnerability has been resolved: iio: adc: rockchip_saradc: fix information leak in
CVE-2024-57908	In the Linux kernel, the following vulnerability has been resolved: iio: imu: kmx61: fix information leak in triggered
CVE-2024-57910	In the Linux kernel, the following vulnerability has been resolved: iio: light: vcnl4035: fix information leak in trigge
CVE-2024-57911	In the Linux kernel, the following vulnerability has been resolved: iio: dummy: iio_simply_dummy_buffer: fix infor
CVE-2024-57912	In the Linux kernel, the following vulnerability has been resolved: iio: pressure: zpa2326: fix information leak in trig
CVE-2024-57913	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: f_fs: Remove WARN_ON in functio
CVE-2024-57916	In the Linux kernel, the following vulnerability has been resolved: misc: microchip: pci1xxx: Resolve kernel panic
CVE-2024-57922	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Add check for granularity in dr
CVE-2024-57917	In the Linux kernel, the following vulnerability has been resolved: topology: Keep the cpumask unchanged when pri
CVE-2024-57924	In the Linux kernel, the following vulnerability has been resolved: fs: relax assertions on failure to encode file handl
CVE-2024-57925	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix a missing return value check bug In th
CVE-2024-57926	In the Linux kernel, the following vulnerability has been resolved: drm/mediatek: Set private->all_drm_private[i]->c
CVE-2024-57930	In the Linux kernel, the following vulnerability has been resolved: tracing: Have process_string() also allow arrays I
CVE-2024-57931	In the Linux kernel, the following vulnerability has been resolved: selinux: ignore unknown extended permissions W
CVE-2024-57929	In the Linux kernel, the following vulnerability has been resolved: dm array: fix releasing a faulty array block twice
CVE-2024-57932	In the Linux kernel, the following vulnerability has been resolved: gve: guard XDP xmit NDO on existence of xdp q
CVE-2024-57938	In the Linux kernel, the following vulnerability has been resolved: net/sctp: Prevent autoclose integer overflow in sc
CVE-2024-57933	In the Linux kernel, the following vulnerability has been resolved: gve: guard XSK operations on the existence of qu
CVE-2024-57939	In the Linux kernel, the following vulnerability has been resolved: riscv: Fix sleeping in invalid context in die() die()

CVE-2024-57940	In the Linux kernel, the following vulnerability has been resolved: exfat: fix the infinite loop in exfat_readdir() If the
CVE-2024-57945	In the Linux kernel, the following vulnerability has been resolved: riscv: mm: Fix the out of bound issue of vmemman
CVE-2024-57946	In the Linux kernel, the following vulnerability has been resolved: virtio-blk: don't keep queue frozen during system
CVE-2024-57947	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_set_pipapo: fix initial map fill The in
CVE-2024-57948	In the Linux kernel, the following vulnerability has been resolved: mac802154: check local interfaces before deleting
CVE-2024-57949	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3-its: Don't enable interrupts in its_in
CVE-2024-57950	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Initialize denominator defaults
CVE-2024-57951	In the Linux kernel, the following vulnerability has been resolved: hrtimers: Handle CPU state correctly on hotplug
CVE-2024-57973	In the Linux kernel, the following vulnerability has been resolved: rdma/cxgb4: Prevent potential integer overflow o
CVE-2024-57952	In the Linux kernel, the following vulnerability has been resolved: Revert "libfs: fix infinite directory reads for offse
CVE-2024-57970	libarchive through 3.7.7 has a heap-based buffer over-read in header_gnu_longlink in archive_read_support_format
CVE-2024-57974	In the Linux kernel, the following vulnerability has been resolved: udp: Deal with race between UDP socket address
CVE-2024-57975	In the Linux kernel, the following vulnerability has been resolved: btrfs: do proper folio cleanup when run_delalloc_
CVE-2024-57978	In the Linux kernel, the following vulnerability has been resolved: media: imx-jpeg: Fix potential error pointer deref
CVE-2024-57976	In the Linux kernel, the following vulnerability has been resolved: btrfs: do proper folio cleanup when cow_file_ran
CVE-2024-57979	In the Linux kernel, the following vulnerability has been resolved: pps: Fix a use-after-free On a board running ntpd
CVE-2024-57977	In the Linux kernel, the following vulnerability has been resolved: memcg: fix soft lockup in the OOM process A so
CVE-2024-57980	In the Linux kernel, the following vulnerability has been resolved: media: uvcvideo: Fix double free in error path If t
CVE-2024-57981	In the Linux kernel, the following vulnerability has been resolved: usb: xhci: Fix NULL pointer dereference on certa
CVE-2024-57982	In the Linux kernel, the following vulnerability has been resolved: xfrm: state: fix out-of-bounds read during lookup
CVE-2024-57986	In the Linux kernel, the following vulnerability has been resolved: HID: core: Fix assumption that Resolution Multip
CVE-2024-57984	In the Linux kernel, the following vulnerability has been resolved: i3c: dw: Fix use-after-free in dw_i3c_master driv
CVE-2024-57993	In the Linux kernel, the following vulnerability has been resolved: HID: hid-thrustmaster: Fix warning in thrustmast
CVE-2024-57996	In the Linux kernel, the following vulnerability has been resolved: net_sched: sch_sfq: don't allow 1 packet limit Th
CVE-2024-57999	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries/iommu: IOMMU incorrectly ma
CVE-2024-58002	In the Linux kernel, the following vulnerability has been resolved: media: uvcvideo: Remove dangling pointers Whe
CVE-2024-58001	In the Linux kernel, the following vulnerability has been resolved: ocfs2: handle a symlink read error correctly Patch
CVE-2024-58005	In the Linux kernel, the following vulnerability has been resolved: tpm: Change to kcalloc() in eventlog/acpi.c The f
CVE-2024-58007	In the Linux kernel, the following vulnerability has been resolved: soc: qcom: socinfo: Avoid out of bounds read of s
CVE-2024-58010	In the Linux kernel, the following vulnerability has been resolved: binfmt_flat: Fix integer overflow bug on 32 bit sy
CVE-2024-58011	In the Linux kernel, the following vulnerability has been resolved: platform/x86: int3472: Check for adev == NULL
CVE-2024-58012	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: hda-dai: Ensure DAI widget is
CVE-2024-58013	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: MGMT: Fix slab-use-after-free Read i
CVE-2024-58014	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmsmac: add gain range check to wlc_phy
CVE-2024-58015	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: Fix for out-of bound access error Se
CVE-2024-58016	In the Linux kernel, the following vulnerability has been resolved: safesetid: check size of policy writes syzbot att
CVE-2024-58017	In the Linux kernel, the following vulnerability has been resolved: printk: Fix signed integer overflow when defining
CVE-2024-58018	In the Linux kernel, the following vulnerability has been resolved: nvkm: correctly calculate the available space of th
CVE-2024-58019	In the Linux kernel, the following vulnerability has been resolved: nvkm/gsp: correctly advance the read pointer of C
CVE-2024-58034	In the Linux kernel, the following vulnerability has been resolved: memory: tegra20-emc: fix an OF node reference l

CVE-2024-58020	In the Linux kernel, the following vulnerability has been resolved: HID: multitouch: Add NULL check in mt_input_
CVE-2024-58051	In the Linux kernel, the following vulnerability has been resolved: ipmi: ipmb: Add check devm_kasprintf() returned
CVE-2024-58052	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Fix potential NULL pointer derefer
CVE-2024-58053	In the Linux kernel, the following vulnerability has been resolved: rxrpc: Fix handling of received connection abort
CVE-2024-58055	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: f_tcm: Don't free command immedi
CVE-2024-58054	In the Linux kernel, the following vulnerability has been resolved: staging: media: max96712: fix kernel oops when
CVE-2024-58057	In the Linux kernel, the following vulnerability has been resolved: idpf: convert workqueues to unbound When a wo
CVE-2024-58061	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: prohibit deactivating all links In
CVE-2024-58058	In the Linux kernel, the following vulnerability has been resolved: ubifs: skip dumping tnc tree when zroot is null Cl
CVE-2024-58063	In the Linux kernel, the following vulnerability has been resolved: wifi: rtlwifi: fix memory leaks and invalid access
CVE-2024-58069	In the Linux kernel, the following vulnerability has been resolved: rtc: pcf85063: fix potential OOB write in PCF850
CVE-2024-58071	In the Linux kernel, the following vulnerability has been resolved: team: prevent adding a device which is already a
CVE-2024-58076	In the Linux kernel, the following vulnerability has been resolved: clk: qcom: gcc-sm6350: Add missing parent_map
CVE-2024-58072	In the Linux kernel, the following vulnerability has been resolved: wifi: rtlwifi: remove unused check_buddy_priv C
CVE-2024-58078	In the Linux kernel, the following vulnerability has been resolved: misc: misc_minor_alloc to use ida for all dynamic
CVE-2024-58077	In the Linux kernel, the following vulnerability has been resolved: ASoC: soc-pcm: don't use soc_pcm_ret() on .prep
CVE-2024-58079	In the Linux kernel, the following vulnerability has been resolved: media: uvcvideo: Fix crash during unbind if gpio
CVE-2024-58083	In the Linux kernel, the following vulnerability has been resolved: KVM: Explicitly verify target vCPU is online in l
CVE-2024-58087	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix racy issue from session lookup and ex
CVE-2024-58085	In the Linux kernel, the following vulnerability has been resolved: tomooyo: don't emit warning in tomooyo_write_con
CVE-2024-58086	In the Linux kernel, the following vulnerability has been resolved: drm/v3d: Stop active perfmon if it is being destro
CVE-2024-58089	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix double accounting race when btrfs_run_
CVE-2024-58090	In the Linux kernel, the following vulnerability has been resolved: sched/core: Prevent rescheduling when interrupts
CVE-2024-58092	In the Linux kernel, the following vulnerability has been resolved: nfsd: fix legacy client tracking initialization Get r
CVE-2024-58094	In the Linux kernel, the following vulnerability has been resolved: jfs: add check read-only before truncation in jfs_t
CVE-2024-58095	In the Linux kernel, the following vulnerability has been resolved: jfs: add check read-only before txBeginAnon() ca
CVE-2024-58093	In the Linux kernel, the following vulnerability has been resolved: PCI/ASPM: Fix link state exit during switch upstr
CVE-2024-58096	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: add srng->lock for ath11k_hal_srng
CVE-2024-58097	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: fix RCU stall while reaping monitor
CVE-2024-58098	In the Linux kernel, the following vulnerability has been resolved: bpf: track changes_pkt_data property for global fu
CVE-2024-58099	In the Linux kernel, the following vulnerability has been resolved: vmxnet3: Fix packet corruption in vmxnet3_xdp_
CVE-2024-58100	In the Linux kernel, the following vulnerability has been resolved: bpf: check changes_pkt_data property for extensi
CVE-2024-58237	In the Linux kernel, the following vulnerability has been resolved: bpf: consider that tail calls invalidate packet point
CVE-2024-5998	A vulnerability in the FAISS.deserialize_from_bytes function of langchain-ai/langchain allows for pickle deserializa
CVE-2024-6119	Issue summary: Applications performing certificate name checks (e.g., TLS clients checking server certificates) may
CVE-2024-6104	go-retryablehttp prior to 0.7.7 did not sanitize urls when writing them to its log file. This could lead to go-retryableh
CVE-2024-6221	A vulnerability in corydolphin/flask-cors version 4.0.1 allows the `Access-Control-Allow-Private-Network` CORS h
CVE-2024-6232	There is a MEDIUM severity vulnerability affecting CPython. Regular expressions that allowed excessive backtrack
CVE-2024-6345	A vulnerability in the package_index module of pypa/setuptools versions up to 69.1.1 allows for remote code execut
CVE-2024-6602	A mismatch between allocator and deallocator could have led to memory corruption. This vulnerability affects Firefo

CVE-2024-6655	A flaw was found in the GTK library. Under certain conditions, it is possible for a library to be injected into a GTK application.
CVE-2024-6763	Eclipse Jetty is a lightweight, highly scalable, Java-based web server and Servlet engine . It includes a utility class, <code>HttpServer</code> .
CVE-2024-6839	corydolphin/flask-cors version 4.0.1 contains an improper regex path matching vulnerability. The plugin prioritizes <code>OPTIONS</code> requests.
CVE-2024-6827	Gunicorn version 21.2.0 does not properly validate the value of the 'Transfer-Encoding' header as specified in the RFC 7230.
CVE-2024-6844	A vulnerability in corydolphin/flask-cors version 4.0.1 allows for inconsistent CORS matching due to the handling of <code>OPTIONS</code> requests.
CVE-2024-6866	corydolphin/flask-cors version 4.0.1 contains a vulnerability where the request path matching is case-insensitive due to the handling of <code>OPTIONS</code> requests.
CVE-2024-6923	There is a MEDIUM severity vulnerability affecting CPython. The email module didn't properly quote newlines for email headers.
CVE-2024-7006	A null pointer dereference flaw was found in Libtiff via <code>`tif_dirinfo.c`</code> . This issue may allow an attacker to trigger a crash or denial of service.
CVE-2024-7055	A vulnerability was found in FFmpeg up to 7.0.1. It has been classified as critical. This affects the function <code>pnm_decode</code> .
CVE-2024-7254	Any project that parses untrusted Protocol Buffers data containing an arbitrary number of nested groups / series of <code>SerializedData</code> objects.
CVE-2024-7264	libcurl's ASN1 parser code has the <code>`GTime2str()</code> ` function, used for parsing an ASN.1 Generalized Time field. If given an invalid input, it can cause a crash.
CVE-2024-7348	Time-of-check Time-of-use (TOCTOU) race condition in <code>pg_dump</code> in PostgreSQL allows an object creator to execute arbitrary SQL commands.
CVE-2024-7531	Calling <code>`PK11_Encrypt()</code> ` in NSS using CKM_CHACHA20 and the same buffer for input and output can result in a crash or denial of service.
CVE-2024-7592	There is a LOW severity vulnerability affecting CPython, specifically the 'http.cookies' standard library module. When parsing cookies, it can cause a crash.
CVE-2024-7776	A vulnerability in the <code>`download_model`</code> function of the onnx/onnx framework, before and including version 1.16.1, allows an attacker to trigger a crash or denial of service.
CVE-2024-7804	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-8088	There is a HIGH severity vulnerability affecting the CPython "zipfile" module affecting "zipfile.Path". Note that the vulnerability is only present in the <code>Path</code> class.
CVE-2024-8096	When curl is told to use the Certificate Status Request TLS extension, often referred to as OCSP stapling, to verify the certificate, it can cause a crash or denial of service.
CVE-2024-8176	A stack overflow vulnerability exists in the libexpat library due to the way it handles recursive entity expansion in XML documents.
CVE-2024-8184	There exists a security vulnerability in Jetty's ThreadLimitHandler.getRemote() which can be exploited by unauthorized users to cause a denial of service.
CVE-2024-8309	A vulnerability in the GraphCypherQACHain class of langchain-ai/langchain version 0.2.5 allows for SQL injection attacks.
CVE-2024-8768	A flaw was found in the vLLM library. A completions API request with an empty prompt will crash the vLLM API server.
CVE-2024-8805	BlueZ HID over GATT Profile Improper Access Control Remote Code Execution Vulnerability. This vulnerability allows an attacker to execute arbitrary code on a remote device.
CVE-2024-9042	This CVE affects only Windows worker nodes. Your worker node is vulnerable to this issue if it is running one of the affected versions.
CVE-2024-9052	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2024-9053	vllm-project vllm version 0.6.0 contains a vulnerability in the AsyncEngineRPCServer() RPC server endpoints. This allows an attacker to trigger a crash or denial of service.
CVE-2024-9143	Issue summary: Use of the low-level GF(2^m) elliptic curve APIs with untrusted explicit values for the field polynomial can lead to a crash or denial of service.
CVE-2024-9287	A vulnerability has been found in the CPython <code>`venv`</code> module and CLI where path names provided when creating a virtual environment can be exploited.
CVE-2024-9681	When curl is asked to use HSTS, the expiry time for a subdomain might overwrite a parent domain's cache entry, making the subdomain's cache entry invalid.
CVE-2025-0167	When asked to use a <code>`.netrc`</code> file for credentials <code>**and**</code> to follow HTTP redirects, curl could leak the password used for authentication.
CVE-2024-9823	There exists a security vulnerability in Jetty's DosFilter which can be exploited by unauthorized users to cause a denial of service.
CVE-2025-0291	Type Confusion in V8 in Google Chrome prior to 131.0.6778.264 allowed a remote attacker to execute arbitrary code on the victim's machine.
CVE-2025-0395	When the <code>assert()</code> function in the GNU C Library versions 2.13 to 2.40 fails, it does not allocate enough space for the message, leading to a crash or denial of service.
CVE-2025-0426	A security issue was discovered in Kubernetes where a large number of container checkpoint requests made to the <code>ContainerCheckpointManager</code> could cause a denial of service.
CVE-2025-0434	Out of bounds memory access in V8 in Google Chrome prior to 132.0.6834.83 allowed a remote attacker to potentially execute arbitrary code on the victim's machine.
CVE-2025-0435	Inappropriate implementation in Navigation in Google Chrome on Android prior to 132.0.6834.83 allowed a remote attacker to potentially execute arbitrary code on the victim's machine.
CVE-2025-0436	Integer overflow in Skia in Google Chrome prior to 132.0.6834.83 allowed a remote attacker to potentially exploit heap overflow to execute arbitrary code on the victim's machine.
CVE-2025-0437	Out of bounds read in Metrics in Google Chrome prior to 132.0.6834.83 allowed a remote attacker to potentially exploit heap overflow to execute arbitrary code on the victim's machine.
CVE-2025-0438	Stack buffer overflow in Tracing in Google Chrome prior to 132.0.6834.83 allowed a remote attacker to potentially exploit heap overflow to execute arbitrary code on the victim's machine.
CVE-2025-0439	Race in Frames in Google Chrome prior to 132.0.6834.83 allowed a remote attacker who convinced a user to engage in a phishing attack to execute arbitrary code on the victim's machine.

CVE-2025-0440	Inappropriate implementation in Fullscreen in Google Chrome on Windows prior to 132.0.6834.83 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0441	Inappropriate implementation in Fenced Frames in Google Chrome prior to 132.0.6834.83 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0442	Inappropriate implementation in Payments in Google Chrome prior to 132.0.6834.83 allowed a remote attacker who could interact with the browser to potentially exploit heap overflow
CVE-2025-0443	Insufficient data validation in Extensions in Google Chrome prior to 132.0.6834.83 allowed a remote attacker who could interact with the browser to potentially exploit heap overflow
CVE-2025-0444	Use after free in Skia in Google Chrome prior to 133.0.6943.53 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0445	Use after free in V8 in Google Chrome prior to 133.0.6943.53 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0446	Inappropriate implementation in Extensions in Google Chrome prior to 132.0.6834.83 allowed a remote attacker who could interact with the browser to potentially exploit heap overflow
CVE-2025-0447	Inappropriate implementation in Navigation in Google Chrome prior to 132.0.6834.83 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0451	Inappropriate implementation in Extensions API in Google Chrome prior to 133.0.6943.53 allowed a remote attacker who could interact with the browser to potentially exploit heap overflow
CVE-2025-0518	Unchecked Return Value, Out-of-bounds Read vulnerability in FFmpeg allows Read Sensitive Constants Within an array
CVE-2025-0448	Inappropriate implementation in Compositing in Google Chrome prior to 132.0.6834.83 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0611	Object corruption in V8 in Google Chrome prior to 132.0.6834.110 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0612	Out of bounds memory access in V8 in Google Chrome prior to 132.0.6834.110 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0665	libcurl would wrongly close the same eventfd file descriptor twice when taking down a connection channel after having been used to connect to a server
CVE-2025-0762	Use after free in DevTools in Google Chrome prior to 132.0.6834.159 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0725	When libcurl is asked to perform automatic gzip decompression of content-encoded HTTP responses with the `CURLOPT_HTTP_TRANSFER_ENCODING` option, it would fail to properly handle responses that are not gzip encoded
CVE-2025-0840	A vulnerability, which was classified as problematic, was found in GNU Binutils up to 2.43. This affects the function <code>binutils_elf_relocate_section</code>
CVE-2025-0913	<code>os.OpenFile(path, os.O_CREATE O_EXCL)</code> behaved differently on Unix and Windows systems when the target path exists and is a directory
CVE-2025-0927	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority. Filesystem bugs due to race conditions
CVE-2025-0938	The Python standard library functions <code>`urllib.parse.urlsplit`</code> and <code>`urlparse`</code> accepted domain names that included square brackets
CVE-2025-0995	Use after free in V8 in Google Chrome prior to 133.0.6943.98 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0996	Inappropriate implementation in Browser UI in Google Chrome on Android prior to 133.0.6943.98 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0997	Use after free in Navigation in Google Chrome prior to 133.0.6943.98 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-0999	Heap buffer overflow in V8 in Google Chrome prior to 133.0.6943.126 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-1006	Use after free in Network in Google Chrome prior to 133.0.6943.126 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-1094	Improper neutralization of quoting syntax in PostgreSQL libpq functions <code>PQescapeLiteral()</code> , <code>PQescapeIdentifier()</code> , <code>PQescapeString()</code> , and <code>PQescapeStringConn()</code>
CVE-2025-1097	A security issue was discovered in ingress-nginx https://github.com/kubernetes/ingress-nginx where the <code>`auth-tls-map`</code> annotation was not properly validated
CVE-2025-1098	A security issue was discovered in ingress-nginx https://github.com/kubernetes/ingress-nginx where the <code>`mirror-target`</code> annotation was not properly validated
CVE-2025-1150	A vulnerability was found in GNU Binutils 2.43. It has been declared as problematic. This vulnerability affects the function <code>binutils_elf_relocate_section</code>
CVE-2025-1152	A vulnerability classified as problematic has been found in GNU Binutils 2.43. Affected is the function <code>xstrdup</code> of the <code>binutils_elf_relocate_section</code>
CVE-2025-1153	A vulnerability classified as problematic was found in GNU Binutils 2.43/2.44. Affected by this vulnerability is the function <code>binutils_elf_relocate_section</code>
CVE-2025-1151	A vulnerability was found in GNU Binutils 2.43. It has been rated as problematic. This issue affects the function <code>xmbrlcpy</code>
CVE-2025-1176	A vulnerability was found in GNU Binutils 2.43 and classified as critical. This issue affects the function <code>_bfd_elf_get_relocation_type</code>
CVE-2025-1178	A vulnerability was found in GNU Binutils 2.43. It has been declared as problematic. Affected by this vulnerability is the function <code>binutils_elf_relocate_section</code>
CVE-2025-1181	A vulnerability classified as critical was found in GNU Binutils 2.43. This vulnerability affects the function <code>_bfd_elf_get_relocation_type</code>
CVE-2025-1182	A vulnerability, which was classified as critical, was found in GNU Binutils 2.43. Affected is the function <code>bfd_elf_relocate_section</code>
CVE-2025-1194	A Regular Expression Denial of Service (ReDoS) vulnerability was identified in the huggingface/transformers library
CVE-2025-1215	A vulnerability classified as problematic was found in vim up to 9.1.1096. This vulnerability affects unknown code of the <code>vim</code> editor
CVE-2025-1244	A command injection flaw was found in the text editor Emacs. It could allow a remote, unauthenticated attacker to execute arbitrary commands
CVE-2025-1352	A vulnerability has been found in GNU elfutils 0.192 and classified as critical. This vulnerability affects the function <code>elfutils_elf_relocate_section</code>

CVE-2025-1365	A vulnerability, which was classified as critical, was found in GNU elfutils 0.192. This affects the function process_
CVE-2025-1371	A vulnerability has been found in GNU elfutils 0.192 and classified as problematic. This vulnerability affects the fun
CVE-2025-1372	A vulnerability was found in GNU elfutils 0.192. It has been declared as critical. Affected by this vulnerability is the
CVE-2025-1376	A vulnerability classified as problematic was found in GNU elfutils 0.192. This vulnerability affects the function elf
CVE-2025-1377	A vulnerability, which was classified as problematic, has been found in GNU elfutils 0.192. This issue affects the fun
CVE-2025-1390	The PAM module pam_cap.so of libcap configuration supports group names starting with “@”, during actual parsing
CVE-2025-1426	Heap buffer overflow in GPU in Google Chrome on Android prior to 133.0.6943.126 allowed a remote attacker to p
CVE-2025-1550	The Keras Model.load_model function permits arbitrary code execution, even with safe_mode=True, through a man
CVE-2025-1594	A vulnerability, which was classified as critical, was found in FFmpeg up to 7.1. This affects the function ff_aac_sea
CVE-2025-1632	A vulnerability was found in libarchive up to 3.7.7. It has been classified as problematic. This affects the function lis
CVE-2025-1767	This CVE only affects Kubernetes clusters that utilize the in-tree gitRepo volume to clone git repositories from other
CVE-2025-1795	During an address list folding when a separating comma ends up on a folded line and that line is to be unicode-enco
CVE-2025-1914	Out of bounds read in V8 in Google Chrome prior to 134.0.6998.35 allowed a remote attacker to perform out of bou
CVE-2025-1915	Improper Limitation of a Pathname to a Restricted Directory in DevTools in Google Chrome on Windows prior to 13
CVE-2025-1916	Use after free in Profiles in Google Chrome prior to 134.0.6998.35 allowed an attacker who convinced a user to insta
CVE-2025-1917	Inappropriate implementation in Browser UI in Google Chrome on Android prior to 134.0.6998.35 allowed a remote
CVE-2025-1918	Out of bounds read in PDFium in Google Chrome prior to 134.0.6998.35 allowed a remote attacker to potentially pe
CVE-2025-1919	Out of bounds read in Media in Google Chrome prior to 134.0.6998.35 allowed a remote attacker to potentially perfo
CVE-2025-1920	Type Confusion in V8 in Google Chrome prior to 134.0.6998.88 allowed a remote attacker to potentially exploit hea
CVE-2025-1921	Inappropriate implementation in Media Stream in Google Chrome prior to 134.0.6998.35 allowed a remote attacker
CVE-2025-1922	Inappropriate implementation in Selection in Google Chrome on Android prior to 134.0.6998.35 allowed a remote a
CVE-2025-1974	A security issue was discovered in Kubernetes where under certain conditions, an unauthenticated attacker with acce
CVE-2025-1923	Inappropriate implementation in Permission Prompts in Google Chrome prior to 134.0.6998.35 allowed an attacker v
CVE-2025-1979	Versions of the package ray before 2.43.0 are vulnerable to Insertion of Sensitive Information into Log File where th
CVE-2025-2135	Type Confusion in V8 in Google Chrome prior to 134.0.6998.88 allowed a remote attacker to potentially exploit hea
CVE-2025-2136	Use after free in Inspector in Google Chrome prior to 134.0.6998.88 allowed a remote attacker to potentially exploit
CVE-2025-2137	Out of bounds read in V8 in Google Chrome prior to 134.0.6998.88 allowed a remote attacker to perform out of bou
CVE-2025-21502	Vulnerability in the Oracle Java SE, Oracle GraalVM for JDK, Oracle GraalVM Enterprise Edition product of Orac
CVE-2025-21587	Vulnerability in the Oracle Java SE, Oracle GraalVM for JDK, Oracle GraalVM Enterprise Edition product of Orac

CVE-2025-21614	go-git is a highly extensible git implementation library written in pure Go. A denial of service (DoS) vulnerability w
CVE-2025-21629	In the Linux kernel, the following vulnerability has been resolved: net: reenable NETIF_F_IPV6_CSUM offload for
CVE-2025-21631	In the Linux kernel, the following vulnerability has been resolved: block, bfq: fix waker_bfq UAF after bfq_split_b
CVE-2025-21632	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Ensure shadow stack is active before "ge
CVE-2025-21634	In the Linux kernel, the following vulnerability has been resolved: cgroup/cpuset: remove kernfs active break A war
CVE-2025-21635	In the Linux kernel, the following vulnerability has been resolved: rds: sysctl: rds_tcp_{rcv,snd}buf: avoid using cur
CVE-2025-21636	In the Linux kernel, the following vulnerability has been resolved: sctp: sysctl: plpmtud_probe_interval: avoid using
CVE-2025-21637	In the Linux kernel, the following vulnerability has been resolved: sctp: sysctl: udp_port: avoid using current->nspro
CVE-2025-21638	In the Linux kernel, the following vulnerability has been resolved: sctp: sysctl: auth_enable: avoid using current->ns
CVE-2025-21639	In the Linux kernel, the following vulnerability has been resolved: sctp: sysctl: rto_min/max: avoid using current->n

CVE-2025-21640	In the Linux kernel, the following vulnerability has been resolved: sctp: sysctl: cookie_hmac_alg: avoid using current
CVE-2025-21642	In the Linux kernel, the following vulnerability has been resolved: mptcp: sysctl: sched: avoid using current->nsprox
CVE-2025-21643	In the Linux kernel, the following vulnerability has been resolved: netfs: Fix kernel async DIO Netfslib needs to be a
CVE-2025-21645	In the Linux kernel, the following vulnerability has been resolved: platform/x86/amd/pmc: Only disable IRQ1 wake
CVE-2025-21646	In the Linux kernel, the following vulnerability has been resolved: afs: Fix the maximum cell name length The kafs
CVE-2025-21647	In the Linux kernel, the following vulnerability has been resolved: sched: sch_cake: add bounds checks to host bulk
CVE-2025-21648	In the Linux kernel, the following vulnerability has been resolved: netfilter: conntrack: clamp maximum hashtable si
CVE-2025-21649	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fix kernel crash when 1588 is sent on F
CVE-2025-21650	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fixed hclge_fetch_pf_reg accesses bar s
CVE-2025-21651	In the Linux kernel, the following vulnerability has been resolved: net: hns3: don't auto enable misc vector Currently
CVE-2025-21652	In the Linux kernel, the following vulnerability has been resolved: ipvlan: Fix use-after-free in ipvlan_get_iflink(). s
CVE-2025-21653	In the Linux kernel, the following vulnerability has been resolved: net_sched: cls_flow: validate TCA_FLOW_RSH
CVE-2025-21654	In the Linux kernel, the following vulnerability has been resolved: ovl: support encoding fid from inode with no alias
CVE-2025-21655	In the Linux kernel, the following vulnerability has been resolved: io_uring/eventfd: ensure io_eventfd_signal() defe
CVE-2025-21656	In the Linux kernel, the following vulnerability has been resolved: hwmon: (drivetemp) Fix driver producing garbaga
CVE-2025-21660	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix unexpectedly changed path in ksmbd_
CVE-2025-21659	In the Linux kernel, the following vulnerability has been resolved: netdev: prevent accessing NAPI instances from ar
CVE-2025-21658	In the Linux kernel, the following vulnerability has been resolved: btrfs: avoid NULL pointer dereference if no valid
CVE-2025-21662	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix variable not being completed when
CVE-2025-21663	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: dwmac-tegra: Read iommu stream i
CVE-2025-21664	In the Linux kernel, the following vulnerability has been resolved: dm thin: make get_first_thin use rcu-safe list first
CVE-2025-21665	In the Linux kernel, the following vulnerability has been resolved: filemap: avoid truncating 64-bit offset to 32 bits C
CVE-2025-21666	In the Linux kernel, the following vulnerability has been resolved: vsock: prevent null-ptr-deref in vsock_*[has_data
CVE-2025-21667	In the Linux kernel, the following vulnerability has been resolved: iomap: avoid avoid truncating 64-bit offset to 32
CVE-2025-21668	In the Linux kernel, the following vulnerability has been resolved: pmdomain: imx8mp-blk-ctrl: add missing loop br
CVE-2025-21669	In the Linux kernel, the following vulnerability has been resolved: vsock/virtio: discard packets if the transport chan
CVE-2025-21671	In the Linux kernel, the following vulnerability has been resolved: zram: fix potential UAF of zram table If zram_me
CVE-2025-21670	In the Linux kernel, the following vulnerability has been resolved: vsock/bpf: return early if transport is not assigned
CVE-2025-21672	In the Linux kernel, the following vulnerability has been resolved: afs: Fix merge preference rule failure condition sy
CVE-2025-21673	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix double free of TCP_Server_Info::
CVE-2025-21674	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix inversion dependency warning wh
CVE-2025-21678	In the Linux kernel, the following vulnerability has been resolved: gtp: Destroy device along with udp socket's netns
CVE-2025-21675	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Clear port select structure when fail to c
CVE-2025-21676	In the Linux kernel, the following vulnerability has been resolved: net: fec: handle page_pool_dev_alloc_pages error
CVE-2025-21680	In the Linux kernel, the following vulnerability has been resolved: pktgen: Avoid out-of-bounds access in get_imix_
CVE-2025-21681	In the Linux kernel, the following vulnerability has been resolved: openvswitch: fix lockup on tx to unregistering net
CVE-2025-21682	In the Linux kernel, the following vulnerability has been resolved: eth: bnxt: always recalculate features after XDP c
CVE-2025-21683	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix bpf_sk_select_reuseport() memory leak &
CVE-2025-21684	In the Linux kernel, the following vulnerability has been resolved: gpio: xilinx: Convert gpio_lock to raw spinlock in
CVE-2025-21687	In the Linux kernel, the following vulnerability has been resolved: vfio/platform: check the bounds of read/write sys

CVE-2025-21689	In the Linux kernel, the following vulnerability has been resolved: USB: serial: quatech2: fix null-ptr-deref in qt2_pr
CVE-2025-21690	In the Linux kernel, the following vulnerability has been resolved: scsi: storvsc: Ratelimit warning logs to prevent V
CVE-2025-21691	In the Linux kernel, the following vulnerability has been resolved: cachestat: fix page cache statistics permission che
CVE-2025-21693	In the Linux kernel, the following vulnerability has been resolved: mm: zswap: properly synchronize freeing resourc
CVE-2025-21692	In the Linux kernel, the following vulnerability has been resolved: net: sched: fix ets qdisc OOB Indexing Haowei Y
CVE-2025-21694	In the Linux kernel, the following vulnerability has been resolved: fs/proc: fix softlockup in __read_vmcore (part 2)
CVE-2025-21696	In the Linux kernel, the following vulnerability has been resolved: mm: clear uffd-wp PTE/PMD state on mremap()
CVE-2025-21697	In the Linux kernel, the following vulnerability has been resolved: drm/v3d: Ensure job pointer is set to NULL after
CVE-2025-21700	In the Linux kernel, the following vulnerability has been resolved: net: sched: Disallow replacing of child qdisc from
CVE-2025-21699	In the Linux kernel, the following vulnerability has been resolved: gfs2: Truncate address space when flipping GFS2
CVE-2025-21701	In the Linux kernel, the following vulnerability has been resolved: net: avoid race between device unregistration and
CVE-2025-21702	In the Linux kernel, the following vulnerability has been resolved: pfifo_tail_enqueue: Drop new packet when sch->
CVE-2025-21704	In the Linux kernel, the following vulnerability has been resolved: usb: cdc-acm: Check control transfer buffer size b
CVE-2025-21703	In the Linux kernel, the following vulnerability has been resolved: netem: Update sch->q.qlen before qdisc_tree_red
CVE-2025-21707	In the Linux kernel, the following vulnerability has been resolved: mptcp: consolidate suboption status MPTCP main
CVE-2025-21709	In the Linux kernel, the following vulnerability has been resolved: kernel: be more careful about dup_mmap() failure
CVE-2025-21708	In the Linux kernel, the following vulnerability has been resolved: net: usb: rtl8150: enable basic endpoint checking
CVE-2025-21711	In the Linux kernel, the following vulnerability has been resolved: net/rose: prevent integer overflows in rose_setso
CVE-2025-21712	In the Linux kernel, the following vulnerability has been resolved: md/md-bitmap: Synchronize bitmap_get_stats() v
CVE-2025-21714	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix implicit ODP use after free Pre
CVE-2025-21718	In the Linux kernel, the following vulnerability has been resolved: net: rose: fix timer races against user threads Ros
CVE-2025-21715	In the Linux kernel, the following vulnerability has been resolved: net: davicom: fix UAF in dm9000_drv_remove d
CVE-2025-21719	In the Linux kernel, the following vulnerability has been resolved: ipmr: do not call mr_mfc_uses_dev() for unres en
CVE-2025-21721	In the Linux kernel, the following vulnerability has been resolved: nilfs2: handle errors that nilfs_prepare_chunk() m
CVE-2025-21722	In the Linux kernel, the following vulnerability has been resolved: nilfs2: do not force clear folio if buffer is referenc
CVE-2025-21726	In the Linux kernel, the following vulnerability has been resolved: padata: avoid UAF for reorder_work Although th
CVE-2025-21723	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix possible crash when setting up
CVE-2025-21728	In the Linux kernel, the following vulnerability has been resolved: bpf: Send signals asynchronously if !preemptible
CVE-2025-21727	In the Linux kernel, the following vulnerability has been resolved: padata: fix UAF in padata_reorder A bug was fou
CVE-2025-21729	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: fix race between cancel_hw_scan and
CVE-2025-2173	A vulnerability was found in libzvbi up to 0.2.43. It has been classified as problematic. Affected is the function vbi_
CVE-2025-21730	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw89: avoid to init mgnt_entry list twice wh
CVE-2025-21732	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix a race for an ODP MR which l
CVE-2025-21731	In the Linux kernel, the following vulnerability has been resolved: nbd: don't allow reconnect after disconnect Follow
CVE-2025-21733	In the Linux kernel, the following vulnerability has been resolved: tracing/osnoise: Fix resetting of tracepoints If a ti
CVE-2025-21734	In the Linux kernel, the following vulnerability has been resolved: misc: fastrpc: Fix copy buffer page size For non-r
CVE-2025-21735	In the Linux kernel, the following vulnerability has been resolved: NFC: nci: Add bounds checking in nci_hci_create
CVE-2025-21738	In the Linux kernel, the following vulnerability has been resolved: ata: libata-sff: Ensure that we cannot write outside
CVE-2025-21736	In the Linux kernel, the following vulnerability has been resolved: nilfs2: fix possible int overflows in nilfs_fiemap()
CVE-2025-21739	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Fix use-after free in init error and

CVE-2025-2174	A vulnerability was found in libzvb up to 0.2.43. It has been declared as problematic. Affected by this vulnerability
CVE-2025-21744	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmfmac: fix NULL pointer dereference in
CVE-2025-21745	In the Linux kernel, the following vulnerability has been resolved: blk-cgroup: Fix class @block_class's subsystem n
CVE-2025-21748	In the Linux kernel, the following vulnerability has been resolved: ksmdb: fix integer overflows on 32 bit systems O
CVE-2025-21749	In the Linux kernel, the following vulnerability has been resolved: net: rose: lock the socket in rose_bind() syzbot re
CVE-2025-2175	A vulnerability was found in libzvb up to 0.2.43. It has been rated as problematic. Affected by this issue is the funct
CVE-2025-21750	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmfmac: Check the return value of of_pro
CVE-2025-21751	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: HWS, change error flow on matcher dis
CVE-2025-21752	In the Linux kernel, the following vulnerability has been resolved: btrfs: don't use btrfs_set_item_key_safe on RAID
CVE-2025-21753	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix use-after-free when attempting to join an
CVE-2025-21756	In the Linux kernel, the following vulnerability has been resolved: vsock: Keep the binding until socket destruction
CVE-2025-21758	In the Linux kernel, the following vulnerability has been resolved: ipv6: mcast: add RCU protection to mld_newpack
CVE-2025-21759	In the Linux kernel, the following vulnerability has been resolved: ipv6: mcast: extend RCU protection in igmp6_ser
CVE-2025-2176	A vulnerability classified as critical has been found in libzvb up to 0.2.43. This affects the function vbi_capture_sim
CVE-2025-21760	In the Linux kernel, the following vulnerability has been resolved: ndisc: extend RCU protection in ndisc_send_skb()
CVE-2025-21761	In the Linux kernel, the following vulnerability has been resolved: openvswitch: use RCU protection in ovs_vport_c
CVE-2025-21762	In the Linux kernel, the following vulnerability has been resolved: arp: use RCU protection in arp_xmit() arp_xmit()
CVE-2025-21763	In the Linux kernel, the following vulnerability has been resolved: neighbour: use RCU protection in __neigh_notify
CVE-2025-21764	In the Linux kernel, the following vulnerability has been resolved: ndisc: use RCU protection in ndisc_alloc_skb() n
CVE-2025-21765	In the Linux kernel, the following vulnerability has been resolved: ipv6: use RCU protection in ip6_default_advmss
CVE-2025-21766	In the Linux kernel, the following vulnerability has been resolved: ipv4: use RCU protection in __ip_rt_update_pmtu
CVE-2025-21767	In the Linux kernel, the following vulnerability has been resolved: clocksource: Use migrate_disable() to avoid callin
CVE-2025-21768	In the Linux kernel, the following vulnerability has been resolved: net: ipv6: fix dst ref loops in rpl, seg6 and ioam6
CVE-2025-2177	A vulnerability classified as critical was found in libzvb up to 0.2.43. This vulnerability affects the function vbi_sea
CVE-2025-21772	In the Linux kernel, the following vulnerability has been resolved: partitions: mac: fix handling of bogus partition ta
CVE-2025-21776	In the Linux kernel, the following vulnerability has been resolved: USB: hub: Ignore non-compliant devices with too
CVE-2025-21779	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Reject Hyper-V's SEND_IPI hyperca
CVE-2025-21780	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: avoid buffer overflow attach in smu
CVE-2025-21782	In the Linux kernel, the following vulnerability has been resolved: oragefs: fix a oob in oragefs_debug_write I got
CVE-2025-21781	In the Linux kernel, the following vulnerability has been resolved: batman-adv: fix panic during interface removal R
CVE-2025-21785	In the Linux kernel, the following vulnerability has been resolved: arm64: cacheinfo: Avoid out-of-bounds write to c
CVE-2025-21786	In the Linux kernel, the following vulnerability has been resolved: workqueue: Put the pwq after detaching the rescu
CVE-2025-21787	In the Linux kernel, the following vulnerability has been resolved: team: better TEAM_OPTION_TYPE_STRING v
CVE-2025-21791	In the Linux kernel, the following vulnerability has been resolved: vrf: use RCU protection in l3mdev_l3_out() l3mdev
CVE-2025-21792	In the Linux kernel, the following vulnerability has been resolved: ax25: Fix refcount leak caused by setting SO_BI
CVE-2025-21795	In the Linux kernel, the following vulnerability has been resolved: NFSD: fix hang in nfsd4_shutdown_callback If n
CVE-2025-21796	In the Linux kernel, the following vulnerability has been resolved: nfsd: clear acl_access/acl_default after releasing
CVE-2025-21799	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: ti: am65-cpsw: fix freeing IRQ in an
CVE-2025-21801	In the Linux kernel, the following vulnerability has been resolved: net: ravb: Fix missing rtnl lock in suspend/resume
CVE-2025-21802	In the Linux kernel, the following vulnerability has been resolved: net: hns3: fix oops when unload drivers parallelin

CVE-2025-21804	In the Linux kernel, the following vulnerability has been resolved: PCI: rcar-ep: Fix incorrect variable used when cal
CVE-2025-21811	In the Linux kernel, the following vulnerability has been resolved: nilfs2: protect access to buffers with no active ref
CVE-2025-21806	In the Linux kernel, the following vulnerability has been resolved: net: let net.core.dev_weight always be non-zero T
CVE-2025-21812	In the Linux kernel, the following vulnerability has been resolved: ax25: rcu protect dev->ax25_ptr syzbot found a lo
CVE-2025-21814	In the Linux kernel, the following vulnerability has been resolved: ptp: Ensure info->enable callback is always set T
CVE-2025-21816	In the Linux kernel, the following vulnerability has been resolved: hrtimers: Force migrate away hrtimers queued aft
CVE-2025-21817	In the Linux kernel, the following vulnerability has been resolved: block: mark GFP_NOIO around sysfs ->store() sy
CVE-2025-21819	In the Linux kernel, the following vulnerability has been resolved: Revert "drm/amd/display: Use HW lock mgr for l
CVE-2025-21821	In the Linux kernel, the following vulnerability has been resolved: fbdev: omap: use threaded IRQ for LCD DMA W
CVE-2025-21820	In the Linux kernel, the following vulnerability has been resolved: tty: xilinx_uartps: split sysrq handling lockdep de
CVE-2025-21823	In the Linux kernel, the following vulnerability has been resolved: batman-adv: Drop unmanaged ELP metric worke
CVE-2025-21825	In the Linux kernel, the following vulnerability has been resolved: bpf: Cancel the running bpf_timer through kwork
CVE-2025-21826	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: reject mismatching sum of fie
CVE-2025-21829	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Fix the warning "__rxe_cleanup+0x1
CVE-2025-21828	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: don't flush non-uploaded STAs l
CVE-2025-21830	In the Linux kernel, the following vulnerability has been resolved: landlock: Handle weird files A corrupted filesystem
CVE-2025-21831	In the Linux kernel, the following vulnerability has been resolved: PCI: Avoid putting some root ports into D3 on TU
CVE-2025-21832	In the Linux kernel, the following vulnerability has been resolved: block: don't revert iter for -EIOCBQUEUED blk
CVE-2025-21833	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Avoid use of NULL after WARN_O
CVE-2025-21835	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: f_midi: fix MIDI Streaming descript
CVE-2025-21838	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: core: flush gadget workqueue after d
CVE-2025-21844	In the Linux kernel, the following vulnerability has been resolved: smb: client: Add check for next_buffer in receive
CVE-2025-21839	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Load DR6 with guest value only befo
CVE-2025-21846	In the Linux kernel, the following vulnerability has been resolved: acct: perform last write from workqueue In [1] it
CVE-2025-21847	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: stream-ipc: Check for cstream nullit
CVE-2025-21848	In the Linux kernel, the following vulnerability has been resolved: nfp: bpf: Add check for nfp_app_ctrl_msg_alloc
CVE-2025-21853	In the Linux kernel, the following vulnerability has been resolved: bpf: avoid holding freeze_mutex during mmap op
CVE-2025-21855	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: Don't reference skb after sending to VIC
CVE-2025-21857	In the Linux kernel, the following vulnerability has been resolved: net/sched: cls_api: fix error handling causing NU
CVE-2025-21858	In the Linux kernel, the following vulnerability has been resolved: geneve: Fix use-after-free in geneve_find_dev().
CVE-2025-21859	In the Linux kernel, the following vulnerability has been resolved: USB: gadget: f_midi: f_midi_complete to call que
CVE-2025-21861	In the Linux kernel, the following vulnerability has been resolved: mm/migrate_device: don't add folio to be freed to
CVE-2025-21862	In the Linux kernel, the following vulnerability has been resolved: drop_monitor: fix incorrect initialization order Sy
CVE-2025-21863	In the Linux kernel, the following vulnerability has been resolved: io_uring: prevent opcode speculation sqe->opcode
CVE-2025-21865	In the Linux kernel, the following vulnerability has been resolved: gtp: Suppress list corruption splat in gtp_net_exit
CVE-2025-21866	In the Linux kernel, the following vulnerability has been resolved: powerpc/code-patching: Fix KASAN hit by not fl
CVE-2025-21870	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: ipc4-topology: Harden loops for loo
CVE-2025-21871	In the Linux kernel, the following vulnerability has been resolved: tee: optee: Fix supplicant wait loop OP-TEE supp
CVE-2025-21872	In the Linux kernel, the following vulnerability has been resolved: efi: Don't map the entire mokvar table to determin
CVE-2025-21873	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: bsg: Fix crash when arpmmb comm

CVE-2025-21875	In the Linux kernel, the following vulnerability has been resolved: mptcp: always handle address removal under msk
CVE-2025-21877	In the Linux kernel, the following vulnerability has been resolved: usbnet: gl620a: fix endpoint checking in genelink
CVE-2025-21878	In the Linux kernel, the following vulnerability has been resolved: i2c: npcm: disable interrupt enable bit before dev
CVE-2025-21880	In the Linux kernel, the following vulnerability has been resolved: drm/xe/userptr: fix EFAULT handling Currently
CVE-2025-21881	In the Linux kernel, the following vulnerability has been resolved: uprobes: Reject the shared zeropage in uprobe_w
CVE-2025-21883	In the Linux kernel, the following vulnerability has been resolved: ice: Fix deinitializing VF in error path If ice_ena_
CVE-2025-21884	In the Linux kernel, the following vulnerability has been resolved: net: better track kernel sockets lifetime While ker
CVE-2025-21885	In the Linux kernel, the following vulnerability has been resolved: RDMA/bnxt_re: Fix the page details for the srq c
CVE-2025-21886	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix implicit ODP hang on parent d
CVE-2025-21887	In the Linux kernel, the following vulnerability has been resolved: ovl: fix UAF in ovl_dentry_update_reval by mov
CVE-2025-21888	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix a WARN during dereg_mr for
CVE-2025-21889	In the Linux kernel, the following vulnerability has been resolved: perf/core: Add RCU read lock protection to perf_
CVE-2025-21890	In the Linux kernel, the following vulnerability has been resolved: idpf: fix checksums set in idpf_rx_rsc() idpf_rx_r
CVE-2025-21891	In the Linux kernel, the following vulnerability has been resolved: ipvlan: ensure network headers are in skb linear p
CVE-2025-21894	In the Linux kernel, the following vulnerability has been resolved: net: enetc: VFs do not support HWTSTAMP_TX
CVE-2025-21892	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix the recovery flow of the UMR
CVE-2025-21895	In the Linux kernel, the following vulnerability has been resolved: perf/core: Order the PMU list to fix warning abou
CVE-2025-21898	In the Linux kernel, the following vulnerability has been resolved: ftrace: Avoid potential division by zero in functio
CVE-2025-21899	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix bad hist from corrupting named_trigge
CVE-2025-21903	In the Linux kernel, the following vulnerability has been resolved: mctp i3c: handle NULL header address daddr can
CVE-2025-21904	In the Linux kernel, the following vulnerability has been resolved: caif_virtio: fix wrong pointer check in cfv_probec
CVE-2025-21907	In the Linux kernel, the following vulnerability has been resolved: mm: memory-failure: update ttu flag inside unma
CVE-2025-21905	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: limit printed string from FW file Th
CVE-2025-21908	In the Linux kernel, the following vulnerability has been resolved: NFS: fix nfs_release_folio() to not deadlock via k
CVE-2025-21909	In the Linux kernel, the following vulnerability has been resolved: wifi: nl80211: reject cooked mode if it is set along
CVE-2025-21910	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: regulatory: improve invalid hints
CVE-2025-21911	In the Linux kernel, the following vulnerability has been resolved: drm/imagination: avoid deadlock on fence release
CVE-2025-21912	In the Linux kernel, the following vulnerability has been resolved: gpio: rcar: Use raw_spinlock to protect register ac
CVE-2025-21913	In the Linux kernel, the following vulnerability has been resolved: x86/amd_nb: Use rdmsr_safe() in amd_get_mmco
CVE-2025-21914	In the Linux kernel, the following vulnerability has been resolved: slimbus: messaging: Free transaction ID in delaye
CVE-2025-21915	In the Linux kernel, the following vulnerability has been resolved: cdx: Fix possible UAF error in driver_override_sl
CVE-2025-21916	In the Linux kernel, the following vulnerability has been resolved: usb: atm: cxacr: fix a flaw in existing endpoint c
CVE-2025-21917	In the Linux kernel, the following vulnerability has been resolved: usb: renesas_usbhs: Flush the notify_hotplug_wo
CVE-2025-21918	In the Linux kernel, the following vulnerability has been resolved: usb: typec: ucsi: Fix NULL pointer access Resour
CVE-2025-21919	In the Linux kernel, the following vulnerability has been resolved: sched/fair: Fix potential memory corruption in ch
CVE-2025-21920	In the Linux kernel, the following vulnerability has been resolved: vlan: enforce underlying device type Currently, V
CVE-2025-21922	In the Linux kernel, the following vulnerability has been resolved: ppp: Fix KMSAN uninit-value warning with bpf f
CVE-2025-21924	In the Linux kernel, the following vulnerability has been resolved: net: hns3: make sure ptp clock is unregister and fr
CVE-2025-21925	In the Linux kernel, the following vulnerability has been resolved: llc: do not use skb_get() before dev_queue_xmit()
CVE-2025-21926	In the Linux kernel, the following vulnerability has been resolved: net: gso: fix ownership in __udp_gso_segment In

CVE-2025-21927	In the Linux kernel, the following vulnerability has been resolved: nvme-tcp: fix potential memory corruption in nvme
CVE-2025-21928	In the Linux kernel, the following vulnerability has been resolved: HID: intel-ish-hid: Fix use-after-free issue in ishtp
CVE-2025-21929	In the Linux kernel, the following vulnerability has been resolved: HID: intel-ish-hid: Fix use-after-free issue in hid_
CVE-2025-21931	In the Linux kernel, the following vulnerability has been resolved: hwpoison, memory_hotplug: lock folio before un
CVE-2025-21930	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: mvm: don't try to talk to a dead firm
CVE-2025-21934	In the Linux kernel, the following vulnerability has been resolved: rapidio: fix an API misues when rio_add_net() fa
CVE-2025-21936	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Add check for mgmt_alloc_skb() in m
CVE-2025-21935	In the Linux kernel, the following vulnerability has been resolved: rapidio: add check for rio_add_net() in rio_scan_
CVE-2025-21937	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Add check for mgmt_alloc_skb() in m
CVE-2025-21938	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix 'scheduling while atomic' in mptcp_pm
CVE-2025-21941	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix null check for pipe_ctx->pl
CVE-2025-21944	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix bug on trap in smb2_lock If lock coun
CVE-2025-21943	In the Linux kernel, the following vulnerability has been resolved: gpio: aggregator: protect driver attr handlers again
CVE-2025-21945	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in smb2_lock If smb_lo
CVE-2025-21946	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix out-of-bounds in parse_sec_desc() If d
CVE-2025-21947	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix type confusion via race condition whe
CVE-2025-21948	In the Linux kernel, the following vulnerability has been resolved: HID: appleir: Fix potential NULL dereference at
CVE-2025-21949	In the Linux kernel, the following vulnerability has been resolved: LoongArch: Set hugetlb mmap base address align
CVE-2025-21951	In the Linux kernel, the following vulnerability has been resolved: bus: mhi: host: pci_generic: Use pci_try_reset_fu
CVE-2025-21950	In the Linux kernel, the following vulnerability has been resolved: drivers: virt: acrn: hsm: Use kzalloc to avoid info
CVE-2025-21955	In the Linux kernel, the following vulnerability has been resolved: ksmbd: prevent connection release during oplock
CVE-2025-21956	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Assign normalized_pix_clk wh
CVE-2025-21957	In the Linux kernel, the following vulnerability has been resolved: scsi: qla1280: Fix kernel oops when debug level >
CVE-2025-21960	In the Linux kernel, the following vulnerability has been resolved: eth: bnxt: do not update checksum in bnxt_xdp_b
CVE-2025-21961	In the Linux kernel, the following vulnerability has been resolved: eth: bnxt: fix truesize for mb-xdp-pass case When
CVE-2025-21959	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_conncount: Fully initialize struct nf_c
CVE-2025-21962	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix integer overflow while processing closet
CVE-2025-21963	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix integer overflow while processing acdir
CVE-2025-21966	In the Linux kernel, the following vulnerability has been resolved: dm-flakey: Fix memory corruption in optional co
CVE-2025-21964	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix integer overflow while processing acreg
CVE-2025-21967	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in ksmbd_free_work_st
CVE-2025-21968	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix slab-use-after-free on hdc
CVE-2025-21969	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix slab-use-after-free Read i
CVE-2025-21970	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Bridge, fix the crash caused by LAG sta
CVE-2025-21971	In the Linux kernel, the following vulnerability has been resolved: net_sched: Prevent creation of classes with TC_H
CVE-2025-21972	In the Linux kernel, the following vulnerability has been resolved: net: mctp: unshare packets when reassembling E
CVE-2025-21975	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: handle errors in mlx5_chains_create_ta
CVE-2025-21976	In the Linux kernel, the following vulnerability has been resolved: fbdev: hyperv_fb: Allow graceful removal of fram
CVE-2025-21978	In the Linux kernel, the following vulnerability has been resolved: drm/hyperv: Fix address space leak when Hyper-
CVE-2025-21977	In the Linux kernel, the following vulnerability has been resolved: fbdev: hyperv_fb: Fix hang in kdump kernel whe

CVE-2025-21979	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: cancel wiphy_work before freeing
CVE-2025-21980	In the Linux kernel, the following vulnerability has been resolved: sched: address a potential NULL pointer dereference
CVE-2025-21981	In the Linux kernel, the following vulnerability has been resolved: ice: fix memory leak in aRFS after reset Fix aRFS
CVE-2025-21982	In the Linux kernel, the following vulnerability has been resolved: pinctrl: nuvoton: npcm8xx: Add NULL check in n
CVE-2025-21984	In the Linux kernel, the following vulnerability has been resolved: mm: fix kernel BUG when userfaultfd_move enc
CVE-2025-21985	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix out-of-bound accesses [WH
CVE-2025-21986	In the Linux kernel, the following vulnerability has been resolved: net: switchdev: Convert blocking notification cha
CVE-2025-21991	In the Linux kernel, the following vulnerability has been resolved: x86/microcode/AMD: Fix out-of-bounds on syste
CVE-2025-21992	In the Linux kernel, the following vulnerability has been resolved: HID: ignore non-functional sensor in HP 5MP Ca
CVE-2025-21993	In the Linux kernel, the following vulnerability has been resolved: iscsi_ibft: Fix UBSAN shift-out-of-bounds warni
CVE-2025-21994	In the Linux kernel, the following vulnerability has been resolved: ksmdb: fix incorrect validation for num_acces fiel
CVE-2025-21995	In the Linux kernel, the following vulnerability has been resolved: drm/sched: Fix fence reference count leak The las
CVE-2025-21996	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: fix uninitialized size issue in radeon_
CVE-2025-21997	In the Linux kernel, the following vulnerability has been resolved: xsk: fix an integer overflow in xp_create_and_ass
CVE-2025-21999	In the Linux kernel, the following vulnerability has been resolved: proc: fix UAF in proc_get_inode() Fix race betwe
CVE-2025-22001	In the Linux kernel, the following vulnerability has been resolved: accel/qaic: Fix integer overflow in qaic_validate_
CVE-2025-22002	In the Linux kernel, the following vulnerability has been resolved: netfs: Call `invalidate_cache` only if implemente
CVE-2025-22003	In the Linux kernel, the following vulnerability has been resolved: can: ucan: fix out of bound read in strscpy() sourc
CVE-2025-22004	In the Linux kernel, the following vulnerability has been resolved: net: atm: fix use after free in lec_send() The ->ser
CVE-2025-22005	In the Linux kernel, the following vulnerability has been resolved: ipv6: Fix memleak of nhc_pcpu_rth_output in fib
CVE-2025-22007	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix error code in chan_alloc_skb_cb()
CVE-2025-22008	In the Linux kernel, the following vulnerability has been resolved: regulator: check that dummy regulator has been p
CVE-2025-22009	In the Linux kernel, the following vulnerability has been resolved: regulator: dummy: force synchronous probing So
CVE-2025-22010	In the Linux kernel, the following vulnerability has been resolved: RDMA/hns: Fix soft lockup during bt pages loop
CVE-2025-22011	In the Linux kernel, the following vulnerability has been resolved: ARM: dts: bcm2711: Fix xHCI power-domain Du
CVE-2025-22013	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Unconditionally save+flush host F
CVE-2025-22014	In the Linux kernel, the following vulnerability has been resolved: soc: qcom: pdr: Fix the potential deadlock When
CVE-2025-22015	In the Linux kernel, the following vulnerability has been resolved: mm/migrate: fix shmem xarray update during mig
CVE-2025-22016	In the Linux kernel, the following vulnerability has been resolved: dpll: fix xa_alloc_cyclic() error handling In ca
CVE-2025-22017	In the Linux kernel, the following vulnerability has been resolved: devlink: fix xa_alloc_cyclic() error handling In ca
CVE-2025-22018	In the Linux kernel, the following vulnerability has been resolved: atm: Fix NULL pointer dereference When MPOA
CVE-2025-22019	In the Linux kernel, the following vulnerability has been resolved: bcachefs: bch2_ioctl_subvolume_destroy() fixes l
CVE-2025-22020	In the Linux kernel, the following vulnerability has been resolved: memstick: rtsx_usb_ms: Fix slab-use-after-free in
CVE-2025-22021	In the Linux kernel, the following vulnerability has been resolved: netfilter: socket: Lookup orig tuple for IPv6 SNA
CVE-2025-22022	In the Linux kernel, the following vulnerability has been resolved: usb: xhci: Apply the link chain quirk on NEC iso
CVE-2025-22025	In the Linux kernel, the following vulnerability has been resolved: nfsd: put dl_std if fail to queue dl_recall Before c
CVE-2025-22026	In the Linux kernel, the following vulnerability has been resolved: nfsd: don't ignore the return code of svc_proc_reg
CVE-2025-22027	In the Linux kernel, the following vulnerability has been resolved: media: streamzap: fix race between device discon
CVE-2025-22028	In the Linux kernel, the following vulnerability has been resolved: media: vimc: skip .s_stream() for stopped entities
CVE-2025-22029	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.

CVE-2025-22033	In the Linux kernel, the following vulnerability has been resolved: arm64: Don't call NULL in do_compat_alignmen
CVE-2025-22035	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix use-after-free in print_graph_function
CVE-2025-22036	In the Linux kernel, the following vulnerability has been resolved: exfat: fix random stack corruption after get_block
CVE-2025-22037	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix null pointer dereference in alloc_prea
CVE-2025-22038	In the Linux kernel, the following vulnerability has been resolved: ksmbd: validate zero num_subauth before sub_auth
CVE-2025-22039	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix overflow in dacloffset bounds check T
CVE-2025-22040	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix session use-after-free in multichannel
CVE-2025-22042	In the Linux kernel, the following vulnerability has been resolved: ksmbd: add bounds check for create lease context
CVE-2025-22041	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in ksmbd_sessions_dere
CVE-2025-22043	In the Linux kernel, the following vulnerability has been resolved: ksmbd: add bounds check for durable handle cont
CVE-2025-22044	In the Linux kernel, the following vulnerability has been resolved: acpi: nfit: fix narrowing conversion in acpi_nfit_c
CVE-2025-22045	In the Linux kernel, the following vulnerability has been resolved: x86/mm: Fix flush_tlb_range() when used for zap
CVE-2025-22050	In the Linux kernel, the following vulnerability has been resolved: usbnet:fix NPE during rx_complete Missing usbn
CVE-2025-22053	In the Linux kernel, the following vulnerability has been resolved: net: ibmveth: make veth_pool_store stop hanging
CVE-2025-22055	In the Linux kernel, the following vulnerability has been resolved: net: fix geneve_opt length integer overflow struct
CVE-2025-22054	In the Linux kernel, the following vulnerability has been resolved: arcnet: Add NULL check in com20020pci_prober
CVE-2025-22056	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_tunnel: fix geneve_opt type confusio
CVE-2025-22057	In the Linux kernel, the following vulnerability has been resolved: net: decrease cached dst counters in dst_release U
CVE-2025-22058	In the Linux kernel, the following vulnerability has been resolved: udp: Fix memory accounting leak. Matt Dowling
CVE-2025-22060	In the Linux kernel, the following vulnerability has been resolved: net: mvpp2: Prevent parser TCAM memory corru
CVE-2025-22062	In the Linux kernel, the following vulnerability has been resolved: sctp: add mutual exclusion in proc_sctp_do_udp
CVE-2025-22063	In the Linux kernel, the following vulnerability has been resolved: netlabel: Fix NULL pointer exception caused by
CVE-2025-22064	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: don't unregister hook when ta
CVE-2025-22065	In the Linux kernel, the following vulnerability has been resolved: idpf: fix adapter NULL pointer dereference on rel
CVE-2025-22066	In the Linux kernel, the following vulnerability has been resolved: ASoC: imx-card: Add NULL check in imx_card
CVE-2025-22068	In the Linux kernel, the following vulnerability has been resolved: ublk: make sure ubq->canceling is set when queu
CVE-2025-22070	In the Linux kernel, the following vulnerability has been resolved: fs/9p: fix NULL pointer dereference on mkdir WL
CVE-2025-22071	In the Linux kernel, the following vulnerability has been resolved: spufs: fix a leak in spufs_create_context() Leak fi
CVE-2025-22072	In the Linux kernel, the following vulnerability has been resolved: spufs: fix gang directory lifetimes prior to "[POW
CVE-2025-22073	In the Linux kernel, the following vulnerability has been resolved: spufs: fix a leak on spufs_new_file() failure It's ca
CVE-2025-22075	In the Linux kernel, the following vulnerability has been resolved: rtnetlink: Allocate vfinfo size for VF GUIDs whe
CVE-2025-22077	In the Linux kernel, the following vulnerability has been resolved: Revert "smb: client: fix TCP timers deadlock after
CVE-2025-22079	In the Linux kernel, the following vulnerability has been resolved: ocfs2: validate l_tree_depth to avoid out-of-boun
CVE-2025-22080	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Prevent integer overflow in hdr_first_def
CVE-2025-22083	In the Linux kernel, the following vulnerability has been resolved: vhost-scsi: Fix handling of multiple calls to vhost
CVE-2025-22081	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Fix a couple integer overflows on 32bit s
CVE-2025-22086	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix mlx5_poll_one() cur_qp update
CVE-2025-22090	In the Linux kernel, the following vulnerability has been resolved: x86/mm/pat: Fix VM_PAT handling when fork()
CVE-2025-22089	In the Linux kernel, the following vulnerability has been resolved: RDMA/core: Don't expose hw_counters outside c
CVE-2025-22088	In the Linux kernel, the following vulnerability has been resolved: RDMA/erdma: Prevent use-after-free in erdma_a

CVE-2025-22095	In the Linux kernel, the following vulnerability has been resolved: PCI: brcmstb: Fix error path after a call to regulat
CVE-2025-22097	In the Linux kernel, the following vulnerability has been resolved: drm/vkms: Fix use after free and double free on in
CVE-2025-22101	In the Linux kernel, the following vulnerability has been resolved: net: libwx: fix Tx L4 checksum The hardware onl
CVE-2025-22103	In the Linux kernel, the following vulnerability has been resolved: net: fix NULL pointer dereference in l3mdev_l3_
CVE-2025-22102	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btmxpuart: Fix kernel panic during FW
CVE-2025-22104	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: Use kernel helpers for hex dumps Previo
CVE-2025-22105	In the Linux kernel, the following vulnerability has been resolved: bonding: check xdp prog when set bond mode Fo
CVE-2025-22106	In the Linux kernel, the following vulnerability has been resolved: vmxnet3: unregister xdp rxq info in the reset path
CVE-2025-22107	In the Linux kernel, the following vulnerability has been resolved: net: dsa: sja1105: fix kasan out-of-bounds warnin
CVE-2025-22108	In the Linux kernel, the following vulnerability has been resolved: bnxt_en: Mask the bd_cnt field in the TX BD pro
CVE-2025-22109	In the Linux kernel, the following vulnerability has been resolved: ax25: Remove broken autobind Binding AX25 so
CVE-2025-22111	In the Linux kernel, the following vulnerability has been resolved: net: Remove RTNL dance for SIOCBRADDIF an
CVE-2025-22113	In the Linux kernel, the following vulnerability has been resolved: ext4: avoid journaling sb update on error if journa
CVE-2025-22115	In the Linux kernel, the following vulnerability has been resolved: btrfs: fix block group refcount race in btrfs_creat
CVE-2025-22116	In the Linux kernel, the following vulnerability has been resolved: idpf: check error for register_netdev() on init Cur
CVE-2025-22120	In the Linux kernel, the following vulnerability has been resolved: ext4: goto right label 'out_mmap_sem' in ext4_se
CVE-2025-22121	In the Linux kernel, the following vulnerability has been resolved: ext4: fix out-of-bound read in ext4_xattr_inode_d
CVE-2025-22124	In the Linux kernel, the following vulnerability has been resolved: md/md-bitmap: fix wrong bitmap_limit for cluster
CVE-2025-22125	In the Linux kernel, the following vulnerability has been resolved: md/raid1,raid10: don't ignore IO flags If blk-wbt
CVE-2025-22127	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix potential deadlock in prepare_compress
CVE-2025-22126	In the Linux kernel, the following vulnerability has been resolved: md: fix mddev uaf while iterating all_mddevs list
CVE-2025-22128	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: Clear affinity hint before calling ath
CVE-2025-22227	In some specific scenarios with chained redirects, Reactor Netty HTTP client leaks credentials. In order for this to ha
CVE-2025-22134	When switching to other buffers using the :all command and visual mode still being active, this may cause a heap-bu
CVE-2025-22150	Undici is an HTTP/1.1 client. Starting in version 4.5.0 and prior to versions 5.28.5, 6.21.1, and 7.2.3, undici uses `M
CVE-2025-22228	BCryptPasswordEncoder.matches(CharSequence,String) will incorrectly return true for passwords larger than 72 cha
CVE-2025-22233	CVE-2024-38820 ensured Locale-independent, lowercase conversion for both the configured disallowedFields patter
CVE-2025-22235	EndpointRequest.to() creates a matcher for null/** if the actuator endpoint, for which the EndpointRequest has been
CVE-2025-22868	An attacker can pass a malicious malformed token which causes unexpected memory to be consumed during parsing
CVE-2025-22869	SSH servers which implement file transfer protocols are vulnerable to a denial of service attack from clients which c
CVE-2025-22866	Due to the usage of a variable time instruction in the assembly implementation of an internal function, a small numb
CVE-2025-22870	Matching of hosts against proxy patterns can improperly treat an IPv6 zone ID as a hostname component. For exampl
CVE-2025-22872	The tokenizer incorrectly interprets tags with unquoted attribute values that end with a solidus character (/) as self-cl
CVE-2025-22871	The net/http package improperly accepts a bare LF as a line terminator in chunked data chunk-size lines. This can pe
CVE-2025-22919	A reachable assertion in FFmpeg git-master commit N-113007-g8d24a28d06 allows attackers to cause a Denial of S
CVE-2025-22874	Calling Verify with a VerifyOptions.KeyUsages that contains ExtKeyUsageAny unintentionally disabledpolicy valid
CVE-2025-22921	FFmpeg git-master,N-113007-g8d24a28d06 was discovered to contain a segmentation violation via the component /
CVE-2025-23048	In some mod_ssl configurations on Apache HTTP Server 2.4.35 through to 2.4.63, an access control bypass by truste
CVE-2025-23083	With the aid of the diagnostics_channel utility, an event can be hooked into whenever a worker thread is created. Th
CVE-2025-23085	A memory leak could occur when a remote peer abruptly closes the socket without sending a GOAWAY notification

CVE-2025-2312	A flaw was found in cifs-utils. When trying to obtain Kerberos credentials, the cifs.upcall program from the cifs-utils
CVE-2025-23129	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: Clear affinity hint before calling ath
CVE-2025-23130	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to avoid panic once fallocation fails for p
CVE-2025-23131	In the Linux kernel, the following vulnerability has been resolved: dlm: prevent NPD when writing a positive value
CVE-2025-23132	In the Linux kernel, the following vulnerability has been resolved: f2fs: quota: fix to avoid warning in dquot_writeba
CVE-2025-23133	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: update channel list in reg notifier ins
CVE-2025-23135	In the Linux kernel, the following vulnerability has been resolved: RISC-V: KVM: Teardown riscv specific bits after
CVE-2025-23136	In the Linux kernel, the following vulnerability has been resolved: thermal: int340x: Add NULL check for adev Not
CVE-2025-23138	In the Linux kernel, the following vulnerability has been resolved: watch_queue: fix pipe accounting mismatch Curr
CVE-2025-23140	In the Linux kernel, the following vulnerability has been resolved: misc: pci_endpoint_test: Avoid issue of interrupts
CVE-2025-23141	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Acquire SRCU in KVM_GET_MP_S
CVE-2025-23142	In the Linux kernel, the following vulnerability has been resolved: sctp: detect and prevent references to a freed trans
CVE-2025-23143	In the Linux kernel, the following vulnerability has been resolved: net: Fix null-ptr-deref by sock_lock_init_class_ar
CVE-2025-23145	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix NULL pointer in can_accept_new_sub
CVE-2025-23144	In the Linux kernel, the following vulnerability has been resolved: backlight: led_bl: Hold led_access lock when call
CVE-2025-23146	In the Linux kernel, the following vulnerability has been resolved: mfd: ene-kb3930: Fix a potential NULL pointer d
CVE-2025-23148	In the Linux kernel, the following vulnerability has been resolved: soc: samsung: exynos-chipid: Add NULL pointer
CVE-2025-23147	In the Linux kernel, the following vulnerability has been resolved: i3c: Add NULL pointer check in i3c_master_que
CVE-2025-23150	In the Linux kernel, the following vulnerability has been resolved: ext4: fix off-by-one error in do_split Syzkaller de
CVE-2025-23149	In the Linux kernel, the following vulnerability has been resolved: tpm: do not start chip while suspended Checking
CVE-2025-23151	In the Linux kernel, the following vulnerability has been resolved: bus: mhi: host: Fix race between unprepare and q
CVE-2025-23155	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: Fix accessing freed irq affinity_hin
CVE-2025-23156	In the Linux kernel, the following vulnerability has been resolved: media: venus: hfi_parser: refactor hfi packet pars
CVE-2025-23157	In the Linux kernel, the following vulnerability has been resolved: media: venus: hfi_parser: add check to avoid out
CVE-2025-23158	In the Linux kernel, the following vulnerability has been resolved: media: venus: hfi: add check to handle incorrect c
CVE-2025-23159	In the Linux kernel, the following vulnerability has been resolved: media: venus: hfi: add a check to handle OOB in
CVE-2025-23160	In the Linux kernel, the following vulnerability has been resolved: media: mediatek: vcodec: Fix a resource leak rela
CVE-2025-23161	In the Linux kernel, the following vulnerability has been resolved: PCI: vmd: Make vmd_dev::cfg_lock a raw_spinlo
CVE-2025-23162	In the Linux kernel, the following vulnerability has been resolved: drm/xe/vf: Don't try to trigger a full GT reset if V
CVE-2025-23165	In Node.js, the `ReadFileUtf8` internal binding leaks memory due to a corrupted pointer in `uv_fs_s.file`: a UTF-16
CVE-2025-23163	In the Linux kernel, the following vulnerability has been resolved: net: vlan: don't propagate flags on open With the
CVE-2025-23166	The C++ method SignTraits::DeriveBits() may incorrectly call ThrowException() based on user-supplied inputs whe
CVE-2025-23167	A flaw in Node.js 20's HTTP parser allows improper termination of HTTP/1 headers using `r\n\rX` instead of the re
CVE-2025-23184	A potential denial of service vulnerability is present in versions of Apache CXF before 3.5.10, 3.6.5 and 4.0.6. In so
CVE-2025-24014	Vim is an open source, command line text editor. A segmentation fault was found in Vim before 9.1.1043. In silent l
CVE-2025-24023	Flask-AppBuilder is an application development framework. Prior to 4.5.3, Flask-AppBuilder allows unauthenticated
CVE-2025-24357	vLLM is a library for LLM inference and serving. vllm/model_executor/weight_utils.py implements hf_model_weig
CVE-2025-24358	gorilla/csrif provides Cross Site Request Forgery (CSRF) prevention middleware for Go web applications & services
CVE-2025-24513	A security issue was discovered in ingress-nginx https://github.com/kubernetes/ingress-nginx where attacker-provide
CVE-2025-24514	A security issue was discovered in ingress-nginx https://github.com/kubernetes/ingress-nginx where the `auth-url` In

CVE-2025-2476	Use after free in Lens in Google Chrome prior to 134.0.6998.117 allowed a remote attacker to potentially exploit heap overflow
CVE-2025-24789	Snowflake JDBC provides a JDBC type 4 driver that supports core functionality, allowing Java program to connect to Snowflake
CVE-2025-24790	Snowflake JDBC provides a JDBC type 4 driver that supports core functionality, allowing Java program to connect to Snowflake
CVE-2025-24793	The Snowflake Connector for Python provides an interface for developing Python applications that can connect to Snowflake
CVE-2025-24794	The Snowflake Connector for Python provides an interface for developing Python applications that can connect to Snowflake
CVE-2025-24795	The Snowflake Connector for Python provides an interface for developing Python applications that can connect to Snowflake
CVE-2025-24855	numbers.c in libxslt before 1.1.43 has a use-after-free because, in nested XPath evaluations, an XPath context node can be freed
CVE-2025-24813	Path Equivalence: 'file.Name' (Internal Dot) leading to Remote Code Execution and/or Information disclosure and/or Denial of Service
CVE-2025-24970	Netty, an asynchronous, event-driven network application framework, has a vulnerability starting in version 4.1.91.Final
CVE-2025-24928	libxml2 before 2.12.10 and 2.13.x before 2.13.6 has a stack-based buffer overflow in xmlSnprintfElements in valid.c
CVE-2025-25184	Rack provides an interface for developing web applications in Ruby. Prior to versions 2.2.11, 3.0.12, and 3.1.10, Rack::Session::Cookie
CVE-2025-25183	vLLM is a high-throughput and memory-efficient inference and serving engine for LLMs. Maliciously constructed requests can cause
CVE-2025-25186	Net::IMAP implements Internet Message Access Protocol (IMAP) client functionality in Ruby. Starting in version 0.9.2, Net::IMAP
CVE-2025-25473	FFmpeg git master before commit c08d30 was discovered to contain a NULL pointer dereference via the component avcodec
CVE-2025-25193	Netty, an asynchronous, event-driven network application framework, has a vulnerability in versions up to and including 4.1.91.Final
CVE-2025-25724	list_item_verbose in tar/util.c in libarchive through 3.7.7 does not check an strftime return value, which can lead to a denial of service
CVE-2025-2588	A vulnerability has been found in Hercules Augeas 1.14.1 and classified as problematic. This vulnerability affects the Augeas
CVE-2025-26465	A vulnerability was found in OpenSSH when the VerifyHostKeyDNS option is enabled. A machine-in-the-middle attack can be performed
CVE-2025-26519	musl libc 0.9.13 through 1.2.5 before 1.2.6 has an out-of-bounds write vulnerability when an attacker can trigger iconv
CVE-2025-26597	A buffer overflow flaw was found in X.Org and Xwayland. If XkbChangeTypesOfKey() is called with a 0 group, it can cause a denial of service
CVE-2025-26603	Vim is a greatly improved version of the good old UNIX editor Vi. Vim allows to redirect screen messages using the :redir command
CVE-2025-26699	An issue was discovered in Django 5.1 before 5.1.7, 5.0 before 5.0.13, and 4.2 before 4.2.20. The django.utils.text.truncate_words
CVE-2025-27111	Rack is a modular Ruby web server interface. The Rack::Sendfile middleware logs unsanitised header values from the application
CVE-2025-27018	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') vulnerability in Apache ActiveMQ
CVE-2025-27113	libxml2 before 2.12.10 and 2.13.x before 2.13.6 has a NULL pointer dereference in xmlPatMatch in pattern.c.
CVE-2025-27144	Go JOSE provides an implementation of the Javascript Object Signing and Encryption set of standards in Go, including JWS, JWE, and JWK
CVE-2025-27152	axios is a promise based HTTP client for the browser and node.js. The issue occurs when passing absolute URLs rather than relative
CVE-2025-27219	In the CGI gem before 0.4.2 for Ruby, the CGI::Cookie.parse method in the CGI library contains a potential Denial of Service
CVE-2025-27220	In the CGI gem before 0.4.2 for Ruby, a Regular Expression Denial of Service (ReDoS) vulnerability exists in the URI module
CVE-2025-27221	In the URI gem before 1.0.3 for Ruby, the URI handling methods (URI.join, URI#merge, URI#++) have an inadvertent Denial of Service
CVE-2025-27363	An out of bounds write exists in FreeType versions 2.13.0 and below (newer versions of FreeType are not vulnerable to this issue)
CVE-2025-27496	Snowflake, a platform for using artificial intelligence in the context of cloud computing, has a vulnerability in the Snowflake
CVE-2025-27516	Jinja is an extensible templating engine. Prior to 3.1.6, an oversight in how the Jinja sandboxed environment interacts with the
CVE-2025-27587	OpenSSL 3.0.0 through 3.3.2 on the PowerPC architecture is vulnerable to a Minerva attack, exploitable by measuring the execution
CVE-2025-27610	Rack provides an interface for developing web applications in Ruby. Prior to versions 2.2.13, 3.0.14, and 3.1.12, Rack::Session::Cookie
CVE-2025-27613	Gitk is a Tcl/Tk based Git history browser. Starting with 1.7.0, when a user clones an untrusted repository and runs gitk, a denial of service
CVE-2025-27614	Gitk is a Tcl/Tk based Git history browser. Starting with 2.41.0, a Git repository can be crafted in such a way that when gitk is
CVE-2025-27789	Babel is a compiler for writing next generation JavaScript. When using versions of Babel prior to 7.26.10 and 8.0.0-alpha.4, a
CVE-2025-27817	A possible arbitrary file read and SSRF vulnerability has been identified in Apache Kafka Client. Apache Kafka Client versions
CVE-2025-27820	A bug in PSL validation logic in Apache HttpClient 5.4.x disables domain checks, affecting cookie management and other

CVE-2025-2783	Incorrect handle provided in unspecified circumstances in Mojo in Google Chrome on Windows prior to 134.0.6998.110
CVE-2025-29087	In SQLite 3.44.0 through 3.49.0 before 3.49.1, the concat_ws() SQL function can cause memory to be written beyond the end of the buffer
CVE-2025-2828	A Server-Side Request Forgery (SSRF) vulnerability exists in the RequestsToolkit component of the langchain-community
CVE-2025-29088	In SQLite 3.49.0 before 3.49.1, certain argument values to sqlite3_db_config (in the C-language API) can cause a denial of service
CVE-2025-2953	A vulnerability, which was classified as problematic, has been found in PyTorch 2.6.0+cu124. Affected by this issue is the PyTorch
CVE-2025-29768	Vim, a text editor, is vulnerable to potential data loss with zip.vim and special crafted zip files in versions prior to 9.0.0
CVE-2025-29770	vLLM is a high-throughput and memory-efficient inference and serving engine for LLMs. The outlines library is one of the core dependencies
CVE-2025-29786	Expr is an expression language and expression evaluation for Go. Prior to version 1.17.0, if the Expr expression parser encounters a malformed expression, it can cause a denial of service
CVE-2025-30065	Schema parsing in the parquet-avro module of Apache Parquet 1.15.0 and previous versions allows bad actors to execute arbitrary code
CVE-2025-30165	vLLM is an inference and serving engine for large language models. In a multi-node vLLM deployment using the vLLM
CVE-2025-30167	Jupyter Core is a package for the core common functionality of Jupyter projects. When using Jupyter Core prior to v0.1.0, a user can cause a denial of service
CVE-2025-30202	vLLM is a high-throughput and memory-efficient inference and serving engine for LLMs. Versions starting from 0.5.0, vLLM is vulnerable to a denial of service
CVE-2025-30258	In GnuPG before 2.5.5, if a user chooses to import a certificate with certain crafted subkey data that lacks a valid back signature, a denial of service can be achieved
CVE-2025-30204	golang-jwt is a Go implementation of JSON Web Tokens. Starting in version 3.2.0 and prior to versions 5.2.2 and 4.5.1, a denial of service can be achieved
CVE-2025-30370	jupyterlab-git is a JupyterLab extension for version control using Git. On many platforms, a third party can create a denial of service
CVE-2025-30473	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') vulnerability in Apache Airflow 2.10.0 and previous versions
CVE-2025-3066	Use after free in Site Isolation in Google Chrome prior to 135.0.7049.84 allowed a remote attacker to potentially exploit a browser vulnerability
CVE-2025-3068	Inappropriate implementation in Intents in Google Chrome on Android prior to 135.0.7049.52 allowed a remote attacker to potentially exploit a browser vulnerability
CVE-2025-3067	Inappropriate implementation in Custom Tabs in Google Chrome on Android prior to 135.0.7049.52 allowed a remote attacker to potentially exploit a browser vulnerability
CVE-2025-3069	Inappropriate implementation in Extensions in Google Chrome prior to 135.0.7049.52 allowed a remote attacker to potentially exploit a browser vulnerability
CVE-2025-30691	Vulnerability in Oracle Java SE (component: Compiler). Supported versions that are affected are Oracle Java SE: 21.0.4, 21.0.3, 21.0.2, 21.0.1, 21.0.0, 21.0.0-rc, 21.0.0-rc1, 21.0.0-rc2, 21.0.0-rc3, 21.0.0-rc4, 21.0.0-rc5, 21.0.0-rc6, 21.0.0-rc7, 21.0.0-rc8, 21.0.0-rc9, 21.0.0-rc10, 21.0.0-rc11, 21.0.0-rc12, 21.0.0-rc13, 21.0.0-rc14, 21.0.0-rc15, 21.0.0-rc16, 21.0.0-rc17, 21.0.0-rc18, 21.0.0-rc19, 21.0.0-rc20, 21.0.0-rc21, 21.0.0-rc22, 21.0.0-rc23, 21.0.0-rc24, 21.0.0-rc25, 21.0.0-rc26, 21.0.0-rc27, 21.0.0-rc28, 21.0.0-rc29, 21.0.0-rc30, 21.0.0-rc31, 21.0.0-rc32, 21.0.0-rc33, 21.0.0-rc34, 21.0.0-rc35, 21.0.0-rc36, 21.0.0-rc37, 21.0.0-rc38, 21.0.0-rc39, 21.0.0-rc40, 21.0.0-rc41, 21.0.0-rc42, 21.0.0-rc43, 21.0.0-rc44, 21.0.0-rc45, 21.0.0-rc46, 21.0.0-rc47, 21.0.0-rc48, 21.0.0-rc49, 21.0.0-rc50, 21.0.0-rc51, 21.0.0-rc52, 21.0.0-rc53, 21.0.0-rc54, 21.0.0-rc55, 21.0.0-rc56, 21.0.0-rc57, 21.0.0-rc58, 21.0.0-rc59, 21.0.0-rc60, 21.0.0-rc61, 21.0.0-rc62, 21.0.0-rc63, 21.0.0-rc64, 21.0.0-rc65, 21.0.0-rc66, 21.0.0-rc67, 21.0.0-rc68, 21.0.0-rc69, 21.0.0-rc70, 21.0.0-rc71, 21.0.0-rc72, 21.0.0-rc73, 21.0.0-rc74, 21.0.0-rc75, 21.0.0-rc76, 21.0.0-rc77, 21.0.0-rc78, 21.0.0-rc79, 21.0.0-rc80, 21.0.0-rc81, 21.0.0-rc82, 21.0.0-rc83, 21.0.0-rc84, 21.0.0-rc85, 21.0.0-rc86, 21.0.0-rc87, 21.0.0-rc88, 21.0.0-rc89, 21.0.0-rc90, 21.0.0-rc91, 21.0.0-rc92, 21.0.0-rc93, 21.0.0-rc94, 21.0.0-rc95, 21.0.0-rc96, 21.0.0-rc97, 21.0.0-rc98, 21.0.0-rc99, 21.0.0-rc100, 21.0.0-rc101, 21.0.0-rc102, 21.0.0-rc103, 21.0.0-rc104, 21.0.0-rc105, 21.0.0-rc106, 21.0.0-rc107, 21.0.0-rc108, 21.0.0-rc109, 21.0.0-rc110, 21.0.0-rc111, 21.0.0-rc112, 21.0.0-rc113, 21.0.0-rc114, 21.0.0-rc115, 21.0.0-rc116, 21.0.0-rc117, 21.0.0-rc118, 21.0.0-rc119, 21.0.0-rc120, 21.0.0-rc121, 21.0.0-rc122, 21.0.0-rc123, 21.0.0-rc124, 21.0.0-rc125, 21.0.0-rc126, 21.0.0-rc127, 21.0.0-rc128, 21.0.0-rc129, 21.0.0-rc130, 21.0.0-rc131, 21.0.0-rc132, 21.0.0-rc133, 21.0.0-rc134, 21.0.0-rc135, 21.0.0-rc136, 21.0.0-rc137, 21.0.0-rc138, 21.0.0-rc139, 21.0.0-rc140, 21.0.0-rc141, 21.0.0-rc142, 21.0.0-rc143, 21.0.0-rc144, 21.0.0-rc145, 21.0.0-rc146, 21.0.0-rc147, 21.0.0-rc148, 21.0.0-rc149, 21.0.0-rc150, 21.0.0-rc151, 21.0.0-rc152, 21.0.0-rc153, 21.0.0-rc154, 21.0.0-rc155, 21.0.0-rc156, 21.0.0-rc157, 21.0.0-rc158, 21.0.0-rc159, 21.0.0-rc160, 21.0.0-rc161, 21.0.0-rc162, 21.0.0-rc163, 21.0.0-rc164, 21.0.0-rc165, 21.0.0-rc166, 21.0.0-rc167, 21.0.0-rc840, 21.0.0-rc841, 21.0.0-rc8

CVE-2025-32415	In libxml2 before 2.13.8 and 2.14.x before 2.14.2, xmlSchemaIDCFillNodeTables in xmlschemas.c has a heap-based
CVE-2025-32434	PyTorch is a Python package that provides tensor computation with strong GPU acceleration and deep neural network
CVE-2025-32444	vLLM is a high-throughput and memory-efficient inference and serving engine for LLMs. Versions starting from 0.6
CVE-2025-32462	Sudo before 1.9.17p1, when used with a sudoers file that specifies a host that is neither the current host nor ALL, all
CVE-2025-32463	Sudo before 1.9.17p1 allows local users to obtain root access because /etc/nsswitch.conf from a user-controlled direc
CVE-2025-3262	A Regular Expression Denial of Service (ReDoS) vulnerability was discovered in the huggingface/transformers repo
CVE-2025-3263	A Regular Expression Denial of Service (ReDoS) vulnerability was discovered in the Hugging Face Transformers lib
CVE-2025-3264	A Regular Expression Denial of Service (ReDoS) vulnerability was discovered in the Hugging Face Transformers lib
CVE-2025-32728	In sshd in OpenSSH before 10.0, the DisableForwarding directive does not adhere to the documentation stating that
CVE-2025-3277	An integer overflow can be triggered in SQLite's `concat_ws()` function. The resulting, truncated integer is then use
CVE-2025-32873	An issue was discovered in Django 4.2 before 4.2.21, 5.1 before 5.1.9, and 5.2 before 5.2.1. The django.utils.html.str
CVE-2025-32912	A flaw was found in libsoup, where SoupAuthDigest is vulnerable to a NULL pointer dereference. The HTTP server
CVE-2025-32962	Flask-AppBuilder is an application development framework built on top of Flask. Versions prior to 4.6.2 would allo
CVE-2025-32988	A flaw was found in GnuTLS. A double-free vulnerability exists in GnuTLS due to incorrect ownership handling in
CVE-2025-32989	A heap-buffer-overread vulnerability was found in GnuTLS in how it handles the Certificate Transparency (CT) Sign
CVE-2025-32990	A heap-buffer-overflow (off-by-one) flaw was found in the GnuTLS software in the template parsing logic within th
CVE-2025-3360	A flaw was found in GLib. An integer overflow and buffer under-read occur when parsing a long invalid ISO 8601 t
CVE-2025-35036	Hibernate Validator before 6.2.0 and 7.0.0, by default and depending how it is used, may interpolate user-supplied in
CVE-2025-3576	A vulnerability in the MIT Kerberos implementation allows GSSAPI-protected messages using RC4-HMAC-MD5 t
CVE-2025-3588	A vulnerability, which was classified as problematic, has been found in joelittlejohn jsonschema2pojo 1.2.2. This iss
CVE-2025-3619	Heap buffer overflow in Codecs in Google Chrome on Windows prior to 135.0.7049.95 allowed a remote attacker to
CVE-2025-3620	Use after free in USB in Google Chrome prior to 135.0.7049.95 allowed a remote attacker to potentially exploit heap
CVE-2025-3730	A vulnerability, which was classified as problematic, was found in PyTorch 2.6.0. Affected is the function torch.nn.f
CVE-2025-37738	In the Linux kernel, the following vulnerability has been resolved: ext4: ignore xattrs past end Once inside 'ext4_xatt
CVE-2025-37739	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to avoid out-of-bounds access in f2fs_tru
CVE-2025-37740	In the Linux kernel, the following vulnerability has been resolved: jfs: add sanity check for agwidth in dbMount The
CVE-2025-37741	In the Linux kernel, the following vulnerability has been resolved: jfs: Prevent copying of nlink with value 0 from di
CVE-2025-37742	In the Linux kernel, the following vulnerability has been resolved: jfs: Fix uninit-value access of imap allocated in th
CVE-2025-37743	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: Avoid memory leak while enabling
CVE-2025-37744	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix memory leak in ath12k_pci_rem
CVE-2025-37745	In the Linux kernel, the following vulnerability has been resolved: PM: hibernate: Avoid deadlock in hibernate_com
CVE-2025-37746	In the Linux kernel, the following vulnerability has been resolved: perf/dwc_pcie: fix duplicate pci_dev devices Dur
CVE-2025-37747	In the Linux kernel, the following vulnerability has been resolved: perf: Fix hang while freeing sigtrap event Perf ca
CVE-2025-37748	In the Linux kernel, the following vulnerability has been resolved: iommu/mediatek: Fix NULL pointer dereference in
CVE-2025-37749	In the Linux kernel, the following vulnerability has been resolved: net: ppp: Add bound checking for skb data on ppp
CVE-2025-37752	In the Linux kernel, the following vulnerability has been resolved: net_sched: sch_sfq: move the limit validation It is
CVE-2025-37754	In the Linux kernel, the following vulnerability has been resolved: drm/i915/huc: Fix fence not released on early pro
CVE-2025-37755	In the Linux kernel, the following vulnerability has been resolved: net: libwx: handle page_pool_dev_alloc_pages er
CVE-2025-37756	In the Linux kernel, the following vulnerability has been resolved: net: tls: explicitly disallow disconnect syzbot disc
CVE-2025-37757	In the Linux kernel, the following vulnerability has been resolved: tipc: fix memory leak in tipc_link_xmit In case th

CVE-2025-37758	In the Linux kernel, the following vulnerability has been resolved: ata: pata_pxa: Fix potential NULL pointer dereference
CVE-2025-37759	In the Linux kernel, the following vulnerability has been resolved: ublk: fix handling recovery & reissue in ublk_abort
CVE-2025-37763	In the Linux kernel, the following vulnerability has been resolved: drm/imagination: take paired job reference For paired jobs
CVE-2025-37761	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Fix an out-of-bounds shift when invalidating
CVE-2025-37764	In the Linux kernel, the following vulnerability has been resolved: drm/imagination: fix firmware memory leaks Free
CVE-2025-37765	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau: prime: fix ttm_bo_delayed_delete
CVE-2025-37766	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Prevent division by zero The user c
CVE-2025-37767	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Prevent division by zero The user c
CVE-2025-37768	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Prevent division by zero The user c
CVE-2025-37769	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm/smu11: Prevent division by zero The
CVE-2025-3777	Hugging Face Transformers versions up to 4.49.0 are affected by an improper input validation vulnerability in the `in
CVE-2025-37770	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Prevent division by zero The user c
CVE-2025-37771	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pm: Prevent division by zero The user c
CVE-2025-37772	In the Linux kernel, the following vulnerability has been resolved: RDMA/cma: Fix workqueue crash in cma_netevent
CVE-2025-37773	In the Linux kernel, the following vulnerability has been resolved: virtiofs: add filesystem context source name chec
CVE-2025-37775	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix the warning from __kernel_write_iter
CVE-2025-37776	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in smb_break_all_levII
CVE-2025-37777	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in __smb2_lease_break
CVE-2025-37778	In the Linux kernel, the following vulnerability has been resolved: ksmbd: Fix dangling pointer in krb_authenticate k
CVE-2025-37780	In the Linux kernel, the following vulnerability has been resolved: isofs: Prevent the use of too small fid syzbot repo
CVE-2025-37781	In the Linux kernel, the following vulnerability has been resolved: i2c: cros-ec-tunnel: defer probe if parent EC is no
CVE-2025-37784	In the Linux kernel, the following vulnerability has been resolved: net: ti: icss-iep: Fix possible NULL pointer deref
CVE-2025-37786	In the Linux kernel, the following vulnerability has been resolved: net: dsa: free routing table on probe failure If com
CVE-2025-37785	In the Linux kernel, the following vulnerability has been resolved: ext4: fix OOB read when checking dotdot dir Mo
CVE-2025-37787	In the Linux kernel, the following vulnerability has been resolved: net: dsa: mv88e6xxx: avoid unregistering devlink
CVE-2025-37788	In the Linux kernel, the following vulnerability has been resolved: cxgb4: fix memory leak in cxgb4_init_ethtool_fil
CVE-2025-37789	In the Linux kernel, the following vulnerability has been resolved: net: openvswitch: fix nested key length validation
CVE-2025-37790	In the Linux kernel, the following vulnerability has been resolved: net: mctp: Set SOCK_RCU_FREE Bind lookup r
CVE-2025-37792	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btrtl: Prevent potential NULL derefer
CVE-2025-37794	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: Purge vif txq in ieee80211_do_s
CVE-2025-37793	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: avs: Fix null-ptr-deref in avs_compo
CVE-2025-37795	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2025-37797	In the Linux kernel, the following vulnerability has been resolved: net_sched: hfsc: Fix a UAF vulnerability in class
CVE-2025-37796	In the Linux kernel, the following vulnerability has been resolved: wifi: at76c50x: fix use after free access in at76_d
CVE-2025-37798	In the Linux kernel, the following vulnerability has been resolved: codell: remove sch->q.qlen check before qdisc_tre
CVE-2025-37799	In the Linux kernel, the following vulnerability has been resolved: vmxnet3: Fix malformed packet sizing in vmxnet
CVE-2025-37800	In the Linux kernel, the following vulnerability has been resolved: driver core: fix potential NULL pointer dereferen
CVE-2025-37801	In the Linux kernel, the following vulnerability has been resolved: spi: spi-imx: Add check for spi_imx_setupxfer() a
CVE-2025-37802	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix WARNING "do not call blocking ops
CVE-2025-37803	In the Linux kernel, the following vulnerability has been resolved: udmabuf: fix a buf size overflow issue during udr

CVE-2025-37806	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: Keep write operations atomic syzbot rep
CVE-2025-37805	In the Linux kernel, the following vulnerability has been resolved: sound/virtio: Fix cancel_sync warnings on uniniti
CVE-2025-37807	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix kmemleak warning for percpu hashmap V
CVE-2025-37808	In the Linux kernel, the following vulnerability has been resolved: crypto: null - Use spin lock instead of mutex As t
CVE-2025-37809	In the Linux kernel, the following vulnerability has been resolved: usb: typec: class: Fix NULL pointer access Concu
CVE-2025-37810	In the Linux kernel, the following vulnerability has been resolved: usb: dwc3: gadget: check that event count does no
CVE-2025-37811	In the Linux kernel, the following vulnerability has been resolved: usb: chipidea: ci_hdrc_imx: fix usbmisc handling
CVE-2025-37812	In the Linux kernel, the following vulnerability has been resolved: usb: cdns3: Fix deadlock when using NCM gadge
CVE-2025-37815	In the Linux kernel, the following vulnerability has been resolved: misc: microchip: pci1xxx: Fix Kernel panic duri
CVE-2025-37816	In the Linux kernel, the following vulnerability has been resolved: mei: vsc: Fix fortify-panic caused by invalid coun
CVE-2025-37813	In the Linux kernel, the following vulnerability has been resolved: usb: xhci: Fix invalid pointer dereference in Etron
CVE-2025-37817	In the Linux kernel, the following vulnerability has been resolved: mcb: fix a double free bug in chameleon_parse_g
CVE-2025-37819	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v2m: Prevent use after free of gicv2m
CVE-2025-37820	In the Linux kernel, the following vulnerability has been resolved: xen-netfront: handle NULL returned by xdp_conv
CVE-2025-37822	In the Linux kernel, the following vulnerability has been resolved: riscv: uprobes: Add missing fence.i after building
CVE-2025-37823	In the Linux kernel, the following vulnerability has been resolved: net_sched: hfsc: Fix a potential UAF in hfsc_dequ
CVE-2025-37824	In the Linux kernel, the following vulnerability has been resolved: tipc: fix NULL pointer dereference in tipc_mon_i
CVE-2025-37826	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: core: Add NULL check in ufshcd_mcq_
CVE-2025-37827	In the Linux kernel, the following vulnerability has been resolved: btrfs: zoned: return EIO on RAID1 block group w
CVE-2025-37828	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: mcq: Add NULL check in ufshcd_mcq_
CVE-2025-37829	In the Linux kernel, the following vulnerability has been resolved: cpufreq: scpi: Fix null-ptr-deref in scpi_cpufreq_
CVE-2025-37830	In the Linux kernel, the following vulnerability has been resolved: cpufreq: scmi: Fix null-ptr-deref in scmi_cpufreq
CVE-2025-37831	In the Linux kernel, the following vulnerability has been resolved: cpufreq: apple-soc: Fix null-ptr-deref in apple_so
CVE-2025-37833	In the Linux kernel, the following vulnerability has been resolved: net/niu: Niu requires MSIX ENTRY_DATA field
CVE-2025-37834	In the Linux kernel, the following vulnerability has been resolved: mm/vmscan: don't try to reclaim hwpoison folio S
CVE-2025-37838	In the Linux kernel, the following vulnerability has been resolved: HSI: ssi_protocol: Fix use after free vulnerability
CVE-2025-37836	In the Linux kernel, the following vulnerability has been resolved: PCI: Fix reference leak in pci_register_host_bridg
CVE-2025-37839	In the Linux kernel, the following vulnerability has been resolved: jbd2: remove wrong sb->s_sequence check Journ
CVE-2025-37840	In the Linux kernel, the following vulnerability has been resolved: mtd: rawnand: brcmnand: fix PM resume warning
CVE-2025-37841	In the Linux kernel, the following vulnerability has been resolved: pm: cpupower: bench: Prevent NULL dereference
CVE-2025-37842	In the Linux kernel, the following vulnerability has been resolved: spi: fsl-qspi: use devm function instead of driver
CVE-2025-37844	In the Linux kernel, the following vulnerability has been resolved: cifs: avoid NULL pointer dereference in dbg call
CVE-2025-37846	In the Linux kernel, the following vulnerability has been resolved: arm64: mops: Do not dereference src reg for a set
CVE-2025-37849	In the Linux kernel, the following vulnerability has been resolved: KVM: arm64: Tear down vGIC on failed vCPU c
CVE-2025-37850	In the Linux kernel, the following vulnerability has been resolved: pwm: mediatek: Prevent divide-by-zero in pwm_
CVE-2025-37851	In the Linux kernel, the following vulnerability has been resolved: fbdev: omapfb: Add 'plane' value check Function
CVE-2025-37852	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: handle amdgpu_cgs_create_device
CVE-2025-37853	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: debugfs hang_hws skip GPU with M
CVE-2025-37855	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Guard Possible Null Pointer De
CVE-2025-37854	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Fix mode1 reset crash issue If HW s

CVE-2025-37856	In the Linux kernel, the following vulnerability has been resolved: btrfs: harden block_group::bg_list against list_del
CVE-2025-37857	In the Linux kernel, the following vulnerability has been resolved: scsi: st: Fix array overflow in st_setup() Change t
CVE-2025-37858	In the Linux kernel, the following vulnerability has been resolved: fs/jfs: Prevent integer overflow in AG size calcula
CVE-2025-37861	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Synchronous access b/w reset and t
CVE-2025-37863	In the Linux kernel, the following vulnerability has been resolved: ovl: don't allow datadir only In theory overlaysfs c
CVE-2025-37862	In the Linux kernel, the following vulnerability has been resolved: HID: pidff: Fix null pointer dereference in pidff_f
CVE-2025-37859	In the Linux kernel, the following vulnerability has been resolved: page_pool: avoid infinite loop to schedule delayed
CVE-2025-37860	In the Linux kernel, the following vulnerability has been resolved: sfc: fix NULL dereferences in ef100_process_des
CVE-2025-37864	In the Linux kernel, the following vulnerability has been resolved: net: dsa: clean up FDB, MDB, VLAN entries on t
CVE-2025-37869	In the Linux kernel, the following vulnerability has been resolved: drm/xe: Use local fence in error path of xe_migra
CVE-2025-37870	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: prevent hang on link training fa
CVE-2025-37865	In the Linux kernel, the following vulnerability has been resolved: net: dsa: mv88e6xxx: fix -ENOENT when deletin
CVE-2025-37867	In the Linux kernel, the following vulnerability has been resolved: RDMA/core: Silence oversized kvmalloc() warni
CVE-2025-37872	In the Linux kernel, the following vulnerability has been resolved: net: txgbe: fix memory leak in txgbe_probe() erro
CVE-2025-37873	In the Linux kernel, the following vulnerability has been resolved: eth: bnxt: fix missing ring index trim on error pat
CVE-2025-37875	In the Linux kernel, the following vulnerability has been resolved: igc: fix PTM cycle trigger logic Writing to clear t
CVE-2025-37874	In the Linux kernel, the following vulnerability has been resolved: net: ngbe: fix memory leak in ngbe_probe() erro
CVE-2025-37876	In the Linux kernel, the following vulnerability has been resolved: netfs: Only create /proc/fs/netfs with CONFIG_P
CVE-2025-37877	In the Linux kernel, the following vulnerability has been resolved: iommu: Clear iommu-dma ops on cleanup If iom
CVE-2025-37878	In the Linux kernel, the following vulnerability has been resolved: perf/core: Fix WARN_ON(!ctx) in __free_event(
CVE-2025-37879	In the Linux kernel, the following vulnerability has been resolved: 9p/net: fix improper handling of bogus negative r
CVE-2025-37880	In the Linux kernel, the following vulnerability has been resolved: um: work around sched_yield not yielding in time
CVE-2025-37881	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: aspeed: Add NULL pointer check in
CVE-2025-37882	In the Linux kernel, the following vulnerability has been resolved: usb: xhci: Fix isochronous Ring Underrun/Overru
CVE-2025-37883	In the Linux kernel, the following vulnerability has been resolved: s390/sclp: Add check for get_zeroed_page() Add
CVE-2025-37884	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix deadlock between rcu_tasks_trace and ev
CVE-2025-37885	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Reset IRTE to host control if *new* r
CVE-2025-37886	In the Linux kernel, the following vulnerability has been resolved: pds_core: make wait_context part of q_info Make
CVE-2025-37887	In the Linux kernel, the following vulnerability has been resolved: pds_core: handle unsupported PDS_CORE_CMD
CVE-2025-37889	In the Linux kernel, the following vulnerability has been resolved: ASoC: ops: Consistently treat platform_max as co
CVE-2025-37890	In the Linux kernel, the following vulnerability has been resolved: net_sched: hfsc: Fix a UAF vulnerability in class
CVE-2025-37891	In the Linux kernel, the following vulnerability has been resolved: ALSA: ump: Fix buffer overflow at UMP SysEx
CVE-2025-37892	In the Linux kernel, the following vulnerability has been resolved: mtd: infatcore: Add error check for infat_read_oob
CVE-2025-37897	In the Linux kernel, the following vulnerability has been resolved: wifi: plfxc: Remove erroneous assert in plfxc_m
CVE-2025-37899	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in session logoff The ses
CVE-2025-37900	In the Linux kernel, the following vulnerability has been resolved: iommu: Fix two issues in iommu_copy_struct_fro
CVE-2025-37901	In the Linux kernel, the following vulnerability has been resolved: irqchip/qcom-mpm: Prevent crash when trying to
CVE-2025-37903	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix slab-use-after-free in hdcp
CVE-2025-37905	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_scmi: Balance device refcount wh
CVE-2025-37906	In the Linux kernel, the following vulnerability has been resolved: ublk: fix race between io_uring_cmd_complete_i

CVE-2025-37909	In the Linux kernel, the following vulnerability has been resolved: net: lan743x: Fix memleak issue when GSO enabled
CVE-2025-37907	In the Linux kernel, the following vulnerability has been resolved: accel/ivpu: Fix locking order in ivpu_job_submit
CVE-2025-37911	In the Linux kernel, the following vulnerability has been resolved: bnxt_en: Fix out-of-bound memcpy() during ethtool
CVE-2025-37912	In the Linux kernel, the following vulnerability has been resolved: ice: Check VF VSI Pointer Value in ice_vc_add
CVE-2025-37913	In the Linux kernel, the following vulnerability has been resolved: net_sched: qfq: Fix double list add in class with n
CVE-2025-37914	In the Linux kernel, the following vulnerability has been resolved: net_sched: ets: Fix double list add in class with n
CVE-2025-37915	In the Linux kernel, the following vulnerability has been resolved: net_sched: drr: Fix double list add in class with n
CVE-2025-37916	In the Linux kernel, the following vulnerability has been resolved: pds_core: remove write-after-free of client_id A u
CVE-2025-37917	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: mtk-star-emas: fix spinlock recursio
CVE-2025-37920	In the Linux kernel, the following vulnerability has been resolved: xsk: Fix race condition in AF_XDP generic RX p
CVE-2025-37918	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: btusb: avoid NULL pointer dereferenc
CVE-2025-37921	In the Linux kernel, the following vulnerability has been resolved: vxlan: vnifilter: Fix unlocked deletion of default l
CVE-2025-37922	In the Linux kernel, the following vulnerability has been resolved: book3s64/radix : Align section vmemmap start ad
CVE-2025-37923	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix oob write in trace_seq_to_buffer() sy
CVE-2025-37924	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in kerberos authentication
CVE-2025-37925	In the Linux kernel, the following vulnerability has been resolved: jfs: reject on-disk inodes of an unsupported type S
CVE-2025-37926	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix use-after-free in ksmbd_session_rpc_c
CVE-2025-37927	In the Linux kernel, the following vulnerability has been resolved: iommu/amd: Fix potential buffer overflow in pars
CVE-2025-37928	In the Linux kernel, the following vulnerability has been resolved: dm-bufio: don't schedule in atomic context A BU
CVE-2025-37930	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau: Fix WARN_ON in nouveau_fence
CVE-2025-37932	In the Linux kernel, the following vulnerability has been resolved: sch_htb: make htb_qlen_notify() idempotent htb_
CVE-2025-37933	In the Linux kernel, the following vulnerability has been resolved: octeon_ep: Fix host hang issue during device rebo
CVE-2025-37931	In the Linux kernel, the following vulnerability has been resolved: btrfs: adjust subpage bit start based on sectorsize
CVE-2025-37935	In the Linux kernel, the following vulnerability has been resolved: net: ethernet: mtk_eth_soc: fix SER panic with 4G
CVE-2025-37936	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel: KVM: Mask PEBS_ENABLE load
CVE-2025-37937	In the Linux kernel, the following vulnerability has been resolved: objtool, media: dib8000: Prevent divide-by-zero i
CVE-2025-37940	In the Linux kernel, the following vulnerability has been resolved: ftrace: Add cond_resched() to ftrace_graph_set_h
CVE-2025-37938	In the Linux kernel, the following vulnerability has been resolved: tracing: Verify event formats that have "%*p.." T
CVE-2025-37942	In the Linux kernel, the following vulnerability has been resolved: HID: pidff: Make sure to fetch pool before checki
CVE-2025-37943	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: Fix invalid data access in ath12k_dp
CVE-2025-37944	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: Fix invalid entry fetch in ath12k_dp
CVE-2025-37947	In the Linux kernel, the following vulnerability has been resolved: ksmbd: prevent out-of-bounds stream writes by v
CVE-2025-37945	In the Linux kernel, the following vulnerability has been resolved: net: phy: allow MDIO bus PM ops to start/stop st
CVE-2025-37948	In the Linux kernel, the following vulnerability has been resolved: arm64: bpf: Add BHB mitigation to the epilogue
CVE-2025-37949	In the Linux kernel, the following vulnerability has been resolved: xenbus: Use kref to track req lifetime Marek repo
CVE-2025-37951	In the Linux kernel, the following vulnerability has been resolved: drm/v3d: Add job to pending list if the reset was s
CVE-2025-37952	In the Linux kernel, the following vulnerability has been resolved: ksmbd: Fix UAF in __close_file_table_ids A use-
CVE-2025-37954	In the Linux kernel, the following vulnerability has been resolved: smb: client: Avoid race in open_cached_dir with
CVE-2025-37956	In the Linux kernel, the following vulnerability has been resolved: ksmbd: prevent rename with empty string Client c
CVE-2025-37957	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: Forcibly leave SMM mode on SHU

CVE-2025-37960	In the Linux kernel, the following vulnerability has been resolved: memblock: Accept allocated memory before use
CVE-2025-37959	In the Linux kernel, the following vulnerability has been resolved: bpf: Scrub packet on bpf_redirect_peer When bpf
CVE-2025-37958	In the Linux kernel, the following vulnerability has been resolved: mm/huge_memory: fix dereferencing invalid pmo
CVE-2025-37961	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix uninit-value for saddr in do_output_rout
CVE-2025-37963	In the Linux kernel, the following vulnerability has been resolved: arm64: bpf: Only mitigate cBPF programs loaded
CVE-2025-37969	In the Linux kernel, the following vulnerability has been resolved: iio: imu: st_lsm6dsx: fix possible lockup in st_lsm
CVE-2025-37967	In the Linux kernel, the following vulnerability has been resolved: usb: typec: ucsi: displayport: Fix deadlock This p
CVE-2025-37970	In the Linux kernel, the following vulnerability has been resolved: iio: imu: st_lsm6dsx: fix possible lockup in st_lsm
CVE-2025-37968	In the Linux kernel, the following vulnerability has been resolved: iio: light: opt3001: fix deadlock due to concurr
CVE-2025-37972	In the Linux kernel, the following vulnerability has been resolved: Input: mtk-pmic-keys - fix possible null pointer d
CVE-2025-37973	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: fix out-of-bounds access during n
CVE-2025-37977	In the Linux kernel, the following vulnerability has been resolved: scsi: ufs: exynos: Disable ioccc if dma-coherent pr
CVE-2025-37974	In the Linux kernel, the following vulnerability has been resolved: s390/pci: Fix missing check for zpci_create_devic
CVE-2025-37975	In the Linux kernel, the following vulnerability has been resolved: riscv: module: Fix out-of-bounds relocation acces
CVE-2025-37978	In the Linux kernel, the following vulnerability has been resolved: block: integrity: Do not call set_page_dirty_lock(
CVE-2025-37979	In the Linux kernel, the following vulnerability has been resolved: ASoC: qcom: Fix sc7280 lpass potential buffer ov
CVE-2025-37980	In the Linux kernel, the following vulnerability has been resolved: block: fix resource leak in blk_register_queue() e
CVE-2025-37982	In the Linux kernel, the following vulnerability has been resolved: wifi: wl1251: fix memory leak in wl1251_tx_wor
CVE-2025-37983	In the Linux kernel, the following vulnerability has been resolved: qibfs: fix _another_ leak failure to allocate inode
CVE-2025-37984	In the Linux kernel, the following vulnerability has been resolved: crypto: ecdsa - Harden against integer overflows
CVE-2025-37985	In the Linux kernel, the following vulnerability has been resolved: USB: wdm: close race between wdm_open and w
CVE-2025-37986	In the Linux kernel, the following vulnerability has been resolved: usb: typec: class: Invalidate USB device pointers
CVE-2025-37987	In the Linux kernel, the following vulnerability has been resolved: pds_core: Prevent possible adminq overflow/stuck
CVE-2025-37988	In the Linux kernel, the following vulnerability has been resolved: fix a couple of races in MNT_TREE_BENEATH
CVE-2025-37989	In the Linux kernel, the following vulnerability has been resolved: net: phy: leds: fix memory leak A network restart
CVE-2025-37990	In the Linux kernel, the following vulnerability has been resolved: wifi: brcm80211: fmac: Add error handling for br
CVE-2025-37991	In the Linux kernel, the following vulnerability has been resolved: parisc: Fix double SIGFPE crash Camm noticed t
CVE-2025-37992	In the Linux kernel, the following vulnerability has been resolved: net_sched: Flush gso_skb list too during ->chang
CVE-2025-37994	In the Linux kernel, the following vulnerability has been resolved: usb: typec: ucsi: displayport: Fix NULL pointer a
CVE-2025-37995	In the Linux kernel, the following vulnerability has been resolved: module: ensure that kobject_put() is safe for mod
CVE-2025-37997	In the Linux kernel, the following vulnerability has been resolved: netfilter: ipset: fix region locking in hash types Re
CVE-2025-37998	In the Linux kernel, the following vulnerability has been resolved: openvswitch: Fix unsafe attribute parsing in outpu
CVE-2025-38000	In the Linux kernel, the following vulnerability has been resolved: sch_hfsc: Fix qlen accounting bug when using pe
CVE-2025-38001	In the Linux kernel, the following vulnerability has been resolved: net_sched: hfsc: Address reentrant enqueue addin
CVE-2025-38003	In the Linux kernel, the following vulnerability has been resolved: can: bcm: add missing rcu read protection for pro
CVE-2025-38004	In the Linux kernel, the following vulnerability has been resolved: can: bcm: add locking for bcm_op runtime update
CVE-2025-38005	In the Linux kernel, the following vulnerability has been resolved: dmaengine: ti: k3-udma: Add missing locking Re
CVE-2025-38006	In the Linux kernel, the following vulnerability has been resolved: net: mctp: Don't access ifa_index when missing In
CVE-2025-38007	In the Linux kernel, the following vulnerability has been resolved: HID: ucllogic: Add NULL check in ucllogic_input
CVE-2025-38008	In the Linux kernel, the following vulnerability has been resolved: mm/page_alloc: fix race condition in unaccepted

CVE-2025-38009	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: disable napi on driver removal A warn
CVE-2025-38010	In the Linux kernel, the following vulnerability has been resolved: phy: tegra: xusb: Use a bitmask for UTMI pad po
CVE-2025-38011	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: csa unmap use uninterruptible lock
CVE-2025-38013	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: Set n_channels after allocating s
CVE-2025-38014	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Refactor remove call with idxd
CVE-2025-38015	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: fix memory leak in error handli
CVE-2025-38017	In the Linux kernel, the following vulnerability has been resolved: fs/eventpoll: fix endless busy loop after timeout h
CVE-2025-38018	In the Linux kernel, the following vulnerability has been resolved: net/tls: fix kernel panic when alloc_page failed W
CVE-2025-38019	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum_router: Fix use-after-free when
CVE-2025-38022	In the Linux kernel, the following vulnerability has been resolved: RDMA/core: Fix "KASAN: slab-use-after-free R
CVE-2025-38020	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Disable MACsec offload for uplink re
CVE-2025-38024	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Fix slab-use-after-free Read in rxe_q
CVE-2025-38023	In the Linux kernel, the following vulnerability has been resolved: nfs: handle failure of nfs_get_lock_context in unl
CVE-2025-38027	In the Linux kernel, the following vulnerability has been resolved: regulator: max20086: fix invalid memory access i
CVE-2025-38029	In the Linux kernel, the following vulnerability has been resolved: kasan: avoid sleepable page allocation from atom
CVE-2025-38031	In the Linux kernel, the following vulnerability has been resolved: padata: do not leak refcount in reorder_work A re
CVE-2025-38033	In the Linux kernel, the following vulnerability has been resolved: x86/Kconfig: make CFI_AUTO_DEFAULT depe
CVE-2025-38034	In the Linux kernel, the following vulnerability has been resolved: btrfs: correct the order of prelim_ref arguments in
CVE-2025-38035	In the Linux kernel, the following vulnerability has been resolved: nvmet-tcp: don't restore null sk_state_change que
CVE-2025-38036	In the Linux kernel, the following vulnerability has been resolved: drm/xe/vf: Perform early GT MMIO initialization
CVE-2025-38037	In the Linux kernel, the following vulnerability has been resolved: vxlan: Annotate FDB data races The 'used' and 'up
CVE-2025-38038	In the Linux kernel, the following vulnerability has been resolved: cpufreq: amd-pstate: Remove unnecessary driver_
CVE-2025-38039	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Avoid WARN_ON when configuring
CVE-2025-38040	In the Linux kernel, the following vulnerability has been resolved: serial: mctrl_gpio: split disable_ms into sync and
CVE-2025-38041	In the Linux kernel, the following vulnerability has been resolved: clk: sunxi-ng: h616: Reparent GPU clock during
CVE-2025-38042	In the Linux kernel, the following vulnerability has been resolved: dmaengine: ti: k3-udma-glue: Drop skip_fdq argu
CVE-2025-38043	In the Linux kernel, the following vulnerability has been resolved: firmware: arm_ffa: Set dma_mask for ffa devices
CVE-2025-38044	In the Linux kernel, the following vulnerability has been resolved: media: cx231xx: set device_caps for 417 The vid
CVE-2025-38045	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlmwifi: fix debug actions order The order o
CVE-2025-38046	Rejected reason: This CVE ID has been rejected or withdrawn by its CVE Numbering Authority.
CVE-2025-38047	In the Linux kernel, the following vulnerability has been resolved: x86/fred: Fix system hang during S4 resume with
CVE-2025-38048	In the Linux kernel, the following vulnerability has been resolved: virtio_ring: Fix data race by tagging event_trigger
CVE-2025-38051	In the Linux kernel, the following vulnerability has been resolved: smb: client: Fix use-after-free in cifs_fill_dirent T
CVE-2025-38052	In the Linux kernel, the following vulnerability has been resolved: net/tipc: fix slab-use-after-free Read in tipc_aead
CVE-2025-38053	In the Linux kernel, the following vulnerability has been resolved: idpf: fix null-ptr-deref in idpf_features_check idp
CVE-2025-38055	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel: Fix segfault with PEBS-via-PT wi
CVE-2025-38057	In the Linux kernel, the following vulnerability has been resolved: espintcp: fix skb leaks A few error paths are miss
CVE-2025-38058	In the Linux kernel, the following vulnerability has been resolved: __legitimize_mnt(): check for MNT_SYNC_UM
CVE-2025-38059	In the Linux kernel, the following vulnerability has been resolved: btrfs: avoid NULL pointer dereference if no valid
CVE-2025-38060	In the Linux kernel, the following vulnerability has been resolved: bpf: copy_verifier_state() should copy 'loop_entr

CVE-2025-38061	In the Linux kernel, the following vulnerability has been resolved: net: pktgen: fix access outside of user given buffer
CVE-2025-38062	In the Linux kernel, the following vulnerability has been resolved: genirq/msi: Store the IOMMU IOVA directly in msi_desc
CVE-2025-38063	In the Linux kernel, the following vulnerability has been resolved: dm: fix unconditional IO throttle caused by REQ_FLUSH
CVE-2025-38064	In the Linux kernel, the following vulnerability has been resolved: virtio: break and reset virtio devices on device_shutdown
CVE-2025-38066	In the Linux kernel, the following vulnerability has been resolved: dm cache: prevent BUG_ON by blocking retries
CVE-2025-38065	In the Linux kernel, the following vulnerability has been resolved: orangesfs: Do not truncate file size 'len' is used to
CVE-2025-38067	In the Linux kernel, the following vulnerability has been resolved: rseq: Fix segfault on registration when rseq_cs is
CVE-2025-38068	In the Linux kernel, the following vulnerability has been resolved: crypto: lzo - Fix compression buffer overrun Unli
CVE-2025-38069	In the Linux kernel, the following vulnerability has been resolved: PCI: endpoint: pci-epf-test: Fix double free that c
CVE-2025-38070	In the Linux kernel, the following vulnerability has been resolved: ASoC: sma1307: Add NULL check in sma1307_
CVE-2025-38072	In the Linux kernel, the following vulnerability has been resolved: libnvdimm/labels: Fix divide error in nd_label_da
CVE-2025-38071	In the Linux kernel, the following vulnerability has been resolved: x86/mm: Check return value from memblock_phy
CVE-2025-38073	In the Linux kernel, the following vulnerability has been resolved: block: fix race between set_blocksize and read pa
CVE-2025-38074	In the Linux kernel, the following vulnerability has been resolved: vhost-scsi: protect vq->log_used with vq->mutex
CVE-2025-38075	In the Linux kernel, the following vulnerability has been resolved: scsi: target: iscsi: Fix timeout on deleted connecti
CVE-2025-38078	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Fix race of buffer access at PCM OS
CVE-2025-38077	In the Linux kernel, the following vulnerability has been resolved: platform/x86: dell-wmi-sysman: Avoid buffer ove
CVE-2025-38079	In the Linux kernel, the following vulnerability has been resolved: crypto: algif_hash - fix double free in hash_accept
CVE-2025-38080	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Increase block_sequence array
CVE-2025-38082	In the Linux kernel, the following vulnerability has been resolved: gpio: virtuser: fix potential out-of-bound write If
CVE-2025-38081	In the Linux kernel, the following vulnerability has been resolved: spi-rockchip: Fix register out of bounds access De
CVE-2025-38083	In the Linux kernel, the following vulnerability has been resolved: net_sched: prio: fix a race in prio_tune() Gerrard
CVE-2025-38084	In the Linux kernel, the following vulnerability has been resolved: mm/hugetlb: unshare page tables during VMA sp
CVE-2025-38085	In the Linux kernel, the following vulnerability has been resolved: mm/hugetlb: fix huge_pmd_unshare() vs GUP-fa
CVE-2025-38086	In the Linux kernel, the following vulnerability has been resolved: net: ch9200: fix uninitialised access during mii_n
CVE-2025-38087	In the Linux kernel, the following vulnerability has been resolved: net/sched: fix use-after-free in taprio_dev_notifie
CVE-2025-38088	In the Linux kernel, the following vulnerability has been resolved: powerpc/powernv/memtrace: Fix out of bounds is
CVE-2025-38089	In the Linux kernel, the following vulnerability has been resolved: sunrpc: handle SVC_GARBAGE during svc auth
CVE-2025-38090	In the Linux kernel, the following vulnerability has been resolved: drivers/rapidio/rio_cm.c: prevent possible heap ov
CVE-2025-38091	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: check stream id dml21 wrapper
CVE-2025-38092	In the Linux kernel, the following vulnerability has been resolved: ksmbd: use list_first_entry_or_null for opinfo_ge
CVE-2025-38094	In the Linux kernel, the following vulnerability has been resolved: net: cadence: macb: Fix a possible deadlock in m
CVE-2025-38095	In the Linux kernel, the following vulnerability has been resolved: dma-buf: insert memory barrier before updating n
CVE-2025-38096	In the Linux kernel, the following vulnerability has been resolved: wifi: iwlwifi: don't warn when if there is a FW er
CVE-2025-38097	In the Linux kernel, the following vulnerability has been resolved: espintcp: remove encaps socket caching to avoid r
CVE-2025-38098	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Don't treat wb connector as phy
CVE-2025-38099	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Disable SCO support if READ_VOIC
CVE-2025-38100	In the Linux kernel, the following vulnerability has been resolved: x86/iopl: Cure TIF_IO_BITMAP inconsistencies
CVE-2025-38102	In the Linux kernel, the following vulnerability has been resolved: VMCI: fix race between vmci_host_setup_notify
CVE-2025-38101	In the Linux kernel, the following vulnerability has been resolved: ring-buffer: Fix buffer locking in ring_buffer_sub

CVE-2025-38103	In the Linux kernel, the following vulnerability has been resolved: HID: usbhid: Eliminate recurrent out-of-bounds b
CVE-2025-38104	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: Replace Mutex with Spinlock for R
CVE-2025-38105	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Kill timer properly at removal
CVE-2025-38107	In the Linux kernel, the following vulnerability has been resolved: net_sched: ets: fix a race in ets_qdisc_change() G
CVE-2025-38108	In the Linux kernel, the following vulnerability has been resolved: net_sched: red: fix a race in __red_change() Gerra
CVE-2025-38109	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix ECVF vports unload on shutdown f
CVE-2025-38110	In the Linux kernel, the following vulnerability has been resolved: net/mdionbus: Fix potential out-of-bounds clause 4
CVE-2025-38111	In the Linux kernel, the following vulnerability has been resolved: net/mdionbus: Fix potential out-of-bounds read/wr
CVE-2025-38112	In the Linux kernel, the following vulnerability has been resolved: net: Fix TOCTOU issue in sk_is_readable() sk->s
CVE-2025-38113	In the Linux kernel, the following vulnerability has been resolved: ACPI: CPPC: Fix NULL pointer dereference whe
CVE-2025-38115	In the Linux kernel, the following vulnerability has been resolved: net_sched: sch_sfq: fix a potential crash on gso_s
CVE-2025-38117	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: MGMT: Protect mgmt_pending list w
CVE-2025-38118	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: MGMT: Fix UAF on mgmt_remove_a
CVE-2025-38120	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_set_pipapo_avx2: fix initial map fill
CVE-2025-38119	In the Linux kernel, the following vulnerability has been resolved: scsi: core: ufs: Fix a hang in the error handler ufs
CVE-2025-38122	In the Linux kernel, the following vulnerability has been resolved: gve: add missing NULL check for gve_alloc_pen
CVE-2025-38123	In the Linux kernel, the following vulnerability has been resolved: net: wwan: t7xx: Fix napi rx poll issue When driv
CVE-2025-38124	In the Linux kernel, the following vulnerability has been resolved: net: fix udp gso skb_segment after pull from frag
CVE-2025-38125	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: make sure that ptp_rate is not 0 befo
CVE-2025-38126	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: make sure that ptp_rate is not 0 befo
CVE-2025-38127	In the Linux kernel, the following vulnerability has been resolved: ice: fix Tx scheduler error handling in XDP callba
CVE-2025-38129	In the Linux kernel, the following vulnerability has been resolved: page_pool: Fix use-after-free in page_pool_recyc
CVE-2025-38131	In the Linux kernel, the following vulnerability has been resolved: coresight: prevent deactivate active config while
CVE-2025-38132	In the Linux kernel, the following vulnerability has been resolved: coresight: holding cscfg_csdev_lock while remov
CVE-2025-38135	In the Linux kernel, the following vulnerability has been resolved: serial: Fix potential null-ptr-deref in mlb_usio_pr
CVE-2025-38136	In the Linux kernel, the following vulnerability has been resolved: usb: renesas_usbhs: Reorder clock handling and p
CVE-2025-38138	In the Linux kernel, the following vulnerability has been resolved: dmaengine: ti: Add NULL check in udma_probe()
CVE-2025-38140	In the Linux kernel, the following vulnerability has been resolved: dm: limit swapping tables for devices with zone v
CVE-2025-38142	In the Linux kernel, the following vulnerability has been resolved: hwmon: (asus-ec-sensors) check sensor index in r
CVE-2025-38143	In the Linux kernel, the following vulnerability has been resolved: backlight: pm8941: Add NULL check in wled_co
CVE-2025-38145	In the Linux kernel, the following vulnerability has been resolved: soc: aspeed: Add NULL check in aspeed_lpc_ena
CVE-2025-38146	In the Linux kernel, the following vulnerability has been resolved: net: openvswitch: Fix the dead loop of MPLS par
CVE-2025-38147	In the Linux kernel, the following vulnerability has been resolved: calipso: Don't call calipso functions for AF_INET
CVE-2025-38148	In the Linux kernel, the following vulnerability has been resolved: net: phy: msc: Fix memory leak when using one
CVE-2025-38152	In the Linux kernel, the following vulnerability has been resolved: remoteproc: core: Clear table_sz when rproc_shut
CVE-2025-38149	In the Linux kernel, the following vulnerability has been resolved: net: phy: clear phydev->devlink when the link is
CVE-2025-38153	In the Linux kernel, the following vulnerability has been resolved: net: usb: aqc111: fix error handling of usbnet reac
CVE-2025-38154	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Avoid using sk_socket after free w
CVE-2025-38155	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7915: Fix null-ptr-deref in mt7915_
CVE-2025-38156	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7996: Fix null-ptr-deref in mt7996_

CVE-2025-38157	In the Linux kernel, the following vulnerability has been resolved: wifi: ath9k_htc: Abort software beacon handling
CVE-2025-38158	In the Linux kernel, the following vulnerability has been resolved: hisi_acc_vfio_pci: fix XQE dma address error Th
CVE-2025-38159	In the Linux kernel, the following vulnerability has been resolved: wifi: rtw88: fix the 'para' buffer size to avoid read
CVE-2025-38160	In the Linux kernel, the following vulnerability has been resolved: clk: bcm: rpi: Add NULL check in raspberrypi_cl
CVE-2025-38161	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix error flow upon firmware failur
CVE-2025-38162	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_set_pipapo: prevent overflow in look
CVE-2025-38163	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to do sanity check on sbi->total_valid_bl
CVE-2025-38164	In the Linux kernel, the following vulnerability has been resolved: f2fs: zone: fix to avoid inconsistence in between s
CVE-2025-38165	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix panic when calling skb_linear
CVE-2025-38166	In the Linux kernel, the following vulnerability has been resolved: bpf: fix ktls panic with sockmap [2172.936997] -
CVE-2025-38167	In the Linux kernel, the following vulnerability has been resolved: fs/ntfs3: handle hdr_first_de() return value The h
CVE-2025-38168	In the Linux kernel, the following vulnerability has been resolved: perf: arm-ni: Unregister PMUs on probe failure W
CVE-2025-38169	In the Linux kernel, the following vulnerability has been resolved: arm64/fpsimd: Avoid clobbering kernel FPSIMD
CVE-2025-38170	In the Linux kernel, the following vulnerability has been resolved: arm64/fpsimd: Discard stale CPU state when han
CVE-2025-38173	In the Linux kernel, the following vulnerability has been resolved: crypto: marvell/cesa - Handle zero-length skciph
CVE-2025-38174	In the Linux kernel, the following vulnerability has been resolved: thunderbolt: Do not double dequeue a configurati
CVE-2025-38177	In the Linux kernel, the following vulnerability has been resolved: sch_hfsc: make hfsc_qlen_notify() idempotent hf
CVE-2025-38180	In the Linux kernel, the following vulnerability has been resolved: net: atm: fix /proc/net/atm/lec handling /proc/net/
CVE-2025-38181	In the Linux kernel, the following vulnerability has been resolved: calipso: Fix null-ptr-deref in calipso_req_{set,del
CVE-2025-38182	In the Linux kernel, the following vulnerability has been resolved: ublk: santizize the arguments from userspace whe
CVE-2025-38183	In the Linux kernel, the following vulnerability has been resolved: net: lan743x: fix potential out-of-bounds write in
CVE-2025-38184	In the Linux kernel, the following vulnerability has been resolved: tipc: fix null-ptr-deref when acquiring remote ip o
CVE-2025-38187	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau: fix a use-after-free in r535_gsp_rpc
CVE-2025-38185	In the Linux kernel, the following vulnerability has been resolved: atm: atmtcp: Free invalid length skb in atmtcp_c
CVE-2025-38188	In the Linux kernel, the following vulnerability has been resolved: drm/msm/a7xx: Call CP_RESET_CONTEXT_ST
CVE-2025-38189	In the Linux kernel, the following vulnerability has been resolved: drm/v3d: Avoid NULL pointer dereference in `v3
CVE-2025-38190	In the Linux kernel, the following vulnerability has been resolved: atm: Revert atm_account_tx() if copy_from_iter_
CVE-2025-38192	In the Linux kernel, the following vulnerability has been resolved: net: clear the dst when changing skb protocol A n
CVE-2025-38191	In the Linux kernel, the following vulnerability has been resolved: ksmbd: fix null pointer dereference in destroy_pro
CVE-2025-38193	In the Linux kernel, the following vulnerability has been resolved: net_sched: sch_sfq: reject invalid perturb period C
CVE-2025-38194	In the Linux kernel, the following vulnerability has been resolved: jffs2: check that raw node were preallocated befo
CVE-2025-38197	In the Linux kernel, the following vulnerability has been resolved: platform/x86: dell_rbu: Fix list usage Pass the cor
CVE-2025-38198	In the Linux kernel, the following vulnerability has been resolved: fbcon: Make sure modelist not set on unregistered
CVE-2025-38199	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: Fix memory leak due to multiple rx
CVE-2025-38200	In the Linux kernel, the following vulnerability has been resolved: i40e: fix MMIO write access to an invalid page in
CVE-2025-38201	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_set_pipapo: clamp maximum map bu
CVE-2025-38202	In the Linux kernel, the following vulnerability has been resolved: bpf: Check rcu_read_lock_trace_held() in bpf_ma
CVE-2025-38203	In the Linux kernel, the following vulnerability has been resolved: jfs: Fix null-ptr-deref in jfs_ioc_trim [Syzkaller E
CVE-2025-38204	In the Linux kernel, the following vulnerability has been resolved: jfs: fix array-index-out-of-bounds read in add_mi
CVE-2025-38205	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Avoid divide by zero by initiali

CVE-2025-38206	In the Linux kernel, the following vulnerability has been resolved: exfat: fix double free in delayed_free The double
CVE-2025-38207	In the Linux kernel, the following vulnerability has been resolved: mm: fix uprobe pte be overwritten when expanding
CVE-2025-38208	In the Linux kernel, the following vulnerability has been resolved: smb: client: add NULL check in automount_fullp
CVE-2025-38210	In the Linux kernel, the following vulnerability has been resolved: configs-tsm-report: Fix NULL dereference of tsr
CVE-2025-38211	In the Linux kernel, the following vulnerability has been resolved: RDMA/iwcm: Fix use-after-free of work objects
CVE-2025-38212	In the Linux kernel, the following vulnerability has been resolved: ipc: fix to protect IPCS lookups using RCU syzbo
CVE-2025-38213	In the Linux kernel, the following vulnerability has been resolved: vgacon: Add check for vc_origin address range in
CVE-2025-38214	In the Linux kernel, the following vulnerability has been resolved: fbdev: Fix fb_set_var to prevent null-ptr-deref in
CVE-2025-38217	In the Linux kernel, the following vulnerability has been resolved: hwmon: (ftstetates) Fix TOCTOU race in fts_rea
CVE-2025-38215	In the Linux kernel, the following vulnerability has been resolved: fbdev: Fix do_register_framebuffer to prevent nul
CVE-2025-38218	In the Linux kernel, the following vulnerability has been resolved: f2fs: fix to do sanity check on sit_bitmap_size w/
CVE-2025-38219	In the Linux kernel, the following vulnerability has been resolved: f2fs: prevent kernel warning due to negative i_nli
CVE-2025-38220	In the Linux kernel, the following vulnerability has been resolved: ext4: only dirty folios when data journaling regul
CVE-2025-38222	In the Linux kernel, the following vulnerability has been resolved: ext4: inline: fix len overflow in ext4_prepare_inli
CVE-2025-38225	In the Linux kernel, the following vulnerability has been resolved: media: imx-jpeg: Cleanup after an allocation erro
CVE-2025-38227	In the Linux kernel, the following vulnerability has been resolved: media: vidtv: Terminating the subsequent process
CVE-2025-38226	In the Linux kernel, the following vulnerability has been resolved: media: vivid: Change the size of the composing s
CVE-2025-38229	In the Linux kernel, the following vulnerability has been resolved: media: cxusb: no longer judge rbuf when the writ
CVE-2025-38230	In the Linux kernel, the following vulnerability has been resolved: jfs: validate AG parameters in dbMount() to prev
CVE-2025-38231	In the Linux kernel, the following vulnerability has been resolved: nfsd: Initialize ssc before laundromat_work to pre
CVE-2025-38234	In the Linux kernel, the following vulnerability has been resolved: sched/rt: Fix race in push_rt_task Overview ====
CVE-2025-38232	In the Linux kernel, the following vulnerability has been resolved: NFSD: fix race between nfsd registration and exp
CVE-2025-38236	In the Linux kernel, the following vulnerability has been resolved: af_unix: Don't leave consecutive consumed OOB
CVE-2025-38237	In the Linux kernel, the following vulnerability has been resolved: media: platform: exynos4-is: Add hardware sync
CVE-2025-38239	In the Linux kernel, the following vulnerability has been resolved: scsi: megaraid_sas: Fix invalid node index On a s
CVE-2025-38242	In the Linux kernel, the following vulnerability has been resolved: mm: userfaultfd: fix race of userfaultfd_move and
CVE-2025-38240	In the Linux kernel, the following vulnerability has been resolved: drm/mediatek: dp: drm_err => dev_err in HPD pa
CVE-2025-38244	In the Linux kernel, the following vulnerability has been resolved: smb: client: fix potential deadlock when reconnected
CVE-2025-38245	In the Linux kernel, the following vulnerability has been resolved: atm: Release atm_dev_mutex after removing proc
CVE-2025-38246	In the Linux kernel, the following vulnerability has been resolved: bnxt: properly flush XDP redirect lists We encour
CVE-2025-38249	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Fix out-of-bounds read in snd_
CVE-2025-38248	In the Linux kernel, the following vulnerability has been resolved: bridge: mcast: Fix use-after-free during router por
CVE-2025-38250	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_core: Fix use-after-free in vhci_flu
CVE-2025-38251	In the Linux kernel, the following vulnerability has been resolved: atm: clip: prevent NULL deref in clip_push() Bla
CVE-2025-38253	In the Linux kernel, the following vulnerability has been resolved: HID: wacom: fix crash in wacom_aes_battery_ha
CVE-2025-38257	In the Linux kernel, the following vulnerability has been resolved: s390/pkey: Prevent overflow in size calculation fo
CVE-2025-38255	In the Linux kernel, the following vulnerability has been resolved: lib/group_cpus: fix NULL pointer dereference fro
CVE-2025-38258	In the Linux kernel, the following vulnerability has been resolved: mm/damon/sysfs-schemes: free old damon_sysfs
CVE-2025-38259	In the Linux kernel, the following vulnerability has been resolved: ASoC: codecs: wcd9335: Fix missing free of regu
CVE-2025-38260	In the Linux kernel, the following vulnerability has been resolved: btrfs: handle csum tree error with rescue=ibadroo

CVE-2025-38262	In the Linux kernel, the following vulnerability has been resolved: tty: serial: uartlite: register uart driver in init Whe
CVE-2025-38263	In the Linux kernel, the following vulnerability has been resolved: bcache: fix NULL pointer in cache_set_flush() 1.
CVE-2025-38261	In the Linux kernel, the following vulnerability has been resolved: riscv: save the SR_SUM status over switches Wh
CVE-2025-38265	In the Linux kernel, the following vulnerability has been resolved: serial: jsm: fix NPE during jsm_uart_port_init No
CVE-2025-38264	In the Linux kernel, the following vulnerability has been resolved: nvme-tcp: sanitize request list handling Validate
CVE-2025-38269	In the Linux kernel, the following vulnerability has been resolved: btrfs: exit after state insertion failure at btrfs_con
CVE-2025-38272	In the Linux kernel, the following vulnerability has been resolved: net: dsa: b53: do not enable EEE on bcm63xx BC
CVE-2025-38273	In the Linux kernel, the following vulnerability has been resolved: net: tipc: fix refcount warning in tipc_aead_encrypt
CVE-2025-38274	In the Linux kernel, the following vulnerability has been resolved: fpga: fix potential null pointer deref in fpga_mgr_
CVE-2025-38275	In the Linux kernel, the following vulnerability has been resolved: phy: qcom-qmp-usb: Fix an NULL vs IS_ERR() b
CVE-2025-38277	In the Linux kernel, the following vulnerability has been resolved: mtd: nand: ecc-mxic: Fix use of uninitialized vari
CVE-2025-38278	In the Linux kernel, the following vulnerability has been resolved: octeontx2-pf: QOS: Refactor TC_HTB_LEAF_D
CVE-2025-38279	In the Linux kernel, the following vulnerability has been resolved: bpf: Do not include stack ptr register in precision
CVE-2025-38282	In the Linux kernel, the following vulnerability has been resolved: kernfs: Relax constraint in draining guard The act
CVE-2025-38280	In the Linux kernel, the following vulnerability has been resolved: bpf: Avoid __bpf_prog_ret0_warn when jit fails s
CVE-2025-38283	In the Linux kernel, the following vulnerability has been resolved: hisi_acc_vfio_pci: bugfix live migration function
CVE-2025-38285	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix WARN() in get_bpf_raw_tp_regs syzkal
CVE-2025-38286	In the Linux kernel, the following vulnerability has been resolved: pinctrl: at91: Fix possible out-of-boundary access
CVE-2025-38289	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Avoid potential ndlp use-after-free in d
CVE-2025-38290	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix node corruption in ar->arvifs list
CVE-2025-38292	In the Linux kernel, the following vulnerability has been resolved: wifi: ath12k: fix invalid access to memory In ath1
CVE-2025-38293	In the Linux kernel, the following vulnerability has been resolved: wifi: ath11k: fix node corruption in ar->arvifs list
CVE-2025-38298	In the Linux kernel, the following vulnerability has been resolved: EDAC/skx_common: Fix general protection fault
CVE-2025-38299	In the Linux kernel, the following vulnerability has been resolved: ASoC: mediatek: mt8195: Set ETDM1/2 IN/OUT
CVE-2025-38295	In the Linux kernel, the following vulnerability has been resolved: perf/amlogic: Replace smp_processor_id() with r
CVE-2025-38300	In the Linux kernel, the following vulnerability has been resolved: crypto: sun8i-ce-cipher - fix error handling in sun
CVE-2025-38303	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: eir: Fix possible crashes on eir_create_
CVE-2025-38304	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix NULL pointer deference on eir_ge
CVE-2025-38305	In the Linux kernel, the following vulnerability has been resolved: ptp: remove ptp->n_vclocks check logic in ptp_vc
CVE-2025-38307	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: avs: Verify content returned by pars
CVE-2025-38310	In the Linux kernel, the following vulnerability has been resolved: seg6: Fix validation of nexthop addresses The ker
CVE-2025-38311	In the Linux kernel, the following vulnerability has been resolved: iavf: get rid of the crit lock Get rid of the crit lock
CVE-2025-38312	In the Linux kernel, the following vulnerability has been resolved: fbdev: core: fbcvt: avoid division by 0 in fb_cvt_
CVE-2025-38313	In the Linux kernel, the following vulnerability has been resolved: bus: fsl-mc: fix double-free on mc_dev The blame
CVE-2025-38319	In the Linux kernel, the following vulnerability has been resolved: drm/amd/pp: Fix potential NULL pointer derefere
CVE-2025-38320	In the Linux kernel, the following vulnerability has been resolved: arm64/ptrace: Fix stack-out-of-bounds read in reg
CVE-2025-38323	In the Linux kernel, the following vulnerability has been resolved: net: atm: add lec_mutex syzbot found its way in n
CVE-2025-38321	In the Linux kernel, the following vulnerability has been resolved: smb: Log an error when close_all_cached_dirs fa
CVE-2025-38324	In the Linux kernel, the following vulnerability has been resolved: mpls: Use rcu_dereference_rtnl() in mpls_route_i

CVE-2025-5318	A flaw was found in the libssh library. An out-of-bounds read can be triggered in the sftp_handle function due to an
CVE-2025-5351	A flaw was found in the key export functionality of libssh. The issue occurs in the internal function responsible for c
CVE-2025-53547	Helm is a package manager for Charts for Kubernetes. Prior to 3.18.4, a specially crafted Chart.yaml file along with
CVE-2025-53643	AIOHTTP is an asynchronous HTTP client/server framework for asyncio and Python. Prior to version 3.12.14, the P

CVE-2025-5372	A flaw was found in libssh versions built with OpenSSL versions older than 3.0, specifically in the <code>ssh_kdf()</code> function.
CVE-2025-53864	Connect2id Nimbus JOSE + JWT before 10.0.2 allows a remote attacker to cause a denial of service via a deeply nested object.
CVE-2025-53905	Vim is an open source, command line text editor. Prior to version 9.1.1552, a path traversal issue in Vim's <code>tar.vim</code> plugin.
CVE-2025-53906	Vim is an open source, command line text editor. Prior to version 9.1.1551, a path traversal issue in Vim's <code>zip.vim</code> plugin.
CVE-2025-5419	Out of bounds read and write in V8 in Google Chrome prior to 137.0.7151.68 allowed a remote attacker to potentially execute arbitrary code.
CVE-2025-5455	An issue was found in the private API function <code>qDecodeDataUrl()</code> in QtCore, which is used in <code>QTextDocument</code> and <code>QTextStream</code> .
CVE-2025-5683	When loading a specifically crafted ICNS format image file in QImage then it will trigger a crash. This issue affects Qt versions 5.15.0 through 6.4.0.
CVE-2025-5702	The <code>stricmp</code> implementation optimized for the Power10 processor in the GNU C Library version 2.39 and later writes to memory.
CVE-2025-5889	A vulnerability was found in juliangruber brace-expansion up to 1.1.11/2.0.1/3.0.0/4.0.0. It has been rated as problematic.
CVE-2025-5914	A vulnerability has been identified in the libarchive library, specifically within the <code>archive_read_format_rar_seek_data</code> function.
CVE-2025-5915	A vulnerability has been identified in the libarchive library. This flaw can lead to a heap buffer over-read due to the <code>archive_read_data_block</code> function.
CVE-2025-5916	A vulnerability has been identified in the libarchive library. This flaw involves an integer overflow that can be triggered by a specially crafted archive.
CVE-2025-5917	A vulnerability has been identified in the libarchive library. This flaw involves an 'off-by-one' miscalculation when handling archive data.
CVE-2025-5918	A vulnerability has been identified in the libarchive library. This flaw can be triggered when file streams are piped into the <code>archive_read_data_block</code> function.
CVE-2025-5958	Use after free in Media in Google Chrome prior to 137.0.7151.103 allowed a remote attacker to potentially exploit heap memory.
CVE-2025-5959	Type Confusion in V8 in Google Chrome prior to 137.0.7151.103 allowed a remote attacker to execute arbitrary code.
CVE-2025-5987	A flaw was found in libssh when using the ChaCha20 cipher with the OpenSSL library. If an attacker manages to exploit this, they could potentially execute arbitrary code.
CVE-2025-6020	A flaw was found in linux-pam. The module <code>pam_namespace</code> may use access user-controlled paths without proper permissions.
CVE-2025-6021	A flaw was found in libxml2's <code>xmlBuildQName</code> function, where integer overflows in buffer size calculations can lead to a denial of service.
CVE-2025-6052	A flaw was found in how GLib's GString manages memory when adding data to strings. If a string is already very large, it can lead to a denial of service.
CVE-2025-6069	The <code>html.parser.HTMLParser</code> class had worse-case quadratic complexity when processing certain crafted malformed HTML documents.
CVE-2025-6170	A flaw was found in the interactive shell of the <code>xmlint</code> command-line tool, used for parsing XML files. When a user enters a command, it can lead to a denial of service.
CVE-2025-6199	A flaw was found in the GIF parser of Gdlib's LZW decoder. When an invalid symbol is encountered during decoding, it can lead to a denial of service.
CVE-2025-6297	It was discovered that <code>dpkg-deb</code> does not properly sanitize directory permissions when extracting a control member from a .deb file.
CVE-2025-6395	A NULL pointer dereference flaw was found in the GnuTLS software in <code>_gnutls_figure_common_ciphersuite()</code> .
CVE-2025-6442	Ruby WEBrick <code>read_header</code> HTTP Request Smuggling Vulnerability. This vulnerability allows remote attackers to smuggle HTTP requests.
CVE-2025-6965	There exists a vulnerability in SQLite versions before 3.50.2 where the number of aggregate terms could exceed the stack size.
CVE-2025-7339	on-headers is a node.js middleware for listening to when a response writes headers. A bug in on-headers versions < 2.0.0 can lead to a denial of service.
CVE-2025-7345	A flaw exists in <code>gdk#pixbuf</code> within the <code>gdk_pixbuf__jpeg_image_load_increment</code> function (<code>io-jpeg.c</code>) and in <code>glib's glib</code> .
CVE-2025-7424	A flaw was found in the libxslt library. The same memory field, <code>psvi</code> , is used for both stylesheet and input data, which can lead to a denial of service.
CVE-2025-7425	A flaw was found in libxslt where the attribute type, <code>atype</code> , flags are modified in a way that corrupts internal memory.
CVE-2025-7545	A vulnerability classified as problematic was found in GNU Binutils 2.45. Affected by this vulnerability is the <code>binutils</code> function.
CVE-2025-7546	A vulnerability, which was classified as problematic, has been found in GNU Binutils 2.45. Affected by this issue is the <code>binutils</code> function.

SUSE-SU-2025:1550-1	This update for openssl-3 fixes the following issues: Security: CVE-2025-27587: Timing side channel vulnerability in RSA decryption.

Cumulative hotfixes

Review the cumulative hotfixes for Cloudera Data Services on premises 1.5.5-CHF1.

Cloudera Data Services on premises 1.5.5-CHF1 supports:

- Cloudera Base on premises 7.1.9, 7.1.9 SP1 CHF5, 7.1.7 SP3 CHF10, and 7.3.1.400
- Cloudera Manager 7.13.1.402

Cloudera Data Services on premises 1.5.5-CHF1

There are no new features introduced in cumulative hotfix 1.5.5-CHF1.

Note: Before upgrading to Cloudera Data Services on premises 1.5.5 CHF1 and above with Datalake 7.3.1, follow the [Cloudera Data Engineering Prerequisites](#) to avoid breaking [Data Engineering's Spark support matrix](#).

Cloudera Data Services on premises 1.5.5 existing known issues are carried into Cloudera Data Services on premises 1.5.5-CHF1. For more details, see [Known Issues](#).

Known issue identified in 1.5.5-CHF1

The following are the known issues identified in 1.5.5 CHF1:

COMPX-20437 - Handle DB connection failures in running RPM and CAM

When a customer upgrades from version 1.5.5 to any 1.5.5 hotfix release, the cluster-access-manager and resource-pool-manager pods can enter a CrashLoopBackOff state if they are not restarted during the upgrade.

Restart the cluster-access-manager pod and then restart the resource-pool-manager pod (order of restart is very important). Commands to restart:

```
kubectl rollout restart deployment <cluster-access-manager-deployment-name> -n <namespace>
kubectl rollout restart deployment <resource-pool-manager-deployment-name> -n <namespace>
```

Repository Locations for 1.5.5-CHF1

The URLs for Cloudera Data Services on premises 1.5.5-CHF1 are listed in the following table:

URL Type	Repository Location
Index	<code>https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h2/</code>
Manifest	Repository: <code>https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h2/manifest.json</code>
Parcels	Repository: <code>https://username:password@archive.cloudera.com/p/cdp-pvc-ds/1.5.5-h2/parcels/</code>

Service packs

The service pack issues that have been shipped for Cloudera Data Services on premises 1.5.5-SP1.

Cloudera Data Services on premises 1.5.5 SP1

Review new features, behavioural changes, known issues, and fixed issues introduced in service pack 1.5.5 SP1.

What's new in Cloudera Data Services on premises 1.5.5 SP1

Understand the functionalities and improvements to features of Cloudera Data Services on premises 1.5.5 SP1.

Note: The Cloudera Data Services on premises UI now utilizes advanced browser capabilities introduced in modern Firefox releases. To ensure full functionality, optimal performance, and UI compatibility, upgrade your Firefox browser to version 77 or later.

Upgrade pre-checks

A new host inspection called Host Prerequisite Inspection is added to the upgrade pre-checks. It verifies that the minimum requirements for the system configurations are met on the hosts. For more information, see [Pre-upgrade checklist](#).

Post Upgrade Validation

This is a set of health checks added as the last step in the upgrade to verify that the upgrade was successful and the cluster is healthy. This includes verifying that the services are healthy, the hosts are upgraded to the new version, and that the Cloudera Control Plane is in a healthy state after upgrade. For the Cloudera Control Plane to be determined as good health, it will verify that RKE2, Longhorn, and Vault are healthy. It will also check that the critical pods in the Cloudera Control Plane namespace are up and running. For more information, see [Upgrading Cloudera Data Services on premises using Cloudera Embedded Container Service](#).

SAML enhancement in Cloudera Management Console

New settings such as Signing and encryption-decryption are added in Cloudera Management Console UI. For more information, see [Setting SAML as IdP](#).

Data Recovery Service (DRS) functionalities

Cloudera Data Services on premises 1.5.5 SP1 and higher versions provide the following DRS features:

- You can view the Backup and Restore Manager on the Cloudera Management Console Backup Manager Control Plane page.
- You can use the S3 locations in Ozone, in AWS buckets, or in both as an external backup location to back up and restore the Cloudera Control Plane.
- DRS automatically backs up Virtual Warehouse configurations from the database along with the namespace backup. You can restore the backup, when required.

For more information, see [Data Recovery Service overview](#).

Cloudera Embedded Container Service containerd And kubelet health tests

Implemented health test Runners for both the Ecs Server and Ecs Agent roles within the Cloudera Embedded Container Service. These runners executed by SMON on each Ecs Server and Ecs Agent to read metrics and determine the health status of containerd and kubelet, which is then displayed on the Cloudera Embedded Container Service Roles page in the Cloudera Manager UI.

Metrics are collected (60 sec of interval) by process running alongside the Ecs Server and Ecs Agent process and sent to SMON.

For more information on enabling Ecs Server/Agent containerd health test and Ecs Server/Agent kubelet health test, see [ECS Agent Health test](#) and [ECS Server Health tests](#).

What's new in Platform Support 1.5.5 SP1

You must be aware of the platform support for Cloudera Data Services on premises 1.5.5 SP1.

Platform Certifications

- Cloudera Base on premises (7.1.9 SP1 CHF11, 7.1.7 SP3 CHF10, 7.3.1.500)
- Cloudera Manager 7.13.1.501
- Iceberg v2 GA on Cloudera Data Warehouse, Cloudera Data Engineering, & Cloudera AI with Ozone
- RHEL 8.10, 9.3, 9.4, 9.5, 9.6
- OEL (RHCK Kernel Only) 8.10, 9.3, 9.4, 9.5, 9.6
- Rocky Linux 8.10, 9.3, 9.4, 9.5, 9.6
- K8s RKE2 1.31 and OCP 4.18
- Longhorn version 1.6.4

Note:

Cloudera Manager 7.11.3 CHF8 does not support any Cloudera Data Services on premises release.

Fixed Issues for the Cloudera Data Services on premises 1.5.5 SP1

You can review the list of reported issues and their fixes in Cloudera Data Services on premises 1.5.5 SP1. Fixed issues represent selected issues that were previously logged through Cloudera Support, but are now addressed in the current Cloudera Data Services on premises release. These issues may have been reported in previous versions of Cloudera Data Services on premises as a known issue; meaning they were reported by customers or identified by Cloudera Quality Engineering teams.

OPSX-6589 - Cloudera Embedded Container Service 1.5.4 or 1.5.5, rke2_launch startup script fails to run because root is disallowed to use sudo

Startup failure in Cloudera Embedded Container Service 1.5.4 or 1.5.5 when sudo is disallowed for root. In 1.5.4 SP2, the rke2_launch startup script was updated to use sudo for setting the default NFSv4 configuration. This change caused Cloudera Embedded Container Service startup failures in environments where sudo is disabled for all users (including root).

The rke2_launch installer script has been updated so that inline sudo commands are no longer required and startup now proceeds without needing sudo.

OPSX-6049 - Diagnostics service did not purge logs from /data/env

Previously, the diagnostics service only purged logs under /data/bundles and /data/dp. Log-purging functionality has been extended to also include the /data/env directory.

OPSX-6602 - Break the dependency between unseal vault and restart validations steps

The restart validation step waits for pods in the cdp namespace to become Ready. However, some pods in this namespace depend on vault being unsealed first. Since the vault unsealing occurs after this step, the validation process waits until it times out unless vault is unsealed manually.

To prevent this issue, the validation of the cdp namespace is excluded from the restart validation to eliminate the manual unseal dependency.

OPSX-6349 - Upgrade logic missing for nvidia-device-plugin in Cloudera Embedded Container Service

After upgrading from Cloudera Embedded Container Service 1.5.2 to 1.5.4 (or later), Nvidia pods continued using legacy images because only install logic (not upgrade logic) was present.

The installer now includes a pre-upgrade step that upgrades the nvidia-device-plugin. After this change, upgrades of Cloudera Data Services on premises will ensure the plugin is updated too.

OPSX-6305 - Removal of SUID bit from /opt/cni/bin/install after Cloudera Embedded Container Service upgrade

The issue was identified during upgrades from older Calico versions, which left the binary with SUID permissions, posing a security risk. The fix involved removal of the SUID bit from the /opt/cni/bin/install binary after Cloudera Embedded Container Service upgrades to ensure compliance with security policies.

Note: The change applies specifically to Cloudera Embedded Container Service environments and does not impact OCP, with ongoing verification for Kubernetes 1.31 clusters.

Note: Latest updates will remove the binary entirely in newer Calico versions (v3.28.0+), but current upgrades from older versions require manual or scripted cleanup.

OPSX-6245 - Airgap | Multiple pods are in pending state on rolling restart

When performing consecutive rolling restarts on Cloudera Embedded Container Service clusters, the kube-controller-manager pod sometimes fails to become Ready promptly. This prevents other critical pods (including Vault) from initializing, causing the Vault-unseal step to fail.

The installer now implements pre-stop and post-start actions for Cloudera Embedded Container Service restarts in air-gapped environments to ensure pods return to Ready before proceeding.

OPSX-6241 - rke2-ingress-nginx-controller pod fails after Cloudera Embedded Container Service upgrade

After upgrading Cloudera Embedded Container Service, the ingress controller pod failed to start reliably. The restart sequence for the ingress component now includes forced termination of ingress pods, followed by scaling down and scaling up of the rke2-ingress-nginx-controller pod to ensure correct startup.

OPSX-5216 - Unsupported 'internal alias for registry' option

The internal alias for registry setting in Cloudera Embedded Container Service was enabled, but this configuration is not supported when running Cloudera AI workloads on fresh clusters.

Do not set the internal alias for registry flag if you intend to run Cloudera AI workloads.

OPSX-4763 - Environment state not reset after failed creation

In EnvironmentServiceAsyncUtils, when hive warehouse external directory creation failed, the isAvailable flag was set to false. While the subsequent API calls succeeded, the environment remained in a non-AVAILABLE state. The fix ensures that after failure and retry, the environment can be correctly marked as AVAILABLE when all tasks succeed.

Note: A pod#restart of the environment service may be required in earlier deployments.

OPSX-3323 - Custom log redaction does not work for JSON files in the diag bundle

Redaction rules (configured through the admin console) were not applied to JSON files in the diagnostic bundle, although they worked for .log and .txt files.

The diagnostic-bundle logic has been refactored so that JSON files are now included in log redaction. No behavioural change; only the file coverage is extended.

OPSAPS-74598 - Removal of Internal Alias Configuration from Cloudera Embedded Container Service Installation Wizard

ECS Internal Alias configuration is removed from Cloudera Embedded Container Service installation wizard, so that you do not enable this configuration.

OPSAPS-75358 - Configure the 'worker-shutdown-timeout' value for nginx ingress controller to 15 minutes

Based on the analysis for sample workloads, the worker-shutdown-timeout parameter for the nginx ingress controller has been lowered to 15 minutes to ensure graceful shutdown.

OPSX-6227 - Environment should be marked as FAILED if one of the async tasks fails

Previously, if one asynchronous task failed during environment creation, the environment remained in a CREATED state rather than FAILED, causing downstream workflows to proceed incorrectly.

The environment service now transitions the environment to FAILED status if any async task fails during creation.

OPSX-3953 - Upgrade postgresql image used in cdp-embedded-db

The embedded DB PostgreSQL component is upgraded from version 10.x to 17.4 as part of the Cloudera Control Plane upgrade. When Cloudera Control Plane 1.5.5 SP1 is installed or Cloudera Control Plane 1.5.x is upgraded to 1.5.5 SP1, cdp-embedded-db will participate in the Cloudera Control Plane upgrade. If the prior version is 1.5.x, then the data is automatically migrated to the new PostgreSQL 16 database.

Behavioral issues for the Cloudera Data Services on premises 1.5.5 SP1

Behavioral changes denote a marked change in behavior from the previously released version to this version of Cloudera Data Services on premises release.

Summary:

Implement Longhorn Recurring Job for Prometheus Snapshot Cleanup

Previous behaviour:

Longhorn's automatic snapshot generation, even without configured recurring jobs, can result in high-volume utilization for highly volatile data, such as Prometheus metrics. Prometheus frequently writes new metrics and cleans up old metrics, which is not an ideal write pattern for Longhorn's snapshot management. This can cause volume utilization to exceed configured limits, triggering volume filling up or above 100% alerts in the Cloudera Manager UI, when the actual issue is accumulated snapshots.

New behaviour:

In Cloudera Data Services on premises 1.5.5 SP1, a snapshot cleanup job is automatically configured for all Prometheus volumes. This new Recurring Job runs daily at 1:00 A.M. The timezone setting matches the Cloudera Manager Server's timezone.

You can reconfigure the schedule or completely disable this job through the Longhorn UI.

1. [Snapshot documentation](#)
2. [Recurring Snapshot Cleanup](#)

Known issues for the Cloudera Data Services on premises 1.5.5 SP1

You must be aware of the known issues and limitations, the areas of impact, and workaround in Cloudera Data Services on premises 1.5.5 SP1 release.

Cloudera Data Services on premises 1.5.5 existing known issues are carried into Cloudera Data Services on premises 1.5.5 SP1. For more details, see [Known Issues](#).

Known issue identified in 1.5.5 SP1

The following are the known issues identified in 1.5.5 SP1:

OPSAPS-70612: Invalid URL error while installing Cloudera Data Services on premises 1.5.5 SP1 from Cloudera Manager 7.13.1.501

When attempting to install Cloudera Data Services on premises using a Cloudera Manager 7.13.1.501 hotfix, the installation may fail.

The installation fails to process the repository URL correctly in this specific scenario, resulting in an "Invalid URL" error, which blocks the installation.

Perform the following steps to mitigate this issue:

1. Login to Cloudera Manager and click **Hosts Add Hosts**.
2. In the **Add Hosts** page, select the **Add hosts to Cloudera Manager** option and then click **Continue**.
3. Follow the instructions on the **Setup Auto-TLS** page and then click **Continue**.
4. In the **Specify Hosts** page, enter a host name or pattern to search for new hosts to add to the cluster, and then click **Continue**. You can click the **Patterns** link for more information.

A list of matching hosts are displayed.

5. Select the hosts that you want to add and click **Continue**.
6. Select the repository location where Cloudera Manager can access the software required to install on the new hosts. Choose either the **Public Cloudera Repository** or a **Custom Repository**, and provide the URL of the custom repository available on your local network.

7. Click Continue.

After completing the above tasks, you can proceed with the Cloudera Data Services on premises installation.

OPSX-6794 - Upgrading from Cloudera Data Services on premises 1.5.4 to 1.5.5 Service Pack 1 fails with a Upgrade embedded DB error message midway through the upgrade process.

When attempting to upgrade from Cloudera Data Services on premises 1.5.4 to 1.5.5 Service Pack 1, the upgrade process could fail.

If you have performed a manual **Expand Volume** operation on the cdp-embedded-db-backend Persistent Volume Claim (PVC) of the cdp-embedded-db service in **cdp** namespace, it can cause the upgrade process to fail. The upgrade workflow attempts to apply the original value that was used during the initial cluster set up. As Longhorn does not support reducing the volume size, the upgrade process fails.

To avoid stalling the ongoing upgrade process, you must manually exclude the PVC for the cdp-embedded-db-backend in the upgrade process.

Important: You must abort the upgrade process before applying this workaround.

Perform the following steps:

```
#Login to ECS master node
ssh root@ecs_master_node

#Switch to embedded db directory in the ECS parcel
cd /opt/cloudera/parcels/ECS-1.5.5-h1000-b167-ecs-1.5.5-h1000-b167.p0.72522329/installer/helm/cdp-embedded-db

#Create a tmp working directory
mkdir temp-cdp-embedded-db-1.5.5-h1000-b167

#Extract the tgz contents into the temp working directory
tar -xzf cdp-embedded-db-1.5.5-h1000-b167.tgz -C ./temp-cdp-embedded-db-1.5.5-h1000-b167

#Manual changes
vi temp-cdp-embedded-db-1.5.5-h1000-b167/templates/persistentVolumeClaim.yaml

#This file will have two PVCs. cdp-embedded-db-backend and cdp-embedded-db-backend-v17. Remove cdp-embedded-db-backend PVC from the file. Save the file and exit

#Take a backup of the old tgz file
mv cdp-embedded-db-1.5.5-h1000-b167.tgz backup-cdp-embedded-db-1.5.5-h1000-b167.tgz

#Switch to temp working directory
cd temp-cdp-embedded-db-1.5.5-h1000-b167

#Prepare an updated tgz file
tar -czvf ../cdp-embedded-db-1.5.5-h1000-b167.tgz .

#Switch to previous directory and check the tgz file
cd ..
ls -lrth

#Move the backup tgz to a different directory
mv backup-cdp-embedded-db-1.5.5-h1000-b167.tgz /tmp/some_directory
```

```
#Cleanup the temp working directory
rm -rf temp-cdp-embedded-db-1.5.5-h1000-b167/

#Backup the following secret in cdp namespace to 'some_directory'
'. Make sure to replace 'some_directory' with an appropriate path
kubectl get secret cdp-thunderheaduserpreference-db-secret -n
cdp -o yaml > /tmp/some_directory/backup-cdp-thunderheaduserpref
erence-db-secret

#Delete the following secret in cdp namespace
kubectl delete secret cdp-thunderheaduserpreference-db-secret -n
cdp
```

Once you complete these steps, you can resume the upgrade process.

OPSX-6797 - A possible upgrade failure resulting from expanding the cdp-embedded-db volume from Longhorn UI after the initial installation of your Data Services on premises cluster

If you have expanded cdp-embedded-db volume from Longhorn UI after the initial installation of your Data Services on premises cluster, you must complete the workaround steps before planning your upgrade to Cloudera Data Services on premises 1.5.5 Service Pack 1 to avoid a potential upgrade failure.

Login to your ECS master node on your cluster and perform the following these steps:

```
# Find the size of cdp-embedded-db-backend PVC, look for the val
ue in CAPACITY column
kubectl get pvc -n cdp | grep cdp-embedded-db-backend
# Find the latest/current copy of cdp-private-installer-values
# If the cluster is on 1.5.5-b212, then the secret to use will be
cdp-private-installer-values-1.5.5-b212
kubectl get secret -n cdp | grep cdp-private-installer-values
# For this example, we will use 'cdp-private-installer-values-1
.5.5-b212'
# Please use the correct one from your cluster

# Backup the existing values, in case you need to restore it late
r
kubectl get secret cdp-private-installer-values-1.5.5-b212 -n
cdp -o yaml > backup-cdp-private-installer-values-1.5.5-b212.yaml

# Make a new copy before updating the values
cp backup-cdp-private-installer-values-1.5.5-b212.yaml updated-c
dp-private-installer-values-1.5.5-b212.yaml
# Edit 'updated-cdp-private-installer-values-1.5.5-b212.yaml' u
sing the following instructions:
# 1. Base64decode the value present in 'values.yaml.merged' att
ribute
# 2. Update Database.EmbeddedDbStorage to the latest value obtain
ed in the first step
# 3. Base64encode the updated yaml string and update it in 'val
ues.yaml.merged' attribute
# 4. Delete metadata.creationTimestamp, metadata.name, metadata.r
esourceVersion and metadata.uid attributes
# 5. Save these changes to updated-cdp-private-installer-values-1
.5.5-b212.yaml

# Delete the existing secret
kubectl delete secret cdp-private-installer-values-1.5.5-b212 -n
cdp

# Create a new secret using the updated file
kubectl apply -f updated-cdp-private-installer-values-1.5.5-b212
.yaml
```

```
# Check if the secret got created
kubectl get secret -n cdp | grep cdp-private-installer-values

# Verify if the value got updated
kubectl get secret cdp-private-installer-values-1.5.5-b212 -n
cdp -o jsonpath='{.data.values\.yaml\.merged}' | base64 --decode
```

COMPX-20437 - DB connection failures causing RPM and CAM pods to CrashLoopBackOff

During an upgrade from version 1.5.5 to any 1.5.5 hotfix release, the cluster-access-manager (CAM) and resource-pool-manager (RPM) pods can enter a CrashLoopBackOff state if they are not automatically restarted during the upgrade.

After upgrade, manually restart the CAM pod and then restart the RPM pod (order of restart is very important).

Commands to restart:

```
kubectl rollout restart deployment <cluster-access-manager-depl
oyment-name> -n <namespace>
kubectl rollout restart deployment <resource-pool-manager-deplo
yment-name> -n <namespace>
```

OBS-9491 - Prometheus configuration exceeds size limit in large environments

In environments with a large number of namespaces (approximately 300 or more per environment), the Prometheus configuration for Cloudera Monitoring might exceed the 1 MB Kubernetes Secret size limit. If the total size, which depends on factors such as the number of namespaces, the length of namespace names, their variability, and the size of the certificate store, exceeds 1 MB, the new Prometheus configuration will not be applied, and new namespaces will not be monitored. As a result, the telemetry data will not be collected from those namespaces and will not be reflected on the corresponding Grafana charts.

To resolve this issue, you must enable Prometheus configuration compression at the Cloudera Control Plane level.

1. Upgrade to Cloudera Data Services on premises 1.5.5 SP1 or a higher version.
2. Back up the secret from the monitoring namespace to allow for rollback and disabling compression later.
3. Set the environment variable `ENABLE_ENVIRONMENT_PROMETHEUS_CONFIG_COMPRESSION` to "true" on the `cdp-release-monitoring-pvcservice` deployment in the Cloudera Control Plane namespace.

Note: The upper bound for monitoring is based on the number of namespaces per environment, the length of the namespace name, the variability of the names, and the size of the cert store.

- For example, about 700 workload namespaces in a single environment with a short, consistent pattern ("aaaa-bbbb-XXXX") generate around 150 KB of configuration, which fits within the 1 MB limit.
- About 3000 namespaces in a single environment with a longer, consistent pattern ("aaaa-cccc-dddd-XXXXX") generate about 900 KB.

Rolling back the workaround:

1. Set the environment variable `ENABLE_ENVIRONMENT_PROMETHEUS_CONFIG_COMPRESSION` to "false" on the `cdp-release-monitoring-pvcservice` deployment in the Cloudera Control Plane namespace.
2. Reapply the secret from the backup.

OPSX-6618 - In Cloudera Embedded Container Service upgrade not all volumes are upgraded to the latest longhorn version

During restart of the Cloudera Embedded Container Service cluster from 1.5.5 to 1.5.5 SP1, the upgrade failed due to longhorn health issues. This is because one of the volumes was degraded.

Follow the steps to resolve the issue:

- Identify the problematic volumes (degraded state).
- Set the value of `spec.numberOfReplicas` of the volume to the number of active replicas. For example, set the value to 3 if two replicas are active.
- Apply the fix before or during the upgrade as per the workaround instructions (refer to Longhorn issue #11825). Longhorn Engineering is addressing in v1.11.0 and will back-port the fix. The workaround is included as part of the upgrade. However, if the issue is noticed even after upgrade please follow the workaround steps documented here: <https://github.com/longhorn/longhorn/issues/11825>

COMPX-23842 / COMPX-24130/ COMPX-23319 - Pod status shown as OutOfcpu, OutOfmemory, or Pending after a cluster restart

During a cluster restart, due to an upgrade or normal maintenance, all nodes in the cluster are restarted. During this process, the cluster operates with reduced resource capacity. When this occurs, pod placement can be rejected, resulting in some pods entering `OutOfcpu` or `OutOfmemory` state.

Do not restart failed pods until the cluster restart process has fully completed. Once the cluster is fully operational:

- Restart any pods that are in a failed (`OutOfcpu` or `OutOfmemory`) state, so they can be rescheduled properly.
- If any pods remain in a pending state after the restart, restart the YuniKorn scheduler to refresh scheduling:

```
kubectl rollout restart deployment yunikorn-scheduler -n yunikorn
```

OPSX-6566 - Cloudera Embedded Container Service restart fails with etcd connectivity issues

Restart of the Cloudera Embedded Container Service server fails with etcd error: "error reading from server"

1. Identify the server role that failed.
2. Restart only the Cloudera Embedded Container Service server role which failed.
3. Once the server role is restarted and healthy, proceed with the remainder of the Cloudera Embedded Container Service server role restart sequence.

OPSX-6401 - Istio ingress-default-cert is not created in the upgrade scenario

After upgrading to 1.5.5 SP1, the Secret `ingress-default-cert` is not created in the `istio-ingress` namespace. Because this certificate is expected, failing to create it causes components like CAII & MR provisioning to fail.

To resolve this issue:

- After upgrading from an older version to 1.5.5 SP1, check for the secret called `ingress-default-cert` in the `istio-ingress` namespace (ns).

For example:

```
kubectl get secret ingress-default-cert -n istio-ingress
```

- If missing, copy the identical secret from `kube-system` namespace (or from the pre-upgrade environment) into `istio-ingress` namespace with the same name and contents.
- This will restore the expected certificate and allow CAII & MR provisioning to proceed.

OPSX-6645 - Cloudera Embedded Container Service upgrade failure at restart step

When the Cloudera Embedded Container Service role fails to start after a node reboot or service restart, the root cause can be that the etcd defragmentation process which runs on startup takes longer than the component timeout thresholds. As a result:

- The kubelet service may fail to start or time out.
- The kube-apiserver, kube-scheduler or kube-controller-manager roles may remain in a NotReady state.
- etcd may perform automatic defragmentation at startup.
- The API server may fail to connect to etcd (connection refused or timeout).

To fix this issue:

1. Resume the Cloudera Embedded Container Service start/restart from the Cloudera Manager UI once etcd has come up.
2. Ensure etcd meets production hardware and configuration requirements: For more information, see [etcd requirements](#) and [Knowledge Base](#).

OPSX-6767 - Cloudera Embedded Container Service cluster has stale configuration after Cloudera Manager upgrade to 7.13.1.501-b2 from 7.11.3.24

After upgrading Cloudera Manager to version 7.13.1.501, the Cloudera Embedded Container Service shows a staleness indicator. This occurs due to configuration changes applied by the upgrade:

- worker-shutdown-timeout: reduced from 24 hours (86,400 s) to 15 minutes (900 s).
- smon_host: a new monitoring configuration added.
- smon_port: a new monitoring port configuration (9997).

No action required — the staleness is expected following this upgrade and can be safely ignored. The indicator will automatically clear once Cloudera Embedded Container Service is upgraded to version 1.5.5 SP1 or later.

If you prefer to clear the staleness indicator right away, you may manually refresh the Cloudera Embedded Container Service service through the Cloudera Manager UI.

Note: Performing a refresh will restart the ingress controller and may cause a brief service interruption.

OPSX-6638 - Post rolling restart many pods are stuck in pending state

Pods remain in Pending state and fail to schedule with etcd performance warnings.

Restart the Cloudera Embedded Container Service master role which has etcd performance issues. For more information, see [etcd hardware recommendations](#) and [Knowledge Base](#).

List of fixed Common Vulnerabilities and Exposures in 1.5.5 SP1

Review the Common vulnerabilities and Exposures (CVEs) that were fixed in this release of Cloudera Data Services on premises 1.5.5 SP1.

CVE ID	Description
CVE-2001-1268	Directory traversal vulnerability in Info-ZIP UnZip 5.42 and earlier allows attackers to overwrite arbitrary files during archive extraction via a .. (dot dot) in an extracted filename.
CVE-2001-1269	Info-ZIP UnZip 5.42 and earlier allows attackers to overwrite arbitrary files during archive extraction via filenames in the archive that begin with the '/' (slash) character.
CVE-2005-0602	Unzip 5.51 and earlier does not properly warn the user when extracting setuid or setgid files, which may allow local users to gain privileges.
CVE-2005-2541	Tar 1.15.1 does not properly warn the user when extracting setuid or setgid files, which may allow local users or remote attackers to gain privileges.

CVE ID	Description
CVE-2007-5686	initscripts in rPath Linux 1 sets insecure permissions for the /var/log/btmp file, which allows local users to obtain sensitive information regarding authentication attempts. NOTE: because sshd detects the insecure permissions and does not log certain events, this also prevents sshd from logging failed authentication attempts by remote attackers.
CVE-2010-4756	The glob implementation in the GNU C Library (aka glibc or libc6) allows remote authenticated users to cause a denial of service (CPU and memory consumption) via crafted glob expressions that do not match any pathnames, as demonstrated by glob expressions in STAT commands to an FTP daemon, a different vulnerability than CVE-2010-2632.
CVE-2010-5312	Cross-site scripting (XSS) vulnerability in jquery.ui.dialog.js in the Dialog widget in jQuery UI before 1.10.0 allows remote attackers to inject arbitrary web script or HTML via the title option.
CVE-2011-3374	It was found that apt-key in apt, all versions, do not correctly validate gpg keys with the master keyring, leading to a potential man-in-the-middle attack.
CVE-2011-3389	The SSL protocol, as used in certain configurations in Microsoft Windows and Microsoft Internet Explorer, Mozilla Firefox, Google Chrome, Opera, and other products, encrypts data by using CBC mode with chained initialization vectors, which allows man-in-the-middle attackers to obtain plaintext HTTP headers via a blockwise chosen-boundary attack (BCBA) on an HTTPS session, in conjunction with JavaScript code that uses (1) the HTML5 WebSocket API, (2) the Java URLConnection API, or (3) the Silverlight WebClient API, aka a "BEAST" attack.
CVE-2011-4116	_is_safe in the File::Temp module for Perl does not properly handle symlinks.
CVE-2011-4461	Jetty 8.1.0.RC2 and earlier computes hash values for form parameters without restricting the ability to trigger hash collisions predictably, which allows remote attackers to cause a denial of service (CPU consumption) by sending many crafted parameters.
CVE-2011-4969	Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.
CVE-2012-2663	extensions/libxt_tcp.c in iptables through 1.4.21 does not match TCP SYN+FIN packets in --syn rules, which might allow remote attackers to bypass intended firewall restrictions via crafted packets. NOTE: the CVE-2012-6638 fix makes this issue less relevant.
CVE-2012-6708	jQuery before 1.9.0 is vulnerable to Cross-site Scripting (XSS) attacks. The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.
CVE-2013-4235	shadow: TOCTOU (time-of-check time-of-use) race condition when copying and removing directory trees
CVE-2013-4392	systemd, when updating file permissions, allows local users to change the permissions and SELinux security contexts for arbitrary files via a symlink attack on unspecified files.
CVE-2013-7445	The Direct Rendering Manager (DRM) subsystem in the Linux kernel through 4.x mishandles requests for Graphics Execution Manager (GEM) objects, which allows context-dependent attackers to cause a denial of service (memory consumption) via an application that processes graphics data, as demonstrated by JavaScript code that creates many CANVAS elements for rendering by Chrome or Firefox.
CVE-2014-6071	jQuery 1.4.2 allows remote attackers to conduct cross-site scripting (XSS) attacks via vectors related to use of the text method inside after.
CVE-2014-9471	The parse_datetime function in GNU coreutils allows remote attackers to cause a denial of service (crash) or possibly execute arbitrary code via a crafted date string, as demonstrated by the "--date=TZ='123'345" @1" string to the touch or date command.
CVE-2015-4041	The keycompare_mb function in sort.c in sort in GNU Coreutils through 8.23 on 64-bit platforms performs a size calculation without considering the number of bytes occupied by multibyte characters, which allows attackers to cause a denial of service (heap-based buffer overflow and application crash) or possibly have unspecified other impact via long UTF-8 strings.
CVE-2015-4042	Integer overflow in the keycompare_mb function in sort.c in sort in GNU Coreutils through 8.23 might allow attackers to cause a denial of service (application crash) or possibly have unspecified other impact via long strings.
CVE-2015-5237	protobuf allows remote authenticated attackers to cause a heap-based buffer overflow.

CVE ID	Description
CVE-2015-7837	The Linux kernel, as used in Red Hat Enterprise Linux 7, kernel-rt, and Enterprise MRG 2 and when booted with UEFI Secure Boot enabled, allows local users to bypass intended securelevel/secureboot restrictions by leveraging improper handling of secure_boot flag across kexec reboot.
CVE-2015-8553	Xen allows guest OS users to obtain sensitive information from uninitialized locations in host OS kernel memory by not enabling memory and I/O decoding control bits. NOTE: this vulnerability exists because of an incomplete fix for CVE-2015-0777.
CVE-2015-9251	jQuery before 3.0.0 is vulnerable to Cross-site Scripting (XSS) attacks when a cross-domain Ajax request is performed without the dataType option, causing text/javascript responses to be executed.
CVE-2016-1000027	Pivotal Spring Framework through 5.3.16 suffers from a potential remote code execution (RCE) issue if used for Java deserialization of untrusted data. Depending on how the library is implemented within a product, this issue may or not occur, and authentication may be required. NOTE: the vendor's position is that untrusted data is not an intended use case. The product's behavior will not be changed because some users rely on deserialization of trusted data.
CVE-2016-2781	chroot in GNU coreutils, when used with --userspec, allows local users to escape to the parent session via a crafted TIOCTSTIOCTL call, which pushes characters to the terminal's input buffer.
CVE-2016-4971	GNU wget before 1.18 allows remote servers to write to arbitrary files by redirecting a request from HTTP to a crafted FTP resource.
CVE-2016-7098	Race condition in wget 1.17 and earlier, when used in recursive or mirroring mode to download a single file, might allow remote servers to bypass intended access list restrictions by keeping an HTTP connection open.
CVE-2016-7103	Cross-site scripting (XSS) vulnerability in jQuery UI before 1.12.0 might allow remote attackers to inject arbitrary web script or HTML via the closeText parameter of the dialog function.
CVE-2016-8660	The XFS subsystem in the Linux kernel through 4.8.2 allows local users to cause a denial of service (fdatasync failure and system hang) by using the vfs syscall group in the trinity program, related to a "page lock order bug in the XFS seek hole/data implementation."
CVE-2017-0537	An information disclosure vulnerability in the kernel USB gadget driver could enable a local malicious application to access data outside of its permission levels. This issue is rated as Moderate because it first requires compromising a privileged process. Product: Android. Versions: Kernel-3.18. Android ID: A-31614969.
CVE-2017-11164	In PCRE 8.41, the OP_KETRMATCH feature in the match function in pcre_exec.c allows stack exhaustion (uncontrolled recursion) when processing a crafted regular expression.
CVE-2017-13165	An elevation of privilege vulnerability in the kernel file system. Product: Android. Versions: Android kernel. Android ID A-31269937.
CVE-2017-13693	The acpi_ds_create_operands() function in drivers/acpi/acpica/dsutils.c in the Linux kernel through 4.12.9 does not flush the operand cache and causes a kernel stack dump, which allows local users to obtain sensitive information from kernel memory and bypass the KASLR protection mechanism (in the kernel through 4.9) via a crafted ACPI table.
CVE-2017-13716	The C++ symbol demangler routine in cplusplus-dem.c in libiberty, as distributed in GNU Binutils 2.29, allows remote attackers to cause a denial of service (excessive memory allocation and application crash) via a crafted file, as demonstrated by a call from the Binary File Descriptor (BFD) library (aka libbfd).
CVE-2017-13745	There is a reachable assertion abort in the function jpc_dec_process_sot() in jpc/jpc_dec.c in JasPer 2.0.12 that will lead to a remote denial of service attack by triggering an unexpected jpc_ppmstabtostreams return value, a different vulnerability than CVE-2018-9154.
CVE-2017-16231	In PCRE 8.41, after compiling, a pcretest load test PoC produces a crash overflow in the function match() in pcre_exec.c because of a self-recursive call. NOTE: third parties dispute the relevance of this report, noting that there are options that can be used to limit the amount of stack that is used
CVE-2017-16516	In the yajl-ruby gem 1.3.0 for Ruby, when a crafted JSON file is supplied to Yajl::Parser.new.parse, the whole ruby process crashes with a SIGABRT in the yajl_string_decode function in yajl_encode.c. This results in the whole ruby process terminating and potentially a denial of service.
CVE-2017-18018	In GNU Coreutils through 8.29, chown-core.c in chown and chgrp does not prevent replacement of a plain file with a symlink during use of the POSIX "-R -L" options, which allows local users to modify the ownership of arbitrary files by leveraging a race condition.
CVE-2017-3161	The HDFS web UI in Apache Hadoop before 2.7.0 is vulnerable to a cross-site scripting (XSS) attack through an unescaped query parameter.

CVE ID	Description
CVE-2017-3162	HDFS clients interact with a servlet on the DataNode to browse the HDFS namespace. The NameNode is provided as a query parameter that is not validated in Apache Hadoop before 2.7.0.
CVE-2017-3735	While parsing an IPAddressFamily extension in an X.509 certificate, it is possible to do a one-byte overread. This would result in an incorrect text display of the certificate. This bug has been present since 2006 and is present in all versions of OpenSSL before 1.0.2m and 1.1.0g.
CVE-2017-3736	There is a carry propagating bug in the x86_64 Montgomery squaring procedure in OpenSSL before 1.0.2m and 1.1.0 before 1.1.0g. No EC algorithms are affected. Analysis suggests that attacks against RSA and DSA as a result of this defect would be very difficult to perform and are not believed likely. Attacks against DH are considered just feasible (although very difficult) because most of the work necessary to deduce information about a private key may be performed offline. The amount of resources required for such an attack would be very significant and likely only accessible to a limited number of attackers. An attacker would additionally need online access to an unpatched system using the target private key in a scenario with persistent DH parameters and a private key that is shared between multiple clients. This only affects processors that support the BMI1, BMI2 and ADX extensions like Intel Broadwell (5th generation) and later or AMD Ryzen.
CVE-2017-3737	OpenSSL 1.0.2 (starting from version 1.0.2b) introduced an "error state" mechanism. The intent was that if a fatal error occurred during a handshake then OpenSSL would move into the error state and would immediately fail if you attempted to continue the handshake. This works as designed for the explicit handshake functions (SSL_do_handshake(), SSL_accept() and SSL_connect()), however due to a bug it does not work correctly if SSL_read() or SSL_write() is called directly. In that scenario, if the handshake fails then a fatal error will be returned in the initial function call. If SSL_read()/SSL_write() is subsequently called by the application for the same SSL object then it will succeed and the data is passed without being decrypted/encrypted directly from the SSL/TLS record layer. In order to exploit this issue an application bug would have to be present that resulted in a call to SSL_read()/SSL_write() being issued after having already received a fatal error. OpenSSL version 1.0.2b-1.0.2m are affected. Fixed in OpenSSL 1.0.2n. OpenSSL 1.1.0 is not affected.
CVE-2017-3738	There is an overflow bug in the AVX2 Montgomery multiplication procedure used in exponentiation with 1024-bit moduli. No EC algorithms are affected. Analysis suggests that attacks against RSA and DSA as a result of this defect would be very difficult to perform and are not believed likely. Attacks against DH1024 are considered just feasible, because most of the work necessary to deduce information about a private key may be performed offline. The amount of resources required for such an attack would be significant. However, for an attack on TLS to be meaningful, the server would have to share the DH1024 private key among multiple clients, which is no longer an option since CVE-2016-0701. This only affects processors that support the AVX2 but not ADX extensions like Intel Haswell (4th generation). Note: The impact from this issue is similar to CVE-2017-3736, CVE-2017-3732 and CVE-2015-3193. OpenSSL version 1.0.2-1.0.2m and 1.1.0-1.1.0g are affected. Fixed in OpenSSL 1.0.2n. Due to the low severity of this issue we are not issuing a new release of OpenSSL 1.1.0 at this time. The fix will be included in OpenSSL 1.1.0h when it becomes available. The fix is also available in commit e502cc86d in the OpenSSL git repository.
CVE-2017-5499	Integer overflow in libjasper/jpc/jpc_dec.c in JasPer 1.900.17 allows remote attackers to cause a denial of service (crash) via a crafted file.
CVE-2017-5503	The dec_clnpass function in libjasper/jpc/jpc_t1dec.c in JasPer 1.900.27 allows remote attackers to cause a denial of service (invalid memory write and crash) or possibly have unspecified other impact via a crafted image.
CVE-2017-5504	The jpc_undo_roi function in libjasper/jpc/jpc_dec.c in JasPer 1.900.27 allows remote attackers to cause a denial of service (invalid memory read and crash) via a crafted image.
CVE-2017-5505	The jas_matrix_asl function in jas_seq.c in JasPer 1.900.27 allows remote attackers to cause a denial of service (invalid memory read and crash) via a crafted image.
CVE-2017-6519	avahi-daemon in Avahi through 0.6.32 and 0.7 inadvertently responds to IPv6 unicast queries with source addresses that are not on-link, which allows remote attackers to cause a denial of service (traffic amplification) and may cause information leakage by obtaining potentially sensitive information from the responding device via port-5353 UDP packets. NOTE: this may overlap CVE-2015-2809.
CVE-2017-7245	Stack-based buffer overflow in the pcre32_copy_substring function in pcre_get.c in libpcre1 in PCRE 8.40 allows remote attackers to cause a denial of service (WRITE of size 4) or possibly have unspecified other impact via a crafted file.
CVE-2017-7246	Stack-based buffer overflow in the pcre32_copy_substring function in pcre_get.c in libpcre1 in PCRE 8.40 allows remote attackers to cause a denial of service (WRITE of size 268) or possibly have unspecified other impact via a crafted file.

CVE ID	Description
CVE-2017-7475	Cairo version 1.15.4 is vulnerable to a NULL pointer dereference related to the FT_Load_Glyph and FT_Render_Glyph resulting in an application crash.
CVE-2017-9782	JasPer 2.0.12 allows remote attackers to cause a denial of service (heap-based buffer over-read and application crash) via a crafted image, related to the jp2_decode function in libjasper/jp2/jp2_dec.c.
CVE-2018-0732	During key agreement in a TLS handshake using a DH(E) based ciphersuite a malicious server can send a very large prime value to the client. This will cause the client to spend an unreasonably long period of time generating a key for this prime resulting in a hang until the client has finished. This could be exploited in a Denial Of Service attack. Fixed in OpenSSL 1.1.0i-dev (Affected 1.1.0-1.1.0h). Fixed in OpenSSL 1.0.2p-dev (Affected 1.0.2-1.0.2o).
CVE-2018-0734	The OpenSSL DSA signature algorithm has been shown to be vulnerable to a timing side channel attack. An attacker could use variations in the signing algorithm to recover the private key. Fixed in OpenSSL 1.1.1a (Affected 1.1.1). Fixed in OpenSSL 1.1.0j (Affected 1.1.0-1.1.0i). Fixed in OpenSSL 1.0.2q (Affected 1.0.2-1.0.2p).
CVE-2018-0737	The OpenSSL RSA Key generation algorithm has been shown to be vulnerable to a cache timing side channel attack. An attacker with sufficient access to mount cache timing attacks during the RSA key generation process could recover the private key. Fixed in OpenSSL 1.1.0i-dev (Affected 1.1.0-1.1.0h). Fixed in OpenSSL 1.0.2p-dev (Affected 1.0.2b-1.0.2o).
CVE-2018-0739	Constructed ASN.1 types with a recursive definition (such as can be found in PKCS7) could eventually exceed the stack given malicious input with excessive recursion. This could result in a Denial Of Service attack. There are no such structures used within SSL/TLS that come from untrusted sources so this is considered safe. Fixed in OpenSSL 1.1.0h (Affected 1.1.0-1.1.0g). Fixed in OpenSSL 1.0.2o (Affected 1.0.2b-1.0.2n).
CVE-2018-1000021	GIT version 2.15.1 and earlier contains a Input Validation Error vulnerability in Client that can result in problems including messing up terminal configuration to RCE. This attack appear to be exploitable via The user must interact with a malicious git server, (or have their traffic modified in a MITM attack).
CVE-2018-1000201	ruby-ffi version 1.9.23 and earlier has a DLL loading issue which can be hijacked on Windows OS, when a Symbol is used as DLL name instead of a String This vulnerability appears to have been fixed in v1.9.24 and later.
CVE-2018-1000520	ARM mbedTLS version 2.7.0 and earlier contains a Ciphersuite Allows Incorrectly Signed Certificates vulnerability in mbedtls_ssl_get_verify_result() that can result in ECDSA-signed certificates are accepted, when only RSA-signed ones should be.. This attack appear to be exploitable via Peers negotiate a TLS-ECDH-RSA-* ciphersuite. Any of the peers can then provide an ECDSA-signed certificate, when only an RSA-signed one should be accepted..
CVE-2018-1000654	GNU Libtasn1-4.13 libtasn1-4.13 version libtasn1-4.13, libtasn1-4.12 contains a DoS, specifically CPU usage will reach 100% when running asn1Paser against the POC due to an issue in _asn1_expand_object_id(p_tree), after a long time, the program will be killed. This attack appears to be exploitable via parsing a crafted file.
CVE-2018-1000876	binutils version 2.32 and earlier contains a Integer Overflow vulnerability in objdump, bfd_get_dynamic_reloc_upper_bound, bfd_canonicalize_dynamic_reloc that can result in Integer overflow trigger heap overflow. Successful exploitation allows execution of arbitrary code.. This attack appear to be exploitable via Local. This vulnerability appears to have been fixed in after commit 3a551c7a1b80fca579461774860574eabfd7f18f.
CVE-2018-1000879	libarchive version commit 379867ecb330b3a952fb7bfa7bffb7bbd5547205 onwards (release v3.3.0 onwards) contains a CWE-476: NULL Pointer Dereference vulnerability in ACL parser - libarchive/ archive_acl.c, archive_acl_from_text_l() that can result in Crash/DoS. This attack appear to be exploitable via the victim must open a specially crafted archive file.
CVE-2018-1000880	libarchive version commit 9693801580c0cf7c70e862d305270a16b52826a7 onwards (release v3.2.0 onwards) contains a CWE-20: Improper Input Validation vulnerability in WARC parser - libarchive/ archive_read_support_format_warc.c, _warc_read() that can result in DoS - quasi-infinite run time and disk usage from tiny file. This attack appear to be exploitable via the victim must open a specially crafted WARC file.
CVE-2018-10237	Unbounded memory allocation in Google Guava 11.0 through 24.x before 24.1.1 allows remote attackers to conduct denial of service attacks against servers that depend on this library and deserialize attacker-provided data, because the AtomicDoubleArray class (when serialized with Java serialization) and the CompoundOrdering class (when serialized with GWT serialization) perform eager allocation without appropriate checks on what a client has sent and whether the data size is reasonable.
CVE-2018-10779	TIFFWriteScanline in tif_write.c in LibTIFF 3.8.2 has a heap-based buffer over-read, as demonstrated by bmp2tiff.

CVE ID	Description
CVE-2018-10801	TIFFClientOpen in tif_unix.c in LibTIFF 3.8.2 has memory leaks, as demonstrated by bmp2tiff.
CVE-2018-1121	procpns-ng, procpns is vulnerable to a process hiding through race condition. Since the kernel's proc_pid_readdir() returns PID entries in ascending numeric order, a process occupying a high PID can use inotify events to determine when the process list is being scanned, and fork/exec to obtain a lower PID, thus avoiding enumeration. An unprivileged attacker can hide a process from procpns-ng's utilities by exploiting a race condition in reading /proc/PID entries. This vulnerability affects procpns and procpns-ng up to version 3.3.15, newer versions might be affected also.
CVE-2018-12641	An issue was discovered in arm_pt in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.30. Stack Exhaustion occurs in the C++ demangling functions provided by libiberty, and there are recursive stack frames: demangle_arm_hp_template, demangle_class_name, demangle_fund_type, do_type, do_arg, demangle_args, and demangle_nested_args. This can occur during execution of nm-new.
CVE-2018-12697	A NULL pointer dereference (aka SEGV on unknown address 0x000000000000) was discovered in work_stuff_copy_to_from in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.30. This can occur during execution of objdump.
CVE-2018-12698	demangle_template in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.30, allows attackers to trigger excessive memory consumption (aka OOM) during the "Create an array for saving the template argument values" XNEWVEC call. This can occur during execution of objdump.
CVE-2018-12928	In the Linux kernel 4.15.0, a NULL pointer dereference was discovered in hfs_ext_read_extent in hfs.ko. This can occur during a mount of a crafted hfs filesystem.
CVE-2018-12929	ntfs_read_locked_inode in the ntfs.ko filesystem driver in the Linux kernel 4.15.0 allows attackers to trigger a use-after-free read and possibly cause a denial of service (kernel oops or panic) via a crafted ntfs filesystem.
CVE-2018-12930	ntfs_end_buffer_async_read in the ntfs.ko filesystem driver in the Linux kernel 4.15.0 allows attackers to trigger a stack-based out-of-bounds write and cause a denial of service (kernel oops or panic) or possibly have unspecified other impact via a crafted ntfs filesystem.
CVE-2018-12931	ntfs_attr_find in the ntfs.ko filesystem driver in the Linux kernel 4.15.0 allows attackers to trigger a stack-based out-of-bounds write and cause a denial of service (kernel oops or panic) or possibly have unspecified other impact via a crafted ntfs filesystem.
CVE-2018-12934	remember_Ktype in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.30, allows attackers to trigger excessive memory consumption (aka OOM). This can occur during execution of cxxfilt.
CVE-2018-15594	arch/x86/kernel/paravirt.c in the Linux kernel before 4.18.1 mishandles certain indirect calls, which makes it easier for attackers to conduct Spectre-v2 attacks against paravirtual guests.
CVE-2018-15919	Remotely observable behaviour in auth-gss2.c in OpenSSH through 7.8 could be used by remote attackers to detect existence of users on a target system when GSS2 is in use. NOTE: the discoverer states 'We understand that the OpenSSH developers do not want to treat such a username enumeration (or "oracle") as a vulnerability.'
CVE-2018-16335	newoffsets handling in ChopUpSingleUncompressedStrip in tif_dirread.c in LibTIFF 4.0.9 allows remote attackers to cause a denial of service (heap-based buffer overflow and application crash) or possibly have unspecified other impact via a crafted TIFF file, as demonstrated by tiff2pdf. This is a different vulnerability than CVE-2018-15209.
CVE-2018-16862	A security flaw was found in the Linux kernel in a way that the cleancache subsystem clears an inode after the final file truncation (removal). The new file created with the same inode may contain leftover pages from cleancache and the old file data instead of the new one.
CVE-2018-17101	An issue was discovered in LibTIFF 4.0.9. There are two out-of-bounds writes in cpTags in tools/tiff2bw.c and tools/pal2rgb.c, which can cause a denial of service (application crash) or possibly have unspecified other impact via a crafted image file.
CVE-2018-17360	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.31. a heap-based buffer over-read in bfd_getl32 in libbfd.c allows an attacker to cause a denial of service through a crafted PE file. This vulnerability can be triggered by the executable objdump.
CVE-2018-17794	An issue was discovered in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a NULL pointer dereference in work_stuff_copy_to_from when called from iterate_demangle_function.
CVE-2018-17977	The Linux kernel 4.14.67 mishandles certain interaction among XFRM Netlink messages, IPPROTO_AH packets, and IPPROTO_IP packets, which allows local users to cause a denial of service (memory consumption and system hang) by leveraging root access to execute crafted applications, as demonstrated on CentOS 7.

CVE ID	Description
CVE-2018-17985	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a stack consumption problem caused by the cplus_demangle_type function making recursive calls to itself in certain scenarios involving many 'P' characters.
CVE-2018-18064	cairo through 1.15.14 has an out-of-bounds stack-memory write during processing of a crafted document by WebKitGTK+ because of the interaction between cairo-rectangular-scan-converter.c (the generate and render_rows functions) and cairo-image-compositor.c (the _cairo_image_spans_and_zero function).
CVE-2018-18309	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.31. An invalid memory address dereference was discovered in read_reloc in reloc.c. The vulnerability causes a segmentation fault and application crash, which leads to denial of service, as demonstrated by objdump, because of missing _bfd_clear_contents bounds checking.
CVE-2018-18483	The get_count function in cplus-dem.c in GNU libiberty, as distributed in GNU Binutils 2.31, allows remote attackers to cause a denial of service (malloc called with the result of an integer-overflowing calculation) or possibly have unspecified other impact via a crafted string, as demonstrated by c++filt.
CVE-2018-18484	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. Stack Exhaustion occurs in the C++ demangling functions provided by libiberty, and there is a stack consumption problem caused by recursive stack frames: cplus_demangle_type, d_bare_function_type, d_function_type.
CVE-2018-18605	A heap-based buffer over-read issue was discovered in the function sec_merge_hash_lookup in merge.c in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.31, because _bfd_add_merge_section mishandles section merges when size is not a multiple of entsize. A specially crafted ELF allows remote attackers to cause a denial of service, as demonstrated by ld.
CVE-2018-18606	An issue was discovered in the merge_strings function in merge.c in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.31. There is a NULL pointer dereference in _bfd_add_merge_section when attempting to merge sections with large alignments. A specially crafted ELF allows remote attackers to cause a denial of service, as demonstrated by ld.
CVE-2018-18607	An issue was discovered in elf_link_input_bfd in elflink.c in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.31. There is a NULL pointer dereference in elf_link_input_bfd when used for finding STT_TLS symbols without any TLS section. A specially crafted ELF allows remote attackers to cause a denial of service, as demonstrated by ld.
CVE-2018-18700	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a stack consumption vulnerability resulting from infinite recursion in the functions d_name(), d_encoding(), and d_local_name() in cp-demangle.c. Remote attackers could leverage this vulnerability to cause a denial-of-service via an ELF file, as demonstrated by nm.
CVE-2018-18701	An issue was discovered in cp-demangle.c in GNU libiberty, as distributed in GNU Binutils 2.31. There is a stack consumption vulnerability resulting from infinite recursion in the functions next_is_type_qual() and cplus_demangle_type() in cp-demangle.c. Remote attackers could leverage this vulnerability to cause a denial-of-service via an ELF file, as demonstrated by nm.
CVE-2018-18873	An issue was discovered in JasPer 2.0.14. There is a NULL pointer dereference in the function ras_putdatastd in ras/ras_enc.c.
CVE-2018-19139	An issue has been found in JasPer 2.0.14. There is a memory leak in jas_malloc.c when called from jpc_unk_getparms in jpc_cs.c.
CVE-2018-19210	In LibTIFF 4.0.9, there is a NULL pointer dereference in the TIFFWriteDirectorySec function in tif_dirwrite.c that will lead to a denial of service attack, as demonstrated by tiffset.
CVE-2018-19211	In ncurses 6.1, there is a NULL pointer dereference at function _nc_parse_entry in parse_entry.c that will lead to a denial of service attack. The product proceeds to the dereference code path even after a "dubious character '*' in name or alias field" detection.
CVE-2018-19217	In ncurses, possibly a 6.x version, there is a NULL pointer dereference at the function _nc_name_match that will lead to a denial of service attack. NOTE: the original report stated version 6.1, but the issue did not reproduce for that version according to the maintainer or a reliable third-party
CVE-2018-19539	An issue was discovered in JasPer 2.0.14. There is an access violation in the function jas_image_readcmpt in libjasper/base/jas_image.c, leading to a denial of service.
CVE-2018-19540	An issue was discovered in JasPer 1.900.8, 1.900.9, 1.900.10, 1.900.11, 1.900.12, 1.900.13, 1.900.14, 1.900.15, 1.900.16, 1.900.17, 1.900.18, 1.900.19, 1.900.20, 1.900.21, 1.900.22, 1.900.23, 1.900.24, 1.900.25, 1.900.26, 1.900.27, 1.900.28, 1.900.29, 1.900.30, 1.900.31, 2.0.0, 2.0.1, 2.0.2, 2.0.3, 2.0.4, 2.0.5, 2.0.6, 2.0.7, 2.0.8, 2.0.9, 2.0.10, 2.0.11, 2.0.12, 2.0.13, 2.0.14, 2.0.15, 2.0.16. There is a heap-based buffer overflow of size 1 in the function jas_icctxtdesc_input in libjasper/base/jas_icc.c.

CVE ID	Description
CVE-2018-19541	An issue was discovered in JasPer 1.900.8, 1.900.9, 1.900.10, 1.900.11, 1.900.12, 1.900.13, 1.900.14, 1.900.15, 1.900.16, 1.900.17, 1.900.18, 1.900.19, 1.900.20, 1.900.21, 1.900.22, 1.900.23, 1.900.24, 1.900.25, 1.900.26, 1.900.27, 1.900.28, 1.900.29, 1.900.30, 1.900.31, 2.0.0, 2.0.1, 2.0.2, 2.0.3, 2.0.4, 2.0.5, 2.0.6, 2.0.7, 2.0.8, 2.0.9, 2.0.10, 2.0.11, 2.0.12, 2.0.13, 2.0.14, 2.0.15, 2.0.16. There is a heap-based buffer over-read of size 8 in the function <code>jas_image_depalettize</code> in <code>libjasper/base/jas_image.c</code> .
CVE-2018-19542	An issue was discovered in JasPer 2.0.14. There is a NULL pointer dereference in the function <code>jp2_decode</code> in <code>libjasper/jp2/jp2_dec.c</code> , leading to a denial of service.
CVE-2018-19543	An issue was discovered in JasPer 2.0.14. There is a heap-based buffer over-read of size 8 in the function <code>jp2_decode</code> in <code>libjasper/jp2/jp2_dec.c</code> .
CVE-2018-19876	cairo 1.16.0, in <code>cairo_ft_apply_variations()</code> in <code>cairo-ft-font.c</code> , would free memory using a free function incompatible with WebKit's <code>fastMalloc</code> , leading to an application crash with a "free(): invalid pointer" error.
CVE-2018-19932	An issue was discovered in the Binary File Descriptor (BFD) library (aka <code>libbfd</code>), as distributed in GNU Binutils through 2.31. There is an integer overflow and infinite loop caused by the <code>IS_CONTAINED_BY_LMA</code> macro in <code>elf.c</code> .
CVE-2018-20002	The <code>_bfd_generic_read_minisymbols</code> function in <code>syms.c</code> in the Binary File Descriptor (BFD) library (aka <code>libbfd</code>), as distributed in GNU Binutils 2.31, has a memory leak via a crafted ELF file, leading to a denial of service (memory consumption), as demonstrated by <code>nm</code> .
CVE-2018-20225	An issue was discovered in <code>pip</code> (all versions) because it installs the version with the highest version number, even if the user had intended to obtain a private package from a private index. This only affects use of the <code>--extra-index-url</code> option, and exploitation requires that the package does not already exist in the public index (and thus the attacker can put the package there with an arbitrary version number). NOTE: it has been reported that this is intended functionality and the user is responsible for using <code>--extra-index-url</code> securely
CVE-2018-20570	<code>jp2_encode</code> in <code>jp2/jp2_enc.c</code> in JasPer 2.0.14 has a heap-based buffer over-read.
CVE-2018-20622	JasPer 2.0.14 has a memory leak in <code>base/jas_malloc.c</code> in <code>libjasper.a</code> when <code>"--output-format jp2"</code> is used.
CVE-2018-20623	In GNU Binutils 2.31.1, there is a use-after-free in the error function in <code>elfcomm.c</code> when called from the <code>process_archive</code> function in <code>readelf.c</code> via a crafted ELF file.
CVE-2018-20651	A NULL pointer dereference was discovered in <code>elf_link_add_object_symbols</code> in <code>elflink.c</code> in the Binary File Descriptor (BFD) library (aka <code>libbfd</code>), as distributed in GNU Binutils 2.31.1. This occurs for a crafted ET_DYN with no program headers. A specially crafted ELF file allows remote attackers to cause a denial of service, as demonstrated by <code>ld</code> .
CVE-2018-20657	The <code>demangle_template</code> function in <code>cplus-dem.c</code> in GNU <code>libiberty</code> , as distributed in GNU Binutils 2.31.1, has a memory leak via a crafted string, leading to a denial of service (memory consumption), as demonstrated by <code>cxxfilt</code> , a related issue to CVE-2018-12698.
CVE-2018-20671	<code>load_specific_debug_section</code> in <code>objdump.c</code> in GNU Binutils through 2.31.1 contains an integer overflow vulnerability that can trigger a heap-based buffer overflow via a crafted section size.
CVE-2018-20673	The <code>demangle_template</code> function in <code>cplus-dem.c</code> in GNU <code>libiberty</code> , as distributed in GNU Binutils 2.31.1, contains an integer overflow vulnerability (for "Create an array for saving the template argument values") that can trigger a heap-based buffer overflow, as demonstrated by <code>nm</code> .
CVE-2018-20786	<code>libvterm</code> through 0+bzr726, as used in Vim and other products, mishandles certain out-of-memory conditions, leading to a denial of service (application crash), related to <code>screen.c</code> , <code>state.c</code> , and <code>vterm.c</code> .
CVE-2018-20796	In the GNU C Library (aka <code>glibc</code> or <code>libc6</code>) through 2.29, <code>check_dst_limits_calc_pos_1</code> in <code>posix/regexec.c</code> has Uncontrolled Recursion, as demonstrated by <code>'(\\227)(\\1\\1 t1\\2537)+'</code> in <code>grep</code> .
CVE-2018-20839	<code>systemd</code> 242 changes the VT1 mode upon a logout, which allows attackers to read cleartext passwords in certain circumstances, such as watching a shutdown, or using Ctrl-Alt-F1 and Ctrl-Alt-F2. This occurs because the KDGKBMODE (aka current keyboard mode) check is mishandled.
CVE-2018-5360	LibTIFF before 4.0.6 mishandles the reading of TIFF files, as demonstrated by a heap-based buffer over-read in the <code>ReadTIFFImage</code> function in <code>coders/tiff.c</code> in <code>GraphicsMagick</code> 1.3.27.
CVE-2018-5407	Simultaneous Multi-threading (SMT) in processors can enable local users to exploit software vulnerable to timing attacks via a side-channel timing attack on 'port contention'.

CVE ID	Description
CVE-2018-5709	An issue was discovered in MIT Kerberos 5 (aka krb5) through 1.16. There is a variable "dbentry->n_key_data" in kadmin/dbutil/dump.c that can store 16-bit data but unknowingly the developer has assigned a "u4" variable to it, which is for 32-bit data. An attacker can use this vulnerability to affect other artifacts of the database as we know that a Kerberos database dump file contains trusted data.
CVE-2018-5711	gd_gif_in.c in the GD Graphics Library (aka libgd), as used in PHP before 5.6.33, 7.0.x before 7.0.27, 7.1.x before 7.1.13, and 7.2.x before 7.2.1, has an integer signedness error that leads to an infinite loop via a crafted GIF file, as demonstrated by a call to the imagecreatefromgif or imagecreatefromstring PHP function. This is related to GetCode_ and gdImageCreateFromGifCtx.
CVE-2018-6829	cipher/elgamal.c in Libgcrypt through 1.8.2, when used to encrypt messages directly, improperly encodes plaintexts, which allows attackers to obtain sensitive information by reading ciphertext data (i.e., it does not have semantic security in face of a ciphertext-only attack). The Decisional Diffie-Hellman (DDH) assumption does not hold for Libgcrypt's ElGamal implementation.
CVE-2018-6872	The elf_parse_notes function in elf.c in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.30, allows remote attackers to cause a denial of service (out-of-bounds read and segmentation violation) via a note with a large alignment.
CVE-2018-6952	A double free exists in the another_hunk function in pch.c in GNU patch through 2.7.6.
CVE-2018-7273	In the Linux kernel through 4.15.4, the floppy driver reveals the addresses of kernel functions and global variables using printk calls within the function show_floppy in drivers/block/floppy.c. An attacker can read this information from dmesg and use the addresses to find the locations of kernel code and data and bypass kernel security protections such as KASLR.
CVE-2018-8043	The unimac_mdio_probe function in drivers/net/phy/mdio-bcm-unimac.c in the Linux kernel through 4.15.8 does not validate certain resource availability, which allows local users to cause a denial of service (NULL pointer dereference).
CVE-2018-9055	JasPer 2.0.14 allows denial of service via a reachable assertion in the function jpc_firstone in libjasper/jpc/jpc_math.c.
CVE-2018-9252	JasPer 2.0.14 allows denial of service via a reachable assertion in the function jpc_abstorelstepsize in libjasper/jpc/jpc_enc.c.
CVE-2019-1010022	GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may bypass stack guard protection. The component is: nptl. The attack vector is: Exploit stack buffer overflow vulnerability and use this bypass vulnerability to bypass stack guard. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat."
CVE-2019-1010023	GNU Libc current is affected by: Re-mapping current loaded library with malicious ELF file. The impact is: In worst case attacker may evaluate privileges. The component is: libld. The attack vector is: Attacker sends 2 ELF files to victim and asks to run ldd on it. ldd execute code. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat."
CVE-2019-1010024	GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may bypass ASLR using cache of thread stack and heap. The component is: glibc. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat."
CVE-2019-1010025	GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may guess the heap addresses of pthread_created thread. The component is: glibc. NOTE: the vendor's position is "ASLR bypass itself is not a vulnerability."
CVE-2019-11038	When using the gdImageCreateFromXbm() function in the GD Graphics Library (aka LibGD) 2.2.5, as used in the PHP GD extension in PHP versions 7.1.x below 7.1.30, 7.2.x below 7.2.19 and 7.3.x below 7.3.6, it is possible to supply data that will cause the function to use the value of uninitialized variable. This may lead to disclosing contents of the stack that has been left there by previous code.
CVE-2019-11358	jQuery before 3.4.0, as used in Drupal, Backdrop CMS, and other products, mishandles jQuery.extend(true, {}, ...) because of Object.prototype pollution. If an unsanitized source object contained an enumerable __proto__ property, it could extend the native Object.prototype.
CVE-2019-12380	**DISPUTED** An issue was discovered in the efi subsystem in the Linux kernel through 5.1.5. phys_efi_set_virtual_address_map in arch/x86/platform/efi/efi.c and efi_call_phys_prolog in arch/x86/platform/efi/efi_64.c mishandle memory allocation failures. NOTE: This id is disputed as not being an issue because "All the code touched by the referenced commit runs only at boot, before any user processes are started. Therefore, there is no possibility for an unprivileged user to control it."

CVE ID	Description
CVE-2019-12904	In Libgcrypt 1.8.4, the C implementation of AES is vulnerable to a flush-and-reload side-channel attack because physical addresses are available to other processes. (The C implementation is used on platforms where an assembly-language implementation is unavailable.) NOTE: the vendor's position is that the issue report cannot be validated because there is no description of an attack
CVE-2019-12972	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.32. There is a heap-based buffer over-read in <code>_bfd_doprnt</code> in <code>bfd.c</code> because <code>elf_object_p</code> in <code>elfcode.h</code> mishandles an <code>e_shstrndx</code> section of type <code>SHT_GROUP</code> by omitting a trailing <code>'\0'</code> character.
CVE-2019-13117	In <code>numbers.c</code> in <code>libxslt 1.1.33</code> , an <code>xsl:number</code> with certain format strings could lead to a uninitialized read in <code>xsltNumberFormatInsertNumbers</code> . This could allow an attacker to discern whether a byte on the stack contains the characters A, a, I, i, or 0, or any other character.
CVE-2019-13118	In <code>numbers.c</code> in <code>libxslt 1.1.33</code> , a type holding grouping characters of an <code>xsl:number</code> instruction was too narrow and an invalid character/length combination could be passed to <code>xsltNumberFormatDecimal</code> , leading to a read of uninitialized stack data.
CVE-2019-14250	An issue was discovered in GNU libiberty, as distributed in GNU Binutils 2.32. <code>simple_object_elf_match</code> in <code>simple-object-elf.c</code> does not check for a zero <code>shstrndx</code> value, leading to an integer overflow and resultant heap-based buffer overflow.
CVE-2019-14899	A vulnerability was discovered in Linux, FreeBSD, OpenBSD, MacOS, iOS, and Android that allows a malicious access point, or an adjacent user, to determine if a connected user is using a VPN, make positive inferences about the websites they are visiting, and determine the correct sequence and acknowledgement numbers in use, allowing the bad actor to inject data into the TCP stream. This provides everything that is needed for an attacker to hijack active connections inside the VPN tunnel.
CVE-2019-15213	An issue was discovered in the Linux kernel before 5.2.3. There is a use-after-free caused by a malicious USB device in the <code>drivers/media/usb/dvb-usb/dvb-usb-init.c</code> driver.
CVE-2019-15217	An issue was discovered in the Linux kernel before 5.2.3. There is a NULL pointer dereference caused by a malicious USB device in the <code>drivers/media/usb/zr364xx/zr364xx.c</code> driver.
CVE-2019-15218	An issue was discovered in the Linux kernel before 5.1.8. There is a NULL pointer dereference caused by a malicious USB device in the <code>drivers/media/usb/siano/smsusb.c</code> driver.
CVE-2019-15219	An issue was discovered in the Linux kernel before 5.1.8. There is a NULL pointer dereference caused by a malicious USB device in the <code>drivers/usb/misc/sisusbvga/sisusb.c</code> driver.
CVE-2019-15291	An issue was discovered in the Linux kernel through 5.2.9. There is a NULL pointer dereference caused by a malicious USB device in the <code>flexcop_usb_probe</code> function in the <code>drivers/media/usb/b2c2/flexcop-usb.c</code> driver.
CVE-2019-1547	Normally in OpenSSL EC groups always have a co-factor present and this is used in side channel resistant code paths. However, in some cases, it is possible to construct a group using explicit parameters (instead of using a named curve). In those cases it is possible that such a group does not have the cofactor present. This can occur even where all the parameters match a known named curve. If such a curve is used then OpenSSL falls back to non-side channel resistant code paths which may result in full key recovery during an ECDSA signature operation. In order to be vulnerable an attacker would have to have the ability to time the creation of a large number of signatures where explicit parameters with no co-factor present are in use by an application using libcrypto. For the avoidance of doubt libssl is not vulnerable because explicit parameters are never used. Fixed in OpenSSL 1.1.1d (Affected 1.1.1-1.1.1c). Fixed in OpenSSL 1.1.0l (Affected 1.1.0-1.1.0k). Fixed in OpenSSL 1.0.2t (Affected 1.0.2-1.0.2s).
CVE-2019-1551	There is an overflow bug in the x64_64 Montgomery squaring procedure used in exponentiation with 512-bit moduli. No EC algorithms are affected. Analysis suggests that attacks against 2-prime RSA1024, 3-prime RSA1536, and DSA1024 as a result of this defect would be very difficult to perform and are not believed likely. Attacks against DH512 are considered just feasible. However, for an attack the target would have to re-use the DH512 private key, which is not recommended anyway. Also applications directly using the low level API <code>BN_mod_exp</code> may be affected if they use <code>BN_FLG_CONSTTIME</code> . Fixed in OpenSSL 1.1.1e (Affected 1.1.1-1.1.1d). Fixed in OpenSSL 1.0.2u (Affected 1.0.2-1.0.2t).

CVE ID	Description
CVE-2019-1552	OpenSSL has internal defaults for a directory tree where it can find a configuration file as well as certificates used for verification in TLS. This directory is most commonly referred to as OPENSSLDIR, and is configurable with the --prefix / --openssldir configuration options. For OpenSSL versions 1.1.0 and 1.1.1, the mingw configuration targets assume that resulting programs and libraries are installed in a Unix-like environment and the default prefix for program installation as well as for OPENSSLDIR should be '/usr/local'. However, mingw programs are Windows programs, and as such, find themselves looking at sub-directories of 'C:/usr/local', which may be world writable, which enables untrusted users to modify OpenSSL's default configuration, insert CA certificates, modify (or even replace) existing engine modules, etc. For OpenSSL 1.0.2, '/usr/local/ssl' is used as default for OPENSSLDIR on all Unix and Windows targets, including Visual C builds. However, some build instructions for the diverse Windows targets on 1.0.2 encourage you to specify your own --prefix. OpenSSL versions 1.1.1, 1.1.0 and 1.0.2 are affected by this issue. Due to the limited scope of affected deployments this has been assessed as low severity and therefore we are not creating new releases at this time. Fixed in OpenSSL 1.1.1d (Affected 1.1.1-1.1.1c). Fixed in OpenSSL 1.1.0l (Affected 1.1.0-1.1.0k). Fixed in OpenSSL 1.0.2t (Affected 1.0.2-1.0.2s).
CVE-2019-1559	If an application encounters a fatal protocol error and then calls SSL_shutdown() twice (once to send a close_notify, and once to receive one) then OpenSSL can respond differently to the calling application if a 0 byte record is received with invalid padding compared to if a 0 byte record is received with an invalid MAC. If the application then behaves differently based on that in a way that is detectable to the remote peer, then this amounts to a padding oracle that could be used to decrypt data. In order for this to be exploitable "non-stitched" ciphersuites must be in use. Stitched ciphersuites are optimised implementations of certain commonly used ciphersuites. Also the application must call SSL_shutdown() twice even if a protocol error has occurred (applications should not do this but some do anyway). Fixed in OpenSSL 1.0.2r (Affected 1.0.2-1.0.2q).
CVE-2019-1563	In situations where an attacker receives automated notification of the success or failure of a decryption attempt an attacker, after sending a very large number of messages to be decrypted, can recover a CMS/ PKCS7 transported encryption key or decrypt any RSA encrypted message that was encrypted with the public RSA key, using a Bleichenbacher padding oracle attack. Applications are not affected if they use a certificate together with the private RSA key to the CMS_decrypt or PKCS7_decrypt functions to select the correct recipient info to decrypt. Fixed in OpenSSL 1.1.1d (Affected 1.1.1-1.1.1c). Fixed in OpenSSL 1.1.0l (Affected 1.1.0-1.1.0k). Fixed in OpenSSL 1.0.2t (Affected 1.0.2-1.0.2s).
CVE-2019-15794	Overlayfs in the Linux kernel and shifts, a non-upstream patch to the Linux kernel included in the Ubuntu 5.0 and 5.3 kernel series, both replace vma->vm_file in their mmap handlers. On error the original value is not restored, and the reference is put for the file to which vm_file points. On upstream kernels this is not an issue, as no callers dereference vm_file following after call_mmap() returns an error. However, the aufs patches change mmap_region() to replace the fput() using a local variable with vma_fput(), which will fput() vm_file, leading to a refcount underflow.
CVE-2019-15807	In the Linux kernel before 5.1.13, there is a memory leak in drivers/scsi/libsas/sas_expander.c when SAS expander discovery fails. This will cause a BUG and denial of service.
CVE-2019-16089	An issue was discovered in the Linux kernel through 5.2.13. nbd_genl_status in drivers/block/nbd.c does not check the nla_nest_start_noflag return value.
CVE-2019-16229	drivers/gpu/drm/amd/amdkfd/kfd_interrupt.c in the Linux kernel 5.2.14 does not check the alloc_workqueue return value, leading to a NULL pointer dereference. NOTE: The security community disputes this issues as not being serious enough to be deserving a CVE id
CVE-2019-16230	drivers/gpu/drm/radeon/radeon_display.c in the Linux kernel 5.2.14 does not check the alloc_workqueue return value, leading to a NULL pointer dereference. NOTE: A third-party software maintainer states that the work queue allocation is happening during device initialization, which for a graphics card occurs during boot. It is not attacker controllable and OOM at that time is highly unlikely
CVE-2019-17113	In libopenmpt before 0.3.19 and 0.4.x before 0.4.9, ModPlug_InstrumentName and ModPlug_SampleName in libopenmpt_modplug.c do not restrict the lengths of libmodplug output-buffer strings in the C API, leading to a buffer overflow.
CVE-2019-17567	Apache HTTP Server versions 2.4.6 to 2.4.46 mod_proxy_wstunnel configured on an URL that is not necessarily Upgraded by the origin server was tunneling the whole connection regardless, thus allowing for subsequent requests on the same connection to pass through with no HTTP validation, authentication or authorization possibly configured.
CVE-2019-18806	A memory leak in the ql_alloc_large_buffers() function in drivers/net/ethernet/qlogic/qla3xxx.c in the Linux kernel before 5.3.5 allows local users to cause a denial of service (memory consumption) by triggering pci_dma_mapping_error() failures, aka CID-1acb8f2a7a9f.

CVE ID	Description
CVE-2019-19039	<code>__btrfs_free_extent</code> in <code>fs/btrfs/extent-tree.c</code> in the Linux kernel through 5.3.12 calls <code>btrfs_print_leaf</code> in a certain <code>ENOENT</code> case, which allows local users to obtain potentially sensitive information about register values via the <code>dmesg</code> program. NOTE: The BTRFS development team disputes this issues as not being a vulnerability because “1) The kernel provide facilities to restrict access to <code>dmesg</code> - <code>dmesg_restrict=1</code> <code>sysctl</code> option. So it's really up to the system administrator to judge whether <code>dmesg</code> access shall be disallowed or not. 2) <code>WARN/WARN_ON</code> are widely used macros in the linux kernel. If this CVE is considered valid this would mean there are literally thousands CVE lurking in the kernel - something which clearly is not the case.
CVE-2019-19054	A memory leak in the <code>cx23888_ir_probe()</code> function in <code>drivers/media/pci/cx23885/cx23888-ir.c</code> in the Linux kernel through 5.3.11 allows attackers to cause a denial of service (memory consumption) by triggering <code>kfifo_alloc()</code> failures, aka CID-a7b2df76b42b.
CVE-2019-19066	A memory leak in the <code>bfa_dm_get_stats()</code> function in <code>drivers/scsi/bfa/bfa_attr.c</code> in the Linux kernel through 5.3.11 allows attackers to cause a denial of service (memory consumption) by triggering <code>bfa_port_get_stats()</code> failures, aka CID-0e62395da2bd.
CVE-2019-19076	A memory leak in the <code>nfp_abm_u32_knode_replace()</code> function in <code>drivers/net/ethernet/netronome/nfp/abm/cls.c</code> in the Linux kernel before 5.3.6 allows attackers to cause a denial of service (memory consumption), aka CID-78beef629fd9. NOTE: This has been argued as not a valid vulnerability. The upstream commit 78beef629fd9 was reverted
CVE-2019-19080	Four memory leaks in the <code>nfp_flower_spawn_phy_reprs()</code> function in <code>drivers/net/ethernet/netronome/nfp/flower/main.c</code> in the Linux kernel before 5.3.4 allow attackers to cause a denial of service (memory consumption), aka CID-8572cea1461a.
CVE-2019-19081	A memory leak in the <code>nfp_flower_spawn_vnic_reprs()</code> function in <code>drivers/net/ethernet/netronome/nfp/flower/main.c</code> in the Linux kernel before 5.3.4 allows attackers to cause a denial of service (memory consumption), aka CID-8ce39eb5a67a.
CVE-2019-19082	Memory leaks in <code>*create_resource_pool()</code> functions under <code>drivers/gpu/drm/amd/display/dc</code> in the Linux kernel through 5.3.11 allow attackers to cause a denial of service (memory consumption). This affects the <code>dce120_create_resource_pool()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce120/dce120_resource.c</code> , the <code>dce110_create_resource_pool()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce110/dce110_resource.c</code> , the <code>dce100_create_resource_pool()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce100/dce100_resource.c</code> , the <code>dcn10_create_resource_pool()</code> function in <code>drivers/gpu/drm/amd/display/dc/dcn10/dcn10_resource.c</code> , and the <code>dce112_create_resource_pool()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce112/dce112_resource.c</code> , aka CID-104c307147ad.
CVE-2019-19083	Memory leaks in <code>*clock_source_create()</code> functions under <code>drivers/gpu/drm/amd/display/dc</code> in the Linux kernel before 5.3.8 allow attackers to cause a denial of service (memory consumption). This affects the <code>dce112_clock_source_create()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce112/dce112_resource.c</code> , the <code>dce100_clock_source_create()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce100/dce100_resource.c</code> , the <code>dcn10_clock_source_create()</code> function in <code>drivers/gpu/drm/amd/display/dc/dcn10/dcn10_resource.c</code> , the <code>dcn20_clock_source_create()</code> function in <code>drivers/gpu/drm/amd/display/dc/dcn20/dcn20_resource.c</code> , the <code>dce120_clock_source_create()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce120/dce120_resource.c</code> , the <code>dce110_clock_source_create()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce110/dce110_resource.c</code> , and the <code>dce80_clock_source_create()</code> function in <code>drivers/gpu/drm/amd/display/dc/dce80/dce80_resource.c</code> , aka CID-055e547478a1.
CVE-2019-19244	<code>sqlite3Select</code> in <code>select.c</code> in SQLite 3.30.1 allows a crash if a sub-select uses both <code>DISTINCT</code> and window functions, and also has certain <code>ORDER BY</code> usage.
CVE-2019-19378	In the Linux kernel 5.0.21, mounting a crafted <code>btrfs</code> filesystem image can lead to slab-out-of-bounds write access in <code>index_rbio_pages</code> in <code>fs/btrfs/raid56.c</code> .
CVE-2019-19462	<code>relay_open</code> in <code>kernel/relay.c</code> in the Linux kernel through 5.4.1 allows local users to cause a denial of service (such as relay blockage) by triggering a <code>NULL alloc_percpu</code> result.
CVE-2019-19530	In the Linux kernel before 5.2.10, there is a use-after-free bug that can be caused by a malicious USB device in the <code>drivers/usb/class/cdc-acm.c</code> driver, aka CID-c52873e5a1ef.
CVE-2019-19814	In the Linux kernel 5.0.21, mounting a crafted <code>f2fs</code> filesystem image can cause <code>__remove_dirty_segment</code> slab-out-of-bounds write access because an array is bounded by the number of dirty types (8) but the array index can exceed this.
CVE-2019-19965	In the Linux kernel through 5.4.6, there is a <code>NULL</code> pointer dereference in <code>drivers/scsi/libsas/sas_discover.c</code> because of mishandling of port disconnection during discovery, related to a PHY down race condition, aka CID-f70267f379b5.

CVE ID	Description
CVE-2019-20095	mwifiex_tm_cmd in drivers/net/wireless/marvell/mwifiex/cfg80211.c in the Linux kernel before 5.1.6 has some error-handling cases that did not free allocated hostcmd memory, aka CID-003b686ace82. This will cause a memory leak and denial of service.
CVE-2019-20426	In the Lustre file system before 2.12.3, the ptlrpc module has an out-of-bounds access and panic due to the lack of validation for specific fields of packets sent by a client. In the function ldlm_cancel_hpreq_check, there is no lock_count bounds check.
CVE-2019-20633	GNU patch through 2.7.6 contains a free(p_line[p_end]) Double Free vulnerability in the function another_hunk in pch.c that can cause a denial of service via a crafted patch file. NOTE: this issue exists because of an incomplete fix for CVE-2018-6952.
CVE-2019-20794	An issue was discovered in the Linux kernel 4.18 through 5.6.11 when unprivileged user namespaces are allowed. A user can create their own PID namespace, and mount a FUSE filesystem. Upon interaction with this FUSE filesystem, if the userspace component is terminated via a kill of the PID namespace's pid 1, it will result in a hung task, and resources being permanently locked up until system reboot. This can result in resource exhaustion.
CVE-2019-20838	libpcre in PCRE before 8.43 allows a subject buffer over-read in JIT when UTF is disabled, and \X or \R has more than one fixed quantifier, a related issue to CVE-2019-20454.
CVE-2019-2201	In generate_jsimd_ycc_rgb_convert_neon of jsimd_arm64_neon.S, there is a possible out of bounds write due to a missing bounds check. This could lead to remote code execution in an unprivileged process with no additional execution privileges needed. User interaction is needed for exploitation. Product: Android Versions: Android-8.0 Android-8.1 Android-9 Android-10 Android ID: A-120551338
CVE-2019-25160	In the Linux kernel, the following vulnerability has been resolved: netlabel: fix out-of-bounds memory accesses There are two array out-of-bounds memory accesses, one in cipso_v4_map_lvl_valid(), the other in netlbl_bitmap_walk(). Both errors are embarrassingly simple, and the fixes are straightforward. As a FYI for anyone backporting this patch to kernels prior to v4.8, you'll want to apply the netlbl_bitmap_walk() patch to cipso_v4_bitmap_walk() as netlbl_bitmap_walk() doesn't exist before Linux v4.8.
CVE-2019-6110	In OpenSSH 7.9, due to accepting and displaying arbitrary stderr output from the server, a malicious server (or Man-in-The-Middle attacker) can manipulate the client output, for example to use ANSI control codes to hide additional files being transferred.
CVE-2019-6128	The TIFFFdOpen function in tif_unix.c in LibTIFF 4.0.10 has a memory leak, as demonstrated by pal2rgb.
CVE-2019-6461	An issue was discovered in cairo 1.16.0. There is an assertion problem in the function _cairo_arc_in_direction in the file cairo-arc.c.
CVE-2019-6462	An issue was discovered in cairo 1.16.0. There is an infinite loop in the function _arc_error_normalized in the file cairo-arc.c, related to _arc_max_angle_for_tolerance_normalized.
CVE-2019-6988	An issue was discovered in OpenJPEG 2.3.0. It allows remote attackers to cause a denial of service (attempted excessive memory allocation) in opj_calloc in openjp2/opj_malloc.c, when called from opj_tcd_init_tile in openjp2/tcd.c, as demonstrated by the 64-bit opj_decompress.
CVE-2019-7317	png_image_free in png.c in libpng 1.6.x before 1.6.37 has a use-after-free because png_image_free_function is called under png_safe_execute.
CVE-2019-8457	SQLite3 from 3.6.0 to and including 3.27.2 is vulnerable to heap out-of-bound read in the rtreenode() function when handling invalid rtree tables.
CVE-2019-8905	do_core_note in readelf.c in libmagic.a in file 5.35 has a stack-based buffer over-read, related to file_printable, a different vulnerability than CVE-2018-10360.
CVE-2019-8906	do_core_note in readelf.c in libmagic.a in file 5.35 has an out-of-bounds read because memcpy is misused.
CVE-2019-9071	An issue was discovered in GNU libiberty, as distributed in GNU Binutils 2.32. It is a stack consumption issue in d_count_templates_scopes in cp-demangle.c after many recursive calls.
CVE-2019-9075	An issue was discovered in the Binary File Descriptor (BFD) library (aka libbfd), as distributed in GNU Binutils 2.32. It is a heap-based buffer overflow in _bfd_archive_64_bit_slurp_armap in archive64.c.
CVE-2019-9077	An issue was discovered in GNU Binutils 2.32. It is a heap-based buffer overflow in process_mips_specific in readelf.c via a malformed MIPS option section.

CVE ID	Description
CVE-2019-9192	In the GNU C Library (aka glibc or libc6) through 2.29, <code>check_dst_limits_calc_pos_1</code> in <code>posix/regexec.c</code> has Uncontrolled Recursion, as demonstrated by <code>'(\)(\\1\\1)*'</code> in <code>grep</code> , a different issue than CVE-2018-20796. NOTE: the software maintainer disputes that this is a vulnerability because the behavior occurs only with a crafted pattern
CVE-2019-9674	<code>Lib/zipfile.py</code> in Python through 3.7.2 allows remote attackers to cause a denial of service (resource consumption) via a ZIP bomb.
CVE-2019-9923	<code>pax_decode_header</code> in <code>sparse.c</code> in GNU Tar before 1.32 had a NULL pointer dereference when parsing certain archives that have malformed extended headers.
CVE-2019-9936	In SQLite 3.27.2, running <code>fts5</code> prefix queries inside a transaction could trigger a heap-based buffer over-read in <code>fts5HashEntrySort</code> in <code>sqlite3.c</code> , which may lead to an information leak. This is related to <code>ext/fts5/fts5_hash.c</code> .
CVE-2019-9937	In SQLite 3.27.2, interleaving reads and writes in a single transaction with an <code>fts5</code> virtual table will lead to a NULL Pointer Dereference in <code>fts5ChunkIterate</code> in <code>sqlite3.c</code> . This is related to <code>ext/fts5/fts5_hash.c</code> and <code>ext/fts5/fts5_index.c</code> .
CVE-2020-0499	In <code>FLAC__bitreader_read_rice_signed_block</code> of <code>bitreader.c</code> , there is a possible out of bounds read due to a heap buffer overflow. This could lead to remote information disclosure with no additional execution privileges needed. User interaction is needed for exploitation. Product: Android Versions: Android-11 Android ID: A-156076070
CVE-2020-10135	Legacy pairing and secure-connections pairing authentication in Bluetooth BR/EDR Core Specification v5.2 and earlier may allow an unauthenticated user to complete authentication without pairing credentials via adjacent access. An unauthenticated, adjacent attacker could impersonate a Bluetooth BR/EDR master or slave to pair with a previously paired remote device to successfully complete the authentication procedure without knowing the link key.
CVE-2020-10663	The JSON gem through 2.2.0 for Ruby, as used in Ruby 2.4 through 2.4.9, 2.5 through 2.5.7, and 2.6 through 2.6.5, has an Unsafe Object Creation Vulnerability. This is quite similar to CVE-2013-0269, but does not rely on poor garbage-collection behavior within Ruby. Specifically, use of JSON parsing methods can lead to creation of a malicious object within the interpreter, with adverse effects that are application-dependent.
CVE-2020-10693	A flaw was found in Hibernate Validator version 6.1.2.Final. A bug in the message interpolation processor enables invalid EL expressions to be evaluated as if they were valid. This flaw allows attackers to bypass input sanitation (escaping, stripping) controls that developers may have put in place when handling user-controlled data in error messages.
CVE-2020-10781	A flaw was found in the Linux Kernel before 5.8-rc6 in the ZRAM kernel module, where a user with a local account and the ability to read the <code>/sys/class/zram-control/hot_add</code> file can create ZRAM device nodes in the <code>/dev/</code> directory. This read allocates kernel memory and is not accounted for a user that triggers the creation of that ZRAM device. With this vulnerability, continually reading the device may consume a large amount of system memory and cause the Out-of-Memory (OOM) killer to activate and terminate random userspace processes, possibly making the system inoperable.
CVE-2020-11022	In jQuery versions greater than or equal to 1.2 and before 3.5.0, passing HTML from untrusted sources - even after sanitizing it - to one of jQuery's DOM manipulation methods (i.e. <code>.html()</code> , <code>.append()</code> , and others) may execute untrusted code. This problem is patched in jQuery 3.5.0.
CVE-2020-11023	In jQuery versions greater than or equal to 1.0.3 and before 3.5.0, passing HTML containing <code><option></code> elements from untrusted sources - even after sanitizing it - to one of jQuery's DOM manipulation methods (i.e. <code>.html()</code> , <code>.append()</code> , and others) may execute untrusted code. This problem is patched in jQuery 3.5.0.
CVE-2020-11494	An issue was discovered in <code>slc_bump</code> in <code>drivers/net/can/slcanc.c</code> in the Linux kernel 3.16 through 5.6.2. It allows attackers to read uninitialized <code>can_frame</code> data, potentially containing sensitive information from kernel stack memory, if the configuration lacks <code>CONFIG_INIT_STACK_ALL</code> , aka CID-b9258a2cece4.
CVE-2020-11609	An issue was discovered in the <code>stv06xx</code> subsystem in the Linux kernel before 5.6.1. <code>drivers/media/usb/gspca/stv06xx/stv06xx.c</code> and <code>drivers/media/usb/gspca/stv06xx/stv06xx_pb0100.c</code> mishandle invalid descriptors, as demonstrated by a NULL pointer dereference, aka CID-485b06aadb93.
CVE-2020-12413	The Raccoon attack is a timing attack on DHE ciphersuites inherit in the TLS specification. To mitigate this vulnerability, Firefox disabled support for DHE ciphersuites.
CVE-2020-12480	In Play Framework 2.6.0 through 2.8.1, the CSRF filter can be bypassed by making CORS simple requests with content types that contain parameters that can't be parsed.

CVE ID	Description
CVE-2020-12656	gss_mech_free in net/sunrpc/auth_gss/gss_mech_switch.c in the rpcsec_gss_krb5 implementation in the Linux kernel through 5.6.10 lacks certain domain_release calls, leading to a memory leak. Note: This was disputed with the assertion that the issue does not grant any access not already available. It is a problem that on unloading a specific kernel module some memory is leaked, but loading kernel modules is a privileged operation. A user could also write a kernel module to consume any amount of memory they like and load that replicating the effect of this bug
CVE-2020-12768	An issue was discovered in the Linux kernel before 5.6. svm_cpu_uninit in arch/x86/kvm/svm.c has a memory leak, aka CID-d80b64ff297e. NOTE: third parties dispute this issue because it's a one-time leak at the boot, the size is negligible, and it can't be triggered at will
CVE-2020-12769	An issue was discovered in the Linux kernel before 5.4.17. drivers/spi/spi-dw.c allows attackers to cause a panic via concurrent calls to dw_spi_irq and dw_spi_transfer_one, aka CID-19b61392c5a8.
CVE-2020-13529	An exploitable denial-of-service vulnerability exists in Systemd 245. A specially crafted DHCP FORCERENEW packet can cause a server running the DHCP client to be vulnerable to a DHCP ACK spoofing attack. An attacker can forge a pair of FORCERENEW and DCHP ACK packets to reconfigure the server.
CVE-2020-13844	Arm Armv8-A core implementations utilizing speculative execution past unconditional changes in control flow may allow unauthorized disclosure of information to an attacker with local user access via a side-channel analysis, aka "straight-line speculation."
CVE-2020-13956	Apache HttpClient versions prior to version 4.5.13 and 5.0.3 can misinterpret malformed authority component in request URIs passed to the library as java.net.URI object and pick the wrong target host for request execution.
CVE-2020-14304	A memory disclosure flaw was found in the Linux kernel's ethernet drivers, in the way it read data from the EEPROM of the device. This flaw allows a local user to read uninitialized values from the kernel memory. The highest threat from this vulnerability is to confidentiality.
CVE-2020-14356	A flaw null pointer dereference in the Linux kernel cgroupv2 subsystem in versions before 5.7.10 was found in the way when reboot the system. A local user could use this flaw to crash the system or escalate their privileges on the system.
CVE-2020-14390	A flaw was found in the Linux kernel in versions before 5.9-rc6. When changing screen size, an out-of-bounds memory write can occur leading to memory corruption or a denial of service. Due to the nature of the flaw, privilege escalation cannot be fully ruled out.
CVE-2020-14416	In the Linux kernel before 5.4.16, a race condition in tty->disc_data handling in the slip and slcan line discipline could lead to a use-after-free, aka CID-0ace17d56824. This affects drivers/net/slip/slip.c and drivers/net/can/slcan.c.
CVE-2020-15522	Bouncy Castle BC Java before 1.66, BC C# .NET before 1.8.7, BC-FJA before 1.0.1.2, 1.0.2.1, and BC-FNA before 1.0.1.1 have a timing issue within the EC math library that can expose information about the private key when an attacker is able to observe timing information for the generation of multiple deterministic ECDSA signatures.
CVE-2020-17049	A security feature bypass vulnerability exists in the way Key Distribution Center (KDC) determines if a service ticket can be used for delegation via Kerberos Constrained Delegation (KCD). To exploit the vulnerability, a compromised service that is configured to use KCD could tamper with a service ticket that is not valid for delegation to force the KDC to accept it. The update addresses this vulnerability by changing how the KDC validates service tickets used with KCD.
CVE-2020-18768	There exists one heap buffer overflow in _TIFFmemcpy in tif_unix.c in libtiff 4.0.10, which allows an attacker to cause a denial-of-service through a crafted tiff file.
CVE-2020-19185	Buffer Overflow vulnerability in one_one_mapping function in progs/dump_entry.c:1373 in ncurses 6.1 allows remote attackers to cause a denial of service via crafted command.
CVE-2020-19186	Buffer Overflow vulnerability in _nc_find_entry function in tinfo/comp_hash.c:66 in ncurses 6.1 allows remote attackers to cause a denial of service via crafted command.
CVE-2020-19187	Buffer Overflow vulnerability in fmt_entry function in progs/dump_entry.c:1100 in ncurses 6.1 allows remote attackers to cause a denial of service via crafted command.
CVE-2020-19188	Buffer Overflow vulnerability in fmt_entry function in progs/dump_entry.c:1116 in ncurses 6.1 allows remote attackers to cause a denial of service via crafted command.
CVE-2020-19189	Buffer Overflow vulnerability in postprocess_terminfo function in tinfo/parse_entry.c:997 in ncurses 6.1 allows remote attackers to cause a denial of service via crafted command.

CVE ID	Description
CVE-2020-19190	Buffer Overflow vulnerability in <code>_nc_find_entry</code> in <code>tinfo/comp_hash.c:70</code> in <code>ncurses 6.1</code> allows remote attackers to cause a denial of service via crafted command.
CVE-2020-1968	The Raccoon attack exploits a flaw in the TLS specification which can lead to an attacker being able to compute the pre-master secret in connections which have used a Diffie-Hellman (DH) based ciphersuite. In such a case this would result in the attacker being able to eavesdrop on all encrypted communications sent over that TLS connection. The attack can only be exploited if an implementation re-uses a DH secret across multiple TLS connections. Note that this issue only impacts DH ciphersuites and not ECDH ciphersuites. This issue affects OpenSSL 1.0.2 which is out of support and no longer receiving public updates. OpenSSL 1.1.1 is not vulnerable to this issue. Fixed in OpenSSL 1.0.2w (Affected 1.0.2-1.0.2v).
CVE-2020-1971	The X.509 GeneralName type is a generic type for representing different types of names. One of those name types is known as EDIPartyName. OpenSSL provides a function <code>GENERAL_NAME_cmp</code> which compares different instances of a <code>GENERAL_NAME</code> to see if they are equal or not. This function behaves incorrectly when both <code>GENERAL_NAME</code> s contain an <code>EDIPARTYNAME</code> . A NULL pointer dereference and a crash may occur leading to a possible denial of service attack. OpenSSL itself uses the <code>GENERAL_NAME_cmp</code> function for two purposes: 1) Comparing CRL distribution point names between an available CRL and a CRL distribution point embedded in an X509 certificate 2) When verifying that a timestamp response token signer matches the timestamp authority name (exposed via the API functions <code>TS_RESP_verify_response</code> and <code>TS_RESP_verify_token</code>) If an attacker can control both items being compared then that attacker could trigger a crash. For example if the attacker can trick a client or server into checking a malicious certificate against a malicious CRL then this may occur. Note that some applications automatically download CRLs based on a URL embedded in a certificate. This checking happens prior to the signatures on the certificate and CRL being verified. OpenSSL's <code>s_server</code> , <code>s_client</code> and <code>verify</code> tools have support for the <code>"-crl_download"</code> option which implements automatic CRL downloading and this attack has been demonstrated to work against those tools. Note that an unrelated bug means that affected versions of OpenSSL cannot parse or construct correct encodings of <code>EDIPARTYNAME</code> . However it is possible to construct a malformed <code>EDIPARTYNAME</code> that OpenSSL's parser will accept and hence trigger this attack. All OpenSSL 1.1.1 and 1.0.2 versions are affected by this issue. Other OpenSSL releases are out of support and have not been checked. Fixed in OpenSSL 1.1.1i (Affected 1.1.1-1.1.1h). Fixed in OpenSSL 1.0.2x (Affected 1.0.2-1.0.2w).
CVE-2020-20703	Buffer Overflow vulnerability in <code>VIM v.8.1.2135</code> allows a remote attacker to execute arbitrary code via the operand parameter.
CVE-2020-21469	An issue was discovered in PostgreSQL 12.2 allows attackers to cause a denial of service via repeatedly sending <code>SIGHUP</code> signals. NOTE: this is disputed by the vendor because untrusted users cannot send <code>SIGHUP</code> signals; they can only be sent by a PostgreSQL superuser, a user with <code>pg_reload_conf</code> access, or a user with sufficient privileges at the OS level (the postgres account or the root account).
CVE-2020-21514	An issue was discovered in Fluent Fluentd v.1.8.0 and Fluent-ui v.1.2.2 allows attackers to gain escalated privileges and execute arbitrary code due to a default password.
CVE-2020-21674	Heap-based buffer overflow in <code>archive_string_append_from_wcs()</code> (<code>archive_string.c</code>) in <code>libarchive-3.4.1dev</code> allows remote attackers to cause a denial of service (out-of-bounds write in heap memory resulting into a crash) via a crafted archive file. NOTE: this only affects users who downloaded the development code from GitHub. Users of the product's official releases are unaffected.
CVE-2020-25639	A NULL pointer dereference flaw was found in the Linux kernel's GPU Nouveau driver functionality in versions prior to 5.12-rc1 in the way the user calls <code>ioctl DRM_IOCTL_NOUVEAU_CHANNEL_ALLOC</code> . This flaw allows a local user to crash the system.
CVE-2020-25645	A flaw was found in the Linux kernel in versions before 5.9-rc7. Traffic between two Geneve endpoints may be unencrypted when IPsec is configured to encrypt traffic for the specific UDP port used by the GENEVE tunnel allowing anyone between the two endpoints to read the traffic unencrypted. The main threat from this vulnerability is to data confidentiality.
CVE-2020-25658	It was found that <code>python-rsa</code> is vulnerable to Bleichenbacher timing attacks. An attacker can use this flaw via the RSA decryption API to decrypt parts of the cipher text encrypted with RSA.
CVE-2020-26244	Python oic is a Python OpenID Connect implementation. In Python oic before version 1.2.1, there are several related cryptographic issues affecting client implementations that use the library. The issues are: 1) The <code>IdToken</code> signature algorithm was not checked automatically, but only if the expected algorithm was passed in as a kwarg. 2) JWA <code>'none'</code> algorithm was allowed in all flows. 3) <code>oic.consumer.Consumer.parse_authz</code> returns an unverified <code>IdToken</code> . The verification of the token was left to the discretion of the implementator. 4) <code>iat</code> claim was not checked for sanity (i.e. it could be in the future). These issues are patched in version 1.2.1.

CVE ID	Description
CVE-2020-26558	Bluetooth LE and BR/EDR secure pairing in Bluetooth Core Specification 2.1 through 5.2 may permit a nearby man-in-the-middle attacker to identify the Passkey used during pairing (in the Passkey authentication procedure) by reflection of the public key and the authentication evidence of the initiating device, potentially permitting this attacker to complete authenticated pairing with the responding device using the correct Passkey for the pairing session. The attack methodology determines the Passkey value one bit at a time.
CVE-2020-26939	In Legion of the Bouncy Castle BC before 1.61 and BC-FJA before 1.0.1.2, attackers can obtain sensitive information about a private exponent because of Observable Differences in Behavior to Error Inputs. This occurs in org.bouncycastle.crypto.encodings.OAEP_Encoding. Sending invalid ciphertext that decrypts to a short payload in the OAEP Decoder could result in the throwing of an early exception, potentially leaking some information about the private exponent of the RSA private key performing the encryption.
CVE-2020-27170	An issue was discovered in the Linux kernel before 5.11.8. kernel/bpf/verifier.c performs undesirable out-of-bounds speculation on pointer arithmetic, leading to side-channel attacks that defeat Spectre mitigations and obtain sensitive information from kernel memory, aka CID-f232326f6966. This affects pointer types that do not define a ptr_limit.
CVE-2020-27171	An issue was discovered in the Linux kernel before 5.11.8. kernel/bpf/verifier.c has an off-by-one error (with a resultant integer underflow) affecting out-of-bounds speculation on pointer arithmetic, leading to side-channel attacks that defeat Spectre mitigations and obtain sensitive information from kernel memory, aka CID-10d2bb2e6b1d.
CVE-2020-28097	The vgacon subsystem in the Linux kernel before 5.8.10 mishandles software scrollbar. There is a vgacon_scrolldelta out-of-bounds read, aka CID-973c096f6a85.
CVE-2020-29374	An issue was discovered in the Linux kernel before 5.7.3, related to mm/gup.c and mm/huge_memory.c. The get_user_pages (aka gup) implementation, when used for a copy-on-write page, does not properly consider the semantics of read operations and therefore can grant unintended write access, aka CID-17839856fd58.
CVE-2020-29582	In JetBrains Kotlin before 1.4.21, a vulnerable Java API was used for temporary file and folder creation. An attacker was able to read data from such files and list directories due to insecure permissions.
CVE-2020-35493	A flaw exists in binutils in bfd/pef.c. An attacker who is able to submit a crafted PEF file to be parsed by objdump could cause a heap buffer overflow -> out-of-bounds read that could lead to an impact to application availability. This flaw affects binutils versions prior to 2.34.
CVE-2020-35494	There's a flaw in binutils /opcodes/tic4x-dis.c. An attacker who is able to submit a crafted input file to be processed by binutils could cause usage of uninitialized memory. The highest threat is to application availability with a lower threat to data confidentiality. This flaw affects binutils versions prior to 2.34.
CVE-2020-35495	There's a flaw in binutils /bfd/pef.c. An attacker who is able to submit a crafted input file to be processed by the objdump program could cause a null pointer dereference. The greatest threat from this flaw is to application availability. This flaw affects binutils versions prior to 2.34.
CVE-2020-35496	There's a flaw in bfd_pef_scan_start_address() of bfd/pef.c in binutils which could allow an attacker who is able to submit a crafted file to be processed by objdump to cause a NULL pointer dereference. The greatest threat of this flaw is to application availability. This flaw affects binutils versions prior to 2.34.
CVE-2020-35501	A flaw was found in the Linux kernels implementation of audit rules, where a syscall can unexpectedly not be correctly not be logged by the audit subsystem
CVE-2020-35507	There's a flaw in bfd_pef_parse_function_stubs of bfd/pef.c in binutils in versions prior to 2.34 which could allow an attacker who is able to submit a crafted file to be processed by objdump to cause a NULL pointer dereference. The greatest threat of this flaw is to application availability.
CVE-2020-35512	A use-after-free flaw was found in D-Bus Development branch <= 1.13.16, dbus-1.12.x stable branch <= 1.12.18, and dbus-1.10.x and older branches <= 1.10.30 when a system has multiple usernames sharing the same UID. When a set of policy rules references these usernames, D-Bus may free some memory in the heap, which is still used by data structures necessary for the other usernames sharing the UID, possibly leading to a crash or other undefined behaviors
CVE-2020-35538	A crafted input file could cause a null pointer dereference in jcopy_sample_rows() when processed by libjpeg-turbo.
CVE-2020-36311	An issue was discovered in the Linux kernel before 5.9. arch/x86/kvm/svm/sev.c allows attackers to cause a denial of service (soft lockup) by triggering destruction of a large SEV VM (which requires unregistering many encrypted regions), aka CID-7be74942f184.

CVE ID	Description
CVE-2020-36518	jackson-databind before 2.13.0 allows a Java StackOverflow exception and denial of service via a large depth of nested objects.
CVE-2020-36789	In the Linux kernel, the following vulnerability has been resolved: can: dev: can_get_echo_skb(): prevent call to kfree_skb() in hard IRQ context If a driver calls can_get_echo_skb() during a hardware IRQ (which is often, but not always, the case), the 'WARN_ON(in_irq)' in net/core/skbuff.c#skb_release_head_state() might be triggered, under network congestion circumstances, together with the potential risk of a NULL pointer dereference. The root cause of this issue is the call to kfree_skb() instead of dev_kfree_skb_irq() in net/core/dev.c#enqueue_to_backlog(). This patch prevents the skb to be freed within the call to netif_rx() by incrementing its reference count with skb_get(). The skb is finally freed by one of the in-irq-context safe functions: dev_consume_skb_any() or dev_kfree_skb_any(). The "any" version is used because some drivers might call can_get_echo_skb() in a normal context. The reason for this issue to occur is that initially, in the core network stack, loopback skb were not supposed to be received in hardware IRQ context. The CAN stack is an exception. This bug was previously reported back in 2017 in [1] but the proposed patch never got accepted. While [1] directly modifies net/core/dev.c, we try to propose here a smoother modification local to CAN network stack (the assumption behind is that only CAN devices are affected by this issue). [1] http://lore.kernel.org/r/57a3ffb6-3309-3ad5-5a34-e93c3fe3614d@cetitec.com
CVE-2020-36790	In the Linux kernel, the following vulnerability has been resolved: nvmet: fix a memory leak We forgot to free new_model_number
CVE-2020-36791	In the Linux kernel, the following vulnerability has been resolved: net_sched: keep alloc_hash updated after hash allocation In commit 599be01ee567 ("net_sched: fix an OOB access in cls_tcindex") I moved cp->hash calculation before the first tcindex_alloc_perfect_hash(), but cp->alloc_hash is left untouched. This difference could lead to another out of bound access. cp->alloc_hash should always be the size allocated, we should update it after this tcindex_alloc_perfect_hash().
CVE-2020-3702	u'Specifically timed and handcrafted traffic can cause internal errors in a WLAN device that lead to improper layer 2 Wi-Fi encryption with a consequent possibility of information disclosure over the air for a discrete set of traffic' in Snapdragon Auto, Snapdragon Compute, Snapdragon Connectivity, Snapdragon Consumer IOT, Snapdragon Industrial IOT, Snapdragon Mobile, Snapdragon Voice & Music, Snapdragon Wearables, Snapdragon Wired Infrastructure and Networking in APQ8053, IPQ4019, IPQ8064, MSM8909W, MSM8996AU, QCA9531, QCN5502, QCS405, SDX20, SM6150, SM7150
CVE-2020-7656	jquery prior to 1.9.0 allows Cross-site Scripting attacks via the load method. The load method fails to recognize and remove "<script>" HTML tags that contain a whitespace character, i.e: "</script >", which results in the enclosed script logic to be executed.
CVE-2020-8130	There is an OS command injection vulnerability in Ruby Rake < 12.3.3 in Rake::FileList when supplying a filename that begins with the pipe character ` `.
CVE-2020-8559	The Kubernetes kube-apiserver in versions v1.6-v1.15, and versions prior to v1.16.13, v1.17.9 and v1.18.6 are vulnerable to an unvalidated redirect on proxied upgrade requests that could allow an attacker to escalate privileges from a node compromise to a full cluster compromise.
CVE-2020-8694	Insufficient access control in the Linux kernel driver for some Intel(R) Processors may allow an authenticated user to potentially enable information disclosure via local access.
CVE-2020-8908	A temp directory creation vulnerability exists in all versions of Guava, allowing an attacker with access to the machine to potentially access data in a temporary directory created by the Guava API com.google.common.io.Files.createTempDir(). By default, on unix-like systems, the created directory is world-readable (readable by an attacker with access to the system). The method in question has been marked @Deprecated in versions 30.0 and later and should not be used. For Android developers, we recommend choosing a temporary directory API provided by Android, such as context.getCacheDir(). For other Java developers, we recommend migrating to the Java 7 API java.nio.file.Files.createTempDirectory() which explicitly configures permissions of 700, or configuring the Java runtime's java.io.tmpdir system property to point to a location whose permissions are appropriately configured.
CVE-2020-9492	In Apache Hadoop 3.2.0 to 3.2.1, 3.0.0-alpha1 to 3.1.3, and 2.0.0-alpha to 2.10.0, WebHDFS client might send SPNEGO authorization header to remote URL without proper verification.
CVE-2021-0561	In append_to_verify_fifo_interleaved_ of stream_encoder.c, there is a possible out of bounds write due to a missing bounds check. This could lead to local information disclosure with no additional execution privileges needed. User interaction is not needed for exploitation.Product: AndroidVersions: Android-11Android ID: A-174302683

CVE ID	Description
CVE-2021-20193	A flaw was found in the src/list.c of tar 1.33 and earlier. This flaw allows an attacker who can submit a crafted input file to tar to cause uncontrolled consumption of memory. The highest threat from this vulnerability is to system availability.
CVE-2021-20320	A flaw was found in s390 eBPF JIT in bpf_jit_insn in arch/s390/net/bpf_jit_comp.c in the Linux kernel. In this flaw, a local attacker with special user privilege can circumvent the verifier and may lead to a confidentiality problem.
CVE-2021-22569	An issue in protobuf-java allowed the interleaving of com.google.protobuf.UnknownFieldSet fields in such a way that would be processed out of order. A small malicious payload can occupy the parser for several minutes by creating large numbers of short-lived objects that cause frequent, repeated pauses. We recommend upgrading libraries beyond the vulnerable versions.
CVE-2021-22570	Nullptr dereference when a null char is present in a proto symbol. The symbol is parsed incorrectly, leading to an unchecked call into the proto file's name during generation of the resulting error message. Since the symbol is incorrectly parsed, the file is nullptr. We recommend upgrading to version 3.15.0 or greater.
CVE-2021-23840	Calls to EVP_CipherUpdate, EVP_EncryptUpdate and EVP_DecryptUpdate may overflow the output length argument in some cases where the input length is close to the maximum permissible length for an integer on the platform. In such cases the return value from the function call will be 1 (indicating success), but the output length value will be negative. This could cause applications to behave incorrectly or crash. OpenSSL versions 1.1.1i and below are affected by this issue. Users of these versions should upgrade to OpenSSL 1.1.1j. OpenSSL versions 1.0.2x and below are affected by this issue. However OpenSSL 1.0.2 is out of support and no longer receiving public updates. Premium support customers of OpenSSL 1.0.2 should upgrade to 1.0.2y. Other users should upgrade to 1.1.1j. Fixed in OpenSSL 1.1.1j (Affected 1.1.1-1.1.1i). Fixed in OpenSSL 1.0.2y (Affected 1.0.2-1.0.2x).
CVE-2021-23841	The OpenSSL public API function X509_issuer_and_serial_hash() attempts to create a unique hash value based on the issuer and serial number data contained within an X509 certificate. However it fails to correctly handle any errors that may occur while parsing the issuer field (which might occur if the issuer field is maliciously constructed). This may subsequently result in a NULL pointer deref and a crash leading to a potential denial of service attack. The function X509_issuer_and_serial_hash() is never directly called by OpenSSL itself so applications are only vulnerable if they use this function directly and they use it on certificates that may have been obtained from untrusted sources. OpenSSL versions 1.1.1i and below are affected by this issue. Users of these versions should upgrade to OpenSSL 1.1.1j. OpenSSL versions 1.0.2x and below are affected by this issue. However OpenSSL 1.0.2 is out of support and no longer receiving public updates. Premium support customers of OpenSSL 1.0.2 should upgrade to 1.0.2y. Other users should upgrade to 1.1.1j. Fixed in OpenSSL 1.1.1j (Affected 1.1.1-1.1.1i). Fixed in OpenSSL 1.0.2y (Affected 1.0.2-1.0.2x).
CVE-2021-24032	Beginning in v1.4.1 and prior to v1.4.9, due to an incomplete fix for CVE-2021-24031, the Zstandard command-line utility created output files with default permissions and restricted those permissions immediately afterwards. Output files could therefore momentarily be readable or writable to unintended parties.
CVE-2021-25317	A Incorrect Default Permissions vulnerability in the packaging of cups of SUSE Linux Enterprise Server 11-SP4-LTSS, SUSE Manager Server 4.0, SUSE OpenStack Cloud Crowbar 9; openSUSE Leap 15.2, Factory allows local attackers with control of the lp users to create files as root with 0644 permissions without the ability to set the content. This issue affects: SUSE Linux Enterprise Server 11-SP4-LTSS cups versions prior to 1.3.9. SUSE Manager Server 4.0 cups versions prior to 2.2.7. SUSE OpenStack Cloud Crowbar 9 cups versions prior to 1.7.5. openSUSE Leap 15.2 cups versions prior to 2.2.7. openSUSE Factory cups version 2.3.3op2-2.1 and prior versions.
CVE-2021-26934	An issue was discovered in the Linux kernel 4.18 through 5.10.16, as used by Xen. The backend allocation (aka be-alloc) mode of the drm_xen_front drivers was not meant to be a supported configuration, but this wasn't stated accordingly in its support status entry.
CVE-2021-28168	Eclipse Jersey 2.28 to 2.33 and Eclipse Jersey 3.0.0 to 3.0.1 contains a local information disclosure vulnerability. This is due to the use of the File.createTempFile which creates a file inside of the system temporary directory with the permissions: -rw-r--r--. Thus the contents of this file are viewable by all other users locally on the system. As such, if the contents written is security sensitive, it can be disclosed to other local users.
CVE-2021-28170	In the Jakarta Expression Language implementation 3.0.3 and earlier, a bug in the ELParserTokenManager enables invalid EL expressions to be evaluated as if they were valid.

CVE ID	Description
CVE-2021-28711	Rogue backends can cause DoS of guests via high frequency events T[his CNA information record relates to multiple CVEs; the text explains which aspects/vulnerabilities correspond to which CVE.] Xen offers the ability to run PV backends in regular unprivileged guests, typically referred to as "driver domains". Running PV backends in driver domains has one primary security advantage: if a driver domain gets compromised, it doesn't have the privileges to take over the system. However, a malicious driver domain could try to attack other guests via sending events at a high frequency leading to a Denial of Service in the guest due to trying to service interrupts for elongated amounts of time. There are three affected backends: * blkfront patch 1, CVE-2021-28711 * netfront patch 2, CVE-2021-28712 * hvc_xen (console) patch 3, CVE-2021-28713
CVE-2021-28712	Rogue backends can cause DoS of guests via high frequency events T[his CNA information record relates to multiple CVEs; the text explains which aspects/vulnerabilities correspond to which CVE.] Xen offers the ability to run PV backends in regular unprivileged guests, typically referred to as "driver domains". Running PV backends in driver domains has one primary security advantage: if a driver domain gets compromised, it doesn't have the privileges to take over the system. However, a malicious driver domain could try to attack other guests via sending events at a high frequency leading to a Denial of Service in the guest due to trying to service interrupts for elongated amounts of time. There are three affected backends: * blkfront patch 1, CVE-2021-28711 * netfront patch 2, CVE-2021-28712 * hvc_xen (console) patch 3, CVE-2021-28713
CVE-2021-28713	Rogue backends can cause DoS of guests via high frequency events T[his CNA information record relates to multiple CVEs; the text explains which aspects/vulnerabilities correspond to which CVE.] Xen offers the ability to run PV backends in regular unprivileged guests, typically referred to as "driver domains". Running PV backends in driver domains has one primary security advantage: if a driver domain gets compromised, it doesn't have the privileges to take over the system. However, a malicious driver domain could try to attack other guests via sending events at a high frequency leading to a Denial of Service in the guest due to trying to service interrupts for elongated amounts of time. There are three affected backends: * blkfront patch 1, CVE-2021-28711 * netfront patch 2, CVE-2021-28712 * hvc_xen (console) patch 3, CVE-2021-28713
CVE-2021-28972	In drivers/pci/hotplug/rpadlp_sysfs.c in the Linux kernel through 5.11.8, the RPA PCI Hotplug driver has a user-tolerable buffer overflow when writing a new device name to the driver from userspace, allowing userspace to write data to the kernel stack frame directly. This occurs because add_slot_store and remove_slot_store mishandle drc_name '\0' termination, aka CID-cc7a0bb058b8.
CVE-2021-29657	arch/x86/kvm/svm/nested.c in the Linux kernel before 5.11.12 has a use-after-free in which an AMD KVM guest can bypass access control on host OS MSRs when there are nested guests, aka CID-a58d9166a756. This occurs because of a TOCTOU race condition associated with a VMCB12 double fetch in nested_svm_vmrn.
CVE-2021-3178	fs/nfsd/nfs3xdr.c in the Linux kernel through 5.10.8, when there is an NFS export of a subdirectory of a filesystem, allows remote attackers to traverse to other parts of the filesystem via REaddirPLUS. NOTE: some parties argue that such a subdirectory export is not intended to prevent this attack; see also the exports(5) no_subtree_check default behavior
CVE-2021-31879	GNU Wget through 1.21.1 does not omit the Authorization header upon a redirect to a different origin, a related issue to CVE-2018-1000007.
CVE-2021-3236	vim 8.2.2348 is affected by null pointer dereference, allows local attackers to cause a denial of service (DoS) via the ex_buffer_all method.
CVE-2021-33036	In Apache Hadoop 2.2.0 to 2.10.1, 3.0.0-alpha1 to 3.1.4, 3.2.0 to 3.2.2, and 3.3.0 to 3.3.1, a user who can escalate to yarn user can possibly run arbitrary commands as root user. Users should upgrade to Apache Hadoop 2.10.2, 3.2.3, 3.3.2 or higher.
CVE-2021-33294	In elfutils 0.183, an infinite loop was found in the function handle_syntab in readelf.c .Which allows attackers to cause a denial of service (infinite loop) via crafted file.
CVE-2021-33560	Libgcrypt before 1.8.8 and 1.9.x before 1.9.3 mishandles ElGamal encryption because it lacks exponent blinding to address a side-channel attack against mpi_powm, and the window size is not chosen appropriately. This, for example, affects use of ElGamal in OpenPGP.
CVE-2021-33624	In kernel/bpf/verifier.c in the Linux kernel before 5.12.13, a branch can be mispredicted (e.g., because of type confusion) and consequently an unprivileged BPF program can read arbitrary memory locations via a side-channel attack, aka CID-9183671af6db.
CVE-2021-3411	A flaw was found in the Linux kernel in versions prior to 5.10. A violation of memory access was found while detecting a padding of int3 in the linking state. The highest threat from this vulnerability is to data confidentiality and integrity as well as system availability.

CVE ID	Description
CVE-2021-34428	For Eclipse Jetty versions <= 9.4.40, <= 10.0.2, <= 11.0.2, if an exception is thrown from the SessionListener#sessionDestroyed() method, then the session ID is not invalidated in the session ID manager. On deployments with clustered sessions and multiple contexts this can result in a session not being invalidated. This can result in an application used on a shared computer being left logged in.
CVE-2021-3443	A NULL pointer dereference flaw was found in the way Jasper versions before 2.0.27 handled component references in the JP2 image format decoder. A specially crafted JP2 image file could cause an application using the Jasper library to crash when opened.
CVE-2021-3444	The bpf verifier in the Linux kernel did not properly handle mod32 destination register truncation when the source register was known to be 0. A local attacker with the ability to load bpf programs could use this gain out-of-bounds reads in kernel memory leading to information disclosure (kernel memory), and possibly out-of-bounds writes that could potentially lead to code execution. This issue was addressed in the upstream kernel in commit 9b00f1b78809 ("bpf: Fix truncation handling for mod32 dst reg wrt zero") and in Linux stable kernels 5.11.2, 5.10.19, and 5.4.101.
CVE-2021-34556	In the Linux kernel through 5.13.7, an unprivileged BPF program can obtain sensitive information from kernel memory via a Speculative Store Bypass side-channel attack because the protection mechanism neglects the possibility of uninitialized memory locations on the BPF stack.
CVE-2021-3467	A NULL pointer dereference flaw was found in the way Jasper versions before 2.0.26 handled component references in CDEF box in the JP2 image format decoder. A specially crafted JP2 image file could cause an application using the Jasper library to crash when opened.
CVE-2021-34693	net/can/bcm.c in the Linux kernel through 5.12.10 allows local users to obtain sensitive information from kernel stack memory because parts of a data structure are uninitialized.
CVE-2021-34981	Linux Kernel Bluetooth CMTP Module Double Free Privilege Escalation Vulnerability. This vulnerability allows local attackers to escalate privileges on affected installations of Linux Kernel. An attacker must first obtain the ability to execute high-privileged code on the target system in order to exploit this vulnerability. The specific flaw exists within the CMTP module. The issue results from the lack of validating the existence of an object prior to performing further free operations on the object. An attacker can leverage this vulnerability to escalate privileges and execute code in the context of the kernel. Was ZDI-CAN-11977.
CVE-2021-35477	In the Linux kernel through 5.13.7, an unprivileged BPF program can obtain sensitive information from kernel memory via a Speculative Store Bypass side-channel attack because a certain preempting store operation does not necessarily occur before a store operation that has an attacker-controlled value.
CVE-2021-3655	A vulnerability was found in the Linux kernel in versions prior to v5.14-rc1. Missing size validations on inbound SCTP packets may allow the kernel to read uninitialized memory.
CVE-2021-3714	A flaw was found in the Linux kernels memory deduplication mechanism. Previous work has shown that memory deduplication can be attacked via a local exploitation mechanism. The same technique can be used if an attacker can upload page sized files and detect the change in access time from a networked service to determine if the page has been merged.
CVE-2021-37404	There is a potential heap buffer overflow in Apache Hadoop libhdfs native code. Opening a file path provided by user without validation may result in a denial of service or arbitrary code execution. Users should upgrade to Apache Hadoop 2.10.2, 3.2.3, 3.3.2 or higher.
CVE-2021-38166	In kernel/bpf/hashtab.c in the Linux kernel through 5.13.8, there is an integer overflow and out-of-bounds write when many elements are placed in a single bucket. NOTE: exploitation might be impractical without the CAP_SYS_ADMIN capability.
CVE-2021-38198	arch/x86/kvm/mmu/paging_tmpl.h in the Linux kernel before 5.12.11 incorrectly computes the access permissions of a shadow page, leading to a missing guest protection page fault.
CVE-2021-38199	fs/nfs/nfs4client.c in the Linux kernel before 5.13.4 has incorrect connection-setup ordering, which allows operators of remote NFSv4 servers to cause a denial of service (hanging of mounts) by arranging for those servers to be unreachable during trunking detection.
CVE-2021-38206	The mac80211 subsystem in the Linux kernel before 5.12.13, when a device supporting only 5 GHz is used, allows attackers to cause a denial of service (NULL pointer dereference in the radiotap parser) by injecting a frame with 802.11a rates.
CVE-2021-3826	Heap/stack buffer overflow in the clang_lname function in d-demangle.c in libiberty allows attackers to potentially cause a denial of service (segmentation fault and crash) via a crafted mangled symbol.
CVE-2021-38593	Qt 5.x before 5.15.6 and 6.x through 6.1.2 has an out-of-bounds write in QOutlineMapper::convertPath (called from QRasterPaintEngine::fill and QPaintEngineEx::stroke).

CVE ID	Description
CVE-2021-3864	A flaw was found in the way the dumpable flag setting was handled when certain SUID binaries executed its descendants. The prerequisite is a SUID binary that sets real UID equal to effective UID, and real GID equal to effective GID. The descendant will then have a dumpable value set to 1. As a result, if the descendant process crashes and core_pattern is set to a relative value, its core dump is stored in the current directory with uid:gid permissions. An unprivileged local user with eligible root SUID binary could use this flaw to place core dumps into root-owned directories, potentially resulting in escalation of privileges.
CVE-2021-3927	vim is vulnerable to Heap-based Buffer Overflow
CVE-2021-39537	An issue was discovered in ncurses through v6.2-1. _nc_captaininfo in captaininfo.c has a heap-based buffer overflow.
CVE-2021-3974	vim is vulnerable to Use After Free
CVE-2021-3997	A flaw was found in systemd. An uncontrolled recursion in systemd-tmpfiles may lead to a denial of service at boot time when too many nested directories are created in /tmp.
CVE-2021-4001	A race condition was found in the Linux kernel's ebpf verifier between bpf_map_update_elem and bpf_map_freeze due to a missing lock in kernel/bpf/syscall.c. In this flaw, a local user with a special privilege (cap_sys_admin or cap_bpf) can modify the frozen mapped address space. This flaw affects kernel versions prior to 5.16 rc2.
CVE-2021-40490	A race condition was discovered in ext4_write_inline_data_end in fs/ext4/inline.c in the ext4 subsystem in the Linux kernel through 5.13.13.
CVE-2021-41182	jQuery-UI is the official jQuery user interface library. Prior to version 1.13.0, accepting the value of the `altField` option of the Datepicker widget from untrusted sources may execute untrusted code. The issue is fixed in jQuery UI 1.13.0. Any string value passed to the `altField` option is now treated as a CSS selector. A workaround is to not accept the value of the `altField` option from untrusted sources.
CVE-2021-41183	jQuery-UI is the official jQuery user interface library. Prior to version 1.13.0, accepting the value of various `*Text` options of the Datepicker widget from untrusted sources may execute untrusted code. The issue is fixed in jQuery UI 1.13.0. The values passed to various `*Text` options are now always treated as pure text, not HTML. A workaround is to not accept the value of the `*Text` options from untrusted sources.
CVE-2021-41184	jQuery-UI is the official jQuery user interface library. Prior to version 1.13.0, accepting the value of the `of` option of the `.position()` util from untrusted sources may execute untrusted code. The issue is fixed in jQuery UI 1.13.0. Any string value passed to the `of` option is now treated as a CSS selector. A workaround is to not accept the value of the `of` option from untrusted sources.
CVE-2021-4135	A memory leak vulnerability was found in the Linux kernel's eBPF for the Simulated networking device driver in the way user uses BPF for the device such that function nsim_map_alloc_elem being called. A local user could use this flaw to get unauthorized access to some data.
CVE-2021-4159	A vulnerability was found in the Linux kernel's EBPF verifier when handling internal data structures. Internal memory locations could be returned to userspace. A local attacker with the permissions to insert eBPF code to the kernel can use this to leak internal kernel memory details defeating some of the exploit mitigations in place for the kernel.
CVE-2021-4166	vim is vulnerable to Out-of-bounds Read
CVE-2021-4209	A NULL pointer dereference flaw was found in GnuTLS. As Nettle's hash update functions internally call memcpy, providing zero-length input may cause undefined behavior. This flaw leads to a denial of service after authentication in rare circumstances.
CVE-2021-4217	A flaw was found in unzip. The vulnerability occurs due to improper handling of Unicode strings, which can lead to a null pointer dereference. This flaw allows an attacker to input a specially crafted zip file, leading to a crash or code execution.
CVE-2021-42357	When using Apache Knox SSO prior to 1.6.1, a request could be crafted to redirect a user to a malicious page due to improper URL parsing. A request that included a specially crafted request parameter could be used to redirect the user to a page controlled by an attacker. This URL would need to be presented to the user outside the normal request flow through a XSS or phishing campaign.

CVE ID	Description
CVE-2021-4439	In the Linux kernel, the following vulnerability has been resolved: isdn: cpai: check ctr->cnr to avoid array index out of bound The cmtplib_add_connection() would add a cmtplib session to a controller and run a kernel thread to process cmtplib. __module_get(THIS_MODULE); session->task = kthread_run(cmtplib_session, session, "kcmtplib_ctr_%d", session->num); During this process, the kernel thread would call detach_capi_ctr() to detach a register controller. if the controller was not attached yet, detach_capi_ctr() would trigger an array-index-out-of-bounds bug. [46.866069][T6479] UBSAN: array-index-out-of-bounds in drivers/isdn/capi/kcapi.c:483:21 [46.867196][T6479] index -1 is out of range for type 'capi_ctr *[32]' [46.867982][T6479] CPU: 1 PID: 6479 Comm: kcmtplib_ctr_0 Not tainted 5.15.0-rc2+ #8 [46.869002][T6479] Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.14.0-2 04/01/2014 [46.870107][T6479] Call Trace: [46.870473][T6479] dump_stack_lvl+0x57/0x7d [46.870974][T6479] ubsan_epilogue+0x5/0x40 [46.871458][T6479] __ubsan_handle_out_of_bounds.cold+0x43/0x48 [46.872135][T6479] detach_capi_ctr+0x64/0xc0 [46.872639][T6479] cmtplib_session+0x5c8/0x5d0 [46.873131][T6479] ? __init_waitqueue_head+0x60/0x60 [46.873712][T6479] ? cmtplib_add_msgpart+0x120/0x120 [46.874256][T6479] kthread+0x147/0x170 [46.874709][T6479] ? set_kthread_struct+0x40/0x40 [46.875248][T6479] ret_from_fork+0x1f/0x30 [46.875773][T6479]
CVE-2021-4440	In the Linux kernel, the following vulnerability has been resolved: x86/xen: Drop USERGS_SYCRET64 paravirt call commit afd30525a659ac0ae0904f0cb4a2ca75522c3123 upstream. USERGS_SYCRET64 is used to return from a syscall via SYSRET, but a Xen PV guest will nevertheless use the IRET hypercall, as there is no sysret PV hypercall defined. So instead of testing all the prerequisites for doing a sysret and then mangling the stack for Xen PV again for doing an iret just use the iret exit from the beginning. This can easily be done via an ALTERNATIVE like it is done for the sysenter compat case already. It should be noted that this drops the optimization in Xen for not restoring a few registers when returning to user mode, but it seems as if the saved instructions in the kernel mode than compensate for this drop (a kernel build in a Xen PV guest was slightly faster with this patch applied). While at it remove the stale sysret32 remnants. [pawan: Brad Spengler and Salvatore Bonaccorso <carnil@debian.org> reported a problem with the 5.10 backport commit edc702b4a820 ("x86/entry_64: Add VERW just before userspace transition"). When CONFIG_PARAVIRT_XXL=y, CLEAR_CPU_BUFFERS is not executed in syscall_return_via_sysret path as USERGS_SYCRET64 is runtime patched to: .cpu_usergs_sysret64 = { 0x0f, 0x01, 0xf8, 0x48, 0x0f, 0x07 }, // swapgs; sysretq which is missing CLEAR_CPU_BUFFERS. It turns out dropping USERGS_SYCRET64 simplifies the code, allowing CLEAR_CPU_BUFFERS to be explicitly added to syscall_return_via_sysret path. Below is with CONFIG_PARAVIRT_XXL=y and this patch applied: syscall_return_via_sysret: ... <+342>: swapgs <+345>: xchg %ax,%ax <+347>: verw -0x1a2(%rip) <----- <+354>: sysretq]
CVE-2021-4442	In the Linux kernel, the following vulnerability has been resolved: tcp: add sanity tests to TCP_QUEUE_SEQ Qingyu Li reported a syzkaller bug where the repro changes RCV_SEQ after restoring data in the receive queue. mprotect(0x4aa000, 12288, PROT_READ) = 0 mmap(0x1ffff000, 4096, PROT_NONE, MAP_PRIVATE MAP_FIXED MAP_ANONYMOUS, -1, 0) = 0x1ffff000 mmap(0x20000000, 16777216, PROT_READ PROT_WRITE PROT_EXEC, MAP_PRIVATE MAP_FIXED MAP_ANONYMOUS, -1, 0) = 0x20000000 mmap(0x21000000, 4096, PROT_NONE, MAP_PRIVATE MAP_FIXED MAP_ANONYMOUS, -1, 0) = 0x21000000 socket(AF_INET6, SOCK_STREAM, IPPROTO_IP) = 3 setsockopt(3, SOL_TCP, TCP_REPAIR, [1], 4) = 0 connect(3, {sa_family=AF_INET6, sin6_port=htons(0), sin6_flowinfo=htonl(0), inet_pton(AF_INET6, "::1", &sin6_addr), sin6_scope_id=0}, 28) = 0 setsockopt(3, SOL_TCP, TCP_REPAIR_QUEUE, [1], 4) = 0 sendmsg(3, {msg_name=NULL, msg_namelen=0, msg_iov=[{iov_base="0x0000000000000003\0\0", iov_len=20}], msg_iovlen=1, msg_controllen=0, msg_flags=0}, 0) = 20 setsockopt(3, SOL_TCP, TCP_REPAIR, [0], 4) = 0 setsockopt(3, SOL_TCP, TCP_QUEUE_SEQ, [128], 4) = 0 recvfrom(3, NULL, 20, 0, NULL, NULL) = -1 ECONNRESET (Connection reset by peer) syslog shows: [111.205099] TCP rcvmsg seq # bug 2: copied 80, seq 0, rcvnext 80, fl 0 [111.207894] WARNING: CPU: 1 PID: 356 at net/ipv4/tcp.c:2343 tcp_rcvmsg_locked+0x90e/0x29a0 This should not be allowed. TCP_QUEUE_SEQ should only be used when queues are empty. This patch fixes this case, and the tx path as well.
CVE-2021-4460	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: Fix UBSAN shift-out-of-bounds warning If get_num_sdma_queues or get_num_xgmi_sdma_queues is 0, we end up doing a shift operation where the number of bits shifted equals number of bits in the operand. This behaviour is undefined. Set num_sdma_queues or num_xgmi_sdma_queues to ULLONG_MAX, if the count is >= number of bits in the operand. Bug: https://gitlab.freedesktop.org/drm/amd/-/issues/1472
CVE-2021-44732	Mbed TLS before 3.0.1 has a double free in certain out-of-memory conditions, as demonstrated by an mbedtls_ssl_set_session() failure.
CVE-2021-45078	stab_xcoff_builtin_type in stabs.c in GNU Binutils through 2.37 allows attackers to cause a denial of service (heap-based buffer overflow) or possibly have unspecified other impact, as demonstrated by an out-of-bounds write. NOTE: this issue exists because of an incorrect fix for CVE-2018-12699.

CVE ID	Description
CVE-2021-45261	An Invalid Pointer vulnerability exists in GNU patch 2.7 via the another_hunk function, which causes a Denial of Service.
CVE-2021-45402	The check_alu_op() function in kernel/bpf/verifier.c in the Linux kernel through v5.16-rc5 did not properly update bounds while handling the mov32 instruction, which allows local users to obtain potentially sensitive address information, aka a "pointer leak."
CVE-2021-46877	jackson-databind 2.10.x through 2.12.x before 2.12.6 and 2.13.x before 2.13.1 allows attackers to cause a denial of service (2 GB transient heap usage per read) in uncommon situations involving JsonNode JDK serialization.
CVE-2021-46904	In the Linux kernel, the following vulnerability has been resolved: net: hso: fix null-ptr-deref during tty device unregistration Multiple ttys try to claim the same the minor number causing a double unregistration of the same device. The first unregistration succeeds but the next one results in a null-ptr-deref. The get_free_serial_index() function returns an available minor number but doesn't assign it immediately. The assignment is done by the caller later. But before this assignment, calls to get_free_serial_index() would return the same minor number. Fix this by modifying get_free_serial_index to assign the minor number immediately after one is found to be and rename it to obtain_minor() to better reflect what it does. Similarly, rename set_serial_by_index() to release_minor() and modify it to free up the minor number of the given hso_serial. Every obtain_minor() should have corresponding release_minor() call.
CVE-2021-46908	In the Linux kernel, the following vulnerability has been resolved: bpf: Use correct permission flag for mixed signed bounds arithmetic We forbid adding unknown scalars with mixed signed bounds due to the spectre v1 masking mitigation. Hence this also needs bypass_spec_v1 flag instead of allow_ptr_leaks.
CVE-2021-46910	In the Linux kernel, the following vulnerability has been resolved: ARM: 9063/1: mm: reduce maximum number of CPUs if DEBUG_KMAP_LOCAL is enabled The debugging code for kmap_local() doubles the number of per-CPU fixmap slots allocated for kmap_local(), in order to use half of them as guard regions. This causes the fixmap region to grow downwards beyond the start of its reserved window if the supported number of CPUs is large, and collide with the newly added virtual DT mapping right below it, which is obviously not good. One manifestation of this is EFI boot on a kernel built with NR_CPUS=32 and CONFIG_DEBUG_KMAP_LOCAL=y, which may pass the FDT in highmem, resulting in block entries below the fixmap region that the fixmap code misidentifies as fixmap table entries, and subsequently tries to dereference using a phys-to-virt translation that is only valid for lowmem. This results in a cryptic splat such as the one below. ftrace: allocating 45548 entries in 89 pages 8<--- cut here --- Unable to handle kernel paging request at virtual address fc6006f0 pgd = (ptrval) [fc6006f0] *pgd=80000040207003, *pmd=00000000 Internal error: Oops: a06 [#1] SMP ARM Modules linked in: CPU: 0 PID: 0 Comm: swapper Not tainted 5.11.0+ #382 Hardware name: Generic DT based system PC is at cpu_ca15_set_pte_ext+0x24/0x30 LR is at __set_fixmap+0xe4/0x118 pc : [<c041ac9c>] lr : [<c04189d8>] psr: 400000d3 sp : c1601ed8 ip : 00400000 fp : 00800000 r10: 0000071f r9 : 00421000 r8 : 00c00000 r7 : 00c00000 r6 : 0000071f r5 : ffade000 r4 : 4040171f r3 : 00c00000 r2 : 4040171f r1 : c041ac78 r0 : fc6006f0 Flags: nZcv IRQs off FIQs off Mode SVC_32 ISA ARM Segment none Control: 30c5387d Table: 40203000 DAC: 00000001 Process swapper (pid: 0, stack limit = 0x(ptrval)) So let's limit CONFIG_NR_CPUS to 16 when CONFIG_DEBUG_KMAP_LOCAL=y. Also, fix the BUILD_BUG_ON() check that was supposed to catch this, by checking whether the region grows below the start address rather than above the end address.

CVE ID	Description
CVE-2021-46915	In the Linux kernel, the following vulnerability has been resolved: netfilter: nft_limit: avoid possible divide error in nft_limit_init div_u64() divides u64 by u32. nft_limit_init() wants to divide u64 by u64, use the appropriate math function (div64_u64) divide error: 0000 [#1] PREEMPT SMP KASAN CPU: 1 PID: 8390 Comm: syz-executor188 Not tainted 5.12.0-rc4-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:div_u64_rem include/linux/math64.h:28 [inline] RIP: 0010:div_u64 include/linux/math64.h:127 [inline] RIP: 0010:nft_limit_init+0x2a2/0x5e0 net/netfilter/nft_limit.c:85 Code: ef 4c 01 eb 41 0f 92 c7 48 89 de e8 38 a5 22 fa 4d 85 ff 0f 85 97 02 00 00 e8 ea 9e 22 fa 4c 0f af f3 45 89 ed 31 d2 4c 89 f0 <49> f7 f5 49 89 c6 e8 d3 9e 22 fa 48 8d 7d 48 48 b8 00 00 00 00 00 RSP: 0018:ffff90009447198 EFLAGS: 00010246 RAX: 0000000000000000 RBX: 0000200000000000 RCX: 0000000000000000 RDX: 0000000000000000 RSI: ffffffff875152e6 RDI: 0000000000000003 RBP: ffff888020f80908 R08: 0000200000000000 R09: 0000000000000000 R10: ffffffff875152d8 R11: 0000000000000000 R12: ffff90009447270 R13: 0000000000000000 R14: 0000000000000000 R15: 0000000000000000 FS: 000000000097a300(0000) GS:ffff8880b9d00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00000000200001c4 CR3: 0000000026a52000 CR4: 00000000001506e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 00000000000000400 Call Trace: nf_tables_newexpr net/netfilter/nf_tables_api.c:2675 [inline] nft_expr_init+0x145/0x2d0 net/netfilter/nf_tables_api.c:2713 nft_set_elem_expr_alloc+0x27/0x280 net/netfilter/nf_tables_api.c:5160 nf_tables_newset +0x1997/0x3150 net/netfilter/nf_tables_api.c:4321 nfnetlink_rcv_batch+0x85a/0x21b0 net/netfilter/nfnetlink.c:456 nfnetlink_rcv_skb_batch net/netfilter/nfnetlink.c:580 [inline] nfnetlink_rcv +0x3af/0x420 net/netfilter/nfnetlink.c:598 netlink_unicast_kernel net/netlink/af_netlink.c:1312 [inline] netlink_unicast+0x533/0x7d0 net/netlink/af_netlink.c:1338 netlink_sendmsg+0x856/0xd90 net/netlink/af_netlink.c:1927 sock_sendmsg_nosec net/socket.c:654 [inline] sock_sendmsg+0xcf/0x120 net/socket.c:674 __sys_sendmsg+0x6e8/0x810 net/socket.c:2350 __sys_sendmsg+0xf3/0x170 net/socket.c:2404 __sys_sendmsg+0xe5/0x1b0 net/socket.c:2433 do_syscall_64+0x2d/0x70 arch/x86/entry/common.c:46 entry_SYSCALL_64_after_hwframe+0x44/0xae
CVE-2021-46917	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: fix wq cleanup of WQCFG registers A pre-release silicon erratum workaround where wq reset does not clear WQCFG registers was leaked into upstream code. Use wq reset command instead of blasting the MMIO region. This also address an issue where we clobber registers in future devices.
CVE-2021-46918	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: clear MSIX permission entry on shutdown Add disabling/clearing of MSIX permission entries on device shutdown to mirror the enabling of the MSIX entries on probe. Current code left the MSIX enabled and the pasid entries still programmed at device shutdown.
CVE-2021-46920	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix clobbering of SWERR overflow bit on writeback Current code blindly writes over the SWERR and the OVERFLOW bits. Write back the bits actually read instead so the driver avoids clobbering the OVERFLOW bit that comes after the register is read.
CVE-2021-46921	In the Linux kernel, the following vulnerability has been resolved: locking/qrwlock: Fix ordering in queued_write_lock_slowpath() While this code is executed with the wait_lock held, a reader can acquire the lock without holding wait_lock. The writer side loops checking the value with the atomic_cond_read_acquire(), but only truly acquires the lock when the compare-and-exchange is completed successfully which isn't ordered. This exposes the window between the acquire and the cmpxchg to an A-B-A problem which allows reads following the lock acquisition to observe values speculatively before the write lock is truly acquired. We've seen a problem in epoll where the reader does a xchg while holding the read lock, but the writer can see a value change out from under it. Writer Reader ----- ep_scan_ready_list() - write_lock_irq() - queued_write_lock_slowpath() - atomic_cond_read_acquire() read_lock_irqsave(&ep->lock, flags); --> (observes value before unlock) chain_epi_lockless() epi->next = xchg(&ep->ovflist, epi); read_unlock_irqrestore(&ep->lock, flags); atomic_cmpxchg_relaxed() -- READ_ONCE(ep->ovflist); A core can order the read of the ovflist ahead of the atomic_cmpxchg_relaxed(). Switching the cmpxchg to use acquire semantics addresses this issue at which point the atomic_cond_read can be switched to use relaxed semantics. [peterz: use try_cmpxchg()]

CVE ID	Description
CVE-2021-46925	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix kernel panic caused by race of smc_sock A crash occurs when smc_cdc_tx_handler() tries to access smc_sock but smc_release() has already freed it. [4570.695099] BUG: unable to handle page fault for address: 000000002eae9e88 [4570.696048] #PF: supervisor write access in kernel mode [4570.696728] #PF: error_code(0x0002) - not-present page [4570.697401] PGD 0 P4D 0 [4570.697716] Oops: 0002 [#1] PREEMPT SMP NOPTI [4570.698228] CPU: 0 PID: 0 Comm: swapper/0 Not tainted 5.16.0-rc4+ #111 [4570.699013] Hardware name: Alibaba Cloud Alibaba Cloud ECS, BIOS 8c24b4c 04/0 [4570.699933] RIP: 0010: _raw_spin_lock+0x1a/0x30 <...> [4570.711446] Call Trace: [4570.711746] <IRQ> [4570.711992] smc_cdc_tx_handler+0x41/0xc0 [4570.712470] smc_wr_tx_tasklet_fn+0x213/0x560 [4570.712981] ? smc_cdc_tx_dismiss+0x10/0x10 [4570.713489] tasklet_action_common.isra.17+0x66/0x140 [4570.714083] __do_softirq+0x123/0x2f4 [4570.714521] irq_exit_rcu+0xc4/0xf0 [4570.714934] common_interrupt+0xba/0xe0 Though smc_cdc_tx_handler() checked the existence of smc connection, smc_release() may have already dismissed and released the smc socket before smc_cdc_tx_handler() further visits it. smc_cdc_tx_handler() smc_release() if (!conn) smc_cdc_tx_dismiss_slots() smc_cdc_tx_dismiss() sock_put(&smc->sk) <- last sock_put, smc_sock freed bh_lock_sock(&smc->sk) (panic) To make sure we won't receive any CDC messages after we free the smc_sock, add a refcount on the smc_connection for inflight CDC message(posted to the QP but haven't received related CQE), and don't release the smc_connection until all the inflight CDC messages haven been done, for both success or failed ones. Using refcount on CDC messages brings another problem: when the link is going to be destroyed, smcr_link_clear() will reset the QP, which then remove all the pending CQEs related to the QP in the CQ. To make sure all the CQEs will always come back so the refcount on the smc_connection can always reach 0, smc_ib_modify_qp_reset() was replaced by smc_ib_modify_qp_error(). And remove the timeout in smc_wr_tx_wait_no_pending_sends() since we need to wait for all pending WQEs done, or we may encounter use-after- free when handling CQEs. For IB device removal routine, we need to wait for all the QPs on that device been destroyed before we can destroy CQs on the device, or the refcount on smc_connection won't reach 0 and smc_sock cannot be released.
CVE-2021-46926	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: intel-sdw-acpi: harden detection of controller The existing code currently sets a pointer to an ACPI handle before checking that it's actually a SoundWire controller. This can lead to issues where the graph walk continues and eventually fails, but the pointer was set already. This patch changes the logic so that the information provided to the caller is set when a controller is found.
CVE-2021-46929	In the Linux kernel, the following vulnerability has been resolved: sctp: use call_rcu to free endpoint This patch is to delay the endpoint free by calling call_rcu() to fix another use-after-free issue in sctp_sock_dump(): BUG: KASAN: use-after-free in __lock_acquire+0x36d9/0x4c20 Call Trace: __lock_acquire+0x36d9/0x4c20 kernel/locking/lockdep.c:3218 lock_acquire+0x1ed/0x520 kernel/locking/lockdep.c:3844 __raw_spin_lock_bh include/linux/spinlock_api_smp.h:135 [inline] _raw_spin_lock_bh+0x31/0x40 kernel/locking/spinlock.c:168 spin_lock_bh include/linux/spinlock.h:334 [inline] __lock_sock+0x203/0x350 net/core/sock.c:2253 lock_sock_nested+0xfe/0x120 net/core/sock.c:2774 lock_sock include/net/sock.h:1492 [inline] sctp_sock_dump+0x122/0xb20 net/sctp/diag.c:324 sctp_for_each_transport+0x2b5/0x370 net/sctp/socket.c:5091 sctp_diag_dump+0x3ac/0x660 net/sctp/diag.c:527 __inet_diag_dump+0xa8/0x140 net/ipv4/inet_diag.c:1049 inet_diag_dump+0x9b/0x110 net/ipv4/inet_diag.c:1065 netlink_dump+0x606/0x1080 net/netlink/af_netlink.c:2244 __netlink_dump_start+0x59a/0x7c0 net/netlink/af_netlink.c:2352 netlink_dump_start include/linux/netlink.h:216 [inline] inet_diag_handler_cmd+0x2ce/0x3f0 net/ipv4/inet_diag.c:1170 __sock_diag_cmd net/core/sock_diag.c:232 [inline] sock_diag_rcv_msg+0x31d/0x410 net/core/sock_diag.c:263 netlink_rcv_skb+0x172/0x440 net/netlink/af_netlink.c:2477 sock_diag_rcv+0x2a/0x40 net/core/sock_diag.c:274 This issue occurs when asoc is peeled off and the old sk is freed after getting it by asoc->base.sk and before calling lock_sock(sk). To prevent the sk free, as a holder of the sk, ep should be alive when calling lock_sock(). This patch uses call_rcu() and moves sock_put and ep free into sctp_endpoint_destroy_rcu(), so that it's safe to try to hold the ep under rcu_read_lock in sctp_transport_traverse_process(). If sctp_endpoint_hold() returns true, it means this ep is still alive and we have held it and can continue to dump it; If it returns false, it means this ep is dead and can be freed after rcu_read_unlock, and we should skip it. In sctp_sock_dump(), after locking the sk, if this ep is different from tsp->asoc->ep, it means during this dumping, this asoc was peeled off before calling lock_sock(), and the sk should be skipped; If this ep is the same with tsp->asoc->ep, it means no peeloff happens on this asoc, and due to lock_sock, no peeloff will happen either until release_sock. Note that delaying endpoint free won't delay the port release, as the port release happens in sctp_endpoint_destroy() before calling call_rcu(). Also, freeing endpoint by call_rcu() makes it safe to access the sk by asoc->base.sk in sctp_assocs_seq_show() and sctp_rcv(). Thanks Jones to bring this issue up. v1->v2: - improve the changelog. - add kfree(ep) into sctp_endpoint_destroy_rcu(), as Jakub noticed.

CVE ID	Description
CVE-2021-46932	In the Linux kernel, the following vulnerability has been resolved: Input: appletouch - initialize work before device registration Syzbot has reported warning in __flush_work(). This warning is caused by work->func == NULL, which means missing work initialization. This may happen, since input_dev->close() calls cancel_work_sync(&dev->work), but dev->work initialization happens _after_ input_register_device() call. So this patch moves dev->work initialization before registering input device
CVE-2021-46937	In the Linux kernel, the following vulnerability has been resolved: mm/damon/dbgfs: fix 'struct pid' leaks in 'dbgfs_target_ids_write()' DAMON debugfs interface increases the reference counts of 'struct pid's for targets from the 'target_ids' file write callback ('dbgfs_target_ids_write()'), but decreases the counts only in DAMON monitoring termination callback ('dbgfs_before_terminate()'). Therefore, when 'target_ids' file is repeatedly written without DAMON monitoring start/termination, the reference count is not decreased and therefore memory for the 'struct pid' cannot be freed. This commit fixes this issue by decreasing the reference counts when 'target_ids' is written.
CVE-2021-46960	In the Linux kernel, the following vulnerability has been resolved: cifs: Return correct error code from smb2_get_enc_key Avoid a warning if the error percolates back up: [440700.376476] CIFS VFS: \\\otters.example.com crypt_message: Could not get encryption key [440700.386947] ----- [cut here]----- [440700.386948] err = 1 [440700.386977] WARNING: CPU: 11 PID: 2733 at /build/linux-hwe-5.4-p6lk6L/linux-hwe-5.4-5.4.0/lib/errseq.c:74 errseq_set+0x5c/0x70 ... From the call trace, we can find three interrupts (noted A, B, C above): interrupt (A) is preempted by (B), which is further interrupted by (C). Subsequent investigations show that (B) results in nmi_enter() being called, but that it actually is a spurious interrupt. Furthermore, interrupts are reenabled in the context of (B), and (C) fires with NMI priority. We end-up with a nested NMI situation, something we definitely do not want to (and cannot) handle. The bug here is that spurious interrupts should never result in any state change, and we should just return to the interrupted context. Moving the handling of spurious interrupts as early as possible in the GICv3 handler fixes this issue. [maz: rewrote commit message, corrected Fixes: tag]

CVE ID	Description
CVE-2021-46963	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Fix crash in qla2xxx_mqueuecommand() RIP: 0010:kmem_cache_free+0xfa/0x1b0 Call Trace: qla2xxx_mqueuecommand+0x2b5/0x2c0 [qla2xxx] scsi_queue_rq+0x5e2/0xa40 __blk_mq_try_issue_directly+0x128/0x1d0 blk_mq_request_issue_directly+0x4e/0xb0 Fix incorrect call to free srb in qla2xxx_mqueuecommand(), as srb is now allocated by upper layers. This fixes smatch warning of srb unintended free.
CVE-2021-46973	In the Linux kernel, the following vulnerability has been resolved: net: qrtr: Avoid potential use after free in MHI send It is possible that the MHI ul_callback will be invoked immediately following the queueing of the skb for transmission, leading to the callback decrementing the refcount of the associated sk and freeing the skb. As such the dereference of skb and the increment of the sk refcount must happen before the skb is queued, to avoid the skb to be used after free and potentially the sk to drop its last refcount..
CVE-2021-46976	In the Linux kernel, the following vulnerability has been resolved: drm/i915: Fix crash in auto_retire The retire logic uses the 2 lower bits of the pointer to the retire function to store flags. However, the auto_retire function is not guaranteed to be aligned to a multiple of 4, which causes crashes as we jump to the wrong address, for example like this: 2021-04-24T18:03:53.804300Z WARNING kernel: [516.876901] invalid opcode: 0000 [#1] PREEMPT SMP NOPTI 2021-04-24T18:03:53.804310Z WARNING kernel: [516.876906] CPU: 7 PID: 146 Comm: kworker/u16:6 Tainted: G U 5.4.105-13595-g3cd84167b2df #1 2021-04-24T18:03:53.804311Z WARNING kernel: [516.876907] Hardware name: Google Volteer2/Volteer2, BIOS Google_Volteer2.13672.76.0 02/22/2021 2021-04-24T18:03:53.804312Z WARNING kernel: [516.876911] Workqueue: events_unbound active_work 2021-04-24T18:03:53.804313Z WARNING kernel: [516.876914] RIP: 0010:auto_retire+0x1/0x20 2021-04-24T18:03:53.804314Z WARNING kernel: [516.876916] Code: e8 01 f2 ff ff eb 02 31 db 48 89 d8 5b 5d c3 0f 1f 44 00 00 55 48 89 e5 f0 ff 87 c8 00 00 00 0f 8b ab 47 4a 00 31 c0 5d c3 0f <1f> 44 00 00 55 48 89 e5 f0 ff 8f c8 00 00 00 0f 88 9a 47 4a 00 74 2021-04-24T18:03:53.804319Z WARNING kernel: [516.876918] RSP: 0018:ffff9b4d809fbc38 EFLAGS: 00010286 2021-04-24T18:03:53.804320Z WARNING kernel: [516.876919] RAX: 0000000000000007 RBX: ffff927915079600 RCX: 0000000000000007 2021-04-24T18:03:53.804320Z WARNING kernel: [516.876921] RDX: ffff9b4d809fbc40 RSI: 0000000000000286 RDI: ffff927915079600 2021-04-24T18:03:53.804321Z WARNING kernel: [516.876922] RBP: ffff9b4d809fbc68 R08: 8080808080808080 R09: fefefefefefeff 2021-04-24T18:03:53.804321Z WARNING kernel: [516.876924] R10: 0000000000000010 R11: ffffffff92e44bd8 R12: ffff9279150796a0 2021-04-24T18:03:53.804322Z WARNING kernel: [516.876925] R13: ffff92791c368180 R14: ffff927915079640 R15: 000000001c867605 2021-04-24T18:03:53.804323Z WARNING kernel: [516.876926] FS: 0000000000000000(0000) GS:ffff92791ffc0000(0000) knlGS:0000000000000000 2021-04-24T18:03:53.804323Z WARNING kernel: [516.876928] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 2021-04-24T18:03:53.804324Z WARNING kernel: [516.876929] CR2: 0000239514955000 CR3: 000000007f82da001 CR4: 0000000000760ee0 2021-04-24T18:03:53.804325Z WARNING kernel: [516.876930] PKRU: 55555554 2021-04-24T18:03:53.804325Z WARNING kernel: [516.876931] Call Trace: 2021-04-24T18:03:53.804326Z WARNING kernel: [516.876935] __active_retire+0x77/0xcf 2021-04-24T18:03:53.804326Z WARNING kernel: [516.876939] process_one_work+0x1da/0x394 2021-04-24T18:03:53.804327Z WARNING kernel: [516.876941] worker_thread+0x216/0x375 2021-04-24T18:03:53.804327Z WARNING kernel: [516.876944] kthread+0x147/0x156 2021-04-24T18:03:53.804335Z WARNING kernel: [516.876946] ? pr_cont_work+0x58/0x58 2021-04-24T18:03:53.804335Z WARNING kernel: [516.876948] ? kthread_blkcg+0x2e/0x2e 2021-04-24T18:03:53.804336Z WARNING kernel: [516.876950] ret_from_fork+0x1f/0x40 2021-04-24T18:03:53.804336Z WARNING kernel: [516.876952] Modules linked in: cdc_mbim cdc_ncm cdc_wdm xt_cgroup rfcomm cmac algif_hash algif_skcipher af_alg xt_MASQUERADE uinput snd_soc_rt5682_sdw snd_soc_rt5682 snd_soc_max98373_sdw snd_soc_max98373 snd_soc_rl6231 regmap_sdw snd_soc_sof_sdw snd_soc_hdac_hdmi snd_soc_dmic snd_hda_codec_hdmi snd_sof_pci snd_sof_intel_hda_common intel_ipu6_psys snd_sof_xtensa_dsp soundwire_intel soundwire_generic_allocation soundwire_cadence snd_sof_intel_hda snd_sof snd_soc_hdac_hda snd_soc_acpi_intel_match snd_soc_acpi snd_hda_ext_core soundwire_bus snd_hda_intel snd_intel_dspcfg snd_hda_codec snd_hwdep snd_hda_core intel_ipu6_isys videobuf2_dma_contig videobuf2_v4l2 videobuf2_common videobuf2_memops mei_hdcp intel_ipu6 ov2740 ov8856 at24 sx9310 dw9768 v4l2_fwnode cros_ec_typec intel_pmc_mux roles acpi_als typec fuse iio_trig_sysfs cros_ec_light_prox cros_ec_lid_angle cros_ec_sensors cros ---truncated---

CVE ID	Description
CVE-2021-46978	In the Linux kernel, the following vulnerability has been resolved: KVM: nVMX: Always make an attempt to map eVMCS after migration When enlightened VMCS is in use and nested state is migrated with vmx_get_nested_state()/vmx_set_nested_state() KVM can't map evmcs page right away: evmcs gpa is not 'struct kvm_vmx_nested_state_hdr' and we can't read it from VP assist page because userspace may decide to restore HV_X64_MSR_VP_ASSIST_PAGE after restoring nested state (and QEMU, for example, does exactly that). To make sure eVMCS is mapped / vmx_set_nested_state() raises KVM_REQ_GET_NESTED_STATE_PAGES request. Commit f2c7ef3ba955 ("KVM: nSVM: cancel KVM_REQ_GET_NESTED_STATE_PAGES on nested vmexit") added KVM_REQ_GET_NESTED_STATE_PAGES clearing to nested_vmx_vmxexit() to make sure MSR permission bitmap is not switched when an immediate exit from L2 to L1 happens right after migration (caused by a pending event, for example). Unfortunately, in the exact same situation we still need to have eVMCS mapped so nested_sync_vmcs12_to_shadow() reflects changes in VMCS12 to eVMCS. As a band-aid, restore nested_get_evmcs_page() when clearing KVM_REQ_GET_NESTED_STATE_PAGES in nested_vmx_vmxexit(). The 'fix' is far from being ideal as we can't easily propagate possible failures and even if we could, this is most likely already too late to do so. The whole 'KVM_REQ_GET_NESTED_STATE_PAGES' idea for mapping eVMCS after migration seems to be fragile as we diverge too much from the 'native' path when vmptr loading happens on vmx_set_nested_state().
CVE-2021-46988	In the Linux kernel, the following vulnerability has been resolved: userfaultfd: release page in error path to avoid BUG_ON Consider the following sequence of events: 1. Userspace issues a UFFD ioctl, which ends up calling into shmem_mfill_atomic_pte(). We successfully account the blocks, we shmem_alloc_page(), but then the copy_from_user() fails. We return -ENOENT. We don't release the page we allocated. 2. Our caller detects this error code, tries the copy_from_user() after dropping the mmap_lock, and retries, calling back into shmem_mfill_atomic_pte(). 3. Meanwhile, let's say another process filled up the tmpfs being used. 4. So shmem_mfill_atomic_pte() fails to account blocks this time, and immediately returns - without releasing the page. This triggers a BUG_ON in our caller, which asserts that the page should always be consumed, unless -ENOENT is returned. To fix this, detect if we have such a "dangling" page when accounting fails, and if so, release it before returning.
CVE-2021-46997	In the Linux kernel, the following vulnerability has been resolved: arm64: entry: always set GIC_PRIO_PSR_I_SET during entry Zenghui reports that booting a kernel with "irqchip.gicv3_pseudo_nmi=1" on the command line hits a warning during kernel entry, due to the way we manipulate the PMR. Early in the entry sequence, we call lockdep_hardirqs_off() to inform lockdep that interrupts have been masked (as the HW sets DAIF when entering an exception). Architecturally PMR_EL1 is not affected by exception entry, and we don't set GIC_PRIO_PSR_I_SET in the PMR early in the exception entry sequence, so early in exception entry the PMR can indicate that interrupts are unmasked even though they are masked by DAIF. If DEBUG_LOCKDEP is selected, lockdep_hardirqs_off() will check that interrupts are masked, before we set GIC_PRIO_PSR_I_SET in any of the exception entry paths, and hence lockdep_hardirqs_off() will WARN() that something is amiss. We can avoid this by consistently setting GIC_PRIO_PSR_I_SET during exception entry so that kernel code sees a consistent environment. We must also update local_daif_inherit() to undo this, as currently only touches DAIF. For other paths, local_daif_restore() will update both DAIF and the PMR. With this done, we can remove the existing special cases which set this later in the entry code. We always use (GIC_PRIO_IRQON GIC_PRIO_PSR_I_SET) for consistency with local_daif_save(), as this will warn if it ever encounters (GIC_PRIO_IRQOFF GIC_PRIO_PSR_I_SET), and never sets this itself. This matches the gic_prio_kentry_setup that we have to retain for ret_to_user. The original splat from Zenghui's report was: DEBUG_LOCKS_WARN_ON(!irqs_disabled()) WARNING: CPU: 3 PID: 125 at kernel/locking/lockdep.c:4258 lockdep_hardirqs_off+0xd4/0xe8 Modules linked in: CPU: 3 PID: 125 Comm: modprobe Tainted: G W 5.12.0-rc8+ #463 Hardware name: QEMU KVM Virtual Machine, BIOS 0.0.0 02/06/2015 pstate: 604003c5 (nZCv DAIF +PAN -UAO -TCO BTYPE=--) pc : lockdep_hardirqs_off+0xd4/0xe8 lr : lockdep_hardirqs_off+0xd4/0xe8 sp : ffff80002a39bad0 pmr_save: 000000e0 x29: ffff80002a39bad0 x28: ffff0000de214bc0 x27: ffff0000de1c0400 x26: 000000000049b328 x25: 0000000000406f30 x24: ffff0000de1c00a0 x23: 0000000020400005 x22: ffff8000105f747c x21: 0000000096000044 x20: 0000000000498ef9 x19: ffff80002a39bc88 x18: ffffffff7fffffff x17: 0000000000000000 x16: ffff800011c61eb0 x15: ffff800011700a88 x14: 0720072007200720 x13: 0720072007200720 x12: 0720072007200720 x11: 0720072007200720 x10: 0720072007200720 x9: ffff80002a39bad0 x8: ffff80002a39bad0 x7: ffff8000119f0800 x6: c0000000ffff7fff x5: ffff8000119f07a8 x4: 0000000000000001 x3: 9bcdab23f2432800 x2: ffff800011730538 x1: 9bcdab23f2432800 x0: 0000000000000000 Call trace: lockdep_hardirqs_off+0xd4/0xe8 enter_from_kernel_mode.isra.5+0x7c/0xa8 el1_abort+0x24/0x100 el1_sync_handler+0x80/0xd0 el1_sync+0x6c/0x100 __arch_clear_user+0xc/0x90 load_elf_binary+0x9fc/0x1450 bprm_execve+0x404/0x880 kernel_execve+0x180/0x188 call_usermodehelper_exec_async+0xdc/0x158 ret_from_fork+0x10/0x18

CVE ID	Description
CVE-2021-46999	In the Linux kernel, the following vulnerability has been resolved: sctp: do asoc update earlier in sctp_sf_do_dupcook_a There's a panic that occurs in a few of envs, the call trace is as below: [] general protection fault, ... 0x29acd70f1000a: 0000 [#1] SMP PTI [] RIP: 0010:sctp_ulpevent_notify_peer_addr_change+0x4b/0x1fa [sctp] [] sctp_assoc_control_transport+0x1b9/0x210 [sctp] [] sctp_do_8_2_transport_strike.isra.16+0x15c/0x220 [sctp] [] sctp_cmd_interpreter.isra.21+0x1231/0x1a10 [sctp] [] sctp_do_sm+0xc3/0x2a0 [sctp] [] sctp_generate_timeout_event+0x81/0xf0 [sctp] This is caused by a transport use-after-free issue. When processing a duplicate COOKIE-ECHO chunk in sctp_sf_do_dupcook_a(), both COOKIE-ACK and SHUTDOWN chunks are allocated with the transport from the new asoc. However, later in the sideeffect machine, the old asoc is used to send them out and old asoc's shutdown_last_sent_to is set to the transport that SHUTDOWN chunk attached to in sctp_cmd_setup_t2(), which actually belongs to the new asoc. After the new_asoc is freed and the old asoc T2 timeout, the old asoc's shutdown_last_sent_to that is already freed would be accessed in sctp_sf_t2_timer_expire(). Thanks Alexander and Jere for helping dig into this issue. To fix it, this patch is to do the asoc update first, then allocate the COOKIE-ACK and SHUTDOWN chunks with the 'updated' old asoc. This would make more sense, as a chunk from an asoc shouldn't be sent out with another asoc. We had fixed quite a few issues caused by this.
CVE-2021-47001	In the Linux kernel, the following vulnerability has been resolved: xprtrdma: Fix cwnd update ordering After a reconnect, the reply handler is opening the cwnd (and thus enabling more RPC Calls to be sent) / before/ rprdma_post_recv() can post enough Receive WRs to receive their replies. This causes an RNR and the new connection is lost immediately. The race is most clearly exposed when KASAN and disconnect injection are enabled. This slows down rprdma_rep_create() enough to allow the send side to post a bunch of RPC Calls before the Receive completion handler can invoke ib_post_recv().
CVE-2021-47003	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix potential null dereference on pointer status There are calls to idxd_cmd_exec that pass a null status pointer however a recent commit has added an assignment to *status that can end up with a null pointer dereference. The function expects a null status pointer sometimes as there is a later assignment to *status where status is first null checked. Fix the issue by null checking status before making the assignment. Addresses-Coverity: ("Explicit null dereferenced")
CVE-2021-47010	In the Linux kernel, the following vulnerability has been resolved: net: Only allow init netns to set default tcp cong to a restricted algo tcp_set_default_congestion_control() is netns-safe in that it writes to &net->ipv4.tcp_congestion_control, but it also sets ca->flags = TCP_CONG_NON_RESTRICTED which is not namespaced. This has the unintended side-effect of changing the global net.ipv4.tcp_allowed_congestion_control sysctl, despite the fact that it is read-only: 97684f0970f6 ("net: Make tcp_allowed_congestion_control readonly in non-init netns") Resolve this netns "leak" by only allowing the init netns to set the default algorithm to one that is restricted. This restriction could be removed if tcp_allowed_congestion_control were namespace-ified in the future. This bug was uncovered with https://github.com/JonathonReinhart/linux-netns-sysctl-verify
CVE-2021-47011	In the Linux kernel, the following vulnerability has been resolved: mm: memcontrol: slab: fix obtain a reference to a freeing memcg Patch series "Use obj_cgroup APIs to charge kmem pages", v5. Since Roman's series "The new cgroup slab memory controller" applied. All slab objects are charged with the new APIs of obj_cgroup. The new APIs introduce a struct obj_cgroup to charge slab objects. It prevents long-living objects from pinning the original memory cgroup in the memory. But there are still some corner objects (e.g. allocations larger than order-1 page on SLUB) which are not charged with the new APIs. Those objects (include the pages which are allocated from buddy allocator directly) are charged as kmem pages which still hold a reference to the memory cgroup. E.g. We know that the kernel stack is charged as kmem pages because the size of the kernel stack can be greater than 2 pages (e.g. 16KB on x86_64 or arm64). If we create a thread (suppose the thread stack is charged to memory cgroup A) and then move it from memory cgroup A to memory cgroup B. Because the kernel stack of the thread hold a reference to the memory cgroup A. The thread can pin the memory cgroup A in the memory even if we remove the cgroup A. If we want to see this scenario by using the following script. We can see that the system has added 500 dying cgroups (This is not a real world issue, just a script to show that the large kmmallocs are charged as kmem pages which can pin the memory cgroup in the memory). #!/bin/bash cat /proc/cgroups grep memory cd /sys/fs/cgroup/memory echo 1 > memory.move_charge_at_immigrate for i in range{1..500} do mkdir kmem_test echo \$\$ > kmem_test/cgroup.procs sleep 3600 & echo \$\$ > cgroup.procs echo `cat kmem_test/cgroup.procs` > cgroup.procs rmdir kmem_test done cat /proc/cgroups grep memory This patchset aims to make those kmem pages to drop the reference to memory cgroup by using the APIs of obj_cgroup. Finally, we can see that the number of the dying cgroups will not increase if we run the above test script. This patch (of 7): The rcu_read_lock/unlock only can guarantee that the memcg will not be freed, but it cannot guarantee the success of css_get (which is in the refill_stock when cached memcg changed) to memcg. rcu_read_lock() memcg = obj_cgroup_memcg(old) __memcg_kmem_uncharge(memcg) refill_stock(memcg) if (stock->cached != memcg) // css_get can change the ref counter from 0 back to 1. css_get(&memcg->css) rcu_read_unlock() This fix is very like the commit: eefbfa7fd678 ("mm: memcg/slab: fix use after free in obj_cgroup_charge") Fix this by holding a reference to the memcg which is passed to the __memcg_kmem_uncharge() before calling __memcg_kmem_uncharge().

CVE ID	Description
CVE-2021-47012	In the Linux kernel, the following vulnerability has been resolved: RDMA/siw: Fix a use after free in siw_alloc_mr Our code analyzer reported a UAF. In siw_alloc_mr(), it calls siw_mr_add_mem(mr,...). In the implementation of siw_mr_add_mem(), mem is assigned to mr->mem and then mem is freed via kfree(mem) if xa_alloc_cyclic() failed. Here, mr->mem still point to a freed object. After, the execution continue up to the err_out branch of siw_alloc_mr, and the freed mr->mem is used in siw_mr_drop_mem(mr). My patch moves "mr->mem = mem" behind the if (xa_alloc_cyclic(<0>) {} section, to avoid the uaf.
CVE-2021-47014	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_ct: fix wild memory access when clearing fragments while testing re-assembly/re-fragmentation using act_ct, it's possible to observe a crash like the following one: KASAN: maybe wild-memory-access in range [0x0001000000000448-0x000100000000044f] CPU: 50 PID: 0 Comm: swapper/50 Tainted: G S 5.12.0-rc7+ #424 Hardware name: Dell Inc. Never overwrite the skb cb in case tcf_ct_handle_fragments() returns -EINPROGRESS.
CVE-2021-47017	In the Linux kernel, the following vulnerability has been resolved: ath10k: Fix a use after free in ath10k_htc_send_bundle In ath10k_htc_send_bundle, the bundle_skb could be freed by dev_kfree_skb_any(bundle_skb). But the bundle_skb is used later by bundle_skb->len. As skb_len = bundle_skb->len, my patch replaces bundle_skb->len to skb_len after the bundle_skb was freed.
CVE-2021-47020	In the Linux kernel, the following vulnerability has been resolved: soundwire: stream: fix memory leak in stream config error path When stream config is failed, master runtime will release all slave runtime in the slave_rt_list, but slave runtime is not added to the list at this time. This patch frees slave runtime in the config error path to fix the memory leak.
CVE-2021-47024	In the Linux kernel, the following vulnerability has been resolved: vsock/virtio: free queued packets when closing socket As reported by syzbot [1], there is a memory leak while closing the socket. We partially solved this issue with commit ac03046ece2b ("vsock/virtio: free packets during the socket release"), but we forgot to drain the RX queue when the socket is definitely closed by the scheduled work. To avoid future issues, let's use the new virtio_transport_remove_sock() to drain the RX queue before removing the socket from the af_vsock lists calling vsock_remove_sock(). [1] https://syzkaller.appspot.com/bug?extid=24452624fc4c571eadd9
CVE-2021-47036	In the Linux kernel, the following vulnerability has been resolved: udp: skip L4 aggregation for UDP tunnel packets If NETIF_F_GRO_FRAGLIST or NETIF_F_GRO_UDP_FWD are enabled, and there are UDP tunnels available in the system, udp_gro_receive() could end-up doing L4 aggregation (either SKB_GSO_UDP_L4 or SKB_GSO_FRAGLIST) at the outer UDP tunnel level for packets effectively carrying and UDP tunnel header. That could cause inner protocol corruption. If e.g. the relevant packets carry a vxlan header, different vxlan ids will be ignored/ aggregated to the same GSO packet. Inner headers will be ignored, too, so that e.g. TCP over vxlan push packets will be held in the GRO engine till the next flush, etc. Just skip the SKB_GSO_UDP_L4 and SKB_GSO_FRAGLIST code path if the current packet could land in a UDP tunnel, and let udp_gro_receive() do GRO via udp_sk(sk)->gro_receive. The check implemented in this patch is broader than what is strictly needed, as the existing UDP tunnel could be e.g. configured on top of a different device: we could end-up skipping GRO at all for some packets. Anyhow, that is a very thin corner case and covering it will add quite a bit of complexity. v1 -> v2: - hopefully clarify the commit message

CVE ID	Description
CVE-2021-47038	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: avoid deadlock between hci_dev->lock and socket lock Commit eab2404ba798 ("Bluetooth: Add BT_PHY socket option") added a dependency between socket lock and hci_dev->lock that could lead to deadlock. It turns out that hci_conn_get_phy() is not in any way relying on hdev being immutable during the runtime of this function, neither does it even look at any of the members of hdev, and as such there is no need to hold that lock. This fixes the lockdep splat below: <pre>===== WARNING: possible circular locking dependency detected 5.12.0-rc1-00026-g73d464503354 #10 Not tainted ----- bluetoothd/1118 is trying to acquire lock: ffff8f078383c078 (&hdev->lock){+..}-{3:3}, at: hci_conn_get_phy+0x1c/0x150 [bluetooth] but task is already holding lock: ffff8f07e831d920 (sk_lock-AF_BLUETOOTH-BTPROTO_L2CAP){+..}-{0:0}, at: l2cap_sock_getsockopt+0x8b/0x610 which lock already depends on the new lock. the existing dependency chain (in reverse order) is: -> #3 (sk_lock-AF_BLUETOOTH-BTPROTO_L2CAP){+..}- {0:0}: lock_sock_nested+0x72/0xa0 l2cap_sock_ready_cb+0x18/0x70 [bluetooth] l2cap_config_rsp +0x27a/0x520 [bluetooth] l2cap_sig_channel+0x658/0x1330 [bluetooth] l2cap_recv_frame +0x1ba/0x310 [bluetooth] hci_rx_work+0x1cc/0x640 [bluetooth] process_one_work+0x244/0x5f0 worker_thread+0x3c/0x380 kthread+0x13e/0x160 ret_from_fork+0x22/0x30 -> #2 (&chan- >lock#2/1){+..}-{3:3}: __mutex_lock+0xa3/0xa10 l2cap_chan_connect+0x33a/0x940 [bluetooth] l2cap_sock_connect+0x141/0x2a0 [bluetooth] __sys_connect+0x9b/0xc0 __x64_sys_connect +0x16/0x20 do_syscall_64+0x33/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae -> #1 (&conn- >chan_lock){+..}-{3:3}: __mutex_lock+0xa3/0xa10 l2cap_chan_connect+0x322/0x940 [bluetooth] l2cap_sock_connect+0x141/0x2a0 [bluetooth] __sys_connect+0x9b/0xc0 __x64_sys_connect +0x16/0x20 do_syscall_64+0x33/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae -> #0 (&hdev- >lock){+..}-{3:3}: __lock_acquire+0x147a/0x1a50 lock_acquire+0x277/0x3d0 __mutex_lock +0xa3/0xa10 hci_conn_get_phy+0x1c/0x150 [bluetooth] l2cap_sock_getsockopt+0x5a9/0x610 [bluetooth] __sys_getsockopt+0xcc/0x200 __x64_sys_getsockopt+0x20/0x30 do_syscall_64+0x33/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae other info that might help us debug this: Chain exists of: &hdev->lock --> &chan->lock#2/1 --> sk_lock-AF_BLUETOOTH-BTPROTO_L2CAP Possible unsafe locking scenario: CPU0 CPU1 ---- ---- lock(sk_lock-AF_BLUETOOTH-BTPROTO_L2CAP); lock(&chan->lock#2/1); lock(sk_lock-AF_BLUETOOTH-BTPROTO_L2CAP); lock(&hdev- >lock); *** DEADLOCK *** 1 lock held by bluetoothd/1118: #0: ffff8f07e831d920 (sk_lock- AF_BLUETOOTH-BTPROTO_L2CAP){+..}-{0:0}, at: l2cap_sock_getsockopt+0x8b/0x610 [bluetooth] stack backtrace: CPU: 3 PID: 1118 Comm: bluetoothd Not tainted 5.12.0-rc1-00026- g73d464503354 #10 Hardware name: LENOVO 20K5S22R00/20K5S22R00, BIOS R0IET38W (1.16) 05/31/2017 Call Trace: dump_stack+0x7f/0xa1 check_noncircular+0x105/0x120 ? __lock_acquire +0x147a/0x1a50 __lock_acquire+0x147a/0x1a50 lock_acquire+0x277/0x3d0 ? hci_conn_get_phy +0x1c/0x150 [bluetooth] ? __lock_acquire+0x2e1/0x1a50 ? lock_is_held_type+0xb4/0x120 ? hci_conn_get_phy+0x1c/0x150 [bluetooth] __mutex_lock+0xa3/0xa10 ? hci_conn_get_phy +0x1c/0x150 [bluetooth] ? lock_acquire+0x277/0x3d0 ? mark_held_locks+0x49/0x70 ? mark_held_locks+0x49/0x70 ? hci_conn_get_phy+0x1c/0x150 [bluetooth] hci_conn_get_phy+0x truncated---</pre>

CVE ID	Description
CVE-2021-47041	In the Linux kernel, the following vulnerability has been resolved: nvmet-tcp: fix incorrect locking in state_change sk callback We are not changing anything in the TCP connection state so we should not take a write_lock but rather a read lock. This caused a deadlock when running nvmet-tcp and nvme-tcp on the same system, where state_change callbacks on the host and on the controller side have causal relationship and made lockdep report on this with blktests: ===== WARNING: inconsistent lock state 5.12.0-rc3 #1 Tainted: G I ----- inconsistent {IN-SOFTIRQ-W} -> {SOFTIRQ-ON-R} usage. nvme/1324 [HC0[0]:SC0[0]:HE1:SE1] takes: ffff888363151000 (clock-AF_INET){++-?}-{2:2}, at: nvme_tcp_state_change+0x21/0x150 [nvme_tcp] {IN-SOFTIRQ-W} state was registered at: __lock_acquire+0x79b/0x18d0 lock_acquire+0x1ca/0x480 __raw_write_lock_bh+0x39/0x80 nvmet_tcp_state_change+0x21/0x170 [nvmet_tcp] tcp_fin+0x2a8/0x780 tcp_data_queue+0xf94/0x1f20 tcp_rcv_established+0x6ba/0x1f00 tcp_v4_do_rcv+0x502/0x760 tcp_v4_rcv+0x257e/0x3430 ip_protocol_deliver_rcu+0x69/0x6a0 ip_local_deliver_finish+0x1e2/0x2f0 ip_local_deliver+0x1a2/0x420 ip_rcv+0x4fb/0x6b0 __netif_receive_skb_one_core+0x162/0x1b0 process_backlog+0x1ff/0x770 __napi_poll.constprop.0+0xa9/0x5c0 net_rx_action+0x7b3/0xb30 __do_softirq+0x1f0/0x940 do_softirq+0xa1/0xd0 __local_bh_enable_ip+0xd8/0x100 ip_finish_output2+0x6b7/0x18a0 __ip_queue_xmit+0x706/0x1aa0 __tcp_transmit_skb+0x2068/0x2e20 tcp_write_xmit+0xc9e/0x2bb0 __tcp_push_pending_frames+0x92/0x310 inet_shutdown+0x158/0x300 __nvme_tcp_stop_queue+0x36/0x270 [nvme_tcp] nvme_tcp_stop_queue+0x87/0xb0 [nvme_tcp] nvme_tcp_teardown_admin_queue+0x69/0xe0 [nvme_tcp] nvme_do_delete_ctrl+0x100/0x10c [nvme_core] nvme_sysfs_delete.cold+0x8/0xd [nvme_core] kernfs_fop_write_iter+0x2c7/0x460 new_sync_write+0x36c/0x610 vfs_write+0x5c0/0x870 ksys_write+0xf9/0x1d0 do_syscall_64+0x33/0x40 entry_SYSCALL_64_after_hwframe+0x44/0xae irq event stamp: 10687 hardirqs last enabled at (10687): [<fffffff9ec376bd>] _raw_spin_unlock_irqrestore+0x2d/0x40 hardirqs last disabled at (10686): [<fffffff9ec374d8>] _raw_spin_lock_irqsave+0x68/0x90 softirqs last enabled at (10684): [<fffffff9f000608>] __do_softirq+0x608/0x940 softirqs last disabled at (10649): [<fffffff9cdedd31>] do_softirq+0xa1/0xd0 other info that might help us debug this: Possible unsafe locking scenario: CPU0 ---- lock(clock-AF_INET); <Interrupt> lock(clock-AF_INET); *** DEADLOCK *** 5 locks held by nvme/1324: #0: ffff8884a01fe470 (sb_writers#4) {+.+}-{0:0}, at: ksys_write+0xf9/0x1d0 #1: ffff8886e435c090 (&of->mutex){+.+}-{3:3}, at: kernfs_fop_write_iter+0x216/0x460 #2: ffff888104d90c38 (kn->active#255){++++}-{0:0}, at: kernfs_remove_self+0x22d/0x330 #3: ffff8884634538d0 (&queue->queue_lock){+.+}-{3:3}, at: nvme_tcp_stop_queue+0x52/0xb0 [nvme_tcp] #4: ffff888363150d30 (sk_lock-AF_INET) {+.+}-{0:0}, at: inet_shutdown+0x59/0x300 stack backtrace: CPU: 26 PID: 1324 Comm: nvme Tainted: G I 5.12.0-rc3 #1 Hardware name: Dell Inc. CVE-2021-47045	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix null pointer dereference in lpfc_prep_els_iocb() It is possible to call lpfc_issue_els_plogi() passing a did for which no matching ndlp is found. A call is then made to lpfc_prep_els_iocb() with a null pointer to a lpfc_nodelist structure resulting in a null pointer dereference. Fix by returning an error status if no valid ndlp is found. Fix up comments regarding ndlp reference counting.
CVE-2021-47070	In the Linux kernel, the following vulnerability has been resolved: uio_hv_generic: Fix another memory leak in error handling paths Memory allocated by 'vmbus_alloc_ring()' at the beginning of the probe function is never freed in the error handling path. Add the missing 'vmbus_free_ring()' call. Note that it is already freed in the .remove function.
CVE-2021-47071	In the Linux kernel, the following vulnerability has been resolved: uio_hv_generic: Fix a memory leak in error handling paths If 'vmbus_establish_gpadl()' fails, the (recv/send)_gpadl will not be updated and 'hv_uio_cleanup()' in the error handling path will not be able to free the corresponding buffer. In such a case, we need to free the buffer explicitly.
CVE-2021-47074	In the Linux kernel, the following vulnerability has been resolved: nvme-loop: fix memory leak in nvme_loop_create_ctrl() When creating loop ctrl in nvme_loop_create_ctrl(), if nvme_init_ctrl() fails, the loop ctrl should be freed before jumping to the "out" label.
CVE-2021-47075	In the Linux kernel, the following vulnerability has been resolved: nvmet: fix memory leak in nvmet_alloc_ctrl() When creating ctrl in nvmet_alloc_ctrl(), if the cntlid_min is larger than cntlid_max of the subsystem, and jumps to the "out_free_changed_ns_list" label, but the ctrl->sqs lack of be freed. Fix this by jumping to the "out_free_sqs" label.

CVE ID	Description
CVE-2021-47077	In the Linux kernel, the following vulnerability has been resolved: scsi: qedf: Add pointer checks in qedf_update_link_speed() The following trace was observed: [14.042059] Call Trace: [14.042061] <IRQ> [14.042068] qedf_link_update+0x144/0x1f0 [qedf] [14.042117] qed_link_update+0x5c/0x80 [qed] [14.042135] qed_mcp_handle_link_change+0x2d2/0x410 [qed] [14.042155] ? qed_set_ptt+0x70/0x80 [qed] [14.042170] ? qed_set_ptt+0x70/0x80 [qed] [14.042186] ? qed_rd+0x13/0x40 [qed] [14.042205] qed_mcp_handle_events+0x437/0x690 [qed] [14.042221] ? qed_set_ptt+0x70/0x80 [qed] [14.042239] qed_int_sp_dpc+0x3a6/0x3e0 [qed] [14.042245] tasklet_action_common.isra.14+0x5a/0x100 [14.042250] __do_softirq+0xe4/0x2f8 [14.042253] irq_exit+0xf7/0x100 [14.042255] do_IRQ+0x7f/0xd0 [14.042257] common_interrupt+0xf/0xf [14.042259] </IRQ> API qedf_link_update() is getting called from QED but by that time shost_data is not initialised. This results in a NULL pointer dereference when we try to dereference shost_data while updating supported_speeds. Add a NULL pointer check before dereferencing shost_data.
CVE-2021-47078	In the Linux kernel, the following vulnerability has been resolved: RDMA/rxe: Clear all QP fields if creation failed rxe_qp_do_cleanup() relies on valid pointer values in QP for the properly created ones, but in case rxe_qp_from_init() failed it was filled with garbage and caused tot the following error. refcount_t: underflow; use-after-free. CVE-2021-47079	In the Linux kernel, the following vulnerability has been resolved: platform/x86: ideapad-laptop: fix a NULL pointer dereference The third parameter of dytc_cql_command should not be NULL since it will be dereferenced immediately.

CVE ID	Description
CVE-2021-47092	In the Linux kernel, the following vulnerability has been resolved: KVM: VMX: Always clear vmx->fail on emulation_required Revert a relatively recent change that set vmx->fail if the vCPU is in L2 and emulation_required is true, as that behavior is completely bogus. Setting vmx->fail and synthesizing a VM-Exit is contradictory and wrong: (a) it's impossible to have both a VM-Fail and VM-Exit (b) vmcs.EXIT_REASON is not modified on VM-Fail (c) emulation_required refers to guest state and guest state checks are always VM-Exits, not VM-Fails. For KVM specifically, emulation_required is handled before nested exits in __vmx_handle_exit(), thus setting vmx->fail has no immediate effect, i.e. KVM calls into handle_invalid_guest_state() and vmx->fail is ignored. Setting vmx->fail can ultimately result in a WARN in nested_vmx_vmexit() firing when tearing down the VM as KVM never expects vmx->fail to be set when L2 is active, KVM always reflects those errors into L1. <pre> -----[cut here]----- WARNING: CPU: 0 PID: 21158 at arch/x86/kvm/vmx/nested.c:4548 nested_vmx_vmexit+0x16bd/0x17e0 arch/x86/kvm/vmx/nested.c:4547 Modules linked in: CPU: 0 PID: 21158 Comm: syz-executor.1 Not tainted 5.16.0-rc3-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:nested_vmx_vmexit +0x16bd/0x17e0 arch/x86/kvm/vmx/nested.c:4547 Code: <0f> 0b e9 2e f8 ff ff e8 57 b3 5d 00 0f 0b e9 00 f1 ff ff 89 e9 80 Call Trace: vmx_leave_nested arch/x86/kvm/vmx/nested.c:6220 [inline] nested_vmx_free_vcpu+0x83/0xc0 arch/x86/kvm/vmx/nested.c:330 vmx_free_vcpu +0x11f/0x2a0 arch/x86/kvm/vmx/vmx.c:6799 kvm_arch_vcpu_destroy+0x6b/0x240 arch/x86/ kvm/x86.c:10989 kvm_vcpu_destroy+0x29/0x90 arch/x86/kvm/../../../../virt/kvm/kvm_main.c:441 kvm_free_vcpus arch/x86/kvm/x86.c:11426 [inline] kvm_arch_destroy_vm+0x3ef/0x6b0 arch/ x86/kvm/x86.c:11545 kvm_destroy_vm arch/x86/kvm/../../../../virt/kvm/kvm_main.c:1189 [inline] kvm_put_kvm+0x751/0xe40 arch/x86/kvm/../../../../virt/kvm/kvm_main.c:1220 kvm_vcpu_release +0x53/0x60 arch/x86/kvm/../../../../virt/kvm/kvm_main.c:3489 __fput+0x3fc/0x870 fs/file_table.c:280 task_work_run+0x146/0x1c0 kernel/task_work.c:164 exit_task_work include/linux/task_work.h:32 [inline] do_exit+0x705/0x24f0 kernel/exit.c:832 do_group_exit+0x168/0x2d0 kernel/exit.c:929 get_signal+0x1740/0x2120 kernel/signal.c:2852 arch_do_signal_or_restart+0x9c/0x730 arch/x86/kernel/ signal.c:868 handle_signal_work kernel/entry/common.c:148 [inline] exit_to_user_mode_loop kernel/ entry/common.c:172 [inline] exit_to_user_mode_prepare+0x191/0x220 kernel/entry/common.c:207 __syscall_exit_to_user_mode_work kernel/entry/common.c:289 [inline] syscall_exit_to_user_mode +0x2e/0x70 kernel/entry/common.c:300 do_syscall_64+0x53/0xd0 arch/x86/entry/common.c:86 entry_SYSCALL_64_after_hwframe+0x44/0xae </pre>

CVE ID	Description
CVE-2021-47094	In the Linux kernel, the following vulnerability has been resolved: KVM: x86/mmu: Don't advance iterator after restart due to yielding After dropping mmu_lock in the TDP MMU, restart the iterator during tdp_iter_next() and do not advance the iterator. Advancing the iterator results in skipping the top-level SPTE and all its children, which is fatal if any of the skipped SPTEs were not visited before yielding. When zapping all SPTEs, i.e. when min_level == root_level, restarting the iter and then invoking tdp_iter_next() is always fatal if the current gfn has as a valid SPTE, as advancing the iterator results in try_step_side() skipping the current gfn, which wasn't visited before yielding. Sprinkle WARNs on iter->yielded being true in various helpers that are often used in conjunction with yielding, and tag the helper with __must_check to reduce the probability of improper usage. Failing to zap a top-level SPTE manifests in one of two ways. If a valid SPTE is skipped by both kvm_tdp_mmu_zap_all() and kvm_tdp_mmu_put_root(), the shadow page will be leaked and KVM will WARN accordingly. WARNING: CPU: 1 PID: 3509 at arch/x86/kvm/mmu/tdp_mmu.c:46 [kvm] RIP: 0010:kvm_mmu_uninit_tdp_mmu+0x3e/0x50 [kvm] Call Trace: <TASK> kvm_arch_destroy_vm+0x130/0x1b0 [kvm] kvm_destroy_vm+0x162/0x2a0 [kvm] kvm_vcpu_release+0x34/0x60 [kvm] __fput+0x82/0x240 task_work_run+0x5c/0x90 do_exit+0x364/0xa10 ? futex_unqueue+0x38/0x60 do_group_exit+0x33/0xa0 get_signal+0x155/0x850 arch_do_signal_or_restart+0xed/0x750 exit_to_user_mode_prepare+0xc5/0x120 syscall_exit_to_user_mode+0x1d/0x40 do_syscall_64+0x48/0xc0 entry_SYSCALL_64_after_hwframe+0x44/0xae If kvm_tdp_mmu_zap_all() skips a gfn/SPTE but that SPTE is then zapped by kvm_tdp_mmu_put_root(), KVM triggers a use-after-free in the form of marking a struct page as dirty/ accessed after it has been put back on the free list. This directly triggers a WARN due to encountering a page with page_count() == 0, but it can also lead to data corruption and additional errors in the kernel. WARNING: CPU: 7 PID: 1995658 at arch/x86/kvm/../../../virt/kvm/kvm_main.c:171 RIP: 0010:kvm_is_zone_device_pfn.part.0+0x9e/0xd0 [kvm] Call Trace: <TASK> kvm_set_pfn_dirty+0x120/0x1d0 [kvm] __handle_changed_spte+0x92e/0xca0 [kvm] __handle_changed_spte+0x63c/0xca0 [kvm] __handle_changed_spte+0x63c/0xca0 [kvm] __handle_changed_spte+0x63c/0xca0 [kvm] zap_gfn_range+0x549/0x620 [kvm] kvm_tdp_mmu_put_root+0x1b6/0x270 [kvm] mmu_free_root_page+0x219/0x2c0 [kvm] kvm_mmu_free_roots+0x1b4/0x4e0 [kvm] kvm_mmu_unload+0x1c/0xa0 [kvm] kvm_arch_destroy_vm+0x1f2/0x5c0 [kvm] kvm_put_kvm+0x3b1/0x8b0 [kvm] kvm_vcpu_release+0x4e/0x70 [kvm] __fput+0x1f7/0x8c0 task_work_run+0xf8/0x1a0 do_exit+0x97b/0x2230 do_group_exit+0xda/0x2a0 get_signal+0x3be/0x1e50 arch_do_signal_or_restart+0x244/0x17f0 exit_to_user_mode_prepare+0xcb/0x120 syscall_exit_to_user_mode+0x1d/0x40 do_syscall_64+0x4d/0x90 entry_SYSCALL_64_after_hwframe+0x44/0xae Note, the underlying bug existed even before commit 1af4a96025b3 ("KVM: x86/mmu: Yield in TDU MMU iter even if no SPTEs changed") moved calls to tdp_mmu_iter_cond_resched() to the beginning of loops, as KVM could still incorrectly advance past a top-level entry when yielding on a lower-level entry. But with respect to leaking shadow pages, the bug was introduced by yielding before processing the current gfn. Alternatively, tdp_mmu_iter_cond_resched() could simply fall through, or callers could jump to their "retry" label. The downside of that approach is that tdp_mmu_iter_cond_resched() __must__ be called before anything else in the loop, and there's no easy way to enforce that requirement. Ideally, KVM would handling the cond_resched() fully within the iterator macro (the code is actually quite clean) and avoid this entire class of bugs, but that is extremely difficult do wh ---truncated---

CVE ID	Description
CVE-2021-47103	In the Linux kernel, the following vulnerability has been resolved: inet: fully convert sk->sk_rx_dst to RCU rules syzbot reported various issues around early demux, one being included in this changelog [1] sk->sk_rx_dst is using RCU protection without clearly documenting it. And following sequences in tcp_v4_do_rcv()/tcp_v6_do_rcv() are not following standard RCU rules. [a] dst_release(dst); [b] sk->sk_rx_dst = NULL; They look wrong because a delete operation of RCU protected pointer is supposed to clear the pointer before the call_rcu()/synchronize_rcu() guarding actual memory freeing. In some cases indeed, dst could be freed before [b] is done. We could cheat by clearing sk_rx_dst before calling dst_release(), but this seems the right time to stick to standard RCU annotations and debugging facilities. [1] BUG: KASAN: use-after-free in dst_check include/net/dst.h:470 [inline] BUG: KASAN: use-after-free in tcp_v4_early_demux +0x95b/0x960 net/ipv4/tcp_ipv4.c:1792 Read of size 2 at addr ffff88807f1cb73a by task syz-executor.5/9204 CPU: 0 PID: 9204 Comm: syz-executor.5 Not tainted 5.16.0-rc5-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 Call Trace: <TASK> __dump_stack lib/dump_stack.c:88 [inline] dump_stack_lvl +0xcd/0x134 lib/dump_stack.c:106 print_address_description.constprop.0.cold+0x8d/0x320 mm/kasan/report.c:247 __kasan_report mm/kasan/report.c:433 [inline] kasan_report.cold+0x83/0xdf mm/kasan/report.c:450 dst_check include/net/dst.h:470 [inline] tcp_v4_early_demux+0x95b/0x960 net/ipv4/tcp_ipv4.c:1792 ip_rcv_finish_core.constprop.0+0x15de/0x1e80 net/ipv4/ip_input.c:340 ip_list_rcv_finish.constprop.0+0x1b2/0x6e0 net/ipv4/ip_input.c:583 ip_sublist_rcv net/ipv4/ip_input.c:609 [inline] ip_list_rcv+0x34e/0x490 net/ipv4/ip_input.c:644 __netif_receive_skb_list_ptype net/core/dev.c:5508 [inline] __netif_receive_skb_list_core+0x549/0x8e0 net/core/dev.c:5556 __netif_receive_skb_list net/core/dev.c:5608 [inline] netif_receive_skb_list_internal+0x75e/0xd80 net/core/dev.c:5699 gro_normal_list net/core/dev.c:5853 [inline] gro_normal_list net/core/dev.c:5849 [inline] napi_complete_done+0x1f1/0x880 net/core/dev.c:6590 virtqueue_napi_complete drivers/net/virtio_net.c:339 [inline] virtnet_poll+0xca2/0x11b0 drivers/net/virtio_net.c:1557 __napi_poll +0xaf/0x440 net/core/dev.c:7023 napi_poll net/core/dev.c:7090 [inline] net_rx_action+0x801/0xb40 net/core/dev.c:7177 __do_softirq+0x29b/0x9c2 kernel/softirq.c:558 invoke_softirq kernel/softirq.c:432 [inline] __irq_exit_rcu+0x123/0x180 kernel/softirq.c:637 irq_exit_rcu+0x5/0x20 kernel/softirq.c:649 common_interrupt+0x52/0xc0 arch/x86/kernel/irq.c:240 asm_common_interrupt+0x1e/0x40 arch/x86/include/asm/idtentry.h:629 RIP: 0033:0x7f5e972bfd57 Code: 39 d1 73 14 0f 1f 80 00 00 00 00 48 8b 50 f8 48 83 e8 08 48 39 ca 77 f3 48 39 c3 73 3e 48 89 13 48 8b 50 f8 48 89 38 49 8b 0e <48> 8b 3e 48 83 c3 08 48 83 c6 08 eb bc 48 39 d1 72 9e 48 39 d0 73 RSP: 002b:00007fff8a413210 EFLAGS: 00000283 RAX: 00007f5e97108990 RBX: 00007f5e97108338 RCX: ffffffff81d3aa45 RDX: ffffffff81d3aa45 RSI: 00007f5e97108340 RDI: ffffffff81d3aa45 RBP: 00007f5e97107eb8 R08: 00007f5e97108d88 R09: 0000000093c2e8d9 R10: 0000000000000000 R11: 0000000000000000 R12: 00007f5e97107eb0 R13: 00007f5e97108338 R14: 00007f5e97107ea8 R15: 0000000000000019 </TASK> Allocated by task 13: kasan_save_stack+0x1e/0x50 mm/kasan/common.c:38 kasan_set_track mm/kasan/common.c:46 [inline] set_alloc_info mm/kasan/common.c:434 [inline] __kasan_slab_alloc+0x90/0xc0 mm/kasan/common.c:467 kasan_slab_alloc include/linux/kasan.h:259 [inline] slab_post_alloc_hook mm/slab.h:519 [inline] slab_alloc_node mm/slub.c:3234 [inline] slab_alloc mm/slub.c:3242 [inline] kmem_cache_alloc +0x202/0x3a0 mm/slub.c:3247 dst_alloc+0x146/0x1f0 net/core/dst.c:92 rt_dst_alloc+0x73/0x430 net/ipv4/route.c:1613 ip_route_input_slow+0x1817/0x3a20 net/ipv4/route.c:234 ---truncated---
CVE-2021-47116	In the Linux kernel, the following vulnerability has been resolved: ext4: fix memory leak in ext4_mb_init_backend on error path. Fix a memory leak discovered by syzbot when a file system is corrupted with an illegally large s_log_groups_per_flex.
CVE-2021-47120	In the Linux kernel, the following vulnerability has been resolved: HID: magicmouse: fix NULL-deref on disconnect Commit 9d7b18668956 ("HID: magicmouse: add support for Apple Magic Trackpad 2") added a sanity check for an Apple trackpad but returned success instead of -ENODEV when the check failed. This means that the remove callback will dereference the never-initialised driver data pointer when the driver is later unbound (e.g. on USB disconnect).

CVE ID	Description

CVE-2021-47134	In the Linux kernel, the following vulnerability has been resolved: efi/fdt: fix panic when no valid fdt found setup_arch() would invoke efi_init()->efi_get_fdt_params(). If no valid fdt found then initial_boot_params will be null. So we should stop further fdt processing here. I encountered this issue on risc-v.
CVE-2021-47136	In the Linux kernel, the following vulnerability has been resolved: net: zero-initialize tc skb extension on allocation Function skb_ext_add() doesn't initialize created skb extension with any value and leaves it up to the user. However, since extension of type TC_SKB_EXT originally contained only single value tc_skb_ext->chain its users used to just assign the chain value without setting whole extension memory to zero first. This assumption changed when TC_SKB_EXT extension was extended with additional fields but not all users were updated to initialize the new fields which leads to use of uninitialized memory afterwards. UBSAN log: [778.299821] UBSAN: invalid-load in net/openvswitch/flow.c:899:28 [778.301495] load of value 107 is not a valid value for type '_Bool' [778.303215] CPU: 0 PID: 0 Comm: swapper/0 Not tainted 5.12.0-rc7+ #2 [778.304933] Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS rel-1.13.0-0-gf21b5a4eb02-prebuilt.qemu.org 04/01/2014 [778.307901] Call Trace: [778.308680] <IRQ> [778.309358] dump_stack+0xbb/0x107 [778.310307] ubsan_epilogue+0x5/0x40 [778.311167] __ubsan_handle_load_invalid_value.cold+0x43/0x48 [778.312454] ? memset+0x20/0x40 [778.313230] ovs_flow_key_extract.cold+0xf/0x14 [openvswitch] [778.314532] ovs_vport_receive+0x19e/0x2e0 [openvswitch] [778.315749] ? ovs_vport_find_upcall_portid+0x330/0x330 [openvswitch] [778.317188] ? create_prof_cpu_mask+0x20/0x20 [778.318220] ? arch_stack_walk+0x82/0xf0 [778.319153] ? secondary_startup_64_no_verify+0xb0/0xbb [778.320399] ? stack_trace_save+0x91/0xc0 [778.321362] ? stack_trace_consume_entry+0x160/0x160 [778.322517] ? lock_release+0x52e/0x760 [778.323444] netdev_frame_hook+0x323/0x610 [openvswitch] [778.324668] ? ovs_netdev_get_vport+0xe0/0xe0 [openvswitch] [778.325950] __netif_receive_skb_core+0x771/0x2db0 [778.327067] ? lock_downgrade+0x6e0/0x6f0 [778.328021] ? lock_acquire+0x565/0x720 [778.328940] ? generic_xdp_tx+0x4f0/0x4f0 [778.329902] ? inet_gro_receive+0x2a7/0x10a0 [778.330914] ? lock_downgrade+0x6f0/0x6f0 [778.331867] ? udp4_gro_receive+0x4c4/0x13e0 [778.332876] ? lock_release+0x52e/0x760 [778.333808] ? dev_gro_receive+0xcc8/0x2380 [778.334810] ? lock_downgrade+0x6f0/0x6f0 [778.335769] __netif_receive_skb_list_core+0x295/0x820 [778.336955] ? process_backlog+0x780/0x780 [778.337941] ? mlx5e_rep_tc_netdevice_event_unregister+0x20/0x20 [mlx5_core] [778.339613] ? seqcount_lockdep_reader_access.constprop.0+0xa7/0xc0 [778.341033] ? kvm_clock_get_cycles+0x14/0x20 [778.342072] netif_receive_skb_list_internal+0x5f5/0xcb0 [778.343288] ? __kasan_kmalloc+0x7a/0x90 [778.344234] ? mlx5e_handle_rx_cqe_mpwqrq+0x9e0/0x9e0 [mlx5_core] [778.345676] ? mlx5e_xmit_xdp_frame_mpwqe+0x14d0/0x14d0 [mlx5_core] [778.347140] ? __netif_receive_skb_list_core+0x820/0x820 [778.348351] ? mlx5e_post_rx_mpwqes+0xa6/0x25d0 [mlx5_core] [778.349688] ? napi_gro_flush+0x26c/0x3c0 [778.350641] napi_complete_done+0x188/0x6b0 [778.351627] mlx5e_napi_poll+0x373/0x1b80 [mlx5_core] [778.352853] __napi_poll+0x9f/0x510 [778.353704] ? mlx5_flow_namespace_set_mode+0x260/0x260 [mlx5_core] [778.355158] net_rx_action+0x34c/0xa40 [778.356060] ? napi_threaded_poll+0x3d0/0x3d0 [778.357083] ? sched_clock_cpu+0x18/0x190 [778.358041] ? __common_interrupt+0x8e/0x1a0 [778.359045] __do_softirq+0x1ce/0x984 [778.359938] __irq_exit_rcu+0x137/0x1d0 [778.360865] irq_exit_rcu+0xa/0x20 [778.361708] common_interrupt+0x80/0xa0 [778.362640] <IRQ> [778.363212] asm_common_interrupt+0x1e/0x40 [778.364204] RIP: 0010:native_safe_halt+0xe/0x10 [778.365273] Code: 4f ff ff ff 4c 89 e7 e8 50 3f 40 fe e9 dc fe ff ff 48 89 df e8 43 3f 40 fe eb 90 cc e9 07 00 00 0f 0d 2d 74 05 62 00 fb f4 <c3> 90 e9 07 00 00 0f 0d 2d 64 05 62 00 f4 c3 cc cc 0f 1f 44 00 [778.369355] RSP: 0018:ffffffffff84407e48 EFLAGS: 00000246 [778.370570] RAX ---truncated---

CVE ID	Description
CVE-2021-47138	In the Linux kernel, the following vulnerability has been resolved: cxgb4: avoid accessing registers when clearing filters Hardware register having the server TID base can contain invalid values when adapter is in bad state (for example, due to AER fatal error). Reading these invalid values in the register can lead to out-of-bound memory access. So, fix by using the saved server TID base when clearing filters.
CVE-2021-47140	In the Linux kernel, the following vulnerability has been resolved: iommu/amd: Clear DMA ops when switching domain Since commit 08a27c1c3ecf ("iommu: Add support to change default domain of an iommu group") a user can switch a device between IOMMU and direct DMA through sysfs. This doesn't work for AMD IOMMU at the moment because dev->dma_ops is not cleared when switching from a DMA to an identity IOMMU domain. The DMA layer thus attempts to use the dma-iommu ops on an identity domain, causing an oops: # echo 0000:00:05.0 > /sys/sys/bus/pci/drivers/e1000e/unbind # echo identity > /sys/bus/pci/devices/0000:00:05.0/iommu_group/type # echo 0000:00:05.0 > /sys/sys/bus/pci/drivers/e1000e/bind ... BUG: kernel NULL pointer dereference, address: 0000000000000028 ... Call Trace: iommu_dma_alloc e1000e_setup_tx_resources e1000e_open Since iommu_change_dev_def_domain() calls probe_finalize() again, clear the dma_ops there like Vt-d does.
CVE-2021-47141	In the Linux kernel, the following vulnerability has been resolved: gve: Add NULL pointer checks when freeing irqs. When freeing notification blocks, we index priv->msix_vectors. If we failed to allocate priv->msix_vectors (see abort_with_msix_vectors) this could lead to a NULL pointer dereference if the driver is unloaded.
CVE-2021-47143	In the Linux kernel, the following vulnerability has been resolved: net/smc: remove device from smcd_dev_list after failed device_add() If the device_add() for a smcd_dev fails, there's no cleanup step that rolls back the earlier list_add(). The device subsequently gets freed, and we end up with a corrupted list. Add some error handling that removes the device from the list.
CVE-2021-47146	In the Linux kernel, the following vulnerability has been resolved: mld: fix panic in mld_newpack() mld_newpack() doesn't allow to allocate high order page, only order-0 allocation is allowed. If headroom size is too large, a kernel panic could occur in skb_put(). Test commands: ip netns del A ip netns del B ip netns add A ip netns add B ip link add veth0 type veth peer name veth1 ip link set veth0 netns A ip link set veth1 netns B ip netns exec A ip link set lo up ip netns exec A ip link set veth0 up ip netns exec A ip -6 a a 2001:db8:0::1/64 dev veth0 ip netns exec B ip link set lo up ip netns exec B ip link set veth1 up ip netns exec B ip -6 a a 2001:db8:0::2/64 dev veth1 for i in {1..99} do let A=\$i-1 ip netns exec A ip link add ip6gre\$i type ip6gre \ local 2001:db8:\$A::1 remote 2001:db8:\$A::2 encaps limit 100 ip netns exec A ip -6 a a 2001:db8:\$i::1/64 dev ip6gre\$i ip netns exec A ip link set ip6gre\$i up ip netns exec B ip link add ip6gre\$i type ip6gre \ local 2001:db8:\$A::2 remote 2001:db8:\$A::1 encaps limit 100 ip netns exec B ip -6 a a 2001:db8:\$i::2/64 dev ip6gre\$i ip netns exec B ip link set ip6gre\$i up done Splat looks like: kernel BUG at net/core/skbuff.c:110! invalid opcode: 0000 [0] SMP DEBUG_PAGEALLOC KASAN PTI CPU: 0 PID: 7 Comm: kworker/0:1 Not tainted 5.12.0+ #891 Workqueue: ipv6_addrconf addrconf_dad_work RIP: 0010:skb_panic+0x15d/0x15f Code: 92 fe 4c 8b 4c 24 10 53 8b 4d 70 45 89 e0 48 c7 c7 00 ae 79 83 41 57 41 56 41 55 48 8b 54 24 a6 26 f9 ff <0f> 0b 48 8b 6c 24 20 89 34 24 e8 4a 4e 92 fe 8b 34 24 48 c7 c1 20 RSP: 0018:ffff88810091f820 EFLAGS: 00010282 RAX: 0000000000000089 RBX: ffff8881086e9000 RCX: 0000000000000000 RDX: 0000000000000089 RSI: 0000000000000008 RDI: ffffd1020123efb RBP: ffff888005f6eac0 R08: ffffd1022fc0031 R09: ffffd1022fc0031 R10: ffff888117e00187 R11: ffffd1022fc0030 R12: 0000000000000028 R13: ffff888008284eb0 R14: 00000000000000ed8 R15: 00000000000000ec0 FS: 0000000000000000(0000) GS:ffff888117c00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007f8b801c5640 CR3: 0000000033c2c006 CR4: 00000000003706f0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000ffe0ff0 DR7: 0000000000000400 Call Trace: ? ip6_mc_hdr.isra.26.constprop.46+0x12a/0x600 ? ip6_mc_hdr.isra.26.constprop.46+0x12a/0x600 skb_put.cold.104+0x22/0x22 ip6_mc_hdr.isra.26.constprop.46+0x12a/0x600 ? rcu_read_lock_sched_held+0x91/0xc0 mld_newpack+0x398/0x8f0 ? ip6_mc_hdr.isra.26.constprop.46+0x600/0x600 ? lock_contended+0xc40/0xc40 add_grhead.isra.33+0x280/0x380 add_grec+0x5ca/0xff0 ? mld_sendpack+0xf40/0xf40 ? lock_downgrade+0x690/0x690 mld_send_initial_cr.part.34+0xb9/0x180 ipv6_mc_dad_complete+0x15d/0x1b0 addrconf_dad_completed+0x8d2/0xbb0 ? lock_downgrade+0x690/0x690 ? addrconf_rs_timer+0x660/0x660 ? addrconf_dad_work+0x73c/0x10e0 addrconf_dad_work+0x73c/0x10e0 Allowing high order page allocation could fix this problem.

CVE ID	Description
CVE-2021-47162	In the Linux kernel, the following vulnerability has been resolved: tipc: skb_linearize the head skb when reassembling msg's. It's not a good idea to append the frag skb to a skb's frag_list if the frag_list already has skbs from elsewhere, such as this skb was created by pskb_copy() where the frag_list was cloned (all the skbs in it were skb_get'ed) and shared by multiple skbs. However, the new appended frag skb should have been only seen by the current skb. Otherwise, it will cause use after free crashes as this appended frag skb are seen by multiple skbs but it only got skb_get called once. The same thing happens with a skb updated by pskb_may_pull() with a skb_cloned skb. Li Shuang has reported quite a few crashes caused by this when doing testing over macvlan devices: [] kernel BUG at net/core/skbuff.c:1970! [] Call Trace: [] skb_clone+0x4d/0xb0 [] macvlan_broadcast+0xd8/0x160 [macvlan] [] macvlan_process_broadcast+0x148/0x150 [macvlan] [] process_one_work+0x1a7/0x360 [] worker_thread+0x30/0x390 [] kernel BUG at mm/usercopy.c:102! [] Call Trace: [] __check_heap_object+0xd3/0x100 [] __check_object_size+0xff/0x16b [] simple_copy_to_iter+0x1c/0x30 [] __skb_datagram_iter+0x7d/0x310 [] __skb_datagram_iter+0x2a5/0x310 [] skb_copy_datagram_iter+0x3b/0x90 [] tipc_rcvmsg+0x14a/0x3a0 [tipc] [] ____sys_rcvmsg+0x91/0x150 [] ____sys_rcvmsg+0x7b/0xc0 [] kernel BUG at mm/slub.c:305! [] Call Trace: [] <IRQ> [] kmem_cache_free+0x3ff/0x400 [] __netif_receive_skb_core+0x12c/0xc40 [] ? kmem_cache_alloc+0x12e/0x270 [] netif_receive_skb_internal+0x3d/0xb0 [] ? get_rx_page_info+0x8e/0xa0 [be2net] [] be_poll+0x6ef/0xd00 [be2net] [] ? irq_exit+0x4f/0x100 [] net_rx_action+0x149/0x3b0 ... This patch is to fix it by linearizing the head skb if it has frag_list set in tipc_buf_append(). Note that we choose to do this before calling skb_unshare(), as __skb_linearize() will avoid skb_copy(). Also, we can not just drop the frag_list either as the early time.
CVE-2021-47163	In the Linux kernel, the following vulnerability has been resolved: tipc: wait and exit until all work queues are done. On some host, a crash could be triggered simply by repeating these commands several times: # modprobe tipc # tipc bearer enable media udp name UDP1 localip 127.0.0.1 # rmmmod tipc [] BUG: unable to handle kernel paging request at ffffffff096bb00 [] Workqueue: events 0xffffffff096bb00 [] Call Trace: [] ? process_one_work+0x1a7/0x360 [] ? worker_thread+0x30/0x390 [] ? create_worker+0x1a0/0x1a0 [] ? kthread+0x116/0x130 [] ? kthread_flush_work_fn+0x10/0x10 [] ? ret_from_fork+0x35/0x40 When removing the TIPC module, the UDP tunnel sock will be delayed to release in a work queue as sock_release() can't be done in rtnl_lock(). If the work queue is scheduled to run after the TIPC module is removed, kernel will crash as the work queue function cleanup_bearer() code no longer exists when trying to invoke it. To fix it, this patch introduce a member wq_count in tipc_net to track the numbers of work queues in schedule, and wait and exit until all work queues are done in tipc_exit_net().
CVE-2021-47167	In the Linux kernel, the following vulnerability has been resolved: NFS: Fix an Oopsable condition in __nfs_pageio_add_request(). Ensure that nfs_pageio_error_cleanup() resets the mirror array contents, so that the structure reflects the fact that it is now empty. Also change the test in nfs_pageio_do_add_request() to be more robust by checking whether or not the list is empty rather than relying on the value of pg_count.
CVE-2021-47168	In the Linux kernel, the following vulnerability has been resolved: NFS: fix an incorrect limit in filelayout_decode_layout(). The "sizeof(struct nfs_fh)" is two bytes too large and could lead to memory corruption. It should be NFS_MAXFHSIZE because that's the size of the ->data[] buffer. I reversed the size of the arguments to put the variable on the left.
CVE-2021-47170	In the Linux kernel, the following vulnerability has been resolved: USB: usbfs: Don't WARN about excessively large memory allocations. Syzbot found that the kernel generates a WARNING if the user tries to submit a bulk transfer through usbfs with a buffer that is way too large. This isn't a bug in the kernel; it's merely an invalid request from the user and the usbfs code does handle it correctly. In theory the same thing can happen with async transfers, or with the packet descriptor table for isochronous transfers. To prevent the MM subsystem from complaining about these bad allocation requests, add the __GFP_NOWARN flag to the kmalloc calls for these buffers.
CVE-2021-47173	In the Linux kernel, the following vulnerability has been resolved: misc/uss720: fix memory leak in uss720_probe. uss720_probe forgets to decrease the refcount of usbdev in uss720_probe. Fix this by decreasing the refcount of usbdev by usb_put_dev. BUG: memory leak unreferenced object 0xffff888101113800 (size 2048): comm "kworker/0:1", pid 7, jiffies 4294956777 (age 28.870s) hex dump (first 32 bytes): ff ff ff 31 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<ffffffff82b8e822>] kmalloc include/linux/slab.h:554 [inline] [<ffffffff82b8e822>] kcalloc include/linux/slab.h:684 [inline] [<ffffffff82b8e822>] usb_alloc_dev+0x32/0x450 drivers/usb/core/usb.c:582 [<ffffffff82b98441>] hub_port_connect drivers/usb/core/hub.c:5129 [inline] [<ffffffff82b98441>] hub_port_connect_change drivers/usb/core/hub.c:5363 [inline] [<ffffffff82b98441>] port_event drivers/usb/core/hub.c:5509 [inline] [<ffffffff82b98441>] hub_event+0x1171/0x20c0 drivers/usb/core/hub.c:5591 [<ffffffff81259229>] process_one_work+0x2c9/0x600 kernel/workqueue.c:2275 [<ffffffff81259b19>] worker_thread+0x59/0x5d0 kernel/workqueue.c:2421 [<ffffffff81261228>] kthread+0x178/0x1b0 kernel/kthread.c:292 [<ffffffff8100227f>] ret_from_fork+0x1f/0x30 arch/x86/entry/entry_64.S:294

CVE ID	Description
CVE-2021-47176	In the Linux kernel, the following vulnerability has been resolved: s390/dasd: add missing discipline function Fix crash with illegal operation exception in dasd_device_tasklet. Commit b72949328869 ("s390/dasd: Prepare for additional path event handling") renamed the verify_path function for ECKD but not for FBA and DIAG. This leads to a panic when the path verification function is called for a FBA or DIAG device. Fix by defining a wrapper function for dasd_generic_verify_path().
CVE-2021-47177	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Fix sysfs leak in alloc_iommu() iommu_device_sysfs_add() is called before, so is has to be cleaned on subsequent errors.
CVE-2021-47178	In the Linux kernel, the following vulnerability has been resolved: scsi: target: core: Avoid smp_processor_id() in preemptible code The BUG message "BUG: using smp_processor_id() in preemptible [00000000] code" was observed for TCMU devices with kernel config DEBUG_PREEMPT. The message was observed when blktests block/005 was run on TCMU devices with fileio backend or user:zbc backend [1]. The commit 1130b499b4a7 ("scsi: target: tcm_loop: Use LIO wq cmd submission helper") triggered the symptom. The commit modified work queue to handle commands and changed 'current->nr_cpu_allowed' at smp_processor_id() call. The message was also observed at system shutdown when TCMU devices were not cleaned up [2]. The function smp_processor_id() was called in SCSI host work queue for abort handling, and triggered the BUG message. This symptom was observed regardless of the commit 1130b499b4a7 ("scsi: target: tcm_loop: Use LIO wq cmd submission helper"). To avoid the preemptible code check at smp_processor_id(), get CPU ID with raw_smp_processor_id() instead. The CPU ID is used for performance improvement then thread move to other CPU will not affect the code. CVE ID	Description
CVE-2021-47196	In the Linux kernel, the following vulnerability has been resolved: RDMA/core: Set send and receive CQ before forwarding to the driver Preset both receive and send CQ pointers prior to call to the drivers and overwrite it later again till the mlx4 is going to be changed do not overwrite ibqp properties. This change is needed for mlx5, because in case of QP creation failure, it will go to the path of QP destroy which relies on proper CQ pointers. BUG: KASAN: use-after-free in create_qp.cold+0x164/0x16e [mlx5_ib] Write of size 8 at addr ffff8880064c55c0 by task a.out/246 CPU: 0 PID: 246 Comm: a.out Not tainted 5.15.0+ #291 Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS rel-1.13.0-0-gf21b5a4aeb02-prebuilt.qemu.org 04/01/2014 Call Trace: dump_stack_lvl+0x45/0x59 print_address_description.constprop.0+0x1f/0x140 kasan_report.cold+0x83/0xdf create_qp.cold+0x164/0x16e [mlx5_ib] mlx5_ib_create_qp+0x358/0x28a0 [mlx5_ib] create_qp.part.0+0x45b/0x6a0 [ib_core] ib_create_qp_user+0x97/0x150 [ib_core] ib_uverbs_handler_UVERBS_METHOD_QP_CREATE+0x92c/0x1250 [ib_uverbs] ib_uverbs_cmd_verbs+0x1c38/0x3150 [ib_uverbs] ib_uverbs_ioctl+0x169/0x260 [ib_uverbs] __x64_sys_ioctl+0x866/0x14d0 do_syscall_64+0x3d/0x90 entry_SYSCALL_64_after_hwframe+0x44/0xae Allocated by task 246: kasan_save_stack+0x1b/0x40 __kasan_kmalloc+0xa4/0xd0 create_qp.part.0+0x92/0x6a0 [ib_core] ib_create_qp_user+0x97/0x150 [ib_core] ib_uverbs_handler_UVERBS_METHOD_QP_CREATE+0x92c/0x1250 [ib_uverbs] ib_uverbs_cmd_verbs+0x1c38/0x3150 [ib_uverbs] ib_uverbs_ioctl+0x169/0x260 [ib_uverbs] __x64_sys_ioctl+0x866/0x14d0 do_syscall_64+0x3d/0x90 entry_SYSCALL_64_after_hwframe+0x44/0xae Freed by task 246: kasan_save_stack+0x1b/0x40 kasan_set_track+0x1c/0x30 kasan_set_free_info+0x20/0x30 __kasan_slab_free+0x10c/0x150 slab_free_freelist_hook+0xb4/0x1b0 kfree+0xe7/0x2a0 create_qp.part.0+0x52b/0x6a0 [ib_core] ib_create_qp_user+0x97/0x150 [ib_core] ib_uverbs_handler_UVERBS_METHOD_QP_CREATE+0x92c/0x1250 [ib_uverbs] ib_uverbs_cmd_verbs+0x1c38/0x3150 [ib_uverbs] ib_uverbs_ioctl+0x169/0x260 [ib_uverbs] __x64_sys_ioctl+0x866/0x14d0 do_syscall_64+0x3d/0x90 entry_SYSCALL_64_after_hwframe+0x44/0xae
CVE-2021-47197	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: nullify cq->dbg pointer in mlx5_debug_cq_remove() Prior to this patch in case mlx5_core_destroy_cq() failed it proceeds to rest of destroy operations. mlx5_core_destroy_cq() could be called again by user and cause additional call of mlx5_debug_cq_remove(). cq->dbg was not nullify in previous call and cause the crash. Fix it by nullify cq->dbg pointer after removal. Also proceed to destroy operations only if FW return 0 for MLX5_CMD_OP_DESTROY_CQ command. general protection fault, probably for non-canonical address 0x2000300004058: 0000 [#1] SMP PTI CPU: 5 PID: 1228 Comm: python Not tainted 5.15.0-rc5_for_upstream_min_debug_2021_10_14_11_06 #1 Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS rel-1.13.0-0-gf21b5a4aeb02-prebuilt.qemu.org 04/01/2014 RIP: 0010:lockref_get+0x1/0x60 Code: 5d e9 53 ff ff ff 48 8d 7f 70 e8 0a 2e 48 00 c7 85 d0 00 00 00 02 00 00 00 c6 45 70 00 fb 5d c3 cc cc cc cc cc cc cc cc 53 <48> 8b 17 48 89 fb 85 d2 75 3d 48 89 d0 bf 64 00 00 00 48 89 c1 48 RSP: 0018:ffff888137dd7a38 EFLAGS: 00010206 RAX: 0000000000000000 RBX: ffff888107d5f458 RCX: 00000000ffffffffff RDX: 0000000000002c2b0 RSI: ffffffff8155e2e0 RDI: 0002000300004058 RBP: ffff888137dd7a88 R08: 0002000300004058 R09: ffff8881144a9f88 R10: 0000000000000000 R11: 0000000000000000 R12: ffff8881141d4000 R13: ffff888137dd7c68 R14: ffff888137dd7d58 R15: ffff888137dd7cc0 FS: 00007f4644f2a4c0(0000) GS: ffff8887a2d40000(0000) knlGS: 0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00005b4500f4380 CR3: 00000000114f7a003 CR4: 0000000000170ea0 Call Trace: simple_recursive_removal+0x33/0x2e0 ? debugfs_remove+0x60/0x60 debugfs_remove+0x40/0x60 mlx5_debug_cq_remove+0x32/0x70 [mlx5_core] mlx5_core_destroy_cq+0x41/0x1d0 [mlx5_core] devx_obj_cleanup+0x151/0x330 [mlx5_ib] ? __pollwait+0xd0/0xd0 ? xas_load+0x5/0x70 ? xa_load+0x62/0xa0 destroy_hw_idr_uobject+0x20/0x80 [ib_uverbs] uverbs_destroy_uobject+0x3b/0x360 [ib_uverbs] uobj_destroy+0x54/0xa0 [ib_uverbs] ib_uverbs_cmd_verbs+0xaf2/0x1160 [ib_uverbs] ? uverbs_finalize_object+0xd0/0xd0 [ib_uverbs] ib_uverbs_ioctl+0xc4/0x1b0 [ib_uverbs] __x64_sys_ioctl+0x3e4/0x8e0
CVE-2021-47198	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix use-after-free in lpfc_unreg_rpi() routine An error is detected with the following report when unloading the driver: "KASAN: use-after-free in lpfc_unreg_rpi+0x1b1b" The NLP_REG_LOGIN_SEND nlp_flag is set in lpfc_reg_fab_ctrl_node(), but the flag is not cleared upon completion of the login. This allows a second call to lpfc_unreg_rpi() to proceed with nlp_rpi set to LPFC_RPI_ALLOW_ERROR. This results in a use after free access when used as an rpi_ids array index. Fix by clearing the NLP_REG_LOGIN_SEND nlp_flag in lpfc_mbx_cmpl_fc_reg_login().

CVE ID	Description
CVE-2021-47199	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: CT, Fix multiple allocations and memleak of mod acts CT clear action offload adds additional mod_hdr actions to the flow's original mod actions in order to clear the registers which hold ct_state. When such flow also includes encap action, a neigh update event can cause the driver to unoffload the flow and then reoffload it. Each time this happens, the ct clear handling adds that same set of mod_hdr actions to reset ct_state until the max of mod_hdr actions is reached. Also the driver never releases the allocated mod_hdr actions and causing a memleak. Fix above two issues by moving CT clear mod acts allocation into the parsing actions phase and only use it when offloading the rule. The release of mod acts will be done in the normal flow_put(). backtrace: [<code><000000007316e2f3></code>] krealloc+0x83/0xd0 [<code><00000000ef157de1></code>] mlx5e_mod_hdr_alloc+0x147/0x300 [mlx5_core] [<code><00000000970ce4ae></code>] mlx5e_tc_match_to_reg_set_and_get_id+0xd7/0x240 [mlx5_core] [<code><0000000067c5fa17></code>] mlx5e_tc_match_to_reg_set+0xa/0x20 [mlx5_core] [<code><00000000d032eb98></code>] mlx5_tc_ct_entry_set_registers.isra.0+0x36/0xc0 [mlx5_core] [<code><00000000fd23b869></code>] mlx5_tc_ct_flow_offload+0x272/0x1f10 [mlx5_core] [<code><000000004fc24acc></code>] mlx5e_tc_offload_fdb_rules.part.0+0x150/0x620 [mlx5_core] [<code><00000000dc741c17></code>] mlx5e_tc_encap_flows_add+0x489/0x690 [mlx5_core] [<code><00000000e92e49d7></code>] mlx5e_rep_update_flows+0x6e4/0x9b0 [mlx5_core] [<code><00000000f60f5602></code>] mlx5e_rep_neigh_update+0x39a/0x5d0 [mlx5_core]
CVE-2021-47201	In the Linux kernel, the following vulnerability has been resolved: iavf: free q_vectors before queues in iavf_disable_vf iavf_free_queues() clears adapter->num_active_queues, which iavf_free_q_vectors() relies on, so swap the order of these two function calls in iavf_disable_vf(). This resolves a panic encountered when the interface is disabled and then later brought up again after PF communication is restored.
CVE-2021-47207	In the Linux kernel, the following vulnerability has been resolved: ALSA: gus: fix null pointer dereference on pointer block The pointer block return from snd_gf1_dma_next_block could be null, so there is a potential null pointer dereference issue. Fix this by adding a null check before dereference.
CVE-2021-47210	In the Linux kernel, the following vulnerability has been resolved: usb: typec: tipd: Remove WARN_ON in tps6598x_block_read Calling tps6598x_block_read with a higher than allowed len can be handled by just returning an error. There's no need to crash systems with panic-on-warn enabled.
CVE-2021-47211	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: fix null pointer dereference on pointer cs_desc The pointer cs_desc return from snd_usb_find_clock_source could be null, so there is a potential null pointer dereference issue. Fix this by adding a null check before dereference.
CVE-2021-47215	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: kTLS, Fix crash in RX resync flow For the TLS RX resync flow, we maintain a list of TLS contexts that require some attention, to communicate their resync information to the HW. Here we fix list corruptions, by protecting the entries against movements coming from resync_handle_seq_match(), until their resync handling in napi is fully completed.
CVE-2021-47217	In the Linux kernel, the following vulnerability has been resolved: x86/hyperv: Fix NULL deref in set_hv_tscchange_cb() if Hyper-V setup fails Check for a valid hv_vp_index array prior to dereferencing hv_vp_index when setting Hyper-V's TSC change callback. If Hyper-V setup failed in hyperv_init(), the kernel will still report that it's running under Hyper-V, but will have silently disabled nearly all functionality. BUG: kernel NULL pointer dereference, address: 0000000000000010 #PF: supervisor read access in kernel mode #PF: error_code(0x0000) - not-present page PGD 0 P4D 0 Oops: 0000 [#1] SMP CPU: 4 PID: 1 Comm: swapper/0 Not tainted 5.15.0-rc2+ #75 Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS 0.0.0 02/06/2015 RIP: 0010:set_hv_tscchange_cb+0x15/0xa0 Code: <8b> 04 82 8b 15 12 17 85 01 48 c1 e0 20 48 0d ee 00 01 00 f6 c6 08 ... CVE-2021-47218	In the Linux kernel, the following vulnerability has been resolved: selinux: fix NULL-pointer dereference when hashtable allocation fails When the hash table slot array allocation fails in hashtable_init(), h->size is left initialized with a non-zero value, but the h->htable pointer is NULL. This may then cause a NULL pointer dereference, since the policydb code relies on the assumption that even after a failed hashtable_init(), hashtable_map() and hashtable_destroy() can be safely called on it. Yet, these detect an empty hashtable only by looking at the size. Fix this by making sure that hashtable_init() always leaves behind a valid empty hashtable when the allocation fails.

CVE ID	Description

If userspace passes a large length we will get a negative 'alen'. Switch n, alen, and rlen to u32.
CVE-2021-47222	In the Linux kernel, the following vulnerability has been resolved: net: bridge: fix vlan tunnel dst refcnt when egressing The egress tunnel code uses dst_clone() and directly sets the result which is wrong because the entry might have 0 refcnt or be already deleted, causing number of problems. It also triggers the WARN_ON() in dst_hold()[1] when a refcnt couldn't be taken. Fix it by using dst_hold_safe() and checking if a reference was actually taken before setting the dst. [1] dmesg WARN_ON log and following refcnt errors WARNING: CPU: 5 PID: 38 at include/net/dst.h:230 br_handle_egress_vlan_tunnel+0x10b/0x134 [bridge] Modules linked in: 8021q garp mrp bridge stp llc bonding ipv6 virtio_net CPU: 5 PID: 38 Comm: ksoftirqd/5 Kdump: loaded Tainted: G W 5.13.0-rc3+ #360 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.14.0-1.fc33 04/01/2014 RIP: 0010:br_handle_egress_vlan_tunnel+0x10b/0x134 [bridge] Code: e8 85 bc 01 e1 45 84 f6 74 90 45 31 f6 85 db 48 c7 c7 a0 02 19 a0 41 0f 94 c6 31 c9 31 d2 44 89 f6 e8 64 bc 01 e1 85 db 75 02 <0f> 0b 31 c9 31 d2 44 89 f6 48 c7 c7 70 02 19 a0 e8 4b bc 01 e1 49 RSP: 0018:ffff8881003d39e8 EFLAGS: 00010246 RAX: 0000000000000000 RBX: 0000000000000000 RCX: 0000000000000000 RDX: 0000000000000000 RSI: 0000000000000001 RDI: ffffffff01902a0 RBP: ffff8881040c6700 R08: 0000000000000000 R09: 0000000000000001 R10: 2ce93d0054fe0d00 R11: 54fe0d000000e000 R12: ffff888109515000 R13: 0000000000000000 R14: 0000000000000001 R15: 0000000000000401 FS: 0000000000000000(0000) GS:ffff88822bf40000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007f42ba70f030 CR3: 0000000109926000 CR4: 0000000000000060 Call Trace: br_handle_vlan+0xbc/0xca [bridge] __br_forward+0x23/0x164 [bridge] deliver_clone+0x41/0x48 [bridge] br_handle_frame_finish+0x36f/0x3aa [bridge] ? skb_dst+0x2e/0x38 [bridge] ? br_handle_ingress_vlan_tunnel+0x3e/0x1c8 [bridge] ? br_handle_frame_finish+0x3aa/0x3aa [bridge] br_handle_frame+0x2c3/0x377 [bridge] ? __skb_pull+0x33/0x51 ? vlan_do_receive+0x4f/0x36a ? br_handle_frame_finish+0x3aa/0x3aa [bridge] __netif_receive_skb_core+0x539/0x7c6 ? __list_del_entry_valid+0x16e/0x1c2 __netif_receive_skb_list_core+0x6d/0xd6 netif_receive_skb_list_internal+0x1d9/0x1fa gro_normal_list+0x22/0x3e dev_gro_receive+0x55b/0x600 ? detach_buf_split+0x58/0x140 napi_gro_receive+0x94/0x12e virtnet_poll+0x15d/0x315 [virtio_net] __napi_poll+0x2c/0x1c9 net_rx_action+0xe6/0x1fb __do_softirq+0x115/0x2d8 run_ksoftirqd+0x18/0x20 smpboot_thread_fn+0x183/0x19c ? smpboot_unregister_percpu_thread+0x66/0x66 kthread+0x10a/0x10f ? kthread_mod_delayed_work+0xb6/0xb6 ret_from_fork+0x22/0x30 ---[end trace 49f61b07f775fd2b]--- dst_release: dst:00000000c02d677a refcnt:-1 dst_release underflow
CVE-2021-47223	In the Linux kernel, the following vulnerability has been resolved: net: bridge: fix vlan tunnel dst null pointer dereference This patch fixes a tunnel_dst null pointer dereference due to lockless access in the tunnel egress path. When deleting a vlan tunnel the tunnel_dst pointer is set to NULL without waiting a grace period (i.e. while it's still usable) and packets egressing are dereferencing it without checking. Use READ/WRITE_ONCE to annotate the lockless use of tunnel_id, use RCU for accessing tunnel_dst and make sure it is read only once and checked in the egress path. The dst is already properly RCU protected so we don't need to do anything fancy than to make sure tunnel_id and tunnel_dst are read only once and checked in the egress path.

CVE ID	Description
CVE-2021-47225	In the Linux kernel, the following vulnerability has been resolved: mac80211: fix deadlock in AP/VLAN handling Syzbot reports that when you have AP_VLAN interfaces that are up and close the AP interface they belong to, we get a deadlock. No surprise - since we dev_close() them with the wiphy mutex held, which goes back into the netdev notifier in cfg80211 and tries to acquire the wiphy mutex there. To fix this, we need to do two things: 1) prevent changing iftype while AP_VLANs are up, we can't easily fix this case since cfg80211 already calls us with the wiphy mutex held, but change_interface() is relatively rare in drivers anyway, so changing iftype isn't used much (and userspace has to fall back to down/change/up anyway) 2) pull the dev_close() loop over VLANs out of the wiphy mutex section in the normal stop case
CVE-2021-47226	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Invalidate FPU state after a failed XRSTOR from a user buffer Both Intel and AMD consider it to be architecturally valid for XRSTOR to fail with #PF but nonetheless change the register state. The actual conditions under which this might occur are unclear [1], but it seems plausible that this might be triggered if one sibling thread unmaps a page and invalidates the shared TLB while another sibling thread is executing XRSTOR on the page in question. __fpu__restore_sig() can execute XRSTOR while the hardware registers are preserved on behalf of a different victim task (using the fpu_fpregs_owner_ctx mechanism), and, in theory, XRSTOR could fail but modify the registers. If this happens, then there is a window in which __fpu__restore_sig() could schedule out and the victim task could schedule back in without reloading its own FPU registers. This would result in part of the FPU state that __fpu__restore_sig() was attempting to load leaking into the victim task's user-visible state. Invalidate preserved FPU registers on XRSTOR failure to prevent this situation from corrupting any state. [1] Frequent readers of the errata lists might imagine "complex microarchitectural conditions".
CVE-2021-47227	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Prevent state corruption in __fpu__restore_sig() The non-compacted slowpath uses __copy_from_user() and copies the entire user buffer into the kernel buffer, verbatim. This means that the kernel buffer may now contain entirely invalid state on which XRSTOR will #GP. validate_user_xstate_header() can detect some of that corruption, but that leaves the onus on callers to clear the buffer. Prior to XSAVES support, it was possible just to reinitialize the buffer, completely, but with supervisor states that is not longer possible as the buffer clearing code split got it backwards. Fixing that is possible but not corrupting the state in the first place is more robust. Avoid corruption of the kernel XSAVE buffer by using copy_user_to_xstate() which validates the XSAVE header contents before copying the actual states to the kernel. copy_user_to_xstate() was previously only called for compacted-format kernel buffers, but it works for both compacted and non-compacted forms. Using it for the non-compacted form is slower because of multiple __copy_from_user() operations, but that cost is less important than robust code in an already slow path. [Changelog polished by Dave Hansen]

CVE ID	Description
CVE-2021-47230	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Immediately reset the MMU context when the SMM flag is cleared Immediately reset the MMU context when the vCPU's SMM flag is cleared so that the SMM flag in the MMU role is always synchronized with the vCPU's flag. If RSM fails (which isn't correctly emulated), KVM will bail without calling <code>post_leave_smm()</code> and leave the MMU in a bad state. The bad MMU role can lead to a NULL pointer dereference when grabbing a shadow page's rmap for a page fault as the initial lookups for the gfn will happen with the vCPU's SMM flag (=0), whereas the rmap lookup will use the shadow page's SMM flag, which comes from the MMU (=1). SMM has an entirely different set of memslots, and so the initial lookup can find a memslot (SMM=0) and then explode on the rmap memslot lookup (SMM=1). general protection fault, probably for non-canonical address 0xdffffc0000000000: 0000 [#1] PREEMPT SMP KASAN: null-ptr-deref in range [0x0000000000000000-0x0000000000000007] CPU: 1 PID: 8410 Comm: syz-executor382 Not tainted 5.13.0-rc5-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010: __gfn_to_rmap arch/x86/kvm/mmu/mmu.c:935 [inline] RIP: 0010:gfn_to_rmap+0x2b0/0x4d0 arch/x86/kvm/mmu/mmu.c:947 Code: <42> 80 3c 20 00 74 08 4c 89 ff e8 f1 79 a9 00 4c 89 fb 4d 8b 37 44 RSP: 0018:ffffc90000ffef98 EFLAGS: 00010246 RAX: 0000000000000000 RBX: ffff888015b9f414 RCX: ffff888019669c40 RDX: 0000000000000000 RSI: 0000000000000001 RDI: 0000000000000001 RBP: 0000000000000001 R08: ffffffff811d9cdb R09: ffffed10065a6002 R10: ffffed10065a6002 R11: 0000000000000000 R12: dffffc0000000000 R13: 0000000000000003 R14: 0000000000000001 R15: 0000000000000000 FS: 000000000124b300(0000) GS:ffff8880b9b00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 0000000000000000 CR3: 00000000028e31000 CR4: 00000000001526e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000ffe0ff0 DR7: 0000000000000400 Call Trace: rmap_add arch/x86/kvm/mmu/mmu.c:965 [inline] mmu_set_spte+0x862/0xe60 arch/x86/kvm/mmu/mmu.c:2604 __direct_map arch/x86/kvm/mmu/mmu.c:2862 [inline] direct_page_fault+0x1f74/0x2b70 arch/x86/kvm/mmu/mmu.c:3769 kvm_mmu_do_page_fault arch/x86/kvm/mmu.h:124 [inline] kvm_mmu_page_fault+0x199/0x1440 arch/x86/kvm/mmu/mmu.c:5065 vmx_handle_exit+0x26/0x160 arch/x86/kvm/vmx/vmx.c:6122 vcpu_enter_guest+0x3bdd/0x9630 arch/x86/kvm/x86.c:9428 vcpu_run+0x416/0xc20 arch/x86/kvm/x86.c:9494 kvm_arch_vcpu_ioctl_run+0x4e8/0xa40 arch/x86/kvm/x86.c:9722 kvm_vcpu_ioctl+0x70f/0xbb0 arch/x86/kvm/../../../../virt/kvm/kvm_main.c:3460 vfs_ioctl fs/ioctl.c:51 [inline] __do_sys_ioctl fs/ioctl.c:1069 [inline] __se_sys_ioctl+0xfb/0x170 fs/ioctl.c:1055 do_syscall_64+0x3f/0xb0 arch/x86/entry/common.c:47 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x440ce9
CVE-2021-47238	In the Linux kernel, the following vulnerability has been resolved: net: ipv4: fix memory leak in <code>ip_mc_add1_src</code> BUG: memory leak unreferenced object 0xffff888101bc4c00 (size 32): comm "syz-executor527", pid 360, jiffies 4294807421 (age 19.329s) hex dump (first 32 bytes): 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 01 00 00 00 00 00 00 00 ac 14 14 bb 00 00 02 00 backtrace: [<code><00000000f17c5244></code>] kcalloc include/linux/slab.h:558 [inline] [<code><00000000f17c5244></code>] kzalloc include/linux/slab.h:688 [inline] [<code><00000000f17c5244></code>] <code>ip_mc_add1_src</code> net/ipv4/igmp.c:1971 [inline] [<code><00000000f17c5244></code>] <code>ip_mc_add_src</code>+0x95f/0xdb0 net/ipv4/igmp.c:2095 [<code><000000001cb99709></code>] <code>ip_mc_source</code>+0x84c/0xea0 net/ipv4/igmp.c:2416 [<code><0000000052cf19ed></code>] <code>do_ip_setsockopt</code> net/ipv4/ip_sockglue.c:1294 [inline] [<code><0000000052cf19ed></code>] <code>ip_setsockopt</code>+0x114b/0x30c0 net/ipv4/ip_sockglue.c:1423 [<code><00000000477edfbc></code>] <code>raw_setsockopt</code>+0x13d/0x170 net/ipv4/raw.c:857 [<code><00000000e75ca9bb></code>] <code>__sys_setsockopt</code>+0x158/0x270 net/socket.c:2117 [<code><00000000bdb993a8></code>] <code>__do_sys_setsockopt</code> net/socket.c:2128 [inline] [<code><00000000bdb993a8></code>] <code>__se_sys_setsockopt</code> net/socket.c:2125 [inline] [<code><00000000bdb993a8></code>] <code>__x64_sys_setsockopt</code>+0xba/0x150 net/socket.c:2125 [<code><000000006a1ffdbd></code>] <code>do_syscall_64</code>+0x40/0x80 arch/x86/entry/common.c:47 [<code><00000000b11467c4></code>] <code>entry_SYSCALL_64_after_hwframe</code>+0x44/0xae In commit 24803f38a5c0 ("igmp: do not remove igmp source list info when set link down"), the <code>ip_mc_clear_src()</code> in <code>ip_mc_destroy_dev()</code> was removed, because it was also called in <code>igmpv3_clear_delrec()</code>. Rough callgraph: <code>inetdev_destroy -> ip_mc_destroy_dev -> igmpv3_clear_delrec -> ip_mc_clear_src -> RCU_INIT_POINTER(dev->ip_ptr, NULL)</code> However, <code>ip_mc_clear_src()</code> called in <code>igmpv3_clear_delrec()</code> doesn't release <code>in_dev->mc_list->sources</code>. And <code>RCU_INIT_POINTER()</code> assigns the NULL to <code>dev->ip_ptr</code>. As a result, <code>in_dev</code> cannot be obtained through <code>inetdev_by_index()</code> and then <code>in_dev->mc_list->sources</code> cannot be released by <code>ip_mc_del1_src()</code> in the <code>sock_close</code>. Rough call sequence goes like: <code>sock_close -> __sock_release -> inet_release -> ip_mc_drop_socket -> inetdev_by_index -> ip_mc_leave_src -> ip_mc_del_src -> ip_mc_del1_src</code> So we still need to call <code>ip_mc_clear_src()</code> in <code>ip_mc_destroy_dev()</code> to free <code>in_dev->mc_list->sources</code>.
CVE-2021-47239	In the Linux kernel, the following vulnerability has been resolved: net: usb: fix possible use-after-free in <code>sm5c75xx_bind</code> The commit 46a8b29c6306 ("net: usb: fix memory leak in <code>sm5c75xx_bind</code>") fails to clean up the work scheduled in <code>sm5c75xx_reset->sm5c75xx_set_multicast</code>, which leads to use-after-free if the work is scheduled to start after the deallocation. In addition, this patch also removes a dangling pointer - <code>dev->data[0]</code>. This patch calls <code>cancel_work_sync</code> to cancel the scheduled work and set the dangling pointer to NULL.

CVE ID	Description
CVE-2021-47241	In the Linux kernel, the following vulnerability has been resolved: ethtool: strset: fix message length calculation Outer nest for ETHTOOL_A_STRSET_STRINGSETS is not accounted for. This may result in ETHTOOL_MSG_STRSET_GET producing a warning like: calculated message payload length (684) not sufficient WARNING: CPU: 0 PID: 30967 at net/ethtool/netlink.c:369 ethnl_default_doit +0x87a/0xa20 and a splat. As usually with such warnings three conditions must be met for the warning to trigger: - there must be no skb size rounding up (e.g. reply_size of 684); - string set must be per-device (so that the header gets populated); - the device name must be at least 12 characters long, all in all with current user space it looks like reading priv flags is the only place this could potentially happen. Or with syzbot :)
CVE-2021-47242	In the Linux kernel, the following vulnerability has been resolved: mptcp: fix soft lookup in subflow_error_report() Maxim reported a soft lookup in subflow_error_report(): watchdog: BUG: soft lockup - CPU#0 stuck for 22s! [swapper/0:0] RIP: 0010:native_queued_spin_lock_slowpath RSP: 0018:ffffa859c0003bc0 EFLAGS: 00000202 RAX: 0000000000000101 RBX: 0000000000000001 RCX: 0000000000000000 RDX: ffff9195c2772d88 RSI: 0000000000000000 RDI: ffff9195c2772d88 RBP: ffff9195c2772d00 R08: 00000000000067b0 R09: c6e31da9eb1e44f4 R10: ffff9195ef379700 R11: ffff9195edb50710 R12: ffff9195c2772d88 R13: ffff9195f500e3d0 R14: ffff9195ef379700 R15: ffff9195ef379700 FS: 0000000000000000(0000) GS:ffff91961f400000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 000000c000407000 CR3: 0000000002988000 CR4: 00000000000006f0 Call Trace: <IRQ> _raw_spin_lock_bh subflow_error_report mptcp_subflow_data_available __mptcp_move_skbs_from_subflow mptcp_data_ready tcp_data_queue tcp_rcv_established tcp_v4_do_rcv tcp_v4_rcv ip_protocol_deliver_rcu ip_local_deliver_finish __netif_receive_skb_one_core netif_receive_skb rtl8139_poll 8139too __napi_poll net_rx_action __do_softirq __irq_exit_rcu common_interrupt </IRQ> The calling function - mptcp_subflow_data_available() - can be invoked from different contexts: - plain ssk socket lock - ssk socket lock + mptcp_data_lock - ssk socket lock + mptcp_data_lock + msk socket lock. Since subflow_error_report() tries to acquire the mptcp_data_lock, the latter two call chains will cause soft lookup. This change addresses the issue moving the error reporting call to outer functions, where the held locks list is known and the we can acquire only the needed one.

CVE ID	Description
CVE-2021-47246	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix page reclaim for dead peer hairpin When adding a hairpin flow, a firmware-side send queue is created for the peer net device, which claims some host memory pages for its internal ring buffer. If the peer net device is removed/unbound before the hairpin flow is deleted, then the send queue is not destroyed which leads to a stack trace on pci device remove: [748.005230] mlx5_core 0000:08:00.2: wait_func:1094:(pid 12985): MANAGE_PAGES(0x108) timeout. Will cause a leak of a command resource [748.005231] mlx5_core 0000:08:00.2: reclaim_pages:514:(pid 12985): failed reclaiming pages: err -110 [748.001835] mlx5_core 0000:08:00.2: mlx5_reclaim_root_pages:653:(pid 12985): failed reclaiming pages (-110) for func id 0x0 [748.002171] -----[cut here]----- [748.001177] FW pages counter is 4 after reclaiming all pages [748.001186] WARNING: CPU: 1 PID: 12985 at drivers/net/ethernet/mellanox/mlx5/core/pagealloc.c:685 mlx5_reclaim_startup_pages+0x34b/0x460 [mlx5_core] [+0.002771] Modules linked in: cls_flower mlx5_ib mlx5_core ptp pps_core act_mirred sch_ingress openvswitch nsh xt_conntrack xt_MASQUERADE nf_conntrack_netlink nfnetlink xt_addrtype iptable_nat nf_nat nf_conntrack nf_defrag_ipv6 nf_defrag_ipv4 br_netfilter rpcrdma rdma_ucm ib_iser libiscsi scsi_transport_iscsi rdma_cm ib_umad ib_ipoib iw_cm ib_cm ib_uverbs ib_core overlay fuse [last unloaded: pps_core] [748.007225] CPU: 1 PID: 12985 Comm: tee Not tainted 5.12.0+ #1 [748.001376] Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS rel-1.13.0-0-gf21b5a4aeb02-prebuilt.qemu.org 04/01/2014 [748.002315] RIP: 0010:mlx5_reclaim_startup_pages+0x34b/0x460 [mlx5_core] [748.001679] Code: 28 00 00 00 0f 85 22 01 00 00 48 81 c4 b0 00 00 00 31 c0 5b 5d 41 5c 41 5d 41 5e 41 5f c3 48 c7 c7 40 cc 19 a1 e8 9f 71 0e e2 <0f> 0b e9 30 ff ff ff 48 c7 c7 a0 cc 19 a1 e8 8c 71 0e e2 0f 0b e9 [748.003781] RSP: 0018:ffff88815220faf8 EFLAGS: 00010286 [748.001149] RAX: 0000000000000000 RBX: ffff8881b4900280 RCX: 0000000000000000 [748.001445] RDX: 0000000000000002 RSI: 0000000000000004 RDI: ffffd102a441f51 [748.001614] RBP: 00000000000032b9 R08: 0000000000000001 R09: ffffd1054a15ee8 [748.001446] R10: ffff8882a50af73b R11: ffffd1054a15ee7 R12: ffff8bfff07c1e30 [748.001447] R13: dffffc0000000000 R14: ffff8881b492cba8 R15: 0000000000000000 [748.001429] FS: 00007f58bd08b580(0000) GS:ffff8882a5080000(0000) knlGS:0000000000000000 [748.001695] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 [748.001309] CR2: 000055a026351740 CR3: 00000001d3b48006 CR4: 0000000000370ea0 [748.001506] DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 [748.001483] DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 [748.001654] Call Trace: [748.000576] ? mlx5_satisfy_startup_pages+0x290/0x290 [mlx5_core] [748.001416] ? mlx5_cmd_teardown_hca+0xa2/0xd0 [mlx5_core] [748.001354] ? mlx5_cmd_init_hca+0x280/0x280 [mlx5_core] [748.001203] mlx5_function_teardown+0x30/0x60 [mlx5_core] [748.001275] mlx5_uninit_one+0xa7/0xc0 [mlx5_core] [748.001200] remove_one+0x5f/0xc0 [mlx5_core] [748.001075] pci_device_remove+0x9f/0x1d0 [748.000833] device_release_driver_internal+0x1e0/0x490 [748.001207] unbind_store+0x19f/0x200 [748.000942] ? sysfs_file_ops+0x170/0x170 [748.001000] kernfs_fop_write_iter+0x2bc/0x450 [748.000970] new_sync_write+0x373/0x610 [748.001124] ? new_sync_read+0x600/0x600 [748.001057] ? lock_acquire+0x4d6/0x700 [748.000908] ? lockdep_hardirqs_on_prepare+0x400/0x400 [748.001126] ? fd_install+0x1c9/0x4d0 [748.000951] vfs_write+0x4d0/0x800 [748.000804] ksys_write+0xf9/0x1d0 [748.000868] ? __x64_sys_read+0xb0/0xb0 [748.000811] ? filp_open+0x50/0x50 [748.000919] ? syscall_enter_from_user_mode+0x1d/0x50 [748.001223] do_syscall_64+0x3f/0x80 [748.000892] entry_SYSCALL_64_after_hwframe+0x44/0xae [748.00 --- truncated---

CVE ID	Description

CVE-2021-47248	In the Linux kernel, the following vulnerability has been resolved: udp: fix race between <code>close()</code> and <code>udp_abort()</code> Kaustubh reported and diagnosed a panic in <code>udp_lib_lookup()</code>. The root cause is <code>udp_abort()</code> racing with <code>close()</code>. Both racing functions acquire the socket lock, but <code>udp{v6}_destroy_sock()</code> release it before performing destructive actions. We can't easily extend the socket lock scope to avoid the race, instead use the <code>SOCK_DEAD</code> flag to prevent <code>udp_abort</code> from doing any action when the critical race happens. Diagnosed-and-tested-by: Kaustubh Pandey <kapandey@codeaurora.org>

CVE ID	Description
CVE-2021-47250	In the Linux kernel, the following vulnerability has been resolved: net: ipv4: fix memory leak in netlbl_cipsov4_add_std Reported by syzkaller: BUG: memory leak unreferenced object 0xffff888105df7000 (size 64): comm "syz-executor842", pid 360, jiffies 4294824824 (age 22.546s) hex dump (first 32 bytes): 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<00000000e67ed558>] kcalloc include/linux/slab.h:590 [inline] [<00000000e67ed558>] kzalloc include/linux/slab.h:720 [inline] [<00000000e67ed558>] netlbl_cipsov4_add_std net/netlabel/netlabel_cipso_v4.c:145 [inline] [<00000000e67ed558>] netlbl_cipsov4_add+0x390/0x2340 net/netlabel/netlabel_cipso_v4.c:416 [<0000000006040154>] genl_family_rcv_msg_doit.isra.0+0x20e/0x320 net/netlink/genetlink.c:739 [<00000000204d7a1c>] genl_family_rcv_msg net/netlink/genetlink.c:783 [inline] [<00000000204d7a1c>] genl_rcv_msg+0x2bf/0x4f0 net/netlink/genetlink.c:800 [<00000000c0d6a995>] netlink_rcv_skb+0x134/0x3d0 net/netlink/af_netlink.c:2504 [<00000000d78b9d2c>] genl_rcv+0x24/0x40 net/netlink/genetlink.c:811 [<000000009733081b>] netlink_unicast_kernel net/netlink/af_netlink.c:1314 [inline] [<000000009733081b>] netlink_unicast+0x4a0/0x6a0 net/netlink/af_netlink.c:1340 [<00000000d5fd43b8>] netlink_sendmsg+0x789/0xc70 net/netlink/af_netlink.c:1929 [<000000000a2d1e40>] sock_sendmsg_nosec net/socket.c:654 [inline] [<000000000a2d1e40>] sock_sendmsg+0x139/0x170 net/socket.c:674 [<00000000321d1969>] ____sys_sendmsg+0x658/0x7d0 net/socket.c:2350 [<00000000964e16bc>] __sys_sendmsg+0xf8/0x170 net/socket.c:2404 [<000000001615e288>] __sys_sendmsg+0xd3/0x190 net/socket.c:2433 [<000000004ee8b6a5>] do_syscall_64+0x37/0x90 arch/x86/entry/common.c:47 [<00000000171c7cee>] entry_SYSCALL_64_after_hwframe+0x44/0xae The memory of doi_def->map.std pointing is allocated in netlbl_cipsov4_add_std, but no place has freed it. It should be freed in cipso_v4_doi_free which frees the cipso DOI resource.
CVE-2021-47251	In the Linux kernel, the following vulnerability has been resolved: mac80211: fix skb length check in ieee80211_scan_rx() Replace hard-coded compile-time constants for header length check with dynamic determination based on the frame type. Otherwise, we hit a validation WARN_ON in cfg80211 later. [style fixes, reword commit message]
CVE-2021-47254	In the Linux kernel, the following vulnerability has been resolved: gfs2: Fix use-after-free in gfs2_glock_shrink_scan The GLF_LRU flag is checked under lru_lock in gfs2_glock_remove_from_lru() to remove the glock from the lru list in __gfs2_glock_put(). On the shrink scan path, the same flag is cleared under lru_lock but because of cond_resched_lock(&lru_lock) in gfs2_dispose_glock_lru(), progress on the put side can be made without deleting the glock from the lru list. Keep GLF_LRU across the race window opened by cond_resched_lock(&lru_lock) to ensure correct behavior on both sides - clear GLF_LRU after list_del under lru_lock.
CVE-2021-47255	In the Linux kernel, the following vulnerability has been resolved: kvm: LAPIC: Restore guard to prevent illegal APIC register access Per the SDM, "any access that touches bytes 4 through 15 of an APIC register may cause undefined behavior and must not be executed." Worse, such an access in kvm_lapic_reg_read can result in a leak of kernel stack contents. Prior to commit 01402cf81051 ("kvm: LAPIC: write down valid APIC registers"), such an access was explicitly disallowed. Restore the guard that was removed in that commit.
CVE-2021-47258	In the Linux kernel, the following vulnerability has been resolved: scsi: core: Fix error handling of scsi_host_alloc() After device is initialized via device_initialize(), or its name is set via dev_set_name(), the device has to be freed via put_device(). Otherwise device name will be leaked because it is allocated dynamically in dev_set_name(). Fix the leak by replacing kfree() with put_device(). Since scsi_host_dev_release() properly handles IDA and kthread removal, remove special-casing these from the error handling as well.
CVE-2021-47259	In the Linux kernel, the following vulnerability has been resolved: NFS: Fix use-after-free in nfs4_init_client() KASAN reports a use-after-free when attempting to mount two different exports through two different NICs that belong to the same server. Olga was able to hit this with kernels starting somewhere between 5.7 and 5.10, but I traced the patch that introduced the clear_bit() call to 4.13. So something must have changed in the refcounting of the clp pointer to make this call to nfs_put_client() the very last one.
CVE-2021-47260	In the Linux kernel, the following vulnerability has been resolved: NFS: Fix a potential NULL dereference in nfs_get_client() None of the callers are expecting NULL returns from nfs_get_client() so this code will lead to an Oops. It's better to return an error pointer. I expect that this is dead code so hopefully no one is affected.

CVE ID	Description
CVE-2021-47261	In the Linux kernel, the following vulnerability has been resolved: IB/mlx5: Fix initializing CQ fragments buffer The function init_cq_frag_buf() can be called to initialize the current CQ fragments buffer cq->buf, or the temporary cq->resize_buf that is filled during CQ resize operation. However, the offending commit started to use function get_cqe() for getting the CQEs, the issue with this change is that get_cqe() always returns CQEs from cq->buf, which leads us to initialize the wrong buffer, and in case of enlarging the CQ we try to access elements beyond the size of the current cq->buf and eventually hit a kernel panic. [exception RIP: init_cq_frag_buf+103] [ffff9f799ddcbcd8] mlx5_ib_resize_cq at ffffffff0835d60 [mlx5_ib] [ffff9f799ddcbdb0] ib_resize_cq at ffffffff05270df [ib_core] [ffff9f799ddcbdc0] llc_rdma_setup_qp at ffffffff0a6a712 [llt] [ffff9f799ddcbe10] llc_rdma_cc_event_action at ffffffff0a6b411 [llt] [ffff9f799ddcbe98] llc_rdma_client_conn_thread at ffffffff0a6bb75 [llt] [ffff9f799ddcbec8] kthread at ffffffff0a66c5da1 [ffff9f799ddcbf50] ret_from_fork_nospec_begin at ffffffff0a6d95ddd Fix it by getting the needed CQE by calling mlx5_frag_buf_get_wqe() that takes the correct source buffer as a parameter.
CVE-2021-47262	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Ensure liveness of nested VM-Enter fail tracepoint message Use the __string() machinery provided by the tracing subsystem to make a copy of the string literals consumed by the "nested VM-Enter failed" tracepoint. A complete copy is necessary to ensure that the tracepoint can't outlive the data/memory it consumes and dereference stale memory. Because the tracepoint itself is defined by kvm, if kvm-intel and/or kvm-amd are built as modules, the memory holding the string literals defined by the vendor modules will be freed when the module is unloaded, whereas the tracepoint and its data in the ring buffer will live until kvm is unloaded (or "indefinitely" if kvm is built-in). This bug has existed since the tracepoint was added, but was recently exposed by a new check in tracing to detect exactly this type of bug. fmt: '%s%s' current_buffer: 'vmx_dirty_log_t-140127 [003] kvm_nested_vmenter_failed: ' WARNING: CPU: 3 PID: 140134 at kernel/trace/trace.c:3759 trace_check_vprintf+0x3be/0x3e0 CPU: 3 PID: 140134 Comm: less Not tainted 5.13.0-rc1-ce2e73ce600a-req #184 Hardware name: ASUS Q87M-E/Q87M-E, BIOS 1102 03/03/2014 RIP: 0010:trace_check_vprintf+0x3be/0x3e0 Code: <0f> 0b 44 8b 4c 24 1c e9 a9 fe ff ff c6 44 02 ff 00 49 8b 97 b0 20 RSP: 0018:ffffa895cc37bcb0 EFLAGS: 00010282 RAX: 0000000000000000 RBX: fffffa895cc37bd08 RCX: 0000000000000027 RDX: 00000000000000027 RSI: 00000000ffffdfff RDI: fffff9766cfad74f8 RBP: ffffffc0a041d4 R08: fffff9766cfad74f0 R09: fffffa895cc37bad8 R10: 0000000000000001 R11: 0000000000000001 R12: ffffffc0a041d4 R13: ffffffc0f4dba8 R14: 0000000000000000 R15: fffff976409f2c000 FS: 00007f92fa200740(0000) GS:ffff9766cfac0000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 0000559bd11b0000 CR3: 000000019fbaa002 CR4: 00000000001726e0 Call Trace: trace_event_vprintf+0x5e/0x80 trace_raw_output_kvm_nested_vmenter_failed+0x3a/0x60 [kvm] print_trace_line+0x1dd/0x4e0 s_show+0x45/0x150 seq_read_iter+0x2d5/0x4c0 seq_read+0x106/0x150 vfs_read+0x98/0x180 ksys_read+0x5f/0xe0 do_syscall_64+0x40/0xb0 entry_SYSCALL_64_after_hwframe+0x44/0xae
CVE-2021-47264	In the Linux kernel, the following vulnerability has been resolved: ASoC: core: Fix Null-point-dereference in fmt_single_name() Check the return value of devm_kstrdup() in case of Null-point-dereference.
CVE-2021-47265	In the Linux kernel, the following vulnerability has been resolved: RDMA: Verify port when creating flow rule Validate port value provided by the user and with that remove no longer needed validation by the driver. CVE-2021-47276	In the Linux kernel, the following vulnerability has been resolved: frtrace: Do not blindly read the ip address in frtrace_bug() It was reported that a bug on arm64 caused a bad ip address to be used for updating into a nop in frtrace_init(), but the error path (rightfully) returned -EINVAL and not -EFAULT, as the bug caused more than one error to occur. But because -EINVAL was returned, the frtrace_bug() tried to report what was at the location of the ip address, and read it directly. This caused the machine to panic, as the ip was not pointing to a valid memory address. Instead, read the ip address with copy_from_kernel_nofault() to safely access the memory, and if it faults, report that the address faulted, otherwise report what was in that location.
CVE-2021-47277	In the Linux kernel, the following vulnerability has been resolved: kvm: avoid speculation-based attacks from out-of-range memslot accesses KVM's mechanism for accessing guest memory translates a guest physical address (gpa) to a host virtual address using the right-shifted gpa (also known as gfn) and a struct kvm_memory_slot. The translation is performed in __gfn_to_hva_memslot using the following formula: hva = slot->userspace_addr + (gfn - slot->base_gfn) * PAGE_SIZE It is expected that gfn falls within the boundaries of the guest's physical memory. However, a guest can access invalid physical addresses in such a way that the gfn is invalid. __gfn_to_hva_memslot is called from kvm_vcpu_gfn_to_hva_prot, which first retrieves a memslot through __gfn_to_memslot. While __gfn_to_memslot does check that the gfn falls within the boundaries of the guest's physical memory or not, a CPU can speculate the result of the check and continue execution speculatively using an illegal gfn. The speculation can result in calculating an out-of-bounds hva. If the resulting host virtual address is used to load another guest physical address, this is effectively a Spectre gadget consisting of two consecutive reads, the second of which is data dependent on the first. Right now it's not clear if there are any cases in which this is exploitable. One interesting case was reported by the original author of this patch, and involves visiting guest page tables on x86. Right now these are not vulnerable because the hva read goes through get_user(), which contains an LFENCE speculation barrier. However, there are patches in progress for x86 uaccess.h to mask kernel addresses instead of using LFENCE; once these land, a guest could use speculation to read from the VMM's ring 3 address space. Other architectures such as ARM already use the address masking method, and would be susceptible to this same kind of data-dependent access gadgets. Therefore, this patch proactively protects from these attacks by masking out-of-bounds gfn's in __gfn_to_hva_memslot, which blocks speculation of invalid hvas. Sean Christopherson noted that this patch does not cover kvm_read_guest_offset_cached. This however is limited to a few bytes past the end of the cache, and therefore it is unlikely to be useful in the context of building a chain of data dependent accesses.

CVE ID	Description
CVE-2021-47280	In the Linux kernel, the following vulnerability has been resolved: drm: Fix use-after-free read in drm_getunique() There is a time-of-check-to-time-of-use error in drm_getunique() due to retrieving file_priv->master prior to locking the device's master mutex. An example can be seen in the crash report of the use-after-free error found by Syzbot: https://syzkaller.appspot.com/bug?id=148d2f1dfac64af52ffd27b661981a540724f803 In the report, the master pointer was used after being freed. This is because another process had acquired the device's master mutex in drm_setmaster_ioctl(), then overwrote fpriv->master in drm_new_set_master(). The old value of fpriv->master was subsequently freed before the mutex was unlocked. To fix this, we lock the device's master mutex before retrieving the pointer from from fpriv->master. This patch passes the Syzbot reproducer test.
CVE-2021-47290	In the Linux kernel, the following vulnerability has been resolved: scsi: target: Fix NULL dereference on XCOPY completion CPU affinity control added with commit 39ae3edda325 ("scsi: target: core: Make completion affinity configurable") makes target_complete_cmd() queue work on a CPU based on se_tpg->se_tpg_wwn->cmd_compl_affinity state. LIO's EXTENDED COPY worker is a special case in that read/write cmds are dispatched using the global xcopy_pt_tpg, which carries a NULL se_tpg_wwn pointer following initialization in target_xcopy_setup_pt(). The NULL xcopy_pt_tpg->se_tpg_wwn pointer is dereferenced on completion of any EXTENDED COPY initiated read/write cmds. E.g using the libiscsi SCSI.ExtendedCopy.Simple test: BUG: kernel NULL pointer dereference, address: 00000000000001a8 RIP: 0010:target_complete_cmd+0x9d/0x130 [target_core_mod] Call Trace: fd_execute_rw+0x148/0x42a [target_core_file] ? __dynamic_pr_debug+0xa7/0xe0 ? target_check_reservation+0x5b/0x940 [target_core_mod] __target_execute_cmd+0x1e/0x90 [target_core_mod] transport_generic_new_cmd+0x17c/0x330 [target_core_mod] target_xcopy_issue_pt_cmd+0x9/0x60 [target_core_mod] target_xcopy_read_source.isra.7+0x10b/0x1b0 [target_core_mod] ? target_check_fua+0x40/0x40 [target_core_mod] ? transport_complete_task_attr+0x130/0x130 [target_core_mod] target_xcopy_do_work+0x61f/0xc00 [target_core_mod] This fix makes target_complete_cmd() queue work on se_cmd->cpuid if se_tpg_wwn is NULL.
CVE-2021-47293	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_skbmod: Skip non-Ethernet packets Currently tcf_skbmod_act() assumes that packets use Ethernet as their L2 protocol, which is not always the case. As an example, for CAN devices: \$ ip link add dev vcan0 type vcan \$ ip link set up vcan0 \$ tc qdisc add dev vcan0 root handle 1: htb \$ tc filter add dev vcan0 parent 1: protocol ip prio 10 \ matchall action skbmod swap mac Doing the above silently corrupts all the packets. Do not perform skbmod actions for non-Ethernet packets.
CVE-2021-47295	In the Linux kernel, the following vulnerability has been resolved: net: sched: fix memory leak in tcindex_partial_destroy_work Syzbot reported memory leak in tcindex_set_parms(). The problem was in non-freed perfect hash in tcindex_partial_destroy_work(). In tcindex_set_parms() new tcindex_data is allocated and some fields from old one are copied to new one, but not the perfect hash. Since tcindex_partial_destroy_work() is the destroy function for old tcindex_data, we need to free perfect hash to avoid memory leak.
CVE-2021-47298	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix potential memory leak on unlikely error case If skb_linearize is needed and fails we could leak a msg on the error handling. To fix ensure we kfree the msg block before returning error. Found during code review.

CVE ID	Description
CVE-2021-47303	In the Linux kernel, the following vulnerability has been resolved: bpf: Track subprog poke descriptors correctly and fix use-after-free Subprograms are calling map_poke_track(), but on program release there is no hook to call map_poke_untrack(). However, on program release, the aux memory (and poke descriptor table) is freed even though we still have a reference to it in the element list of the map aux data. When we run map_poke_run(), we then end up accessing free'd memory, triggering KASAN in prog_array_map_poke_run(): [...] [402.824689] BUG: KASAN: use-after-free in prog_array_map_poke_run+0xc2/0x34e [402.824698] Read of size 4 at addr ffff8881905a7940 by task hubble-fgs/4337 [402.824705] CPU: 1 PID: 4337 Comm: hubble-fgs Tainted: G I 5.12.0+ #399 [402.824715] Call Trace: [402.824719] dump_stack+0x93/0xc2 [402.824727] print_address_description.constprop.0+0x1a/0x140 [402.824736] ? prog_array_map_poke_run+0xc2/0x34e [402.824740] ? prog_array_map_poke_run+0xc2/0x34e [402.824744] kasan_report.cold+0x7c/0xd8 [402.824752] ? prog_array_map_poke_run+0xc2/0x34e [402.824757] prog_array_map_poke_run+0xc2/0x34e [402.824765] bpf_fd_array_map_update_elem+0x124/0x1a0 [...] The elements concerned are walked as follows: for (i = 0; i < elem->aux->size_poke_tab; i++) { poke = &elem->aux->poke_tab[i]; [...] The access to size_poke_tab is a 4 byte read, verified by checking offsets in the KASAN dump: [402.825004] The buggy address belongs to the object at ffff8881905a7800 which belongs to the cache kmalloc-1k of size 1024 [402.825008] The buggy address is located 320 bytes inside of 1024-byte region [ffff8881905a7800, ffff8881905a7c00) The pahole output of bpf_prog_aux: struct bpf_prog_aux { [...] /* --- cacheline 5 boundary (320 bytes) --- */ u32 size_poke_tab; /* 320 4 */ [...] In general, subprograms do not necessarily manage their own data structures. For example, BTF func_info and linfo are just pointers to the main program structure. This allows reference counting and cleanup to be done on the latter which simplifies their management a bit. The aux->poke_tab struct, however, did not follow this logic. The initial proposed fix for this use-after-free bug further embedded poke data tracking into the subprogram with proper reference counting. However, Daniel and Alexei questioned why we were treating these objects special; I agree, its unnecessary. The fix here removes the per subprogram poke table allocation and map tracking and instead simply points the aux->poke_tab pointer at the main programs poke table. This way, map tracking is simplified to the main program and we do not need to manage them per subprogram. This also means, bpf_prog_free_deferred(), which unwinds the program reference counting and kfree's objects, needs to ensure that we don't try to double free the poke_tab when free'ing the subprog structures. This is easily solved by NULL'ing the poke_tab pointer. The second detail is to ensure that per subprogram JIT logic only does fixups on poke_tab[] entries it owns. To do this, we add a pointer in the poke structure to point at the subprogram value so JITs can easily check while walking the poke_tab structure if the current entry belongs to the current program. The aux pointer is stable and therefore suitable for such comparison. On the jit_subprogs() error path, we omit cleaning up the poke->aux field because these are only ever referenced from the JIT side, but on error we will never make it to the JIT, so its fine to leave them dangling. Removing these pointers would complicate the error path for no reason. However, we do need to untrack all poke descriptors from the main program as otherwise they could race with the freeing of JIT memory from the subprograms. Lastly, a748c6975dea3 ("bpf: propagate poke des ---truncated---
CVE-2021-47305	In the Linux kernel, the following vulnerability has been resolved: dma-buf/sync_file: Don't leak fences on merge failure Each add_fence() call does a dma_fence_get() on the relevant fence. In the error path, we weren't calling dma_fence_put() so all those fences got leaked. Also, in the krealloc_array failure case, we weren't freeing the fences array. Instead, ensure that i and fences are always zero-initialized and dma_fence_put() all the fences and kfree(fences) on every error path.
CVE-2021-47307	In the Linux kernel, the following vulnerability has been resolved: cifs: prevent NULL deref in cifs_compose_mount_options() The optional @ref parameter might contain a NULL node_name, so prevent dereferencing it in cifs_compose_mount_options(). Addresses-Coverity: 1476408 ("Explicit null dereferenced")
CVE-2021-47308	In the Linux kernel, the following vulnerability has been resolved: scsi: libfc: Fix array index out of bound exception Fix array index out of bound exception in fc_rport_prli_resp().
CVE-2021-47313	In the Linux kernel, the following vulnerability has been resolved: cpufreq: CPPC: Fix potential memleak in cppc_cpufreq_cpu_init It's a classic example of memleak, we allocate something, we fail and never free the resources. Make sure we free all resources on policy ->init() failures.
CVE-2021-47316	In the Linux kernel, the following vulnerability has been resolved: nfsd: fix NULL dereference in nfs3svc_encode_getaclres In error cases the dentry may be NULL. Before 20798dfe249a, the encoder also checked dentry and d_really_is_positive(dentry), but that looks like overkill to me--zero status should be enough to guarantee a positive dentry. This isn't the first time we've seen an error-case NULL dereference hidden in the initialization of a local variable in an xdr encoder. But I went back through the other recent rewrites and didn't spot any similar bugs.

CVE ID	Description
CVE-2021-47317	In the Linux kernel, the following vulnerability has been resolved: powerpc/bpf: Fix detecting BPF atomic instructions Commit 91c960b0056672 ("bpf: Rename BPF_XADD and prepare to encode other atomics in .imm") converted BPF_XADD to BPF_ATOMIC and added a way to distinguish instructions based on the immediate field. Existing JIT implementations were updated to check for the immediate field and to reject programs utilizing anything more than BPF_ADD (such as BPF_FETCH) in the immediate field. However, the check added to powerpc64 JIT did not look at the correct BPF instruction. Due to this, such programs would be accepted and incorrectly JIT'ed resulting in soft lockups, as seen with the atomic bounds test. Fix this by looking at the correct immediate value.
CVE-2021-47319	In the Linux kernel, the following vulnerability has been resolved: virtio-blk: Fix memory leak among suspend/resume procedure The vblk->vqs should be freed before we call init_vqs() in virtblk_restore().
CVE-2021-47320	In the Linux kernel, the following vulnerability has been resolved: nfs: fix acl memory leak of posix_acl_create() When looking into another nfs xfstests report, I found acl and default_acl in nfs3_proc_create() and nfs3_proc_mknod() error paths are possibly leaked. Fix them in advance.
CVE-2021-47325	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: Fix arm_smmu_device refcount leak in address translation The reference counting issue happens in several exception handling paths of arm_smmu_iova_to_phys_hard(). When those error scenarios occur, the function forgets to decrease the refcount of "smmu" increased by arm_smmu_rpm_get(), causing a refcount leak. Fix this issue by jumping to "out" label when those error scenarios occur.
CVE-2021-47327	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: Fix arm_smmu_device refcount leak when arm_smmu_rpm_get fails arm_smmu_rpm_get() invokes pm_runtime_get_sync(), which increases the refcount of the "smmu" even though the return value is less than 0. The reference counting issue happens in some error handling paths of arm_smmu_rpm_get() in its caller functions. When arm_smmu_rpm_get() fails, the caller functions forget to decrease the refcount of "smmu" increased by arm_smmu_rpm_get(), causing a refcount leak. Fix this issue by calling pm_runtime_resume_and_get() instead of pm_runtime_get_sync() in arm_smmu_rpm_get(), which can keep the refcount balanced in case of failure.
CVE-2021-47332	In the Linux kernel, the following vulnerability has been resolved: ALSA: usx2y: Don't call free_pages_exact() with NULL address Unlike some other functions, we can't pass NULL pointer to free_pages_exact(). Add a proper NULL check for avoiding possible Oops.
CVE-2021-47333	In the Linux kernel, the following vulnerability has been resolved: misc: alcor_pci: fix null-ptr-deref when there is no PCI bridge There is an issue with the ASPM(optional) capability checking function. A device might be attached to root complex directly, in this case, bus->self(bridge) will be NULL, thus priv->parent_pdev is NULL. Since alcor_pci_init_check_aspm(priv->parent_pdev) checks the PCI link's ASPM capability and populate parent_cap_off, which will be used later by alcor_pci_aspm_ctrl() to dynamically turn on/off device, what we can do here is to avoid checking the capability if we are on the root complex. This will make pdev_cap_off 0 and alcor_pci_aspm_ctrl() will simply return when bring called, effectively disable ASPM for the device. [1.246492] BUG: kernel NULL pointer dereference, address: 00000000000000c0 [1.248731] RIP: 0010:pci_read_config_byte+0x5/0x40 [1.253998] Call Trace: [1.254131] ? alcor_pci_find_cap_offset.isra.0+0x3a/0x100 [alcor_pci] [1.254476] alcor_pci_probe+0x169/0x2d5 [alcor_pci]
CVE-2021-47339	In the Linux kernel, the following vulnerability has been resolved: media: v4l2-core: explicitly clear ioctl input data As seen from a recent syzbot bug report, mistakes in the compat ioctl implementation can lead to uninitialized kernel stack data getting used as input for driver ioctl handlers. The reported bug is now fixed, but it's possible that other related bugs are still present or get added in the future. As the drivers need to check user input already, the possible impact is fairly low, but it might still cause an information leak. To be on the safe side, always clear the entire ioctl buffer before calling the conversion handler functions that are meant to initialize them.
CVE-2021-47342	In the Linux kernel, the following vulnerability has been resolved: ext4: fix possible UAF when remounting r/o a mmp-protected file system After commit 618f003199c6 ("ext4: fix memory leak in ext4_fill_super"), after the file system is remounted read-only, there is a race where the kmmpd thread can exit, causing sbi->s_mmp_tsk to point at freed memory, which the call to ext4_stop_mmpd() can trip over. Fix this by only allowing kmmpd() to exit when it is stopped via ext4_stop_mmpd(). Bug-Report-Link: <20210629143603.2166962-1-yebin10@huawei.com>

CVE ID	Description
CVE-2021-47343	In the Linux kernel, the following vulnerability has been resolved: dm btree remove: assign new_root only when removal succeeds remove_raw() in dm_btree_remove() may fail due to IO read error (e.g. read the content of origin block fails during shadowing), and the value of shadow_spine::root is uninitialized, but the uninitialized value is still assign to new_root in the end of dm_btree_remove(). For dm-thin, the value of pmd->details_root or pmd->root will become an uninitialized value, so if trying to read details_info tree again out-of-bound memory may occur as showed below: general protection fault, probably for non-canonical address 0x3fdb14c8d7520 CPU: 4 PID: 515 Comm: dmsetup Not tainted 5.13.0-rc6 Hardware name: QEMU Standard PC RIP: 0010:metadata_ll_load_ie+0x14/0x30 Call Trace: sm_metadata_count_is_more_than_one+0xb9/0xe0 dm_tm_shadow_block+0x52/0x1c0 shadow_step+0x59/0xf0 remove_raw+0xb2/0x170 dm_btree_remove+0xf4/0x1c0 dm_pool_delete_thin_device+0xc3/0x140 pool_message+0x218/0x2b0 target_message+0x251/0x290 ctl_ioctl+0x1c4/0x4d0 dm_ctl_ioctl+0xe/0x20 __x64_sys_ioctl+0x7b/0xb0 do_syscall_64+0x40/0xb0 entry_SYSCALL_64_after_hwframe+0x44/0xae Fixing it by only assign new_root when removal succeeds
CVE-2021-47349	In the Linux kernel, the following vulnerability has been resolved: mwifiex: bring down link before deleting interface We can deadlock when rmmod'ing the driver or going through firmware reset, because the cfg80211_unregister_wdev() has to bring down the link for us, ... which then grab the same wiphy lock. nl80211_del_interface() already handles a very similar case, with a nice description: / * * We hold RTNL, so this is safe, without RTNL opencount cannot * reach 0, and thus the rdev cannot be deleted. * * We need to do it for the dev_close(), since that will call * the netdev notifiers, and we need to acquire the mutex there * but don't know if we get there from here or from some other * place (e.g. "ip link set ... down"). */ mutex_unlock(&rdev->wiphy.mtx); ... Do similarly for mwifiex teardown, by ensuring we bring the link down first. Sample deadlock trace: [247.103516] INFO: task rmmod:2119 blocked for more than 123 seconds. [247.110630] Not tainted 5.12.4 #5 [247.115796] "echo 0 > /proc/sys/kernel/hung_task_timeout_secs" disables this message. CVE-2021-47350	In the Linux kernel, the following vulnerability has been resolved: powerpc/mm: Fix lockup on kernel exec fault The powerpc kernel is not prepared to handle exec faults from kernel. Especially, the function is_exec_fault() will return 'false' when an exec fault is taken by kernel, because the check is based on reading current->thread.regs->trap which contains the trap from user. For instance, when provoking a LKDTM EXEC_USERSPACE test, current->thread.regs->trap is set to SYSCALL trap (0xc00), and the fault taken by the kernel is not seen as an exec fault by set_access_flags_filter(). Commit d7df2443cd5f ("powerpc/mm: Fix spurious segfaults on radix with autonuma") made it clear and handled it properly. But later on commit d3ca587404b3 ("powerpc/mm: Fix reporting of kernel execute faults") removed that handling, introducing test based on error_code. And here is the problem, because on the 603 all upper bits of SRR1 get cleared when the TLB instruction miss handler bails out to ISI. Until commit cbd7e6ca0210 ("powerpc/fault: Avoid heavy search_exception_tables() verification"), an exec fault from kernel at a userspace address was indirectly caught by the lack of entry for that address in the exception tables. But after that commit the kernel mainly relies on KUAP or on core mm handling to catch wrong user accesses. Here the access is not wrong, so mm handles it. It is a minor fault because PAGE_EXEC is not set, set_access_flags_filter() should set PAGE_EXEC and voila. But as is_exec_fault() returns false as explained in the beginning, set_access_flags_filter() bails out without setting PAGE_EXEC flag, which leads to a forever minor exec fault. As the kernel is not prepared to handle such exec faults, the thing to do is to fire in bad_kernel_fault() for any exec fault taken by the kernel, as it was prior to commit d3ca587404b3.
CVE-2021-47359	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix soft lockup during fsstress Below traces are observed during fsstress and system got hung. [130.698396] watchdog: BUG: soft lockup - CPU#6 stuck for 26s!

CVE ID	Description
CVE-2021-47360	In the Linux kernel, the following vulnerability has been resolved: binder: make sure fd closes complete During BC_FREE_BUFFER processing, the BINDER_TYPE_FDA object cleanup may close 1 or more fds. The close operations are completed using the task work mechanism -- which means the thread needs to return to userspace or the file object may never be dereferenced -- which can lead to hung processes. Force the binder thread back to userspace if an fd is closed during BC_FREE_BUFFER handling.
CVE-2021-47367	In the Linux kernel, the following vulnerability has been resolved: virtio-net: fix pages leaking when building skb in big mode We try to use build_skb() if we had sufficient tailroom. But we forget to release the unused pages chained via private in big mode which will leak pages. Fixing this by release the pages after building the skb in big mode.
CVE-2021-47370	In the Linux kernel, the following vulnerability has been resolved: mptcp: ensure tx skbs always have the MPTCP ext Due to signed/unsigned comparison, the expression: info->size_goal - skb->len > 0 evaluates to true when the size goal is smaller than the skb size. That results in lack of tx cache refill, so that the skb allocated by the core TCP code lacks the required MPTCP skb extensions. Due to the above, syzbot is able to trigger the following WARN_ON(): WARNING: CPU: 1 PID: 810 at net/mptcp/protocol.c:1366 mptcp_sendmsg_frag+0x1362/0x1bc0 net/mptcp/protocol.c:1366 Modules linked in: CPU: 1 PID: 810 Comm: syz-executor.4 Not tainted 5.14.0-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:mptcp_sendmsg_frag+0x1362/0x1bc0 net/mptcp/protocol.c:1366 Code: ff 4c 8b 74 24 50 48 8b 5c 24 58 e9 0f fb ff ff e8 13 44 8b f8 4c 89 e7 45 31 ed e8 98 57 2e fe e9 81 f4 ff ff e8 fe 43 8b f8 <0f> 0b 41 bd ea ff ff e9 6f f4 ff ff 4c 89 e7 e8 b9 8e d2 f8 e9 RSP: 0018:ffffc9000531f6a0 EFLAGS: 00010216 RAX: 0000000000000697f RBX: 0000000000000000 RCX: ffff90012107000 RDX: 0000000000040000 RSI: ffffffff88eac9e2 RDI: 0000000000000003 RBP: ffff888078b15780 R08: 0000000000000000 R09: 0000000000000000 R10: ffffffff88eac017 R11: 0000000000000000 R12: ffff88801de0a280 R13: 00000000000006b58 R14: ffff888066278280 R15: ffff88803c2fe9c0 FS: 00007fd9f866e700(0000) GS:ffff8880b9d00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007faebcb2f718 CR3: 00000000267cb000 CR4: 0000000001506e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: __mptcp_push_pending+0x1fb/0x6b0 net/mptcp/protocol.c:1547 mptcp_release_cb+0xfe/0x210 net/mptcp/protocol.c:3003 release_sock+0xb4/0x1b0 net/core/sock.c:3206 sk_stream_wait_memory+0x604/0xed0 net/core/stream.c:145 mptcp_sendmsg+0xc39/0x1bc0 net/mptcp/protocol.c:1749 inet6_sendmsg+0x99/0xe0 net/ipv6/af_inet6.c:643 sock_sendmsg_nosec net/socket.c:704 [inline] sock_sendmsg+0xcfc/0x120 net/socket.c:724 sock_write_iter+0x2a0/0x3e0 net/socket.c:1057 call_write_iter include/linux/fs.h:2163 [inline] new_sync_write+0x40b/0x640 fs/read_write.c:507 vfs_write+0x7cf/0xae0 fs/read_write.c:594 ksys_write+0x1ee/0x250 fs/read_write.c:647 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x4665f9 Code: ff ff c3 66 2e 0f 1f 84 00 00 00 00 0f 1f 40 00 48 89 f8 48 89 f7 48 89 d6 48 89 ca 4d 89 c2 4d 89 c8 4c 8b 4c 24 08 0f 05 <48> 3d 01 f0 ff ff 73 01 c3 48 c7 c1 bc ff ff ff f7 d8 64 89 01 48 RSP: 002b:00007fd9f866e188 EFLAGS: 00000246 ORIG_RAX: 0000000000000001 RAX: ffffffff88eac9e2 RBX: 000000000056c038 RCX: 00000000004665f9 RDX: 00000000000e7b78 RSI: 0000000020000000 RDI: 0000000000000003 RBP: 000000000004bfcc4 R08: 0000000000000000 R09: 0000000000000000 R10: 0000000000000000 R11: 0000000000000246 R12: 000000000056c038 R13: 0000000000a9fb1f R14: 00007fd9f866e300 R15: 0000000000022000 Fix the issue rewriting the relevant expression to avoid sign-related problems - note: size_goal is always >= 0. Additionally, ensure that the skb in the tx cache always carries the relevant extension.
CVE-2021-47374	In the Linux kernel, the following vulnerability has been resolved: dma-debug: prevent an error message from causing runtime problems For some drivers, that use the DMA API. This error message can be reached several millions of times per second, causing spam to the kernel's printk buffer and bringing the CPU usage up to 100% (so, it should be rate limited). However, since there is at least one driver that is in the mainline and suffers from the error condition, it is more useful to err_printk() here instead of just rate limiting the error message (in hopes that it will make it easier for other drivers that suffer from this issue to be spotted).

CVE ID	Description
CVE-2021-47376	In the Linux kernel, the following vulnerability has been resolved: bpf: Add oversize check before call kvccalloc() Commit 7661809d493b ("mm: don't allow oversized kvmalloc() calls") add the oversize check. When the allocation is larger than what kmalloc() supports, the following warning triggered: WARNING: CPU: 0 PID: 8408 at mm/util.c:597 kvmalloc_node+0x108/0x110 mm/util.c:597 Modules linked in: CPU: 0 PID: 8408 Comm: syz-executor221 Not tainted 5.14.0-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:kvmalloc_node+0x108/0x110 mm/util.c:597 Call Trace: kvmalloc include/linux/mm.h:806 [inline] kvmalloc_array include/linux/mm.h:824 [inline] kvccalloc include/linux/mm.h:829 [inline] check_btf_line kernel/bpf/verifier.c:9925 [inline] check_btf_info kernel/bpf/verifier.c:10049 [inline] bpf_check+0xd634/0x150d0 kernel/bpf/verifier.c:13759 bpf_prog_load kernel/bpf/syscall.c:2301 [inline] __sys_bpf+0x11181/0x126e0 kernel/bpf/syscall.c:4587 __do_sys_bpf kernel/bpf/syscall.c:4691 [inline] __se_sys_bpf kernel/bpf/syscall.c:4689 [inline] __x64_sys_bpf+0x78/0x90 kernel/bpf/syscall.c:4689 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x3d/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae
CVE-2021-47380	In the Linux kernel, the following vulnerability has been resolved: HID: amd_sfh: Fix potential NULL pointer dereference devm_add_action_or_reset() can suddenly invoke amd_mp2_pci_remove() at registration that will cause NULL pointer dereference since corresponding data is not initialized yet. The patch moves initialization of data before devm_add_action_or_reset(). Found by Linux Driver Verification project (linuxtesting.org). [jkosina@suse.cz: rebase]
CVE-2021-47381	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Fix DSP oops stack dump output contents Fix @buf arg given to hex_dump_to_buffer() and stack address used in dump error output.
CVE-2021-47387	In the Linux kernel, the following vulnerability has been resolved: cpufreq: schedutil: Use kobject release() method to free sugov_tunables The struct sugov_tunables is protected by the kobject, so we can't free it directly. Otherwise we would get a call trace like this: ODEBUG: free active (active state 0) object type: timer_list hint: delayed_work_timer_fn+0x0/0x30 WARNING: CPU: 3 PID: 720 at lib/debugobjects.c:505 debug_print_object+0xb8/0x100 Modules linked in: CPU: 3 PID: 720 Comm: a.sh Tainted: G W 5.14.0-rc1-next-20210715-yocto-standard+ #507 Hardware name: Marvell OcteonTX CN96XX board (DT) pstate: 40400009 (nZcv daif +PAN -UAO -TCO BTYPE=) pc : debug_print_object+0xb8/0x100 lr : debug_print_object+0xb8/0x100 sp : ffff80001ecaf910 x29: ffff80001ecaf910 x28: ffff00011b10b8d0 x27: ffff800011043d80 x26: ffff00011a8f0000 x25: ffff800013cb3ff0 x24: 0000000000000000 x23: ffff80001142aa68 x22: ffff800011043d80 x21: ffff00010de46f20 x20: ffff800013c0c520 x19: ffff800011d8f5b0 x18: 0000000000000010 x17: 6e6968207473696c x16: 5f72656d6974203a x15: 6570797420746365 x14: 6a626f2029302065 x13: 303378302f307830 x12: 2b6e665f72656d69 x11: ffff8000124b1560 x10: ffff800012331520 x9: ffff8000100ca6b0 x8: 000000000017ffe8 x7: c0000000ffffffffff x6: 0000000000000001 x5: ffff800011d8c000 x4: ffff800011d8c740 x3: 0000000000000000 x2: ffff0001108301c0 x1: ab3c90eedf9c0f00 x0: 0000000000000000 Call trace: debug_print_object+0xb8/0x100 __debug_check_no_obj_freed+0x1c0/0x230 debug_check_no_obj_freed+0x20/0x88 slab_free_freelist_hook+0x154/0x1c8 kfree+0x114/0x5d0 sugov_exit+0xbc/0xc0 cpufreq_exit_governor+0x44/0x90 cpufreq_set_policy+0x268/0x4a8 store_scaling_governor+0xe0/0x128 store+0xc0/0xf0 sysfs_kf_write+0x54/0x80 kernfs_fop_write_iter+0x128/0x1c0 new_sync_write+0xf0/0x190 vfs_write+0x2d4/0x478 ksys_write+0x74/0x100 __arm64_sys_write+0x24/0x30 invoke_syscall.constprop.0+0x54/0xe0 do_el0_svc+0x64/0x158 el0_svc+0x2c/0xb0 el0t_64_sync_handler+0xb0/0xb8 el0t_64_sync+0x198/0x19c irq event stamp: 5518 hardirqs last enabled at (5517): [<ffff8000100cbd7c>] console_unlock+0x554/0x6c8 hardirqs last disabled at (5518): [<ffff800010fc0638>] el1_dbg+0x28/0xa0 softirqs last enabled at (5504): [<ffff8000100106e0>] __do_softirq+0x4d0/0x6c0 softirqs last disabled at (5483): [<ffff800010049548>] irq_exit+0x1b0/0x1b8 So split the original sugov_tunables_free() into two functions, sugov_clear_global_tunables() is just used to clear the global_tunables and the new sugov_tunables_free() is used as kobj_type::release to release the sugov_tunables safely.
CVE-2021-47389	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: fix missing sev_decommission in sev_receive_start DECOMMISSION the current SEV context if binding an ASID fails after RECEIVE_START. Per AMD's SEV API, RECEIVE_START generates a new guest context and thus needs to be paired with DECOMMISSION: The RECEIVE_START command is the only command other than the LAUNCH_START command that generates a new guest context and guest handle. The missing DECOMMISSION can result in subsequent SEV launch failures, as the firmware leaks memory and might not be able to allocate more SEV guest contexts in the future. Note, LAUNCH_START suffered the same bug, but was previously fixed by commit 934002cd660b ("KVM: SVM: Call SEV Guest Decommission if ASID binding fails").

CVE ID	Description
CVE-2021-47395	In the Linux kernel, the following vulnerability has been resolved: mac80211: limit injected vht mcs/nss in ieee80211_parse_tx_radiotap Limit max values for vht mcs and nss in ieee80211_parse_tx_radiotap routine in order to fix the following warning reported by syzbot: WARNING: CPU: 0 PID: 10717 at include/net/mac80211.h:989 ieee80211_rate_set_vht include/net/mac80211.h:989 [inline] WARNING: CPU: 0 PID: 10717 at include/net/mac80211.h:989 ieee80211_parse_tx_radiotap +0x101e/0x12d0 net/mac80211/tx.c:2244 Modules linked in: CPU: 0 PID: 10717 Comm: syz-executor.5 Not tainted 5.14.0-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:ieee80211_rate_set_vht include/net/mac80211.h:989 [inline] RIP: 0010:ieee80211_parse_tx_radiotap+0x101e/0x12d0 net/mac80211/tx.c:2244 RSP: 0018:ffffc9000186f3e8 EFLAGS: 00010216 RAX: 0000000000000618 RBX: ffff88804ef76500 RCX: ffff900143a5000 RDX: 0000000000040000 RSI: ffffffff888f478e RDI: 0000000000000003 RBP: 00000000ffffff R08: 0000000000000000 R09: 0000000000000100 R10: ffffffff888f46f9 R11: 0000000000000000 R12: 00000000ffffff R13: ffff88804ef7653c R14: 0000000000000001 R15: 0000000000000004 FS: 00007fbf5718f700(0000) GS:ffff8880b9c00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 0000001b2de23000 CR3: 000000006a671000 CR4: 00000000001506f0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000600 Call Trace: ieee80211_monitor_select_queue +0xa6/0x250 net/mac80211/iface.c:740 netdev_core_pick_tx+0x169/0x2e0 net/core/dev.c:4089 __dev_queue_xmit+0x6f9/0x3710 net/core/dev.c:4165 __bpf_tx_skb net/core/filter.c:2114 [inline] __bpf_redirect_no_mac net/core/filter.c:2139 [inline] __bpf_redirect+0x5ba/0xd20 net/core/filter.c:2162 __bpf_clone_redirect net/core/filter.c:2429 [inline] bpf_clone_redirect+0x2ae/0x420 net/core/filter.c:2401 bpf_prog_eeb6f53a69e5c6a2+0x59/0x234 bpf_dispatcher_nop_func include/linux/bpf.h:717 [inline] __bpf_prog_run include/linux/filter.h:624 [inline] bpf_prog_run include/linux/filter.h:631 [inline] bpf_test_run+0x381/0xa30 net/bpf/test_run.c:119 bpf_prog_test_run_skb +0xb84/0x1ee0 net/bpf/test_run.c:663 bpf_prog_test_run kernel/bpf/syscall.c:3307 [inline] __sys_bpf +0x2137/0x5df0 kernel/bpf/syscall.c:4605 __do_sys_bpf kernel/bpf/syscall.c:4691 [inline] __se_sys_bpf kernel/bpf/syscall.c:4689 [inline] __x64_sys_bpf+0x75/0xb0 kernel/bpf/syscall.c:4689 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x4665f9
CVE-2021-47397	In the Linux kernel, the following vulnerability has been resolved: sctp: break out if skb_header_pointer returns NULL in sctp_rcv_oob We should always check if skb_header_pointer's return is NULL before using it, otherwise it may cause null-ptr-deref, as syzbot reported: KASAN: null-ptr-deref in range [0x0000000000000000-0x0000000000000007] RIP: 0010:sctp_rcv_oob net/sctp/input.c:705 [inline] RIP: 0010:sctp_rcv+0x1d84/0x3220 net/sctp/input.c:196 Call Trace: <IRQ> sctp6_rcv+0x38/0x60 net/sctp/ipv6.c:1109 ip6_protocol_deliver_rcu+0x2e9/0x1ca0 net/ipv6/ipv6_input.c:422 ip6_input_finish +0x62/0x170 net/ipv6/ipv6_input.c:463 NF_HOOK include/linux/netfilter.h:307 [inline] NF_HOOK include/linux/netfilter.h:301 [inline] ip6_input+0x9c/0xd0 net/ipv6/ipv6_input.c:472 dst_input include/net/dst.h:460 [inline] ip6_rcv_finish net/ipv6/ipv6_input.c:76 [inline] NF_HOOK include/linux/netfilter.h:307 [inline] NF_HOOK include/linux/netfilter.h:301 [inline] ipv6_rcv+0x28c/0x3c0 net/ipv6/ipv6_input.c:297
CVE-2021-47398	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Fix kernel pointer leak Pointers should be printed with %p or %px rather than cast to 'unsigned long long' and printed with %llx. Change %llx to %p to print the secured pointer.
CVE-2021-47404	In the Linux kernel, the following vulnerability has been resolved: HID: betop: fix slab-out-of-bounds Write in betop_probe Syzbot reported slab-out-of-bounds Write bug in hid-betopff driver. The problem is the driver assumes the device must have an input report but some malicious devices violate this assumption. So this patch checks hid_device's input is non empty before it's been used.
CVE-2021-47407	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Handle SRCU initialization failure during page track init Check the return of init_srcu_struct(), which can fail due to OOM, when initializing the page track mechanism. Lack of checking leads to a NULL pointer deref found by a modified syzkaller. [Move the call towards the beginning of kvm_arch_init_vm. - Paolo]

CVE ID	Description
CVE-2021-47413	In the Linux kernel, the following vulnerability has been resolved: usb: chipidea: ci_hdrc_imx: Also search for 'phys' phandle When passing 'phys' in the devicetree to describe the USB PHY phandle (which is the recommended way according to Documentation/devicetree/bindings/usb/ci-hdrc-usb2.txt) the following NULL pointer dereference is observed on i.MX7 and i.MX8MM: [1.489344] Unable to handle kernel NULL pointer dereference at virtual address 0000000000000098 [1.498170] Mem abort info: [1.500966] ESR = 0x96000044 [1.504030] EC = 0x25: DABT (current EL), IL = 32 bits [1.509356] SET = 0, FnV = 0 [1.512416] EA = 0, S1PTW = 0 [1.515569] FSC = 0x04: level 0 translation fault [1.520458] Data abort info: [1.523349] ISV = 0, ISS = 0x00000044 [1.527196] CM = 0, WnR = 1 [1.530176] [0000000000000098] user address but active_mm is swapper [1.536544] Internal error: Oops: 96000044 [#1] PREEMPT SMP [1.542125] Modules linked in: [1.545190] CPU: 3 PID: 7 Comm: kworker/u8:0 Not tainted 5.14.0-dirty #3 [1.551901] Hardware name: Kontron i.MX8MM N801X S (DT) [1.557133] Workqueue: events_unbound deferred_probe_work_func [1.562984] pstate: 80000005 (Nzcv daif -PAN -UAO -TCO BTYP=---) [1.568998] pc : imx7d_charger_detection+0x3f0/0x510 [1.573973] lr : imx7d_charger_detection+0x22c/0x510 This happens because the charger functions check for the phy presence inside the imx_usbmisc_data structure (data->usb_phy), but the chipidea core populates the usb_phy passed via 'phys' inside 'struct ci_hdrc' (ci->usb_phy) instead. This causes the NULL pointer dereference inside imx7d_charger_detection(). Fix it by also searching for 'phys' in case 'fsl,usbphy' is not found. Tested on a imx7s-warp board.
CVE-2021-47415	In the Linux kernel, the following vulnerability has been resolved: iwlwifi: mvm: Fix possible NULL dereference In __iwl_mvm_remove_time_event() check that 'te_data->vif' is NULL before dereferencing it.
CVE-2021-47416	In the Linux kernel, the following vulnerability has been resolved: phy: mdio: fix memory leak Syzbot reported memory leak in MDIO bus interface, the problem was in wrong state logic. MDIOBUS_ALLOCATED indicates 2 states: 1. Bus is only allocated 2. Bus allocated and __mdibus_register() fails, but device_register() was called In case of device_register() has been called we should call put_device() to correctly free the memory allocated for this device, but mdibus_free() calls just kfree(dev) in case of MDIOBUS_ALLOCATED state To avoid this behaviour we need to set bus->state to MDIOBUS_UNREGISTERED_before_ calling device_register(), because put_device() should be called even in case of device_register() failure.
CVE-2021-47419	In the Linux kernel, the following vulnerability has been resolved: net/sched: sch_taprio: properly cancel timer from taprio_destroy() There is a comment in qdisc_create() about us not calling ops->reset() in some cases. err_out4: /* * Any broken qdiscs that would require a ops->reset() here? * The qdisc was never in action so it shouldn't be necessary. */ As taprio sets a timer before actually receiving a packet, we need to cancel it from ops->destroy, just in case ops->reset has not been called. syzbot reported: ODEBAG: free active (active state 0) object type: hrtimer hint: advance_sched+0x0/0x9a0 arch/x86/include/asm/atomic64_64.h:22 WARNING: CPU: 0 PID: 8441 at lib/debugobjects.c:505 debug_print_object+0x16e/0x250 lib/debugobjects.c:505 Modules linked in: CPU: 0 PID: 8441 Comm: syz-executor813 Not tainted 5.14.0-rc6-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:debug_print_object+0x16e/0x250 lib/debugobjects.c:505 Code: ff df 48 89 fa 48 c1 ea 03 80 3c 02 00 0f 85 af 00 00 00 48 8b 14 dd e0 d3 e3 89 4c 89 ee 48 c7 c7 e0 c7 e3 89 e8 5b 86 11 05 <0f> 0b 83 05 85 03 92 09 01 48 83 c4 18 5b 5d 41 5c 41 5d 41 5e c3 RSP: 0018:ffff9000130f330 EFLAGS: 00010282 RAX: 0000000000000000 RBX: 0000000000000003 RCX: 0000000000000000 RDX: ffff88802baeb880 RSI: ffffffff815d87b5 RDI: fffff52000261e58 RBP: 0000000000000001 R08: 0000000000000000 R09: 0000000000000000 R10: ffffffff815d25ee R11: 0000000000000000 R12: ffffffff898dd020 R13: ffffffff89e3ce20 R14: ffffffff81653630 R15: dffffc0000000000 FS: 0000000000f0d300(0000) GS:ffff8880b9d00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007ffb64b3e000 CR3: 0000000036557000 CR4: 00000000001506e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: __debug_check_no_obj_freed lib/debugobjects.c:987 [inline] debug_check_no_obj_freed+0x301/0x420 lib/debugobjects.c:1018 slab_free_hook mm/slab.c:1603 [inline] slab_free_freelist_hook+0x171/0x240 mm/slab.c:1653 slab_free mm/slab.c:3213 [inline] kfree+0xe4/0x540 mm/slab.c:4267 qdisc_create+0xbcf/0x1320 net/sched/sch_api.c:1299 tc_modify_qdisc+0x4c8/0x1a60 net/sched/sch_api.c:1663 rtnetlink_rcv_msg+0x413/0xb80 net/core/rtnetlink.c:5571 netlink_rcv_skb+0x153/0x420 net/netlink/af_netlink.c:2504 netlink_unicast_kernel net/netlink/af_netlink.c:1314 [inline] netlink_unicast+0x533/0x7d0 net/netlink/af_netlink.c:1340 netlink_sendmsg+0x86d/0xdb0 net/netlink/af_netlink.c:1929 sock_sendmsg_nosec net/socket.c:704 [inline] sock_sendmsg+0xcf/0x120 net/socket.c:724 __sys_sendmsg+0x6e8/0x810 net/socket.c:2403 __sys_sendmsg+0xf3/0x170 net/socket.c:2457 __sys_sendmsg+0xe5/0x1b0 net/socket.c:2486 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80
CVE-2021-47420	In the Linux kernel, the following vulnerability has been resolved: drm/amdkfd: fix a potential ttm->sg memory leak Memory is allocated for ttm->sg by kmalloc in kfd_mem_dmamap_userptr, but isn't freed by kfree in kfd_mem_dmaunmap_userptr. Free it!

CVE ID	Description
CVE-2021-47421	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: handle the case of pci_channel_io_frozen only in amdgpu_pci_resume In current code, when a PCI error state pci_channel_io_normal is detected, it will report PCI_ERS_RESULT_CAN_RECOVER status to PCI driver, and PCI driver will continue the execution of PCI resume callback report_resume by pci_walk_bridge, and the callback will go into amdgpu_pci_resume finally, where write lock is released unconditionally without acquiring such lock first. In this case, a deadlock will happen when other threads start to acquire the read lock. To fix this, add a member in amdgpu_device struct to cache pci_channel_state, and only continue the execution in amdgpu_pci_resume when it's pci_channel_io_frozen.
CVE-2021-47424	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix freeing of uninitialized misc IRQ vector When VSI set up failed in i40e_probe() as part of PF switch set up driver was trying to free misc IRQ vectors in i40e_clear_interrupt_scheme and produced a kernel Oops: Trying to free already-free IRQ 266 WARNING: CPU: 0 PID: 5 at kernel/irq/manage.c:1731 __free_irq+0x9a/0x300 Workqueue: events work_for_cpu_fn RIP: 0010: __free_irq+0x9a/0x300 Call Trace: ? synchronize_irq+0x3a/0xa0 free_irq+0x2e/0x60 i40e_clear_interrupt_scheme+0x53/0x190 [i40e] i40e_probe.part.108+0x134b/0x1a40 [i40e] ? kmem_cache_alloc+0x158/0x1c0 ? acpi_ut_update_ref_count.part.1+0x8e/0x345 ? acpi_ut_update_object_reference+0x15e/0x1e2 ? strstr+0x21/0x70 ? irq_get_irq_data+0xa/0x20 ? mp_check_pin_attr+0x13/0xc0 ? irq_get_irq_data+0xa/0x20 ? mp_map_pin_to_irq+0xd3/0x2f0 ? acpi_register_gsi_ioapic+0x93/0x170 ? pci_conf1_read+0xa4/0x100 ? pci_bus_read_config_word+0x49/0x70 ? do_pci_enable_device+0xcc/0x100 local_pci_probe+0x41/0x90 work_for_cpu_fn+0x16/0x20 process_one_work+0x1a7/0x360 worker_thread+0x1cf/0x390 ? create_worker+0x1a0/0x1a0 kthread+0x112/0x130 ? kthread_flush_work_fn+0x10/0x10 ret_from_fork+0x1f/0x40 The problem is that at that point misc IRQ vectors were not allocated yet and we get a call trace that driver is trying to free already free IRQ vectors. Add a check in i40e_clear_interrupt_scheme for __I40E_MISC_IRQ_REQUESTED PF state before calling i40e_free_misc_vector. This state is set only if misc IRQ vectors were properly initialized.
CVE-2021-47426	In the Linux kernel, the following vulnerability has been resolved: bpf, s390: Fix potential memory leak about jit_data Make sure to free jit_data through kfree() in the error path.
CVE-2021-47427	In the Linux kernel, the following vulnerability has been resolved: scsi: iscsi: Fix iscsi_task use after free Commit d39df158518c ("scsi: iscsi: Have abort handler get ref to conn") added iscsi_get_conn()/iscsi_put_conn() calls during abort handling but then also changed the handling of the case where we detect an already completed task where we now end up doing a goto to the common put/cleanup code. This results in a iscsi_task use after free, because the common cleanup code will do a put on the iscsi_task. This reverts the goto and moves the iscsi_get_conn() to after we've checked if the iscsi_task is valid.
CVE-2021-47431	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix gart.bo pin_count leak gmc_v{9,10}_0_gart_disable() isn't called matched with corresponding gart_enable function in SRIOV case. This will lead to gart.bo pin_count leak on driver unload.
CVE-2021-47438	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix memory leak in mlx5_core_destroy_cq() error path Prior to this patch in case mlx5_core_destroy_cq() failed it returns without completing all destroy operations and that leads to memory leak. Instead, complete the destroy flow before return error. Also move mlx5_debug_cq_remove() to the beginning of mlx5_core_destroy_cq() to be symmetrical with mlx5_core_create_cq(). kmemleak complains on: unreferenced object 0xc000000038625100 (size 64): comm "ethtool", pid 28301, jiffies 4298062946 (age 785.380s) hex dump (first 32 bytes): 60 01 48 94 00 00 00 c0 b8 05 34 c3 00 00 00 c0 .H.....4..... 02 00 00 00 00 00 00 00 db 7d c1 00 00 00 c0}..... backtrace: [<000000009e8643cb>] add_res_tree+0xd0/0x270 [mlx5_core] [<00000000e7cb8e6c>] mlx5_debug_cq_add+0x5c/0xc0 [mlx5_core] [<000000002a12918f>] mlx5_core_create_cq+0x1d0/0x2d0 [mlx5_core] [<00000000cef0a696>] mlx5e_create_cq+0x210/0x3f0 [mlx5_core] [<000000009c642c26>] mlx5e_open_cq+0xb4/0x130 [mlx5_core] [<0000000058dfa578>] mlx5e_ptp_open+0x7f4/0xe10 [mlx5_core] [<0000000081839561>] mlx5e_open_channels+0x9cc/0x13e0 [mlx5_core] [<000000009cf05d4>] mlx5e_switch_priv_channels+0xa4/0x230 [mlx5_core] [<0000000042bedd8>] mlx5e_safe_switch_params+0x14c/0x300 [mlx5_core] [<0000000004bc9db8>] set_pflag_tx_port_ts+0x9c/0x160 [mlx5_core] [<00000000a0553443>] mlx5e_set_priv_flags+0xd0/0x1b0 [mlx5_core] [<00000000a8f3d84b>] ethnl_set_privflags+0x234/0x2d0 [<00000000fd27f27c>] genl_family_rcv_msg_doit+0x108/0x1d0 [<00000000f495e2bb>] genl_family_rcv_msg+0xe4/0x1f0 [<00000000646c5c2c>] genl_rcv_msg+0x78/0x120 [<00000000d53e384e>] netlink_rcv_skb+0x74/0x1a0

CVE ID	Description
CVE-2021-47449	In the Linux kernel, the following vulnerability has been resolved: ice: fix locking for Tx timestamp tracking flush Commit 4dd0d5c33c3e ("ice: add lock around Tx timestamp tracker flush") added a lock around the Tx timestamp tracker flow which is used to cleanup any left over SKBs and prepare for device removal. This lock is problematic because it is being held around a call to ice_clear_phy_tstamp. The clear function takes a mutex to send a PHY write command to firmware. This could lead to a deadlock if the mutex actually sleeps, and causes the following warning on a kernel with preemption debugging enabled: [715.419426] BUG: sleeping function called from invalid context at kernel/locking/mutex.c:573 [715.427900] in_atomic(): 1, irqs_disabled(): 0, non_block: 0, pid: 3100, name: rmmmod [715.435652] INFO: lockdep is turned off. CVE-2021-47452	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: skip netdev events generated on netns removal syzbot reported following (harmless) WARN: WARNING: CPU: 1 PID: 2648 at net/netfilter/core.c:468 nft_netdev_unregister_hooks net/netfilter/nf_tables_api.c:230 [inline] nf_tables_unregister_hook include/net/netfilter/nf_tables.h:1090 [inline] __nft_release_basechain+0x138/0x640 net/netfilter/nf_tables_api.c:9524 nft_netdev_event net/netfilter/nft_chain_filter.c:351 [inline] nf_tables_netdev_event+0x521/0x8a0 net/netfilter/nft_chain_filter.c:382 reproducer: unshare -n bash -c 'ip link add br0 type bridge; nft add table netdev t ; \nft add chain netdev t ingress \{ type filter hook ingress device "br0" \ priority 0\; policy drop\; \}' Problem is that when netns device exit hooks create the UNREGISTER event, the .pre_exit hook for nf_tables core has already removed the base hook. Notifier attempts to do this again. The need to do base hook unregister unconditionally was needed in the past, because notifier was last stage where reg->dev dereference was safe. Now that nf_tables does the hook removal in .pre_exit, this isn't needed anymore.
CVE-2021-47453	In the Linux kernel, the following vulnerability has been resolved: ice: Avoid crash from unnecessary IDA free In the remove path, there is an attempt to free the aux_idx IDA whether it was allocated or not. This can potentially cause a crash when unloading the driver on systems that do not initialize support for RDMA. But, this free cannot be gated by the status bit for RDMA, since it is allocated if the driver detects support for RDMA at probe time, but the driver can enter into a state where RDMA is not supported after the IDA has been allocated at probe time and this would lead to a memory leak. Initialize aux_idx to an invalid value and check for a valid value when unloading to determine if an IDA free is necessary.

CVE ID	Description
CVE-2021-47462	In the Linux kernel, the following vulnerability has been resolved: mm/mempolicy: do not allow illegal MPOL_F_NUMA_BALANCING MPOL_LOCAL in mbind() syzbot reported access to uninitialized memory in mbind() [1] Issue came with commit bda420b98505 ("numa balancing: migrate on fault among multiple bound nodes") This commit added a new bit in MPOL_MODE_FLAGS, but only checked valid combination (MPOL_F_NUMA_BALANCING can only be used with MPOL_BIND) in do_set_mempolicy() This patch moves the check in sanitize_mpol_flags() so that it is also used by mbind() [1] BUG: KMSAN: uninit-value in __mpol_equal+0x567/0x590 mm/mempolicy.c:2260 __mpol_equal+0x567/0x590 mm/mempolicy.c:2260 mpol_equal include/linux/mempolicy.h:105 [inline] vma_merge+0x4a1/0x1e60 mm/mmap.c:1190 mbind_range+0xcc8/0x1e80 mm/mempolicy.c:811 do_mbind+0xf42/0x15f0 mm/mempolicy.c:1333 kernel_mbind mm/mempolicy.c:1483 [inline] __do_sys_mbind mm/mempolicy.c:1490 [inline] __se_sys_mbind+0x437/0xb80 mm/mempolicy.c:1486 __x64_sys_mbind+0x19d/0x200 mm/mempolicy.c:1486 do_syscall_x64 arch/x86/entry/common.c:51 [inline] do_syscall_64+0x54/0xd0 arch/x86/entry/common.c:82 entry_SYSCALL_64_after_hwframe+0x44/0xae Uninit was created at: slab_alloc_node mm/slub.c:3221 [inline] slab_alloc mm/slub.c:3230 [inline] kmem_cache_alloc+0x751/0xff0 mm/slub.c:3235 mpol_new mm/mempolicy.c:293 [inline] do_mbind+0x912/0x15f0 mm/mempolicy.c:1289 kernel_mbind mm/mempolicy.c:1483 [inline] __do_sys_mbind mm/mempolicy.c:1490 [inline] __se_sys_mbind+0x437/0xb80 mm/mempolicy.c:1486 __x64_sys_mbind+0x19d/0x200 mm/mempolicy.c:1486 do_syscall_x64 arch/x86/entry/common.c:51 [inline] do_syscall_64+0x54/0xd0 arch/x86/entry/common.c:82 entry_SYSCALL_64_after_hwframe+0x44/0xae ===== Kernel panic - not syncing: panic_on_kmsan set ... CVE-2021-47464	In the Linux kernel, the following vulnerability has been resolved: audit: fix possible null-pointer dereference in audit_filter_rules Fix possible null-pointer dereference in audit_filter_rules. audit_filter_rules() error: we previously assumed 'ctx' could be null
CVE-2021-47465	In the Linux kernel, the following vulnerability has been resolved: KVM: PPC: Book3S HV: Fix stack handling in idle_kvm_start_guest() In commit 10d91611f426 ("powerpc/64s: Reimplement book3s idle code in C") kvm_start_guest() became idle_kvm_start_guest(). The old code allocated a stack frame on the emergency stack, but didn't use the frame to store anything, and also didn't store anything in its caller's frame. idle_kvm_start_guest() on the other hand is written more like a normal C function, it creates a frame on entry, and also stores CR/LR into its callers frame (per the ABI). The problem is that there is no caller frame on the emergency stack. The emergency stack for a given CPU is allocated with: paca_ptrs[i]->emergency_sp = alloc_stack(limit, i) + THREAD_SIZE; So emergency_sp actually points to the first address above the emergency stack allocation for a given CPU, we must not store above it without first decrementing it to create a frame. This is different to the regular kernel stack, paca->kstack, which is initialised to point at an initial frame that is ready to use. idle_kvm_start_guest() stores the backchain, CR and LR all of which write outside the allocation for the emergency stack. It then creates a stack frame and saves the non-volatile registers. Unfortunately the frame it creates is not large enough to fit the non-volatiles, and so the saving of the non-volatile registers also writes outside the emergency stack allocation. The end result is that we corrupt whatever is at 0-24 bytes, and 112-248 bytes above the emergency stack allocation. In practice this has gone unnoticed because the memory immediately above the emergency stack happens to be used for other stack allocations, either another CPUs mc_emergency_sp or an IRQ stack. See the order of calls to irqstack_early_init() and emergency_stack_init(). The low addresses of another stack are the top of that stack, and so are only used if that stack is under extreme pressure, which essentially never happens in practice - and if it did there's a high likelihood we'd crash due to that stack overflowing. Still, we shouldn't be corrupting someone else's stack, and it is purely luck that we aren't corrupting something else. To fix it we save CR/LR into the caller's frame using the existing r1 on entry, we then create a SWITCH_FRAME_SIZE frame (which has space for pt_regs) on the emergency stack with the backchain pointing to the existing stack, and then finally we switch to the new frame on the emergency stack.

CVE ID	Description
CVE-2021-47481	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Initialize the ODP xarray when creating an ODP MR Normally the zero fill would hide the missing initialization, but an errant set to desc_size in reg_create() causes a crash: BUG: unable to handle page fault for address: 0000000800000000 PGD 0 P4D 0 Oops: 0000 [#1] SMP PTI CPU: 5 PID: 890 Comm: ib_write_bw Not tainted 5.15.0-rc4+ #47 Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS rel-1.13.0-0-gf21b5a4eb02-prebuilt.qemu.org 04/01/2014 RIP: 0010:mlx5_ib_dereg_mr+0x14/0x3b0 [mlx5_ib] Code: 48 63 cd 4c 89 f7 48 89 0c 24 e8 37 30 03 e1 48 8b 0c 24 eb a0 90 0f 1f 44 00 00 41 56 41 55 41 54 55 53 48 89 fb 48 83 ec 30 <48> 8b 2f 65 48 8b 04 25 28 00 00 00 48 89 44 24 28 31 c0 8b 87 c8 RSP: 0018:ffff88811afa3a60 EFLAGS: 00010286 RAX: 000000000000001c RBX: 0000000800000000 RCX: 0000000000000000 RDX: 0000000000000000 RSI: 0000000000000000 RDI: 0000000800000000 RBP: 0000000800000000 R08: 0000000000000000 R09: c0000000fffff7ff R10: ffff88811afa38f8 R11: ffff88811afa38f0 R12: ffffffff02c7ac0 R13: 0000000000000000 R14: ffff88811afa3cd8 R15: ffff88810772fa00 FS: 00007f47b9080740(0000) GS:ffff88852cd40000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 0000000800000000 CR3: 000000010761e003 CR4: 0000000000370ea0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: mlx5_ib_free_odp_mr+0x95/0xc0 [mlx5_ib] mlx5_ib_dereg_mr+0x128/0x3b0 [mlx5_ib] ib_dereg_mr_user+0x45/0xb0 [ib_core] ? xas_load+0x8/0x80 destroy_hw_idr_uobject+0x1a/0x50 [ib_uverbs] uverbs_destroy_uobject+0x2f/0x150 [ib_uverbs] uobj_destroy+0x3c/0x70 [ib_uverbs] ib_uverbs_cmd_verbs+0x467/0xb00 [ib_uverbs] ? uverbs_finalize_object+0x60/0x60 [ib_uverbs] ? ttwu_queue_wakelist+0xa9/0xe0 ? pty_write+0x85/0x90 ? file_tty_write.isra.33+0x214/0x330 ? process_echoes+0x60/0x60 ib_uverbs_ioctl+0xa7/0x110 [ib_uverbs] __x64_sys_ioctl+0x10d/0x8e0 ? vfs_write+0x17f/0x260 do_syscall_64+0x3c/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae Add the missing xarray initialization and remove the desc_size set.
CVE-2021-47483	In the Linux kernel, the following vulnerability has been resolved: regmap: Fix possible double-free in regcache_rbtrees_exit() In regcache_rbtrees_insert_to_block(), when 'present' realloc failed, the 'blk' which is supposed to assign to 'rbnode->block' will be freed, so 'rbnode->block' points a freed memory, in the error handling path of regcache_rbtrees_init(), 'rbnode->block' will be freed again in regcache_rbtrees_exit(), KASAN will report double-free as follows: BUG: KASAN: double-free or invalid-free in kfree+0xce/0x390 Call Trace: slab_free_freelist_hook+0x10d/0x240 kfree+0xce/0x390 regcache_rbtrees_exit+0x15d/0x1a0 regcache_rbtrees_init+0x224/0x2c0 regcache_init+0x88d/0x1310 __regmap_init+0x3151/0x4a80 __devm_regmap_init+0x7d/0x100 madera_spi_probe+0x10f/0x333 [madera_spi] spi_probe+0x183/0x210 really_probe+0x285/0xc30 To fix this, moving up the assignment of rbnode->block to immediately after the reallocation has succeeded so that the data structure stays valid even if the second reallocation fails.
CVE-2021-47490	In the Linux kernel, the following vulnerability has been resolved: drm/ttm: fix memleak in ttm_transferred_destroy We need to cleanup the fences for ghost objects as well. Bug: https://bugzilla.kernel.org/show_bug.cgi?id=214029 Bug: https://bugzilla.kernel.org/show_bug.cgi?id=214447
CVE-2021-47492	In the Linux kernel, the following vulnerability has been resolved: mm, thp: bail out early in collapse_file for writeback page Currently collapse_file does not explicitly check PG_writeback, instead, page_has_private and try_to_release_page are used to filter writeback pages. This does not work for xfs with blocksize equal to or larger than pagesize, because in such case xfs has no page->private. This makes collapse_file bail out early for writeback page. Otherwise, xfs_end_page_writeback will panic as follows. page:ffffe00201bcc80 refcount:0 mapcount:0 mapping:ffff0003f88c86a8 index:0x0 pfn:0x84ef32 aops:xfs_address_space_operations [xfs] ino:30000b7 dentry name:"libtest.so" flags: 0x57ffff0000008027(locked referenced uptodate active writeback) raw: 57ffff0000008027 ffff80001b48bc28 ffff80001b48bc28 ffff0003f88c86a8 raw: 0000000000000000 0000000000000000 00000000ffffffffff ffff0000c3e9a000 page dumped because: VM_BUG_ON_PAGE(((unsigned int) page_ref_count(page) + 127u <= 127u)) page->mem_cgroup:ffff0000c3e9a000 ----- [cut here]----- kernel BUG at include/linux/mm.h:1212! CVE ID	Description
CVE-2021-47494	In the Linux kernel, the following vulnerability has been resolved: cfg80211: fix management registrations locking The management registrations locking was broken, the list was locked for each wdev, but cfg80211_mgmt_registrations_update() iterated it without holding all the correct spinlocks, causing list corruption. Rather than trying to fix it with fine-grained locking, just move the lock to the wiphy/rdev (still need the list on each wdev), we already need to hold the wdev lock to change it, so there's no contention on the lock in any case. This trivially fixes the bug since we hold one wdev's lock already, and now will hold the lock that protects all lists.
CVE-2021-47496	In the Linux kernel, the following vulnerability has been resolved: net/tls: Fix flipped sign in tls_err_abort() calls sk->sk_err appears to expect a positive value, a convention that ktls doesn't always follow and that leads to memory corruption in other code. For instance, [kworker] tls_encrypt_done(..., err=<negative error from crypto request>) tls_err_abort(..., err) sk->sk_err = err; [task] splice_from_pipe_feed ... tls_sw_do_sendpage if (sk->sk_err) { ret = -sk->sk_err; // ret is positive splice_from_pipe_feed (continued) ret = actor(...) // ret is still positive and interpreted as bytes // written, resulting in underflow of buf->len and // sd->len, leading to huge buf->offset and bogus // addresses computed in later calls to actor() Fix all tls_err_abort() callers to pass a negative error code consistently and centralize the error-prone sign flip there, throwing in a warning to catch future misuse and unlining the function so it really does only warn once.
CVE-2021-47506	In the Linux kernel, the following vulnerability has been resolved: nfsd: fix use-after-free due to delegation race A delegation break could arrive as soon as we've called vfs_setlease. A delegation break runs a callback which immediately (in nfsd4_cb_recall_prepare) adds the delegation to del_recall_lru. If we then exit nfs4_set_delegation without hashing the delegation, it will be freed as soon as the callback is done with it, without ever being removed from del_recall_lru. Symptoms show up later as use-after-free or list corruption warnings, usually in the laundromat thread. I suspect aba2072f4523 "nfsd: grant read delegations to clients holding writes" made this bug easier to hit, but I looked as far back as v3.0 and it looks to me it already had the same problem. So I'm not sure where the bug was introduced; it may have been there from the beginning.
CVE-2021-47507	In the Linux kernel, the following vulnerability has been resolved: nfsd: Fix nsfd startup race (again) Commit bd5ae9288d64 ("nfsd: register pernet ops last, unregister first") has re-opened rpc_pipefs_event() race against nfsd_net_id registration (register_pernet_subsys()) which has been fixed by commit bb7ffbf29e76 ("nfsd: fix nsfd startup race triggering BUG_ON"). Restore the order of register_pernet_subsys() vs register_cld_notifier(). Add WARN_ON() to prevent a future regression. Crash info: Unable to handle kernel NULL pointer dereference at virtual address 0000000000000012 CPU: 8 PID: 345 Comm: mount Not tainted 5.4.144-... #1 pc : rpc_pipefs_event+0x54/0x120 [nfsd] lr : rpc_pipefs_event+0x48/0x120 [nfsd] Call trace: rpc_pipefs_event+0x54/0x120 [nfsd] blocking_notifier_call_chain rpc_fill_super get_tree_keyed rpc_fs_get_tree vfs_get_tree do_mount ksys_mount __arm64_sys_mount el0_svc_handler el0_svc
CVE-2021-47514	In the Linux kernel, the following vulnerability has been resolved: devlink: fix netns refcount leak in devlink_nl_cmd_reload() While preparing my patch series adding netns refcount tracking, I spotted bugs in devlink_nl_cmd_reload() Some error paths forgot to release a refcount on a netns. To fix this, we can reduce the scope of get_net()/put_net() section around the call to devlink_reload().
CVE-2021-47517	In the Linux kernel, the following vulnerability has been resolved: ethtool: do not perform operations on net devices being unregistered There is a short period between a net device starts to be unregistered and when it is actually gone. In that time frame ethtool operations could still be performed, which might end up in unwanted or undefined behaviours[1]. Do not allow ethtool operations after a net device starts its unregistration. This patch targets the netlink part as the ioctl one isn't affected: the reference to the net device is taken and the operation is executed within an rtnl lock section and the net device won't be found after unregister. [1] For example adding Tx queues after unregister ends up in NULL pointer exceptions and UaFs, such as: BUG: KASAN: use-after-free in kobject_get+0x14/0x90 Read of size 1 at addr ffff88801961248c by task ethtool/755 CPU: 0 PID: 755 Comm: ethtool Not tainted 5.15.0-rc6+ #778 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.14.0-4.fc34 04/014 Call Trace: dump_stack_lvl+0x57/0x72 print_address_description.constprop.0+0x1f/0x140 kasan_report.cold+0x7f/0x11b kobject_get+0x14/0x90 kobject_add_internal+0x3d1/0x450 kobject_init_and_add+0xba/0xf0 netdev_queue_update_kobjects+0xcf/0x200 netif_set_real_num_tx_queues+0xb4/0x310 veth_set_channels+0x1c3/0x550 ethtnl_set_channels+0x524/0x610
CVE-2021-47529	In the Linux kernel, the following vulnerability has been resolved: iwlmwifi: Fix memory leaks in error handling path Should an error occur (invalid TLV len or memory allocation failure), the memory already allocated in 'reduce_power_data' should be freed before returning, otherwise it is leaking.

CVE ID	Description
CVE-2021-47536	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix wrong list_del in smc_lgr_cleanup_early smc_lgr_cleanup_early() meant to delete the link group from the link group list, but it deleted the list head by mistake. This may cause memory corruption since we didn't remove the real link group from the list and later memseted the link group structure. We got a list corruption panic when testing: [231.277259] list_del corruption. prev->next should be ffff8881398a8000, but was 0000000000000000 [231.278222] -----[cut here]----- [231.278726] kernel BUG at lib/list_debug.c:53! CVE-2021-47550	In the Linux kernel, the following vulnerability has been resolved: drm/amd/amdgpu: fix potential memleak In function amdgpu_get_xgmi_hive, when kobject_init_and_add failed There is a potential memleak if not call kobject_put.

CVE ID	Description
CVE-2021-47552	In the Linux kernel, the following vulnerability has been resolved: blk-mq: cancel blk-mq dispatch work in both blk_cleanup_queue and disk_release() For avoiding to slow down queue destroy, we don't call blk_mq_quiesce_queue() in blk_cleanup_queue(), instead of delaying to cancel dispatch work in blk_release_queue(). However, this way has caused kernel oops[1], reported by Changhui. The log shows that scsi_device can be freed before running blk_release_queue(), which is expected too since scsi_device is released after the scsi disk is closed and the scsi_device is removed. Fixes the issue by canceling blk-mq dispatch work in both blk_cleanup_queue() and disk_release(): 1) when disk_release() is run, the disk has been closed, and any sync dispatch activities have been done, so canceling dispatch work is enough to quiesce filesystem I/O dispatch activity. 2) in blk_cleanup_queue(), we only focus on passthrough request, and passthrough request is always explicitly allocated & freed by its caller, so once queue is frozen, all sync dispatch activity for passthrough request has been done, then it is enough to just cancel dispatch work for avoiding any dispatch activity. [1] kernel panic log [12622.769416] BUG: kernel NULL pointer dereference, address: 0000000000000300 [12622.777186] #PF: supervisor read access in kernel mode [12622.782918] #PF: error_code(0x0000) - not-present page [12622.788649] PGD 0 P4D 0 [12622.791474] Oops: 0000 [#1] PREEMPT SMP PTI [12622.796138] CPU: 10 PID: 744 Comm: kworker/10:1H Kdump: loaded Not tainted 5.15.0+ #1 [12622.804877] Hardware name: Dell Inc. CVE-2021-47558	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: Disable Tx queues when reconfiguring the interface The Tx queues were not disabled in situations where the driver needed to stop the interface to apply a new configuration. This could result in a kernel panic when doing any of the 3 following actions: * reconfiguring the number of queues (ethtool -L) * reconfiguring the size of the ring buffers (ethtool -G) * installing/removing an XDP program (ip l set dev ethX xdp) Prevent the panic by making sure netif_tx_disable is called when stopping an interface. Without this patch, the following kernel panic can be observed when doing any of the actions above: Unable to handle kernel paging request at virtual address ffff80001238d040 [...] Call trace: dwmac4_set_addr+0x8/0x10 dev_hard_start_xmit+0xe4/0x1ac sch_direct_xmit+0xe8/0x39c __dev_queue_xmit+0x3ec/0xaf0 dev_queue_xmit+0x14/0x20 [...] [end trace 0000000000000002]---
CVE-2021-47559	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix NULL pointer dereferencing in smc_vlan_by_tcpsk() Coverity reports a possible NULL dereferencing problem: in smc_vlan_by_tcpsk(): 6. returned_null: netdev_lower_get_next returns NULL (checked 29 out of 30 times). 7. var_assigned: Assigning: ndev = NULL return value from netdev_lower_get_next. 1623 ndev = (struct net_device *)netdev_lower_get_next(ndev, &lower); CID 1468509 (#1 of 1): Dereference null return value (NULL_RETURNS) 8. dereference: Dereferencing a pointer that might be NULL ndev when calling is_vlan_dev. 1624 if (is_vlan_dev(ndev)) { Remove the manual implementation and use netdev_walk_all_lower_dev() to iterate over the lower devices. While on it remove an obsolete function parameter comment.

CVE ID	Description
CVE-2021-47562	In the Linux kernel, the following vulnerability has been resolved: ice: fix vsi->txq_map sizing The approach of having XDP queue per CPU regardless of user's setting exposed a hidden bug that could occur in case when Rx queue count differ from Tx queue count. Currently vsi->txq_map's size is equal to the doubled vsi->alloc_txq, which is not correct due to the fact that XDP rings were previously based on the Rx queue count. Below splat can be seen when ethtool -L is used and XDP rings are configured: [682.875339] BUG: kernel NULL pointer dereference, address: 000000000000000f [682.883403] #PF: supervisor read access in kernel mode [682.889345] #PF: error_code(0x0000) - not-present page [682.895289] PGD 0 P4D 0 [682.898218] Oops: 0000 [#1] PREEMPT SMP PTI [682.903055] CPU: 42 PID: 2878 Comm: ethtool Tainted: G OE 5.15.0-rc5+ #1 [682.912214] Hardware name: Intel Corp. CVE ID	Description
CVE-2021-47563	In the Linux kernel, the following vulnerability has been resolved: ice: avoid bpf_prog refcount underflow Ice driver has the routines for managing XDP resources that are shared between ndo_bpf op and VSI rebuild flow. The latter takes place for example when user changes queue count on an interface via ethtool's set_channels(). There is an issue around the bpf_prog refcounting when VSI is being rebuilt - since ice_prepare_xdp_rings() is called with vsi->xdp_prog as an argument that is used later on by ice_vsi_assign_bpf_prog(), same bpf_prog pointers are swapped with each other. Then it is also interpreted as an 'old_prog' which in turn causes us to call bpf_prog_put on it that will decrement its refcount. Below splat can be interpreted in a way that due to zero refcount of a bpf_prog it is wiped out from the system while kernel still tries to refer to it: [481.069429] BUG: unable to handle page fault for address: fffff9000640f038 [481.077390] #PF: supervisor read access in kernel mode [481.083335] #PF: error_code(0x0000) - not-present page [481.089276] PGD 100000067 P4D 100000067 PUD 1001cb067 PMD 106d2b067 PTE 0 [481.097141] Oops: 0000 [#1] PREEMPT SMP PTI [481.101980] CPU: 12 PID: 3339 Comm: sudo Tainted: G OE 5.15.0-rc5+ #1 [481.110840] Hardware name: Intel Corp. CVE ID	Description
CVE-2021-47578	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_debug: Don't call kcalloc() if size arg is zero If the size arg to kcalloc() is zero, it returns ZERO_SIZE_PTR. Because of that, for a following NULL pointer check to work on the returned pointer, kcalloc() must not be called with the size arg equal to zero. Return early without error before the kcalloc() call if size arg is zero. CVE-2021-47588	In the Linux kernel, the following vulnerability has been resolved: sit: do not call ipip6_dev_free() from sit_init_net() ipip6_dev_free is sit dev->priv_destructor, already called by register_netdevice() if something goes wrong. Alternative would be to make ipip6_dev_free() robust against multiple invocations, but other drivers do not implement this strategy. syzbot reported: dst_release underflow WARNING: CPU: 0 PID: 5059 at net/core/dst.c:173 dst_release+0xd8/0xe0 net/core/dst.c:173 Modules linked in: CPU: 1 PID: 5059 Comm: syz-executor.4 Not tainted 5.16.0-rc5-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:dst_release+0xd8/0xe0 net/core/dst.c:173 Code: 4c 89 f2 89 d9 31 c0 5b 41 5e 5d e9 da d5 44 f9 e8 1d 90 5f f9 c6 05 87 48 c6 05 01 48 c7 c7 80 44 99 8b 31 c0 e8 e8 67 29 f9 <0f> 0b eb 85 0f 1f 40 00 53 48 89 fb e8 f7 8f 5f f9 48 83 c3 a8 48 RSP: 0018:ffffc9000aa5faa0 EFLAGS: 00010246 RAX: d6894a925dd15a00 RBX: 0000000000000000 RCX: 0000000000004000 RDX: fffff90005e19000 RSI: 0000000000003fff RDI: 0000000000004000 RBP: 0000000000000000 R08: ffffffff816a1f42 R09: fffffd1017344f2c R10: fffffd1017344f2c R11: 0000000000000000 R12: 0000607f462b1358 R13: 1fffffff1bfd305 R14: fffff8ffffcb1358 R15: dffffc0000000000 FS: 00007f66c71a2700(0000) GS:ffff8880b9a00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007f88aed5058 CR3: 0000000023e0f000 CR4: 0000000003506f0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: <TASK> dst_cache_destroy+0x107/0x1e0 net/core/dst_cache.c:160 ipip6_dev_free net/ipv6/sit.c:1414 [inline] sit_init_net+0x229/0x550 net/ipv6/sit.c:1936 ops_init+0x313/0x430 net/core/net_namespace.c:140 setup_net+0x35b/0x9d0 net/core/net_namespace.c:326 copy_net_ns+0x359/0x5c0 net/core/net_namespace.c:470 create_new_namespaces+0x4ce/0xa00 kernel/nsproxy.c:110 unshare_nsproxy_namespaces+0x11e/0x180 kernel/nsproxy.c:226 ksys_unshare+0x57d/0xb50 kernel/fork.c:3075 __do_sys_unshare kernel/fork.c:3146 [inline] __se_sys_unshare kernel/fork.c:3144 [inline] __x64_sys_unshare+0x34/0x40 kernel/fork.c:3144 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x44/0xd0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7f66c882ce99 Code: ff ff c3 66 2e 0f 1f 84 00 00 00 00 0f 1f 40 00 48 89 f8 48 89 f7 48 89 d6 48 89 ca 4d 89 c2 4d 89 c8 4c 8b 4c 24 08 0f 05 <48> 3d 01 f0 ff ff 73 01 c3 48 c7 c1 bc ff ff f7 d8 64 89 01 48 RSP: 002b:00007f66c71a2168 EFLAGS: 00000246 ORIG_RAX: 0000000000000110 RAX: ffffffff816a1f42 RBX: 00007f66c893ff60 RCX: 00007f66c882ce99 RDX: 0000000000000000 RSI: 0000000000000000 RDI: 0000000048040200 RBP: 00007f66c8886ff1 R08: 0000000000000000 R09: 0000000000000000 R10: 0000000000000000 R11: 0000000000000246 R12: 0000000000000000 R13: 00007f66c71a2300 R14: 00007f66c71a2300 R15: 0000000000002200 </TASK>

CVE ID	Description
CVE-2021-47591	In the Linux kernel, the following vulnerability has been resolved: mptcp: remove tcp ulp setsockopt support TCP_ULP setsockopt cannot be used for mptcp because its already used internally to plumb subflow (tcp) sockets to the mptcp layer. syzbot managed to trigger a crash for mptcp connections that are in fallback mode: KASAN: null-ptr-deref in range [0x0000000000000020-0x0000000000000027] CPU: 1 PID: 1083 Comm: syz-executor.3 Not tainted 5.16.0-rc2-syzkaller #0 RIP: 0010:tls_build_proto net/tls/tls_main.c:776 [inline] [...] __tcp_set_ulp net/ipv4/tcp_ulp.c:139 [inline] tcp_set_ulp +0x428/0x4c0 net/ipv4/tcp_ulp.c:160 do_tcp_setsockopt+0x455/0x37c0 net/ipv4/tcp.c:3391 mptcp_setsockopt+0x1b47/0x2400 net/mptcp/socket.c:638 Remove support for TCP_ULP setsockopt.
CVE-2021-47594	In the Linux kernel, the following vulnerability has been resolved: mptcp: never allow the PM to close a listener subflow Currently, when deleting an endpoint the netlink PM traverses all the local MPTCP sockets, regardless of their status. If an MPTCP listener socket is bound to the IP matching the delete endpoint, the listener TCP socket will be closed. That is unexpected, the PM should only affect data subflows. Additionally, syzbot was able to trigger a NULL ptr dereference due to the above: general protection fault, probably for non-canonical address 0xdffffc0000000003: 0000 [#1] PREEMPT SMP KASAN KASAN: null-ptr-deref in range [0x0000000000000018-0x000000000000001f] CPU: 1 PID: 6550 Comm: syz-executor122 Not tainted 5.16.0-rc4-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:__lock_acquire +0xd7d/0x54a0 kernel/locking/lockdep.c:4897 Code: 0f 0e 41 be 01 00 00 00 0f 86 c8 00 00 00 89 05 69 cc 0f 0e e9 bd 00 00 00 48 b8 00 00 00 00 00 fc ff df 48 89 da 48 c1 ea 03 <80> 3c 02 00 0f 85 f3 2f 00 00 48 81 3b 20 75 17 8f 0f 84 52 f3 ff RSP: 0018:ffff90001f2f818 EFLAGS: 00010016 RAX: dffffc0000000000 RBX: 0000000000000018 RCX: 0000000000000000 RDX: 0000000000000003 RSI: 0000000000000000 RDI: 0000000000000001 RBP: 0000000000000000 R08: 0000000000000001 R09: 0000000000000001 R10: 0000000000000000 R11: 000000000000000a R12: 0000000000000000 R13: ffff88801b98d700 R14: 0000000000000000 R15: 0000000000000001 FS: 00007f177cd3d700(0000) GS:ffff8880b9d00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007f177cd1b268 CR3: 000000001dd55000 CR4: 0000000000350ee0 Call Trace: <TASK> lock_acquire kernel/locking/lockdep.c:5637 [inline] lock_acquire+0x1ab/0x510 kernel/locking/lockdep.c:5602 __raw_spin_lock_irqsave include/linux/spinlock_api_smp.h:110 [inline] _raw_spin_lock_irqsave+0x39/0x50 kernel/locking/spinlock.c:162 finish_wait+0xc0/0x270 kernel/sched/wait.c:400 inet_csk_wait_for_connect net/ipv4/inet_connection_sock.c:464 [inline] inet_csk_accept+0x7de/0x9d0 net/ipv4/inet_connection_sock.c:497 mptcp_accept+0xe5/0x500 net/mptcp/protocol.c:2865 inet_accept+0xe4/0x7b0 net/ipv4/af_inet.c:739 mptcp_stream_accept+0x2e7/0x10e0 net/mptcp/protocol.c:3345 do_accept+0x382/0x510 net/socket.c:1773 __sys_accept4_file+0x7e/0xe0 net/socket.c:1816 __sys_accept4+0xb0/0x100 net/socket.c:1846 __do_sys_accept net/socket.c:1864 [inline] __se_sys_accept net/socket.c:1861 [inline] __x64_sys_accept+0x71/0xb0 net/socket.c:1861 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe +0x44/0xae RIP: 0033:0x7f177cd8b8e9 Code: 28 00 00 00 75 05 48 83 c4 28 c3 e8 b1 14 00 00 90 48 89 f8 48 89 f7 48 89 d6 48 89 ca 4d 89 c2 4d 89 c8 4c 8b 4c 24 08 0f 05 <48> 3d 01 f0 ff ff 73 01 c3 48 c7 c1 b8 ff ff ff f7 d8 64 89 01 48 RSP: 002b:00007f177cd3d308 EFLAGS: 00000246 ORIG_RAX: 000000000000002b RAX: ffffffff8bda RBX: 00007f177ce13408 RCX: 00007f177cd8b8e9 RDX: 0000000000000000 RSI: 0000000000000000 RDI: 0000000000000003 RBP: 00007f177ce13400 R08: 0000000000000000 R09: 0000000000000000 R10: 0000000000000000 R11: 0000000000000246 R12: 00007f177ce1340c R13: 00007f177cde1004 R14: 6d705f706374706d R15: 00000000000022000 </TASK> Fix the issue explicitly skipping MPTCP socket in TCP_LISTEN status.

CVE ID	Description
CVE-2021-47597	In the Linux kernel, the following vulnerability has been resolved: inet_diag: fix kernel-infoleak for UDP sockets KMSAN reported a kernel-infoleak [1], that can exploited by unpriv users. After analysis it turned out UDP was not initializing r->idiag_expires. Other users of inet_sk_diag_fill() might make the same mistake in the future, so fix this in inet_sk_diag_fill(). [1] BUG: KMSAN: kernel-infoleak in instrument_copy_to_user include/linux/instrumented.h:121 [inline] BUG: KMSAN: kernel-infoleak in copyout lib/iov_iter.c:156 [inline] BUG: KMSAN: kernel-infoleak in _copy_to_iter+0x69d/0x25c0 lib/iov_iter.c:670 instrument_copy_to_user include/linux/instrumented.h:121 [inline] copyout lib/iov_iter.c:156 [inline] _copy_to_iter+0x69d/0x25c0 lib/iov_iter.c:670 copy_to_iter include/linux/uio.h:155 [inline] simple_copy_to_iter+0xf3/0x140 net/core/datagram.c:519 __skb_datagram_iter+0x2cb/0x1280 net/core/datagram.c:425 skb_copy_datagram_iter+0xdc/0x270 net/core/datagram.c:533 skb_copy_datagram_msg include/linux/skbuff.h:3657 [inline] netlink_rcvmsg+0x660/0x1c60 net/netlink/af_netlink.c:1974 sock_rcvmsg_nosec net/socket.c:944 [inline] sock_rcvmsg net/socket.c:962 [inline] sock_read_iter+0x5a9/0x630 net/socket.c:1035 call_read_iter include/linux/fs.h:2156 [inline] new_sync_read fs/read_write.c:400 [inline] vfs_read+0x1631/0x1980 fs/read_write.c:481 ksys_read+0x28c/0x520 fs/read_write.c:619 __do_sys_read fs/read_write.c:629 [inline] __se_sys_read fs/read_write.c:627 [inline] __x64_sys_read+0xdb/0x120 fs/read_write.c:627 do_syscall_x64 arch/x86/entry/common.c:51 [inline] do_syscall_64+0x54/0xd0 arch/x86/entry/common.c:82 entry_SYSCALL_64_after_hwframe+0x44/0xae Uninit was created at: slab_post_alloc_hook mm/slab.h:524 [inline] slab_alloc_node mm/slub.c:3251 [inline] __kmallocc_node_track_caller+0xe0c/0x1510 mm/slub.c:4974 kmallocc_reserve net/core/skbuff.c:354 [inline] __alloc_skb+0x545/0xf90 net/core/skbuff.c:426 alloc_skb include/linux/skbuff.h:1126 [inline] netlink_dump+0x3d5/0x16a0 net/netlink/af_netlink.c:2245 __netlink_dump_start+0xd1c/0xee0 net/netlink/af_netlink.c:2370 netlink_dump_start include/linux/netlink.h:254 [inline] inet_diag_handler_cmd+0x2e7/0x400 net/ipv4/inet_diag.c:1343 sock_diag_rcv_msg+0x24a/0x620 netlink_rcv_skb+0x447/0x800 net/netlink/af_netlink.c:2491 sock_diag_rcv+0x63/0x80 net/core/sock_diag.c:276 netlink_unicast_kernel net/netlink/af_netlink.c:1319 [inline] netlink_unicast+0x1095/0x1360 net/netlink/af_netlink.c:1345 netlink_sendmsg+0x16f3/0x1870 net/netlink/af_netlink.c:1916 sock_sendmsg_nosec net/socket.c:704 [inline] sock_sendmsg net/socket.c:724 [inline] sock_write_iter+0x594/0x690 net/socket.c:1057 do_iter_readv_writev+0xa7f/0xc70 do_iter_write+0x52c/0x1500 fs/read_write.c:851 vfs_writv fs/read_write.c:924 [inline] do_writv+0x63f/0xe30 fs/read_write.c:967 __do_sys_writv fs/read_write.c:1040 [inline] __se_sys_writv fs/read_write.c:1037 [inline] __x64_sys_writv+0xe5/0x120 fs/read_write.c:1037 do_syscall_x64 arch/x86/entry/common.c:51 [inline] do_syscall_64+0x54/0xd0 arch/x86/entry/common.c:82 entry_SYSCALL_64_after_hwframe+0x44/0xae Bytes 68-71 of 312 are uninitialized Memory access of size 312 starts at ffff88812ab54000 Data copied to user address 0000000020001440 CPU: 1 PID: 6365 Comm: syz-executor801 Not tainted 5.16.0-rc3-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011
CVE-2021-47600	In the Linux kernel, the following vulnerability has been resolved: dm btree remove: fix use after free in rebalance_children() Move dm_tm_unlock() after dm_tm_dec().
CVE-2021-47603	In the Linux kernel, the following vulnerability has been resolved: audit: improve robustness of the audit queue handling If the audit daemon were ever to get stuck in a stopped state the kernel's kauditd_thread() could get blocked attempting to send audit records to the userspace audit daemon. With the kernel thread blocked it is possible that the audit queue could grow unbounded as certain audit record generating events must be exempt from the queue limits else the system enter a deadlock state. This patch resolves this problem by lowering the kernel thread's socket sending timeout from MAX_SCHEDULE_TIMEOUT to HZ/10 and tweaks the kauditd_send_queue() function to better manage the various audit queues when connection problems occur between the kernel and the audit daemon. With this patch, the backlog may temporarily grow beyond the defined limits when the audit daemon is stopped and the system is under heavy audit pressure, but kauditd_thread() will continue to make progress and drain the queues as it would for other connection problems. For example, with the audit daemon put into a stopped state and the system configured to audit every syscall it was still possible to shutdown the system without a kernel panic, deadlock, etc.; granted, the system was slow to shutdown but that is to be expected given the extreme pressure of recording every syscall. The timeout value of HZ/10 was chosen primarily through experimentation and this developer's "gut feeling". There is likely no one perfect value, but as this scenario is limited in scope (root privileges would be needed to send SIGSTOP to the audit daemon), it is likely not worth exposing this as a tunable at present. This can always be done at a later date if it proves necessary.

CVE ID	Description
CVE-2021-47606	In the Linux kernel, the following vulnerability has been resolved: net: netlink: af_netlink: Prevent empty skb by adding a check on len. Adding a check on len parameter to avoid empty skb. This prevents a division error in netem_enqueue function which is caused when skb->len=0 and skb->data_len=0 in the randomized corruption step as shown below. skb->data[random_u32() % skb_headlen(skb)] ^= 1<<(prandom_u32() % 8); Crash Report: [343.170349] netdevsim netdevsim0 netdevsim3: set [1, 0] type 2 family 0 port 6081 - 0 [343.216110] netem: version 1.3 [343.235841] divide error: 0000 [#1] PREEMPT SMP KASAN NOPTI [343.236680] CPU: 3 PID: 4288 Comm: reproducer Not tainted 5.16.0-rc1+ [343.237569] Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.11.0-2.el7 04/01/2014 [343.238707] RIP: 0010:netem_enqueue+0x1590/0x33c0 [sch_netem] [343.239499] Code: 89 85 58 ff ff e8 5f 5d e9 d3 48 8b b5 48 ff ff ff 8b 8d 50 ff ff ff 8b 85 58 ff ff ff 48 8b bd 70 ff ff ff 31 d2 2b 4f 74 <f7> f1 48 b8 00 00 00 00 00 fc ff df 49 01 d5 4c 89 e9 48 c1 e9 03 [343.241883] RSP: 0018:ffff88800bcd7368 EFLAGS: 00010246 [343.242589] RAX: 00000000ba7c0a9c RBX: 0000000000000001 RCX: 0000000000000000 [343.243542] RDX: 0000000000000000 RSI: ffff88800f8edb10 RDI: ffff88800f8eda40 [343.244474] RBP: ffff88800bcd7458 R08: 0000000000000000 R09: ffffffff94fb8445 [343.245403] R10: ffffffff94fb8336 R11: ffffffff94fb8445 R12: 0000000000000000 [343.246355] R13: ffff88800a5a7000 R14: ffff88800a5b5800 R15: 0000000000000002 [343.247291] FS: 00007fdde2bd7700(0000) GS:ffff888109780000(0000) knlGS:0000000000000000 [343.248350] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 [343.249120] CR2: 00000000200000c0 CR3: 000000000ef4c000 CR4: 0000000000000060 [343.250076] Call Trace: [343.250423] <TASK> [343.250713] ? memcpy+0x4d/0x60 [343.251162] ? netem_init+0xa0/0xa0 [sch_netem] [343.251795] ? __sanitizer_cov_trace_pc+0x21/0x60 [343.252443] netem_enqueue+0xe28/0x33c0 [sch_netem] [343.253102] ? stack_trace_save+0x87/0xb0 [343.253655] ? filter_irq_stacks+0xb0/0xb0 [343.254220] ? netem_init+0xa0/0xa0 [sch_netem] [343.254837] ? __kasan_check_write+0x14/0x20 [343.255418] ? _raw_spin_lock+0x88/0xd6 [343.255953] dev_qdisc_enqueue+0x50/0x180 [343.256508] __dev_queue_xmit+0x1a7e/0x3090 [343.257083] ? netdev_core_pick_tx+0x300/0x300 [343.257690] ? check_kcov_mode+0x10/0x40 [343.258219] ? _raw_spin_unlock_irqrestore+0x29/0x40 [343.258899] ? __kasan_init_slab_obj+0x24/0x30 [343.259529] ? setup_object.isra.71+0x23/0x90 [343.260121] ? new_slab+0x26e/0x4b0 [343.260609] ? kasan_poison+0x3a/0x50 [343.261118] ? kasan_unpoison+0x28/0x50 [343.261637] ? __kasan_slab_alloc+0x71/0x90 [343.262214] ? memcpy+0x4d/0x60 [343.262674] ? write_comp_data+0x2f/0x90 [343.263209] ? __kasan_check_write+0x14/0x20 [343.263802] ? __skb_clone+0x5d6/0x840 [343.264329] ? __sanitizer_cov_trace_pc+0x21/0x60 [343.264958] dev_queue_xmit+0x1c/0x20 [343.265470] netlink_deliver_tap+0x652/0x9c0 [343.266067] netlink_unicast+0x5a0/0x7f0 [343.266608] ? netlink_attachskb+0x860/0x860 [343.267183] ? __sanitizer_cov_trace_pc+0x21/0x60 [343.267820] ? write_comp_data+0x2f/0x90 [343.268367] netlink_sendmsg+0x922/0xe80 [343.268899] ? netlink_unicast+0x7f0/0x7f0 [343.269472] ? __sanitizer_cov_trace_pc+0x21/0x60 [343.270099] ? write_comp_data+0x2f/0x90 [343.270644] ? netlink_unicast+0x7f0/0x7f0 [343.271210] sock_sendmsg+0x155/0x190 [343.271721] ____sys_sendmsg+0x75f/0x8f0 [343.272262] ? kernel_sendmsg+0x60/0x60 [343.272788] ? write_comp_data+0x2f/0x90 [343.273332] ? write_comp_data+0x2f/0x90 [343.273869] ____sys_sendmsg+0x10f/0x190 [343.274405] ? sendmsg_copy_msghdr+0x80/0x80 [343.274984] ? slab_post_alloc_hook+0x70/0x230 [343.275597] ? futex_wait_setup+0x240/0x240 [343.276175] ? security_file_alloc+0x3e/0x170 [343.276779] ? write_comp_d ---truncated---
CVE-2021-47607	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix kernel address leakage in atomic cmpxchg's r0 aux reg The implementation of BPF_CMPXCHG on a high level has the following parameters: .-[old-val] .-[new-val] BPF_R0 = cmpxchg{32,64}(DST_REG + insn->off, BPF_R0, SRC_REG) ~-[mem-loc] ~-[old-val] Given a BPF insn can only have two registers (dst, src), the R0 is fixed and used as an auxiliary register for input (old value) as well as output (returning old value from memory location). While the verifier performs a number of safety checks, it misses to reject unprivileged programs where R0 contains a pointer as old value. Through brute-forcing it takes about ~16sec on my machine to leak a kernel pointer with BPF_CMPXCHG. The PoC is basically probing for kernel addresses by storing the guessed address into the map slot as a scalar, and using the map value pointer as R0 while SRC_REG has a canary value to detect a matching address. Fix it by checking R0 for pointers, and reject if that's the case for unprivileged programs.

CVE ID	Description
CVE-2021-47608	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix kernel address leakage in atomic fetch The change in commit 37086bdc737 ("bpf: Propagate stack bounds to registers in atomics w/ BPF_FETCH") around check_mem_access() handling is buggy since this would allow for unprivileged users to leak kernel pointers. For example, an atomic fetch/and with -1 on a stack destination which holds a spilled pointer will migrate the spilled register type into a scalar, which can then be exported out of the program (since scalar != pointer) by dumping it into a map value. The original implementation of XADD was preventing this situation by using a double call to check_mem_access() one with BPF_READ and a subsequent one with BPF_WRITE, in both cases passing -1 as a placeholder value instead of register as per XADD semantics since it didn't contain a value fetch. The BPF_READ also included a check in check_stack_read_fixed_off() which rejects the program if the stack slot is of __is_pointer_value() if dst_regno < 0. The latter is to distinguish whether we're dealing with a regular stack spill/ fill or some arithmetical operation which is disallowed on non-scalars, see also 6e7e63cbb023 ("bpf: Forbid XADD on spilled pointers for unprivileged users") for more context on check_mem_access() and its handling of placeholder value -1. One minimally intrusive option to fix the leak is for the BPF_FETCH case to initially check the BPF_READ case via check_mem_access() with -1 as register, followed by the actual load case with non-negative load_reg to propagate stack bounds to registers.
CVE-2021-47616	In the Linux kernel, the following vulnerability has been resolved: RDMA: Fix use-after-free in rxe_queue_cleanup On error handling path in rxe_qp_from_init() qp->sq.queue is freed and then rxe_create_qp() will drop last reference to this object. qp clean up function will try to free this queue one time and it causes UAF bug. Fix it by zeroing queue pointer after freeing queue in rxe_qp_from_init().
CVE-2021-47617	In the Linux kernel, the following vulnerability has been resolved: PCI: pciehp: Fix infinite loop in IRQ handler upon power fault The Power Fault Detected bit in the Slot Status register differs from all other hotplug events in that it is sticky: It can only be cleared after turning off slot power. Per PCIe r5.0, sec. 6.7.1.8: If a power controller detects a main power fault on the hot-plug slot, it must automatically set its internal main power fault latch [...]. The main power fault latch is cleared when software turns off power to the hot-plug slot. The stickiness used to cause interrupt storms and infinite loops which were fixed in 2009 by commits 5651c48cfafe ("PCI pciehp: fix power fault interrupt storm problem") and 99f0169c17f3 ("PCI: pciehp: enable software notification on empty slots"). Unfortunately in 2020 the infinite loop issue was inadvertently reintroduced by commit 8edf5332c393 ("PCI: pciehp: Fix MSI interrupt race"): The hardirq handler pciehp_isr() clears the PFD bit until pciehp's power_fault_detected flag is set. That happens in the IRQ thread pciehp_ist(), which never learns of the event because the hardirq handler is stuck in an infinite loop. Fix by setting the power_fault_detected flag already in the hardirq handler.
CVE-2021-47619	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix queues reservation for XDP When XDP was configured on a system with large number of CPUs and X722 NIC there was a call trace with NULL pointer dereference. i40e 0000:87:00.0: failed to get tracking for 256 queues for VSI 0 err -12 i40e 0000:87:00.0: setup of MAIN VSI failed BUG: kernel NULL pointer dereference, address: 0000000000000000 RIP: 0010:i40e_xdp+0xea/0x1b0 [i40e] Call Trace: ? i40e_reconfig_rss_queues+0x130/0x130 [i40e] dev_xdp_install+0x61/0xe0 dev_xdp_attach+0x18a/0x4c0 dev_change_xdp_fd+0x1e6/0x220 do_setlink+0x616/0x1030 ? ahci_port_stop+0x80/0x80 ? ata_qc_issue+0x107/0x1e0 ? lock_timer_base+0x61/0x80 ? __mod_timer+0x202/0x380 rtnl_setlink+0xe5/0x170 ? bpf_lsm_binder_transaction+0x10/0x10 ? security_capable+0x36/0x50 rtnetlink_rcv_msg+0x121/0x350 ? rtnl_calcit.isra.0+0x100/0x100 netlink_rcv_skb+0x50/0xf0 netlink_unicast+0x1d3/0x2a0 netlink_sendmsg+0x22a/0x440 sock_sendmsg+0x5e/0x60 __sys_sendto+0xf0/0x160 ? __sys_getsockname+0x7e/0xc0 ? __copy_from_user+0x3c/0x80 ? __sys_setsockopt+0xc8/0x1a0 __x64_sys_sendto+0x20/0x30 do_syscall_64+0x33/0x40 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7f83fa7a39e0 This was caused by PF queue pile fragmentation due to flow director VSI queue being placed right after main VSI. Because of this main VSI was not able to resize its queue allocation for XDP resulting in no queues allocated for main VSI when XDP was turned on. Fix this by always allocating last queue in PF queue pile for a flow director VSI.
CVE-2021-47620	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: refactor malicious adv data check Check for out-of-bound read was being performed at the end of while num_reports loop, and would fill journal with false positives. Added check to beginning of loop processing so that it doesn't get checked after ptr has been advanced.

CVE ID	Description
CVE-2021-47623	In the Linux kernel, the following vulnerability has been resolved: powerpc/fixmap: Fix VM debug warning on unmap Unmapping a fixmap entry is done by calling <code>__set_fixmap()</code> with <code>FIXMAP_PAGE_CLEAR</code> as flags. Today, powerpc <code>__set_fixmap()</code> calls <code>map_kernel_page()</code>. <code>map_kernel_page()</code> is not happy when called a second time for the same page. CVE-2021-47634	In the Linux kernel, the following vulnerability has been resolved: ubi: Fix race condition between <code>ctrl_cdev_ioctl</code> and <code>ubi_cdev_ioctl</code> Hulk Robot reported a KASAN report about use-after-free: ===== BUG: KASAN: use-after-free in <code>__list_del_entry_valid+0x13d/0x160</code> Read of size 8 at addr ffff888035e37d98 by task ubiattach/1385 [...] Call Trace: klist_dec_and_del+0xa7/0x4a0 klist_put+0xc7/0x1a0 device_del+0x4d4/0xed0 cdev_device_del+0x1a/0x80 ubi_attach_mtd_dev+0x2951/0x34b0 [ubi] ctrl_cdev_ioctl+0x286/0x2f0 [ubi] Allocated by task 1414: device_add+0x60a/0x18b0 cdev_device_add+0x103/0x170 ubi_create_volume+0x1118/0x1a10 [ubi] ubi_cdev_ioctl+0xb7f/0x1ba0 [ubi] Freed by task 1385: cdev_device_del+0x1a/0x80 ubi_remove_volume+0x438/0x6c0 [ubi] ubi_cdev_ioctl+0xbf4/0x1ba0 [ubi] [...] ===== The lock held by <code>ctrl_cdev_ioctl</code> is <code>ubi_devices_mutex</code>, but the lock held by <code>ubi_cdev_ioctl</code> is <code>ubi->device_mutex</code>. Therefore, the two locks can be concurrent. <code>ctrl_cdev_ioctl</code> contains two operations: <code>ubi_attach</code> and <code>ubi_detach</code>. <code>ubi_detach</code> is bug-free because it uses reference counting to prevent concurrency. However, <code>uif_init</code> and <code>uif_close</code> in <code>ubi_attach</code> may race with <code>ubi_cdev_ioctl</code>. <code>uif_init</code> will race with <code>ubi_cdev_ioctl</code> as in the following stack. cpu1 cpu2 cpu3 _____ _____ ctrl_cdev_ioctl ubi_attach_mtd_dev uif_init ubi_cdev_ioctl ubi_create_volume cdev_device_add ubi_add_volume // sysfs exist kill_volumes ubi_cdev_ioctl ubi_remove_volume cdev_device_del // first free ubi_free_volume cdev_del // double free cdev_device_del And uif_close will race with ubi_cdev_ioctl as in the following stack. cpu1 cpu2 cpu3 _____ _____ ctrl_cdev_ioctl ubi_attach_mtd_dev uif_init ubi_cdev_ioctl ubi_create_volume cdev_device_add ubi_debugfs_init_dev //error goto out_uif; uif_close kill_volumes ubi_cdev_ioctl ubi_remove_volume cdev_device_del // first free ubi_free_volume // double free The cause of this problem is that commit 714fb87e8bc0 make device "available" before it becomes accessible via sysfs. Therefore, we roll back the modification. We will fix the race condition between ubi device creation and udev by removing <code>ubi_get_device</code> in <code>vol_attribute_show</code> and <code>dev_attribute_show</code>. This avoids accessing uninitialized <code>ubi_devices[ubi_num]</code>. <code>ubi_get_device</code> is used to prevent devices from being deleted during sysfs execution. However, now kernfs ensures that devices will not be deleted before all reference counting are released. The key process is shown in the following stack. device_del device_remove_attrs device_remove_groups sysfs_remove_groups sysfs_remove_group remove_files kernfs_remove_by_name kernfs_remove_by_name_ns __kernfs_remove kernfs_drain

CVE ID	Description
CVE-2021-47639	In the Linux kernel, the following vulnerability has been resolved: KVM: x86/mmu: Zap _all_ roots when unmapping gfn range in TDP MMU Zap both valid and invalid roots when zapping/ unmapping a gfn range, as KVM must ensure it holds no references to the freed page after returning from the unmap operation. Most notably, the TDP MMU doesn't zap invalid roots in mmu_notifier callbacks. This leads to use-after-free and other issues if the mmu_notifier runs to completion while an invalid root zipper yields as KVM fails to honor the requirement that there must be _no_ references to the page after the mmu_notifier returns. The bug is most easily reproduced by hacking KVM to cause a collision between set_nx_huge_pages() and kvm_mmu_notifier_release(), but the bug exists between kvm_mmu_notifier_invalidate_range_start() and memslot updates as well. Invalidating a root ensures pages aren't accessible by the guest, and KVM won't read or write page data itself, but KVM will trigger e.g. kvm_set_pfn_dirty() when zapping SPTes, and thus completing a zap of an invalid root _after_ the mmu_notifier returns is fatal. WARNING: CPU: 24 PID: 1496 at arch/x86/kvm/./../virt/kvm/kvm_main.c:173 [kvm] RIP: 0010:kvm_is_zone_device_pfn+0x96/0xa0 [kvm] Call Trace: <TASK> kvm_set_pfn_dirty+0xa8/0xe0 [kvm] __handle_changed_spte+0x2ab/0x5e0 [kvm] __handle_changed_spte+0x2ab/0x5e0 [kvm] __handle_changed_spte+0x2ab/0x5e0 [kvm] zap_gfn_range+0x1f3/0x310 [kvm] kvm_tdp_mmu_zap_invalidated_roots+0x50/0x90 [kvm] kvm_mmu_zap_all_fast+0x177/0x1a0 [kvm] set_nx_huge_pages+0xb4/0x190 [kvm] param_attr_store+0x70/0x100 module_attr_store+0x19/0x30 kernfs_fop_write_iter+0x119/0x1b0 new_sync_write+0x11c/0x1b0 vfs_write+0x1cc/0x270 ksys_write+0x5f/0xe0 do_syscall_64+0x38/0xc0 entry_SYSCALL_64_after_hwframe+0x44/0xae </TASK>
CVE-2021-47646	In the Linux kernel, the following vulnerability has been resolved: Revert "Revert "block, bfq: honor already-setup queue merges"" A crash [1] happened to be triggered in conjunction with commit 2d52c58b9c9b ("block, bfq: honor already-setup queue merges"). The latter was then reverted by commit ebc69e897e17 ("Revert "block, bfq: honor already-setup queue merges""). Yet, the reverted commit was not the one introducing the bug. In fact, it actually triggered a UAF introduced by a different commit, and now fixed by commit d29bd41428cf ("block, bfq: reset last_bfqq_created on group change"). So, there is no point in keeping commit 2d52c58b9c9b ("block, bfq: honor already-setup queue merges") out. This commit restores it. [1] https://bugzilla.kernel.org/show_bug.cgi?id=214503
CVE-2021-47650	In the Linux kernel, the following vulnerability has been resolved: ASoC: soc-compress: prevent the potentially use of null pointer There is one call trace that snd_soc_register_card()->snd_soc_bind_card()->soc_init_pcm_runtime()->snd_soc_dai_compress_new()->snd_soc_new_compress(). In the trace the 'codec_dai' transfers from card->dai_link, and we can see from the snd_soc_add_pcm_runtime() in snd_soc_bind_card() that, if value of card->dai_link->num_codecs is 0, then 'codec_dai' could be null pointer caused by index out of bound in 'asoc_rtd_to_codec(rtd, 0)'. And snd_soc_register_card() is called by various platforms. Therefore, it is better to add the check in the case of misusing. And because 'cpu_dai' has already checked in soc_init_pcm_runtime(), there is no need to check again. Adding the check as follow, then if 'codec_dai' is null, snd_soc_new_compress() will not pass through the check 'if (playback + capture != 1)', avoiding the leftover use of 'codec_dai'.
CVE-2021-47657	In the Linux kernel, the following vulnerability has been resolved: drm/virtio: Ensure that objs is not NULL in virtio_gpu_array_put_free() If virtio_gpu_object_shmem_init() fails (e.g. due to fault injection, as it happened in the bug report by syzbot), virtio_gpu_array_put_free() could be called with objs equal to NULL. Ensure that objs is not NULL in virtio_gpu_array_put_free(), or otherwise return from the function.
CVE-2021-47659	In the Linux kernel, the following vulnerability has been resolved: drm/plane: Move range check for format_count earlier While the check for format_count > 64 in __drm_universal_plane_init() shouldn't be hit (it's a WARN_ON), in its current position it will then leak the plane->format_types array and fail to call drm_mode_object_unregister() leaking the modeset identifier. Move it to the start of the function to avoid allocating those resources in the first place.
CVE-2021-47668	In the Linux kernel, the following vulnerability has been resolved: can: dev: can_restart: fix use after free bug After calling netif_rx_ni(skb), dereferencing skb is unsafe. Especially, the can_frame cf which aliases skb memory is accessed after the netif_rx_ni() in: stats->rx_bytes += cf->len; Reordering the lines solves the issue.
CVE-2022-0171	A flaw was found in the Linux kernel. The existing KVM SEV API has a vulnerability that allows a non-root (host) user-level application to crash the host kernel by creating a confidential guest VM instance in AMD CPU that supports Secure Encrypted Virtualization (SEV).
CVE-2022-0235	node-fetch is vulnerable to Exposure of Sensitive Information to an Unauthorized Actor
CVE-2022-0264	A vulnerability was found in the Linux kernel's eBPF verifier when handling internal data structures. Internal memory locations could be returned to userspace. A local attacker with the permissions to insert eBPF code to the kernel can use this to leak internal kernel memory details defeating some of the exploit mitigations in place for the kernel. This flaws affects kernel versions < v5.16-rc6

CVE ID	Description
CVE-2022-0351	Access of Memory Location Before Start of Buffer in GitHub repository vim/vim prior to 8.2.
CVE-2022-0391	A flaw was found in Python, specifically within the urllib.parse module. This module helps break Uniform Resource Locator (URL) strings into components. The issue involves how the urlparse method does not sanitize input and allows characters like '\r' and '\n' in the URL path. This flaw allows an attacker to input a crafted URL, leading to injection attacks. This flaw affects Python versions prior to 3.10.0b1, 3.9.5, 3.8.11, 3.7.11 and 3.6.14.
CVE-2022-0400	An out-of-bounds read vulnerability was discovered in linux kernel in the smc protocol stack, causing remote dos.
CVE-2022-0480	A flaw was found in the filelock_init in fs/locks.c function in the Linux kernel. This issue can lead to host memory exhaustion due to memcg not limiting the number of Portable Operating System Interface (POSIX) file locks.
CVE-2022-0529	A flaw was found in Unzip. The vulnerability occurs during the conversion of a wide string to a local string that leads to a heap of out-of-bound write. This flaw allows an attacker to input a specially crafted zip file, leading to a crash or code execution.
CVE-2022-0530	A flaw was found in Unzip. The vulnerability occurs during the conversion of a wide string to a local string that leads to a heap of out-of-bound write. This flaw allows an attacker to input a specially crafted zip file, leading to a crash or code execution.
CVE-2022-0563	A flaw was found in the util-linux chfn and chsh utilities when compiled with Readline support. The Readline library uses an "INPUTRC" environment variable to get a path to the library config file. When the library cannot parse the specified file, it prints an error message containing data from the file. This flaw allows an unprivileged user to read root-owned files, potentially leading to privilege escalation. This flaw affects util-linux versions prior to 2.37.4.
CVE-2022-0995	An out-of-bounds (OOB) memory write flaw was found in the Linux kernel's watch_queue event notification subsystem. This flaw can overwrite parts of the kernel state, potentially allowing a local user to gain privileged access or cause a denial of service on the system.
CVE-2022-1056	Out-of-bounds Read error in tiffcrop in libtiff 4.3.0 allows attackers to cause a denial-of-service via a crafted tiff file. For users that compile libtiff from sources, the fix is available with commit 46dc8fcd.
CVE-2022-1247	An issue found in linux-kernel that leads to a race condition in rose_connect(). The rose driver uses rose_neigh->use to represent how many objects are using the rose_neigh. When a user wants to delete a rose_route via rose_ioctl(), the rose driver calls rose_del_node() and removes neighbours only if their "count" and "use" are zero.
CVE-2022-1354	A heap buffer overflow flaw was found in Libtiffs' tiffinfo.c in TIFFReadRawDataStriped() function. This flaw allows an attacker to pass a crafted TIFF file to the tiffinfo tool, triggering a heap buffer overflow issue and causing a crash that leads to a denial of service.
CVE-2022-1471	SnakeYaml's Constructor() class does not restrict types which can be instantiated during deserialization. Deserializing yaml content provided by an attacker can lead to remote code execution. We recommend using SnakeYaml's SafeConstructor when parsing untrusted content to restrict deserialization. We recommend upgrading to version 2.0 and beyond.
CVE-2022-1619	Heap-based Buffer Overflow in function cmdline_erase_chars in GitHub repository vim/vim prior to 8.2.4899. This vulnerabilities are capable of crashing software, modify memory, and possible remote execution
CVE-2022-1665	A set of pre-production kernel packages of Red Hat Enterprise Linux for IBM Power architecture can be booted by the grub in Secure Boot mode even though it shouldn't. These kernel builds don't have the secure boot lockdown patches applied to it and can bypass the secure boot validations, allowing the attacker to load another non-trusted code.
CVE-2022-1720	Buffer Over-read in function grab_file_name in GitHub repository vim/vim prior to 8.2.4956. This vulnerability is capable of crashing the software, memory modification, and possible remote execution.
CVE-2022-20154	In lock_sock_nested of sock.c, there is a possible use after free due to a race condition. This could lead to local escalation of privilege with System execution privileges needed. User interaction is not needed for exploitation.Product: AndroidVersions: Android kernelAndroid ID: A-174846563References: Upstream kernel
CVE-2022-2047	In Eclipse Jetty versions 9.4.0 thru 9.4.46, and 10.0.0 thru 10.0.9, and 11.0.0 thru 11.0.9 versions, the parsing of the authority segment of an http scheme URI, the Jetty HttpURI class improperly detects an invalid input as a hostname. This can lead to failures in a Proxy scenario.

CVE ID	Description
CVE-2022-20566	In l2cap_chan_put of l2cap_core, there is a possible use after free due to improper locking. This could lead to local escalation of privilege with no additional execution privileges needed. User interaction is not needed for exploitation.Product: AndroidVersions: Android kernelAndroid ID: A-165329981References: Upstream kernel
CVE-2022-2124	Buffer Over-read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2125	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 8.2.
CVE-2022-2126	Out-of-bounds Read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2129	Out-of-bounds Write in GitHub repository vim/vim prior to 8.2.
CVE-2022-2175	Buffer Over-read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2182	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 8.2.
CVE-2022-2183	Out-of-bounds Read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2206	Out-of-bounds Read in GitHub repository vim/vim prior to 8.2.
CVE-2022-2207	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 8.2.
CVE-2022-2208	NULL Pointer Dereference in GitHub repository vim/vim prior to 8.2.5163.
CVE-2022-2210	Out-of-bounds Write in GitHub repository vim/vim prior to 8.2.
CVE-2022-2284	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.
CVE-2022-2285	Integer Overflow or Wraparound in GitHub repository vim/vim prior to 9.0.
CVE-2022-2286	Out-of-bounds Read in GitHub repository vim/vim prior to 9.0.
CVE-2022-2287	Out-of-bounds Read in GitHub repository vim/vim prior to 9.0.
CVE-2022-2343	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0044.
CVE-2022-2344	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0045.
CVE-2022-2345	Use After Free in GitHub repository vim/vim prior to 9.0.0046.
CVE-2022-23990	Expat (aka libexpat) before 2.4.4 has an integer overflow in the doProlog function.
CVE-2022-24329	In JetBrains Kotlin before 1.6.0, it was not possible to lock dependencies for Multiplatform Gradle Projects.
CVE-2022-24795	yajl-ruby is a C binding to the YAJL JSON parsing and generation library. The 1.x branch and the 2.x branch of `yajl` contain an integer overflow which leads to subsequent heap memory corruption when dealing with large (~2GB) inputs. The reallocation logic at `yajl_buf.c#L64` may result in the `need` 32bit integer wrapping to 0 when `need` approaches a value of 0x80000000 (i.e. ~2GB of data), which results in a reallocation of buf->alloc into a small heap chunk. These integers are declared as `size_t` in the 2.x branch of `yajl`, which practically prevents the issue from triggering on 64bit platforms, however this does not preclude this issue triggering on 32bit builds on which `size_t` is a 32bit integer. Subsequent population of this under-allocated heap chunk is based on the original buffer size, leading to heap memory corruption. This vulnerability mostly impacts process availability. Maintainers believe exploitation for arbitrary code execution is unlikely. A patch is available and anticipated to be part of yajl-ruby version 1.4.2. As a workaround, avoid passing large inputs to YAJL.
CVE-2022-25168	Apache Hadoop's FileUtil.unTar(File, File) API does not escape the input file name before being passed to the shell. An attacker can inject arbitrary commands. This is only used in Hadoop 3.3 InMemoryAliasMap.completeBootstrapTransfer, which is only ever run by a local user. It has been used in Hadoop 2.x for yarn localization, which does enable remote code execution. It is used in Apache Spark, from the SQL command ADD ARCHIVE. As the ADD ARCHIVE command adds new binaries to the classpath, being able to execute shell scripts does not confer new permissions to the caller. SPARK-38305. "Check existence of file before untarring/zippping", which is included in 3.3.0, 3.1.4, 3.2.2, prevents shell commands being executed, regardless of which version of the hadoop libraries are in use. Users should upgrade to Apache Hadoop 2.10.2, 3.2.4, 3.3.3 or upper (including HADOOP-18136).
CVE-2022-2522	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0061.

CVE ID	Description
CVE-2022-25836	Bluetooth® Low Energy Pairing in Bluetooth Core Specification v4.0 through v5.3 may permit an unauthenticated MITM to acquire credentials with two pairing devices via adjacent access when the MITM negotiates Legacy Passkey Pairing with the pairing Initiator and Secure Connections Passkey Pairing with the pairing Responder and brute forces the Passkey entered by the user into the Initiator. The MITM attacker can use the identified Passkey value to complete authentication with the Responder via Bluetooth pairing method confusion.
CVE-2022-27664	In net/http in Go before 1.18.6 and 1.19.x before 1.19.1, attackers can cause a denial of service because an HTTP/2 connection can hang during closing if shutdown were preempted by a fatal error.
CVE-2022-27943	libiberty/rust-demangle.c in GNU GCC 11.2 allows stack consumption in demangle_const, as demonstrated by nm-new.
CVE-2022-2819	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0211.
CVE-2022-2845	Improper Validation of Specified Quantity in Input in GitHub repository vim/vim prior to 9.0.0218.
CVE-2022-2849	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0220.
CVE-2022-2879	Reader.Read does not set a limit on the maximum size of file headers. A maliciously crafted archive could cause Read to allocate unbounded amounts of memory, potentially causing resource exhaustion or panics. After fix, Reader.Read limits the maximum size of header blocks to 1 MiB.
CVE-2022-2880	Requests forwarded by ReverseProxy include the raw query parameters from the inbound request, including unparsable parameters rejected by net/http. This could permit query parameter smuggling when a Go proxy forwards a parameter with an unparsable value. After fix, ReverseProxy sanitizes the query parameters in the forwarded query when the outbound request's Form field is set after the ReverseProxy. Director function returns, indicating that the proxy has parsed the query parameters. Proxies which do not parse query parameters continue to forward the original query parameters unchanged.
CVE-2022-2905	An out-of-bounds memory read flaw was found in the Linux kernel's BPF subsystem in how a user calls the bpf_tail_call function with a key larger than the max_entries of the map. This flaw allows a local user to gain unauthorized access to data.
CVE-2022-2923	NULL Pointer Dereference in GitHub repository vim/vim prior to 9.0.0240.
CVE-2022-2946	Use After Free in GitHub repository vim/vim prior to 9.0.0246.
CVE-2022-2961	A use-after-free flaw was found in the Linux kernel's PLP Rose functionality in the way a user triggers a race condition by calling bind while simultaneously triggering the rose_bind() function. This flaw allows a local user to crash or potentially escalate their privileges on the system.
CVE-2022-2963	A vulnerability found in jasper. This security vulnerability happens because of a memory leak bug in function cmdopts_parse that can cause a crash or segmentation fault.
CVE-2022-2980	NULL Pointer Dereference in GitHub repository vim/vim prior to 9.0.0259.
CVE-2022-3037	Use After Free in GitHub repository vim/vim prior to 9.0.0322.
CVE-2022-31015	Waitress is a Web Server Gateway Interface server for Python 2 and 3. Waitress versions 2.1.0 and 2.1.1 may terminate early due to a thread closing a socket while the main thread is about to call select(). This will lead to the main thread raising an exception that is not handled and then causing the entire application to be killed. This issue has been fixed in Waitress 2.1.2 by no longer allowing the WSGI thread to close the socket. Instead, that is always delegated to the main thread. There is no work-around for this issue. However, users using waitress behind a reverse proxy server are less likely to have issues if the reverse proxy always reads the full response.

CVE ID	Description
CVE-2022-31023	Play Framework is a web framework for Java and Scala. Versions prior to 2.8.16 are vulnerable to generation of error messages containing sensitive information. Play Framework, when run in dev mode, shows verbose errors for easy debugging, including an exception stack trace. Play does this by configuring its <code>DefaultExceptionHandler</code> to do so based on the application mode. In its Scala API Play also provides a static object <code>DefaultExceptionHandler</code> that is configured to always show verbose errors. This is used as a default value in some Play APIs, so it is possible to inadvertently use this version in production. It is also possible to improperly configure the <code>DefaultExceptionHandler</code> object instance as the injected error handler. Both of these situations could result in verbose errors displaying to users in a production application, which could expose sensitive information from the application. In particular, the constructor for <code>CORSFilter</code> and <code>apply</code> method for <code>CORSAActionBuilder</code> use the static object <code>DefaultExceptionHandler</code> as a default value. This is patched in Play Framework 2.8.16. The <code>DefaultExceptionHandler</code> object has been changed to use the prod-mode behavior, and <code>DevExceptionHandler</code> has been introduced for the dev-mode behavior. A workaround is available. When constructing a <code>CORSFilter</code> or <code>CORSAActionBuilder</code> , ensure that a properly-configured error handler is passed. Generally this should be done by using the <code>ExceptionHandler</code> instance provided through dependency injection or through Play's <code>BuiltInComponents</code> . Ensure that the application is not using the <code>DefaultExceptionHandler</code> static object in any code that may be run in production.
CVE-2022-31160	jQuery UI is a curated set of user interface interactions, effects, widgets, and themes built on top of jQuery. Versions prior to 1.13.2 are potentially vulnerable to cross-site scripting. Initializing a checkboxradio widget on an input enclosed within a label makes that parent label contents considered as the input label. Calling <code>.checkboxradio("refresh")</code> on such a widget and the initial HTML contained encoded HTML entities will make them erroneously get decoded. This can lead to potentially executing JavaScript code. The bug has been patched in jQuery UI 1.13.2. To remediate the issue, someone who can change the initial HTML can wrap all the non-input contents of the <code>label</code> in a <code>span</code> .
CVE-2022-3153	NULL Pointer Dereference in GitHub repository vim/vim prior to 9.0.0404.
CVE-2022-3171	A parsing issue with binary data in protobuf-java core and lite versions prior to 3.21.7, 3.20.3, 3.19.6 and 3.16.3 can lead to a denial of service attack. Inputs containing multiple instances of non-repeated embedded messages with repeated or unknown fields causes objects to be converted back-n-forth between mutable and immutable forms, resulting in potentially long garbage collection pauses. We recommend updating to the versions mentioned above.
CVE-2022-32149	An attacker may cause a denial of service by crafting an Accept-Language header which ParseAcceptLanguage will take significant time to parse.
CVE-2022-3219	GnuPG can be made to spin on a relatively small input by (for example) crafting a public key with thousands of signatures attached, compressed down to just a few KB.
CVE-2022-32190	JoinPath and URL.JoinPath do not remove <code>../</code> path elements appended to a relative path. For example, <code>JoinPath("https://go.dev", "../go")</code> returns the URL <code>"https://go.dev/./go"</code> , despite the <code>JoinPath</code> documentation stating that <code>../</code> path elements are removed from the result.
CVE-2022-3234	Heap-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0483.
CVE-2022-3235	Use After Free in GitHub repository vim/vim prior to 9.0.0490.
CVE-2022-3238	A double-free flaw was found in the Linux kernel's NTFS3 subsystem in how a user triggers remount and umount simultaneously. This flaw allows a local user to crash or potentially escalate their privileges on the system.
CVE-2022-3256	Use After Free in GitHub repository vim/vim prior to 9.0.0530.
CVE-2022-3296	Stack-based Buffer Overflow in GitHub repository vim/vim prior to 9.0.0577.
CVE-2022-33064	An off-by-one error in function <code>wav_read_header</code> in <code>src/wav.c</code> in <code>Libsndfile 1.1.0</code> , results in a write out of bound, which allows an attacker to execute arbitrary code, Denial of Service or other unspecified impacts.
CVE-2022-33070	Protobuf-c v1.4.0 was discovered to contain an invalid arithmetic shift via the function <code>parse_tag_and_wiretype</code> in <code>protobuf-c/protobuf-c.c</code> . This vulnerability allows attackers to cause a Denial of Service (DoS) via unspecified vectors.
CVE-2022-3344	A flaw was found in the KVM's AMD nested virtualization (SVM). A malicious L1 guest could purposely fail to intercept the shutdown of a cooperative nested guest (L2), possibly leading to a page fault and kernel panic in the host (L0).
CVE-2022-3352	Use After Free in GitHub repository vim/vim prior to 9.0.0614.

CVE ID	Description
CVE-2022-3424	A use-after-free flaw was found in the Linux kernel's SGI GRU driver in the way the first <code>gru_file_unlocked_ioctl</code> function is called by the user, where a fail pass occurs in the <code>gru_check_chiplet_assignment</code> function. This flaw allows a local user to crash or potentially escalate their privileges on the system.
CVE-2022-3509	A parsing issue similar to CVE-2022-3171, but with <code>textformat</code> in <code>protobuf-java</code> core and lite versions prior to 3.21.7, 3.20.3, 3.19.6 and 3.16.3 can lead to a denial of service attack. Inputs containing multiple instances of non-repeated embedded messages with repeated or unknown fields causes objects to be converted back-n-forth between mutable and immutable forms, resulting in potentially long garbage collection pauses. We recommend updating to the versions mentioned above.
CVE-2022-3510	A parsing issue similar to CVE-2022-3171, but with <code>Message-Type Extensions</code> in <code>protobuf-java</code> core and lite versions prior to 3.21.7, 3.20.3, 3.19.6 and 3.16.3 can lead to a denial of service attack. Inputs containing multiple instances of non-repeated embedded messages with repeated or unknown fields causes objects to be converted back-n-forth between mutable and immutable forms, resulting in potentially long garbage collection pauses. We recommend updating to the versions mentioned above.
CVE-2022-3534	A vulnerability classified as critical has been found in Linux Kernel. Affected is the function <code>btf_dump_name_dups</code> of the file <code>tools/lib/bpf/btf_dump.c</code> of the component <code>libbpf</code> . The manipulation leads to use after free. It is recommended to apply a patch to fix this issue. The identifier of this vulnerability is VDB-211032.
CVE-2022-3570	Multiple heap buffer overflows in <code>tiffcrop.c</code> utility in <code>libtiff</code> library Version 4.4.0 allows attacker to trigger unsafe or out of bounds memory access via crafted TIFF image file which could result into application crash, potential information disclosure or any other context-dependent impact
CVE-2022-3598	LibTIFF 4.4.0 has an out-of-bounds write in <code>extractContigSamplesShifted24bits</code> in <code>tools/tiffcrop.c:3604</code> , allowing attackers to cause a denial-of-service via a crafted tiff file. For users that compile <code>libtiff</code> from sources, the fix is available with commit <code>cffb883b</code> .
CVE-2022-3599	LibTIFF 4.4.0 has an out-of-bounds read in <code>writeSingleSection</code> in <code>tools/tiffcrop.c:7345</code> , allowing attackers to cause a denial-of-service via a crafted tiff file. For users that compile <code>libtiff</code> from sources, the fix is available with commit <code>e8131125</code> .
CVE-2022-3606	A vulnerability was found in Linux Kernel. It has been classified as problematic. This affects the function <code>find_prog_by_sec_insn</code> of the file <code>tools/lib/bpf/libbpf.c</code> of the component <code>BPF</code> . The manipulation leads to null pointer dereference. It is recommended to apply a patch to fix this issue. The identifier VDB-211749 was assigned to this vulnerability.
CVE-2022-36280	An out-of-bounds(OOB) memory access vulnerability was found in <code>vmwgfx</code> driver in <code>drivers/gpu/vmxgfx/vmxgfx_kms.c</code> in GPU component in the Linux kernel with device file <code>"/dev/dri/renderD128 (or Dxxx)"</code> . This flaw allows a local attacker with a user account on the system to gain privilege, causing a denial of service(DoS).
CVE-2022-3705	A vulnerability was found in <code>vim</code> and classified as problematic. Affected by this issue is the function <code>qf_update_buffer</code> of the file <code>quickfix.c</code> of the component <code>autocmd Handler</code> . The manipulation leads to use after free. The attack may be launched remotely. Upgrading to version 9.0.0805 is able to address this issue. The name of the patch is <code>d0fab10ed2a86698937e3c3fed2f10bd9bb5e731</code> . It is recommended to upgrade the affected component. The identifier of this vulnerability is VDB-212324.
CVE-2022-38533	In GNU Binutils before 2.40, there is a heap-buffer-overflow in the error function <code>bfd_getl32</code> when called from the <code>strip_main</code> function in <code>strip-new</code> via a crafted file.
CVE-2022-3903	An incorrect read request flaw was found in the Infrared Transceiver USB driver in the Linux kernel. This issue occurs when a user attaches a malicious USB device. A local user could use this flaw to starve the resources, causing denial of service or potentially crashing the system.
CVE-2022-39327	Azure CLI is the command-line interface for Microsoft Azure. In versions previous to 2.40.0, Azure CLI contains a vulnerability for potential code injection. Critical scenarios are where a hosting machine runs an Azure CLI command where parameter values have been provided by an external source. The vulnerability is only applicable when the Azure CLI command is run on a Windows machine and with any version of PowerShell and when the parameter value contains the <code>'&'</code> or <code>' '</code> symbols. If any of these prerequisites are not met, this vulnerability is not applicable. Users should upgrade to version 2.40.0 or greater to receive a mitigation for the vulnerability.

CVE ID	Description
CVE-2022-39379	Fluentd collects events from various data sources and writes them to files, RDBMS, NoSQL, IaaS, SaaS, Hadoop and so on. A remote code execution (RCE) vulnerability in non-default configurations of Fluentd allows unauthenticated attackers to execute arbitrary code via specially crafted JSON payloads. Fluentd setups are only affected if the environment variable `FLUENT_OJ_OPTION_MODE` is explicitly set to `object`. Please note: The option FLUENT_OJ_OPTION_MODE was introduced in Fluentd version 1.13.2. Earlier versions of Fluentd are not affected by this vulnerability. This issue was patched in version 1.15.3. As a workaround do not use `FLUENT_OJ_OPTION_MODE=object`.
CVE-2022-3964	A vulnerability classified as problematic has been found in ffmpeg. This affects an unknown part of the file libavcodec/rpzaenc.c of the component QuickTime RPZA Video Encoder. The manipulation of the argument y_size leads to out-of-bounds read. It is possible to initiate the attack remotely. The name of the patch is 92f9b28ed84a77138105475beba16c146bdaf984. It is recommended to apply a patch to fix this issue. The associated identifier of this vulnerability is VDB-213543.
CVE-2022-3965	A vulnerability classified as problematic was found in ffmpeg. This vulnerability affects the function smc_encode_stream of the file libavcodec/smcenc.c of the component QuickTime Graphics Video Encoder. The manipulation of the argument y_size leads to out-of-bounds read. The attack can be initiated remotely. The name of the patch is 13c13109759090b7f7182480d075e13b36ed8edd. It is recommended to apply a patch to fix this issue. The identifier of this vulnerability is VDB-213544.
CVE-2022-40090	An issue was discovered in function TIFFReadDirectory libtiff before 4.4.0 allows attackers to cause a denial of service via crafted TIFF file.
CVE-2022-40755	JasPer 3.0.6 allows denial of service via a reachable assertion in the function inttobits in libjasper/base/jas_image.c.
CVE-2022-40897	Python Packaging Authority (PyPA) setuptools before 65.5.1 allows remote attackers to cause a denial of service via HTML in a crafted package or custom PackageIndex page. There is a Regular Expression Denial of Service (ReDoS) in package_index.py.
CVE-2022-41404	An issue in the fetch() method in the BasicProfile class of org.ini4j before v0.5.4 allows attackers to cause a Denial of Service (DoS) via unspecified vectors.
CVE-2022-41409	Integer overflow vulnerability in pcre2test before 10.41 allows attackers to cause a denial of service or other unspecified impacts via negative input.
CVE-2022-41715	Programs which compile regular expressions from untrusted sources may be vulnerable to memory exhaustion or denial of service. The parsed regexp representation is linear in the size of the input, but in some cases the constant factor can be as high as 40,000, making relatively small regexps consume much larger amounts of memory. After fix, each regexp being parsed is limited to a 256 MB memory footprint. Regular expressions whose representation would use more space than that are rejected. Normal use of regular expressions is unaffected.
CVE-2022-41716	Due to unsanitized NUL values, attackers may be able to maliciously set environment variables on Windows. In syscall.StartProcess and os/exec.Cmd, invalid environment variable values containing NUL values are not properly checked for. A malicious environment variable value can exploit this behavior to set a value for a different environment variable. For example, the environment variable string "A=B \x00C=D" sets the variables "A=B" and "C=D".
CVE-2022-41717	An attacker can cause excessive memory growth in a Go server accepting HTTP/2 requests. HTTP/2 server connections contain a cache of HTTP header keys sent by the client. While the total number of entries in this cache is capped, an attacker sending very large keys can cause the server to allocate approximately 64 MiB per open connection.
CVE-2022-41720	On Windows, restricted files can be accessed via os.DirFS and http.Dir. The os.DirFS function and http.Dir type provide access to a tree of files rooted at a given directory. These functions permit access to Windows device files under that root. For example, os.DirFS("C:/tmp").Open("COM1") opens the COM1 device. Both os.DirFS and http.Dir only provide read-only filesystem access. In addition, on Windows, an os.DirFS for the directory (the root of the current drive) can permit a maliciously crafted path to escape from the drive and access any path on the system. With fix applied, the behavior of os.DirFS("") has changed. Previously, an empty root was treated equivalently to "/", so os.DirFS("").Open("tmp") would open the path "/tmp". This now returns an error.
CVE-2022-41721	A request smuggling attack is possible when using MaxBytesHandler. When using MaxBytesHandler, the body of an HTTP request is not fully consumed. When the server attempts to read HTTP2 frames from the connection, it will instead be reading the body of the HTTP request, which could be attacker-manipulated to represent arbitrary HTTP2 requests.

CVE ID	Description
CVE-2022-41722	A path traversal vulnerability exists in filepath.Clean on Windows. On Windows, the filepath.Clean function could transform an invalid path such as "a/../c:/b" into the valid path "c:\b". This transformation of a relative (if invalid) path into an absolute path could enable a directory traversal attack. After fix, the filepath.Clean function transforms this path into the relative (but still invalid) path ".\c\b".
CVE-2022-41723	A maliciously crafted HTTP/2 stream could cause excessive CPU consumption in the HPACK decoder, sufficient to cause a denial of service from a small number of small requests.
CVE-2022-41724	Large handshake records may cause panics in crypto/tls. Both clients and servers may send large TLS handshake records which cause servers and clients, respectively, to panic when attempting to construct responses. This affects all TLS 1.3 clients, TLS 1.2 clients which explicitly enable session resumption (by setting Config.ClientSessionCache to a non-nil value), and TLS 1.3 servers which request client certificates (by setting Config.ClientAuth >= RequestClientCert).
CVE-2022-41725	A denial of service is possible from excessive resource consumption in net/http and mime/multipart. Multipart form parsing with mime/multipart.Reader.ReadForm can consume largely unlimited amounts of memory and disk files. This also affects form parsing in the net/http package with the Request methods FormFile, FormValue, ParseMultipartForm, and PostFormValue. ReadForm takes a maxMemory parameter, and is documented as storing "up to maxMemory bytes +10MB (reserved for non-file parts) in memory". File parts which cannot be stored in memory are stored on disk in temporary files. The unconfigurable 10MB reserved for non-file parts is excessively large and can potentially open a denial of service vector on its own. However, ReadForm did not properly account for all memory consumed by a parsed form, such as map entry overhead, part names, and MIME headers, permitting a maliciously crafted form to consume well over 10MB. In addition, ReadForm contained no limit on the number of disk files created, permitting a relatively small request body to create a large number of disk temporary files. With fix, ReadForm now properly accounts for various forms of memory overhead, and should now stay within its documented limit of 10MB + maxMemory bytes of memory consumption. Users should still be aware that this limit is high and may still be hazardous. In addition, ReadForm now creates at most one on-disk temporary file, combining multiple form parts into a single temporary file. The mime/multipart.File interface type's documentation states, "If stored on disk, the File's underlying concrete type will be an *os.File.". This is no longer the case when a form contains more than one file part, due to this coalescing of parts into a single file. The previous behavior of using distinct files for each form part may be reenabled with the environment variable GODEBUG=multipartfiles=distinct. Users should be aware that multipart.ReadForm and the http.Request methods that call it do not limit the amount of disk consumed by temporary files. Callers can limit the size of form data with http.MaxBytesReader.
CVE-2022-41848	drivers/char/pcmcia/synclink_cs.c in the Linux kernel through 5.19.12 has a race condition and resultant use-after-free if a physically proximate attacker removes a PCMCIA device while calling ioctl, aka a race condition between mgs_lpc_ioctl and mgs_lpc_detach.
CVE-2022-41850	roccat_report_event in drivers/hid/hid-roccat.c in the Linux kernel through 5.19.12 has a race condition and resultant use-after-free in certain situations where a report is received while copying a report->value is in progress.
CVE-2022-41862	In PostgreSQL, a modified, unauthenticated server can send an unterminated string during the establishment of Kerberos transport encryption. In certain conditions a server can cause a libpq client to over-read and report an error message containing uninitialized bytes.
CVE-2022-42003	In FasterXML jackson-databind before versions 2.13.4.1 and 2.12.17.1, resource exhaustion can occur because of a lack of a check in primitive value deserializers to avoid deep wrapper array nesting, when the UNWRAP_SINGLE_VALUE_ARRAYS feature is enabled.
CVE-2022-42004	In FasterXML jackson-databind before 2.13.4, resource exhaustion can occur because of a lack of a check in BeanDeserializer._deserializeFromArray to prevent use of deeply nested arrays. An application is vulnerable only with certain customized choices for deserialization.
CVE-2022-4292	Use After Free in GitHub repository vim/vim prior to 9.0.0882.
CVE-2022-4293	Floating Point Comparison with Incorrect Operator in GitHub repository vim/vim prior to 9.0.0804.
CVE-2022-44034	An issue was discovered in the Linux kernel through 6.0.6. drivers/char/pcmcia/scr24x_cs.c has a race condition and resultant use-after-free if a physically proximate attacker removes a PCMCIA device while calling open(), aka a race condition between scr24x_open() and scr24x_remove().
CVE-2022-44840	Heap buffer overflow vulnerability in binutils readelf before 2.40 via function find_section_in_set in file readelf.c.
CVE-2022-4543	A flaw named "EntryBleed" was found in the Linux Kernel Page Table Isolation (KPTI). This issue could allow a local attacker to leak KASLR base via prefetch side-channels based on TLB timing for Intel systems.

CVE ID	Description
CVE-2022-45885	An issue was discovered in the Linux kernel through 6.0.9. drivers/media/dvb-core/dvb_frontend.c has a race condition that can cause a use-after-free when a device is disconnected.
CVE-2022-46337	A cleverly devised username might bypass LDAP authentication checks. In LDAP-authenticated Derby installations, this could let an attacker fill up the disk by creating junk Derby databases. In LDAP-authenticated Derby installations, this could also allow the attacker to execute malware which was visible to and executable by the account which booted the Derby server. In LDAP-protected databases which weren't also protected by SQL GRANT/REVOKE authorization, this vulnerability could also let an attacker view and corrupt sensitive data and run sensitive database functions and procedures. Mitigation: Users should upgrade to Java 21 and Derby 10.17.1.0. Alternatively, users who wish to remain on older Java versions should build their own Derby distribution from one of the release families to which the fix was backported: 10.16, 10.15, and 10.14. Those are the releases which correspond, respectively, with Java LTS versions 17, 11, and 8.
CVE-2022-47007	An issue was discovered function stab_demangle_v3_arg in stabs.c in Binutils 2.34 thru 2.38, allows attackers to cause a denial of service due to memory leaks.
CVE-2022-47008	An issue was discovered function make_tmpdir, and make_tmpname in bucomm.c in Binutils 2.34 thru 2.38, allows attackers to cause a denial of service due to memory leaks.
CVE-2022-47010	An issue was discovered function pr_function_type in prdbg.c in Binutils 2.34 thru 2.38, allows attackers to cause a denial of service due to memory leaks.
CVE-2022-47011	An issue was discovered function parse_stab_struct_fields in stabs.c in Binutils 2.34 thru 2.38, allows attackers to cause a denial of service due to memory leaks.
CVE-2022-48303	GNU Tar through 1.34 has a one-byte out-of-bounds read that results in use of uninitialized memory for a conditional jump. Exploitation to change the flow of control has not been demonstrated. The issue occurs in from_header in list.c via a V7 archive in which mtime has approximately 11 whitespace characters.
CVE-2022-48338	An issue was discovered in GNU Emacs through 28.2. In ruby-mode.el, the ruby-find-library-file function has a local command injection vulnerability. The ruby-find-library-file function is an interactive function, and bound to C-c C-f. Inside the function, the external command gem is called through shell-command-to-string, but the feature-name parameters are not escaped. Thus, malicious Ruby source files may cause commands to be executed.
CVE-2022-48628	In the Linux kernel, the following vulnerability has been resolved: ceph: drop messages from MDS when unmounting When unmounting all the dirty buffers will be flushed and after the last osd request is finished the last reference of the i_count will be released. Then it will flush the dirty cap/snap to MDSs, and the unmounting won't wait the possible acks, which will ihold the inodes when updating the metadata locally but makes no sense any more, of this. This will make the evict_inodes() to skip these inodes. If encrypt is enabled the kernel generate a warning when removing the encrypt keys when the skipped inodes still hold the keyring: WARNING: CPU: 4 PID: 168846 at fs/crypto/keyring.c:242 fscrypt_destroy_keyring+0x7e/0xd0 CPU: 4 PID: 168846 Comm: umount Tainted: G S 6.1.0-rc5-ceph-g72ead199864c #1 Hardware name: Supermicro SYS-5018R-WR/X10SRW-F, BIOS 2.0 12/17/2015 RIP: 0010:fscrypt_destroy_keyring+0x7e/0xd0 RSP: 0018:ffffc9000b277e28 EFLAGS: 00010202 RAX: 0000000000000002 RBX: ffff88810d52ac00 RCX: ffff88810b56aa00 RDX: 0000000080000000 RSI: ffffffff822f3a09 RDI: ffff888108f59000 RBP: ffff8881d394fb88 R08: 0000000000000028 R09: 0000000000000000 R10: 0000000000000001 R11: 11ff4fe6834fcd91 R12: ffff8881d394fc40 R13: ffff888108f59000 R14: ffff8881d394f800 R15: 0000000000000000 FS: 00007fd83f6f1080(0000) GS:ffff88885fd00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007f918d417000 CR3: 000000017f89a005 CR4: 00000000003706e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 00000000000000400 Call Trace: <TASK> generic_shutdown_super+0x47/0x120 kill_anon_super+0x14/0x30 ceph_kill_sb+0x36/0x90 [ceph] deactivate_locked_super+0x29/0x60 cleanup_mnt+0xb8/0x140 task_work_run+0x67/0xb0 exit_to_user_mode_prepare+0x23d/0x240 syscall_exit_to_user_mode+0x25/0x60 do_syscall_64+0x40/0x80 entry_SYSCALL_64_after_hwframe+0x63/0xcd RIP: 0033:0x7fd83dc39e9b Later the kernel will crash when iput() the inodes and dereferencing the "sb->s_master_keys", which has been released by the generic_shutdown_super().

CVE ID	Description
CVE-2022-48631	In the Linux kernel, the following vulnerability has been resolved: ext4: fix bug in extents parsing when eh_entries == 0 and eh_depth > 0 When walking through an inode extents, the ext4_ext_binsearch_idx() function assumes that the extent header has been previously validated. However, there are no checks that verify that the number of entries (eh->eh_entries) is non-zero when depth is > 0. And this will lead to problems because the EXT_FIRST_INDEX() and EXT_LAST_INDEX() will return garbage and result in this: [135.245946] -----[cut here]----- [135.247579] kernel BUG at fs/ext4/extents.c:2258! CVE ID	Description
CVE-2022-48634	In the Linux kernel, the following vulnerability has been resolved: drm/gma500: Fix BUG: sleeping function called from invalid context errors gma_crtc_page_flip() was holding the event_lock spinlock while calling crtc_funcs->mode_set_base() which takes ww_mutex. The only reason to hold event_lock is to clear gma_crtc->page_flip_event on mode_set_base() errors. Instead unlock it after setting gma_crtc->page_flip_event and on errors re-take the lock and clear gma_crtc->page_flip_event it is still set. This fixes the following WARN/stacktrace: [512.122953] BUG: sleeping function called from invalid context at kernel/locking/mutex.c:870 [512.123004] in_atomic(): 1, irqs_disabled(): 1, non_block: 0, pid: 1253, name: gnome-shell [512.123031] preempt_count: 1, expected: 0 [512.123048] RCU nest depth: 0, expected: 0 [512.123066] INFO: lockdep is turned off. CVE-2022-48635	In the Linux kernel, the following vulnerability has been resolved: fsdax: Fix infinite loop in dax_iomap_rw() I got an infinite loop and a WARNING report when executing a tail command in virtiofs. WARNING: CPU: 10 PID: 964 at fs/iomap/iter.c:34 iomap_iter+0x3a2/0x3d0 Modules linked in: CPU: 10 PID: 964 Comm: tail Not tainted 5.19.0-rc7 Call Trace: <TASK> dax_iomap_rw+0xea/0x620 ? __this_cpu_preempt_check+0x13/0x20 fuse_dax_read_iter+0x47/0x80 fuse_file_read_iter+0xae/0xd0 new_sync_read+0xfe/0x180 ? 0xffffffff81000000 vfs_read+0x14d/0x1a0 ksys_read+0x6d/0xf0 __x64_sys_read+0x1a/0x20 do_syscall_64+0x3b/0x90 entry_SYSCALL_64_after_hwframe+0x63/0xcd The tail command will call read() with a count of 0. In this case, iomap_iter() will report this WARNING, and always return 1 which causing the infinite loop in dax_iomap_rw(). Fixing by checking count whether is 0 in dax_iomap_rw().
CVE-2022-48637	In the Linux kernel, the following vulnerability has been resolved: bnxt: prevent skb UAF after handing over to PTP worker When reading the timestamp is required bnxt_tx_int() hands over the ownership of the completed skb to the PTP worker. The skb should not be used afterwards, as the worker may run before the rest of our code and free the skb, leading to a use-after-free. Since dev_kfree_skb_any() accepts NULL make the loss of ownership more obvious and set skb to NULL.
CVE-2022-48638	In the Linux kernel, the following vulnerability has been resolved: cgroup: cgroup_get_from_id() must check the looked-up kn is a directory cgroup has to be one kernfs dir, otherwise kernel panic is caused, especially cgroup id is provide from userspace.
CVE-2022-48639	In the Linux kernel, the following vulnerability has been resolved: net: sched: fix possible refcount leak in tc_new_tfilter() tfilter_put need to be called to put the refcount got by tp->ops->get to avoid possible refcount leak when chain->tmplt_ops != NULL and chain->tmplt_ops != tp->ops.

CVE ID	Description
CVE-2022-48640	In the Linux kernel, the following vulnerability has been resolved: bonding: fix NULL deref in bond_rr_gen_slave_id Fix a NULL dereference of the struct bonding.rr_tx_counter member because if a bond is initially created with an initial mode != zero (Round Robin) the memory required for the counter is never created and when the mode is changed there is never any attempt to verify the memory is allocated upon switching modes. This causes the following Oops on an aarch64 machine: [334.686773] Unable to handle kernel paging request at virtual address ffff2c91ac905000 [334.694703] Mem abort info: [334.697486] ESR = 0x0000000096000004 [334.701234] EC = 0x25: DABT (current EL), IL = 32 bits [334.706536] SET = 0, FnV = 0 [334.709579] EA = 0, S1PTW = 0 [334.712719] FSC = 0x04: level 0 translation fault [334.717586] Data abort info: [334.720454] ISV = 0, ISS = 0x00000004 [334.724288] CM = 0, WnR = 0 [334.727244] swapper pgtable: 4k pages, 48-bit VAs, pgdp=000008044d662000 [334.733944] [ffff2c91ac905000] pgd=0000000000000000, p4d=0000000000000000 [334.740734] Internal error: Oops: 96000004 [#1] SMP [334.745602] Modules linked in: bonding tls veth rkill sunrpc arm_spe_pmu vfat fat acpi_ipmi ipmi_ssif ixgbe igb i40e mdio ipmi_devintf ipmi_msghandler arm_cm_n arm_dsu_pmu cppc_cpufreq acpi_tad fuse zram crct10dif_ce ast ghash_ce sbas_gwtd nvme drm_vram_helper drm_ttm_helper nvme_core ttm xgene_hwmon [334.772217] CPU: 7 PID: 2214 Comm: ping Not tainted 6.0.0-rc4-00133-g64ae13ed4784 #4 [334.779950] Hardware name: GIGABYTE R272-P31-00/MP32-AR1-00, BIOS F18v (SCP: 1.08.20211002) 12/01/2021 [334.789244] pstate: 60400009 (nZCv daif +PAN -UAO -TCO -DIT -SSBS BTYPE=--) [334.796196] pc : bond_rr_gen_slave_id +0x40/0x124 [bonding] [334.801691] lr : bond_xmit_roundrobin_slave_get+0x38/0xdc [bonding] [334.807962] sp : ffff8000221733e0 [334.811265] x29: ffff8000221733e0 x28: ffffd9ac8572d198 x27: ffff80002217357c [334.818392] x26: 0000000000000002a x25: ffffd9ac8572d198 x24: ffff07ff980fa000 [334.825519] x23: ffffd9ac8572d198 x22: ffff07ff98102000 x21: ffff07ff981029c0 [334.832646] x20: 0000000000000001 x19: ffff07ff981029c0 x18: 0000000000000014 [334.839773] x17: 0000000000000000 x16: ffffd9ac8572d198 x15: 0000000000000000 [334.846899] x14: ffff07ff981029c0 x13: ffff07ff981029c0 x12: 0000000000000000 [334.854026] x11: ffffd9ac8572d198 x10: 0000000000000001 x9: ffffd9ac8572d198 [334.861153] x8: ffff07ff981029c0 x7: 0000000000000000 x6: 0000000000000000 [334.868279] x5: ffff2c91ac905000 x4: ffff2c91ac905000 x3: ffff07ff981029c0 [334.875406] x2: ffff2c91ac905000 x1: 0000000000000001 x0: ffff07ff981029c0 [334.882532] Call trace: [334.884967] bond_rr_gen_slave_id+0x40/0x124 [bonding] [334.890109] bond_xmit_roundrobin_slave_get+0x38/0xdc [bonding] [334.896033] __bond_start_xmit+0x128/0x3a0 [bonding] [334.901001] bond_start_xmit+0x54/0xb0 [bonding] [334.905622] dev_hard_start_xmit+0xb4/0x220 [334.909798] __dev_queue_xmit+0x1a0/0x720 [334.913799] arp_xmit+0x3c/0x8c [334.916932] arp_send_dst+0x98/0xd0 [334.920410] arp_sollicit +0xe8/0x230 [334.923888] neigh_probe+0x60/0xb0 [334.927279] __neigh_event_send+0x3b0/0x470 [334.931453] neigh_resolve_output+0x70/0x90 [334.935626] ip_finish_output2+0x158/0x514 [334.939714] __ip_finish_output+0xac/0x1a4 [334.943800] ip_finish_output+0x40/0xfc [334.947626] ip_output+0xf8/0x1a4 [334.950931] ip_send_skb+0x5c/0x100 [334.954410] ip_push_pending_frames +0x3c/0x60 [334.958758] raw_sendmsg+0x458/0x6d0 [334.962325] inet_sendmsg+0x50/0x80 [334.965805] sock_sendmsg+0x60/0x6c [334.969286] __sys_sendto+0xc8/0x134 [334.972853] __arm64_sys_sendto+0x34/0x4c ---truncated---
CVE-2022-48641	In the Linux kernel, the following vulnerability has been resolved: netfilter: ebttables: fix memory leak when blob is malformed The bug fix was incomplete, it "replaced" crash with a memory leak. The old code had an assignment to "ret" embedded into the conditional, restore this.
CVE-2022-48643	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: fix nft_counters_enabled underflow at nf_tables_addchain() syzbot is reporting underflow of nft_counters_enabled counter at nf_tables_addchain() [1], for commit 43eb8949cfdffa76 ("netfilter: nf_tables: do not leave chain stats enabled on error") missed that nf_tables_chain_destroy() after nft_basechain_init() in the error path of nf_tables_addchain() decrements the counter because nft_basechain_init() makes nft_is_base_chain() return true by setting NFT_CHAIN_BASE flag. Increment the counter immediately after returning from nft_basechain_init().
CVE-2022-48646	In the Linux kernel, the following vulnerability has been resolved: sfc/siena: fix null pointer dereference in efx_hard_start_xmit Like in previous patch for sfc, prevent potential (but unlikely) NULL pointer dereference.
CVE-2022-48647	In the Linux kernel, the following vulnerability has been resolved: sfc: fix TX channel offset when using legacy interrupts In legacy interrupt mode the tx_channel_offset was hardcoded to 1, but that's not correct if efx_separate_tx_channels is false. In that case, the offset is 0 because the tx queues are in the single existing channel at index 0, together with the rx queue. Without this fix, as soon as you try to send any traffic, it tries to get the tx queues from an uninitialized channel getting these errors: WARNING: CPU: 1 PID: 0 at drivers/net/ethernet/sfc/tx.c:540 efx_hard_start_xmit+0x12e/0x170 [sfc] [...] RIP: 0010:efx_hard_start_xmit+0x12e/0x170 [sfc] [...] Call Trace: <IRQ> dev_hard_start_xmit+0xd7/0x230 sch_direct_xmit+0x9f/0x360 __dev_queue_xmit+0x890/0xa40 [...] BUG: unable to handle kernel NULL pointer dereference at 0000000000000020 [...] RIP: 0010:efx_hard_start_xmit+0x153/0x170 [sfc] [...] Call Trace: <IRQ> dev_hard_start_xmit+0xd7/0x230 sch_direct_xmit+0x9f/0x360 __dev_queue_xmit +0x890/0xa40 [...]

CVE ID	Description
CVE-2022-48648	In the Linux kernel, the following vulnerability has been resolved: sfc: fix null pointer dereference in efx_hard_start_xmit Trying to get the channel from the tx_queue variable here is wrong because we can only be here if tx_queue is NULL, so we shouldn't dereference it. As the above comment in the code says, this is very unlikely to happen, but it's wrong anyway so let's fix it. I hit this issue because of a different bug that caused tx_queue to be NULL. If that happens, this is the error message that we get here: BUG: unable to handle kernel NULL pointer dereference at 0000000000000020 [...] RIP: 0010:efx_hard_start_xmit+0x153/0x170 [sfc]
CVE-2022-48651	In the Linux kernel, the following vulnerability has been resolved: ipvlan: Fix out-of-bound bugs caused by unset skb->mac_header If an AF_PACKET socket is used to send packets through ipvlan and the default xmit function of the AF_PACKET socket is changed from dev_queue_xmit() to packet_direct_xmit() via setsockopt() with the option name of PACKET_QDISC_BYPASS, the skb->mac_header may not be reset and remains as the initial value of 65535, this may trigger slab-out-of-bounds bugs as following: ===== UG: KASAN: slab-out-of-bounds in ipvlan_xmit_mode_l2+0xdb/0x330 [ipvlan] PU: 2 PID: 1768 Comm: raw_send Kdump: loaded Not tainted 6.0.0-rc4+ #6 ardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.14.0-1.fc33 all Trace: print_address_description.constprop.0+0x1d/0x160 print_report.cold+0x4f/0x112 kasan_report+0xa3/0x130 ipvlan_xmit_mode_l2+0xdb/0x330 [ipvlan] ipvlan_start_xmit+0x29/0xa0 [ipvlan] __dev_direct_xmit+0x2e2/0x380 packet_direct_xmit+0x22/0x60 packet_snd+0x7c9/0xc40 sock_sendmsg+0x9a/0xa0 __sys_sendto+0x18a/0x230 __x64_sys_sendto+0x74/0x90 do_syscall_64+0x3b/0x90 entry_SYSCALL_64_after_hwframe+0x63/0xcd The root cause is: 1. packet_snd() only reset skb->mac_header when sock->type is SOCK_RAW and skb->protocol is not specified as in packet_parse_headers() 2. packet_direct_xmit() doesn't reset skb->mac_header as dev_queue_xmit() In this case, skb->mac_header is 65535 when ipvlan_xmit_mode_l2() is called. So when ipvlan_xmit_mode_l2() gets mac header with eth_hdr() which use "skb->head + skb->mac_header", out-of-bound access occurs. This patch replaces eth_hdr() with skb_eth_hdr() in ipvlan_xmit_mode_l2() and reset mac header in multicast to solve this out-of-bound bug.
CVE-2022-48652	In the Linux kernel, the following vulnerability has been resolved: ice: Fix crash by keep old cfg when update TCs more than queues There are problems if allocated queues less than Traffic Classes. Commit a632b2a4c920 ("ice: ethtool: Prohibit improper channel config for DCB") already disallow setting less queues than TCs. Another case is if we first set less queues, and later update more TCs config due to LLDP, ice_vsi_cfg_tc() will failed but left dirty num_tx/rx and tc_cfg in vsi, that will cause invalid pointer access. [95.968089] ice 0000:3b:00.1: More TCs defined than queues/rings allocated. [95.968092] ice 0000:3b:00.1: Trying to use more Rx queues (8), than were allocated (1)! [95.968093] ice 0000:3b:00.1: Failed to config TC for VSI index: 0 [95.969621] general protection fault: 0000 [#1] SMP NOPTI [95.969705] CPU: 1 PID: 58405 Comm: lldpad Kdump: loaded Tainted: G U W O ----- -t - 4.18.0 #1 [95.969867] Hardware name: O.E.M/BC11SPSCB10, BIOS 8.23 12/30/2021 [95.969992] RIP: 0010:devm_kmalloc+0xa/0x60 [95.970052] Code: 5c ff ff ff 31 c0 5b 5d 41 5c 3c b8 f4 ff ff ff eb f4 0f 1f 40 00 66 2e 0f 1f 84 00 00 00 00 0f 1f 44 00 00 48 89 f8 89 d1 <8b> 97 60 02 00 00 48 8d 7e 18 48 39 f7 72 3f 55 89 ce 53 48 8b 4c [95.970344] RSP: 0018:ffffc9003f553888 EFLAGS: 00010206 [95.970425] RAX: dead000000000200 RBX: fffffea003c425b00 RCX: 00000000006080c0 [95.970536] RDX: 00000000006080c0 RSI: 0000000000000200 RDI: dead000000000200 [95.970648] RBP: dead000000000200 R08: 00000000000463c0 R09: ffff888ffa900000 [95.970760] R10: 0000000000000000 R11: 0000000000000002 R12: ffff888ff6b40100 [95.970870] R13: ffff888ff6a55018 R14: 0000000000000000 R15: ffff888ff6a55460 [95.970981] FS: 00007f51b7d24700(0000) GS:ffff88903ee80000(0000) knlGS:0000000000000000 [95.971108] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 [95.971197] CR2: 00007fac5410d710 CR3: 0000000f2c1de002 CR4: 00000000007606e0 [95.971309] DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 [95.971419] DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 [95.971530] PKRU: 55555554 [95.971573] Call Trace: [95.971622] ice_setup_rx_ring+0x39/0x110 [ice] [95.971695] ice_vsi_setup_rx_rings+0x54/0x90 [ice] [95.971774] ice_vsi_open+0x25/0x120 [ice] [95.971843] ice_open_internal+0xb8/0x1f0 [ice] [95.971919] ice_ena_vsi+0x4f/0xd0 [ice] [95.971987] ice_dcb_ena_dis_vsi.constprop.5+0x29/0x90 [ice] [95.972082] ice_pf_dcb_cfg+0x29a/0x380 [ice] [95.972154] ice_dcbnl_setets+0x174/0x1b0 [ice] [95.972220] dcbnl_ieee_set+0x89/0x230 [95.972279] ? dcbnl_ieee_del+0x150/0x150 [95.972341] dcb_doit+0x124/0x1b0 [95.972392] rtnetlink_rcv_msg+0x243/0x2f0 [95.972457] ? dcb_doit+0x14d/0x1b0 [95.972510] ? __kmalloc_node_track_caller+0x1d3/0x280 [95.972591] ? rtnl_calcit.isra.31+0x100/0x100 [95.972661] netlink_rcv_skb+0xc0/0xf0 [95.972720] netlink_unicast+0x16d/0x220 [95.972781] netlink_sendmsg+0x2ba/0x3a0 [95.975891] sock_sendmsg+0x4c/0x50 [95.979032] __sys_sendmsg+0x2e4/0x300 [95.982147] ? kmem_cache_alloc+0x13e/0x190 [95.985242] ? __wake_up_common_lock+0x79/0x90 [95.988338] ? __check_object_size+0xac/0x1b0 [95.991440] ? __copy_to_user+0x22/0x30 [95.994539] ? move_addr_to_user+0xb0/0xd0 [95.997619] ? __sys_sendmsg+0x53/0x80 [96.000664] __sys_sendmsg+0x53/0x80 [96.003747] do_syscall_64+0x5b/0x1d0 [96.006862] entry_SYSCALL_64_after_hwframe+0x65/0xca Only update num_tx/rx when passed check, and restore tc_cfg if setup queue map failed.

CVE ID	Description
CVE-2022-48653	In the Linux kernel, the following vulnerability has been resolved: ice: Don't double unplug aux on peer initiated reset In the IDC callback that is accessed when the aux drivers request a reset, the function to unplug the aux devices is called. This function is also called in the ice_prepare_for_reset function. This double call is causing a "scheduling while atomic" BUG. CVE-2022-48658	In the Linux kernel, the following vulnerability has been resolved: mm: slub: fix flush_cpu_slab()/__free_slab() invocations in task context. Commit 5a836bf6b09f ("mm: slub: move flush_cpu_slab() invocations __free_slab() invocations out of IRQ context") moved all flush_cpu_slab() invocations to the global workqueue to avoid a problem related with deactivate_slab()/__free_slab() being called from an IRQ context on PREEMPT_RT kernels. When the flush_all_cpu_locked() function is called from a task context it may happen that a workqueue with WQ_MEM_RECLAIM bit set ends up flushing the global workqueue, this will cause a dependency issue. workqueue: WQ_MEM_RECLAIM nvme-delete-wq:nvme_delete_ctrl_work [nvme_core] is flushing !WQ_MEM_RECLAIM events:flush_cpu_slab WARNING: CPU: 37 PID: 410 at kernel/workqueue.c:2637 check_flush_dependency+0x10a/0x120 Workqueue: nvme-delete-wq nvme_delete_ctrl_work [nvme_core] RIP: 0010:check_flush_dependency+0x10a/0x120[453.262125] Call Trace: __flush_work.isra.0+0xbf/0x220 ? __queue_work+0x1dc/0x420 flush_all_cpus_locked+0xfb/0x120 __kmem_cache_shutdown+0x2b/0x320 kmem_cache_destroy+0x49/0x100 bioset_exit+0x143/0x190 blk_release_queue+0xb9/0x100 kobject_cleanup+0x37/0x130 nvme_fc_ctrl_free+0xc6/0x150 [nvme_fc] nvme_free_ctrl+0x1ac/0x2b0 [nvme_core] Fix this bug by creating a workqueue for the flush operation with the WQ_MEM_RECLAIM bit set.

CVE ID	Description
CVE-2022-48659	In the Linux kernel, the following vulnerability has been resolved: mm/slab: fix to return errno if kcalloc() fails In create_unique_id(), kcalloc(, GFP_KERNEL) can fail due to out-of-memory, if it fails, return errno correctly rather than triggering panic via BUG_ON(); kernel BUG at mm/slab.c:5893! CVE-2022-48662	In the Linux kernel, the following vulnerability has been resolved: drm/i915/gem: Really move i915_gem_context.link under ref protection i915_perf assumes that it can use the i915_gem_context reference to protect its i915->gem.contexts.list iteration. However, this requires that we do not remove the context from the list until after we drop the final reference and release the struct. If, as currently, we remove the context from the list during context_close(), the link.next pointer may be poisoned while we are holding the context reference and cause a GPF: [4070.573157] i915 0000:00:02.0: [drm:i915_perf_open_ioctl [i915]] filtering on ctx_id=0x1fffff ctx_id_mask=0x1fffff [4070.574881] general protection fault, probably for non-canonical address 0xdead000000000100: 0000 [#1] PREEMPT SMP [4070.574897] CPU: 1 PID: 284392 Comm: amd_performance Tainted: G E 5.17.9 #180 [4070.574903] Hardware name: Intel Corporation NUC7i5BNK/NUC7i5BNB, BIOS BNKBL357.86A.0052.2017.0918.1346 09/18/2017 [4070.574907] RIP: 0010:oa_configure_all_contexts.isra.0+0x222/0x350 [i915] [4070.574982] Code: 08 e8 32 6e 10 e1 4d 8b 6d 50 b8 ff ff ff ff 49 83 ed 50 f0 41 0f c1 04 24 83 f8 01 0f 84 e3 00 00 00 85 c0 0f 8e fa 00 00 00 <49> 8b 45 50 48 8d 70 b0 49 8d 45 50 48 39 44 24 10 0f 85 34 fe ff [4070.574990] RSP: 0018:ffff90002077b78 EFLAGS: 00010202 [4070.574995] RAX: 0000000000000002 RBX: 0000000000000002 RCX: 0000000000000000 [4070.575000] RDX: 0000000000000001 RSI: fffff90002077b20 RDI: fffff88810ddc7c68 [4070.575004] RBP: 0000000000000001 R08: fffff888103242648 R09: ffffffffefc [4070.575008] R10: ffffffff82c50bc0 R11: 0000000000025c80 R12: fffff888101bf1860 [4070.575012] R13: dead0000000000b0 R14: fffff90002077c04 R15: fffff88810be5cab [4070.575016] FS: 00007f1ed50c0780(0000) GS:ffff88885ec80000(0000) knlGS:0000000000000000 [4070.575021] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 [4070.575025] CR2: 00007f1ed5590280 CR3: 000000010ef6f005 CR4: 00000000003706e0 [4070.575029] Call Trace: [4070.575033] <TASK> [4070.575037] lrc_configure_all_contexts+0x13e/0x150 [i915] [4070.575103] gen8_enable_metric_set +0x4d/0x90 [i915] [4070.575164] i915_perf_open_ioctl+0x4bc/0x1500 [i915] [4070.575224] ? asm_common_interrupt+0x1e/0x40 [4070.575232] ? i915_oa_init_reg_state+0x110/0x110 [i915] [4070.575290] drm_ioctl_kernel+0x85/0x110 [4070.575296] ? update_load_avg +0x5f/0x5e0 [4070.575302] drm_ioctl+0x1d3/0x370 [4070.575307] ? i915_oa_init_reg_state +0x110/0x110 [i915] [4070.575382] ? gen8_gt_irq_handler+0x46/0x130 [i915] [4070.575445] __x64_sys_ioctl+0x3c4/0x8d0 [4070.575451] ? __do_softirq+0xaa/0x1d2 [4070.575456] do_syscall_64+0x35/0x80 [4070.575461] entry_SYSCALL_64_after_hwframe+0x44/0xae [4070.575467] RIP: 0033:0x7f1ed5c10397 [4070.575471] Code: 3c 1c e8 1c ff ff 85 c0 79 87 49 c7 c4 ff ff ff ff 5b 5d 4c 89 e0 41 5c c3 66 0f 1f 84 00 00 00 00 00 b8 10 00 00 00 0f 05 <48> 3d 01 f0 ff ff 73 01 c3 48 8b 0d a9 da 0d 00 f7 d8 64 89 01 48 [4070.575478] RSP: 002b:00007ffd65c8d7a8 EFLAGS: 00000246 ORIG_RAX: 0000000000000010 [4070.575484] RAX: ffffffffefcda RBX: 0000000000000006 RCX: 00007f1ed5c10397 [4070.575488] RDX: 00007ffd65c8d7c0 RSI: 0000000040106476 RDI: 0000000000000006 [4070.575492] RBP: 00005620972f9c60 R08: 000000000000000a R09: 0000000000000005 [4070.575496] R10: 000000000000000d R11: 0000000000000246 R12: 000000000000000a [4070.575500] R13: 000000000000000d R14: 0000000000000000 R15: 00007ffd65c8d7c0 [4070.575505] </TASK> [4070.575507] Modules linked in: nls_asci(E) nls_cp437(E) vfat(E) fat(E) i915(E) x86_pkg_temp_thermal(E) intel_powerclamp(E) crc10dif_pclmul(E) crc32_pclmul(E) crc32c_intel(E) aesni_intel(E) crypto_simd(E) intel_gtt(E) cryptd(E) ttmm(E) rapl(E) intel_cstate(E) drm_kms_helper(E) cfbfillrect(E) syscopyarea(E) cfbimgblt(E) intel_uncore(E) sysfillrect(E) mei_me(E) sysimgblt(E) i2c_i801(E) fb_sys_fops(E) mei(E) intel_pch_thermal(E) i2c_smbus ---truncated---
CVE-2022-48672	In the Linux kernel, the following vulnerability has been resolved: of: fdt: fix off-by-one error in unflatten_dt_nodes() Commit 78c44d910d3e ("drivers/of: Fix depth when unflattening devicetree") forgot to fix up the depth check in the loop body in unflatten_dt_nodes() which makes it possible to overflow the nps[] buffer... Found by Linux Verification Center (linuxtesting.org) with the SVACE static analysis tool.

CVE ID	Description
CVE-2022-48673	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix possible access to freed memory in link clear After modifying the QP to the Error state, all RX WR would be completed with WC in IB_WC_WR_FLUSH_ERR status. Current implementation does not wait for it is done, but destroy the QP and free the link group directly. So there is a risk that accessing the freed memory in tasklet context. Here is a crash example: BUG: unable to handle page fault for address: ffffffff8f220860 #PF: supervisor write access in kernel mode #PF: error_code(0x0002) - not-present page PGD f7300e067 P4D f7300e067 PUD f7300f063 PMD 8c4e45063 PTE 800ffff08c9df060 Oops: 0002 [#1] SMP PTI CPU: 1 PID: 0 Comm: swapper/1 Kdump: loaded Tainted: G S OE 5.10.0-0607+ #23 Hardware name: Inspur NF5280M4/YZMB-00689-101, BIOS 4.1.20 07/09/2018 RIP: 0010:native_queued_spin_lock_slowpath+0x176/0x1b0 Code: f3 90 48 8b 32 48 85 f6 74 f6 eb d5 c1 ee 12 83 e0 03 83 ee 01 48 c1 e0 05 48 63 f6 48 05 00 c8 02 00 48 03 04 f5 00 09 98 8e <48> 89 10 8b 42 08 85 c0 75 09 f3 90 8b 42 08 85 c0 74 f7 48 8b 32 RSP: 0018:ffffb3b6c001ebd8 EFLAGS: 00010086 RAX: ffffffff8f220860 RBX: 0000000000000246 RCX: 0000000000080000 RDX: ffff91db1f86c800 RSI: 000000000000173c RDI: ffff91db62bace00 RBP: ffff91db62bacc00 R08: 0000000000000000 R09: c0000010000028b R10: 000000000005198 R11: fffffb3b6c001ea58 R12: ffff91db80e05010 R13: 000000000000000a R14: 0000000000000006 R15: 0000000000000040 FS: 0000000000000000(0000) GS:ffff91db1f840000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: ffffffff8f220860 CR3: 00000001f9580004 CR4: 00000000003706e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: <IRQ> _raw_spin_lock_irqsave+0x30/0x40 mlx5_ib_poll_cq+0x4c/0xc50 [mlx5_ib] smc_wr_rx_tasklet_fn +0x56/0xa0 [smc] tasklet_action_common.isra.21+0x66/0x100 __do_softirq+0xd5/0x29c asm_call_irq_on_stack+0x12/0x20 </IRQ> do_softirq_own_stack+0x37/0x40 irq_exit_rcu+0x9d/0xa0 sysvec_call_function_single+0x34/0x80 asm_sysvec_call_function_single+0x12/0x20
CVE-2022-48686	In the Linux kernel, the following vulnerability has been resolved: nvme-tcp: fix UAF when detecting digest errors We should also bail from the io_work loop when we set rd_enabled to true, so we don't attempt to read data from the socket when the TCP stream is already out-of-sync or corrupted.
CVE-2022-48687	In the Linux kernel, the following vulnerability has been resolved: ipv6: sr: fix out-of-bounds read when setting HMAC data. The SRv6 layer allows defining HMAC data that can later be used to sign IPv6 Segment Routing Headers. This configuration is realised via netlink through four attributes: SEG6_ATTR_HMACKEYID, SEG6_ATTR_SECRET, SEG6_ATTR_SECRETLEN and SEG6_ATTR_ALGID. Because the SECRETLEN attribute is decoupled from the actual length of the SECRET attribute, it is possible to provide invalid combinations (e.g., secret = "", secretlen = 64). This case is not checked in the code and with an appropriately crafted netlink message, an out-of-bounds read of up to 64 bytes (max secret length) can occur past the skb end pointer and into skb_shared_info: Breakpoint 1, seg6_genl_sethmac (skb=<optimized out>, info=<optimized out>) at net/ipv6/seg6.c:208 208 memcpy(hinfo->secret, secret, slen); (gdb) bt #0 seg6_genl_sethmac (skb=<optimized out>, info=<optimized out>) at net/ipv6/seg6.c:208 #1 0xffffffff81e012e9 in genl_family_rcv_msg_doit (skb=skb@entry=0xfffff88800b1f9f00, nlh=nlh@entry=0xfffff88800b1b7600, extack=extack@entry=0xfffff90000ba7af0, ops=ops@entry=0xfffff90000ba7a80, hdrlen=4, net=0xffffffff84237580 <init_net>, family=<optimized out>, family=<optimized out>) at net/netlink/genetlink.c:731 #2 0xffffffff81e01435 in genl_family_rcv_msg (extack=0xfffff90000ba7af0, nlh=0xfffff88800b1b7600, skb=0xfffff88800b1f9f00, family=0xffffffff82fef6c0 <seg6_genl_family>) at net/netlink/genetlink.c:775 #3 genl_rcv_msg (skb=0xfffff88800b1f9f00, nlh=0xfffff88800b1b7600, extack=0xfffff90000ba7af0) at net/netlink/genetlink.c:792 #4 0xffffffff81dffc3 in netlink_rcv_skb (skb=skb@entry=0xfffff88800b1f9f00, cb=cb@entry=0xffffffff81e01350 <genl_rcv_msg>) at net/netlink/af_netlink.c:2501 #5 0xffffffff81e00919 in genl_rcv (skb=0xfffff88800b1f9f00) at net/netlink/genetlink.c:803 #6 0xffffffff81dff6ae in netlink_unicast_kernel (ssk=0xfffff888010eec800, skb=0xfffff88800b1f9f00, sk=0xfffff888004aed000) at net/netlink/af_netlink.c:1319 #7 netlink_unicast (ssk=ssk@entry=0xfffff888010eec800, skb=skb@entry=0xfffff88800b1f9f00, portid=portid@entry=0, nonblock=<optimized out>) at net/netlink/af_netlink.c:1345 #8 0xffffffff81dff9a4 in netlink_sendmsg (sock=<optimized out>, msg=0xfffff90000ba7e48, len=<optimized out>) at net/netlink/af_netlink.c:1921 ... (gdb) p/x ((struct sk_buff *)0xfffff88800b1f9f00)->head + ((struct sk_buff *)0xfffff88800b1f9f00)->end \$1 = 0xfffff88800b1b76c0 (gdb) p/x secret \$2 = 0xfffff88800b1b76c0 (gdb) p slen \$3 = 64 '@' The OOB data can then be read back from userspace by dumping HMAC state. This commit fixes this by ensuring SECRETLEN cannot exceed the actual length of SECRET.
CVE-2022-48690	In the Linux kernel, the following vulnerability has been resolved: ice: Fix DMA mappings leak Fix leak, when user changes ring parameters. During reallocation of RX buffers, new DMA mappings are created for those buffers. New buffers with different RX ring count should substitute older ones, but those buffers were freed in ice_vsi_cfg_rxq and reallocated again with ice_alloc_rx_buf. kfree on rx_buf caused leak of already mapped DMA. Reallocate ZC with xdp_buf struct, when BPF program loads. Reallocate back to rx_buf, when BPF program unloads. If BPF program is loaded/unloaded and XSK pools are created, reallocate RX queues accordingly in XDP_SETUP_XSK_POOL handler. Steps for reproduction: while : do for ((i=0; i<=8160; i=i+32)) do ethtool -G enp130s0f0 rx \$i tx \$i sleep 0.5 ethtool -g enp130s0f0 done done

CVE ID	Description
CVE-2022-48691	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: clean up hook list when offload flags check fails splice back the hook list so nft_chain_release_hook() has a chance to release the hooks. CVE-2022-48696	In the Linux kernel, the following vulnerability has been resolved: regmap: spi: Reserve space for register address/padding Currently the max_raw_read and max_raw_write limits in regmap_spi struct do not take into account the additional size of the transmitted register address and padding. This may result in exceeding the maximum permitted SPI message size, which could cause undefined behaviour, e.g. data corruption. Fix regmap_get_spi_bus() to properly adjust the above mentioned limits by reserving space for the register address/padding as set in the regmap configuration.
CVE-2022-48697	In the Linux kernel, the following vulnerability has been resolved: nvmet: fix a use-after-free Fix the following use-after-free complaint triggered by blktests nvme/004: BUG: KASAN: user-memory-access in blk_mq_complete_request_remote+0xac/0x350 Read of size 4 at addr 0000607bd1835943 by task kworker/13:1/460 Workqueue: nvmet-wq nvme_loop_execute_work [nvme_loop] Call Trace: show_stack+0x52/0x58 dump_stack_lvl+0x49/0x5e print_report.cold+0x36/0x1e2 kasan_report+0xb9/0xf0 __asan_load4+0x6b/0x80 blk_mq_complete_request_remote+0xac/0x350 nvme_loop_queue_response+0x1df/0x275 [nvme_loop] __nvmet_req_complete+0x132/0x4f0 [nvmet] nvmet_req_complete+0x15/0x40 [nvmet] nvmet_execute_io_connect+0x18a/0x1f0 [nvmet] nvme_loop_execute_work+0x20/0x30 [nvme_loop] process_one_work+0x56e/0xa70 worker_thread+0x2d1/0x640 kthread+0x183/0x1c0 ret_from_fork+0x1f/0x30

CVE ID	Description
CVE-2022-48702	In the Linux kernel, the following vulnerability has been resolved: ALSA: emu10k1: Fix out of bounds access in snd_emu10k1_pcm_channel_alloc() The voice allocator sometimes begins allocating from near the end of the array and then wraps around, however snd_emu10k1_pcm_channel_alloc() accesses the newly allocated voices as if it never wrapped around. This results in out of bounds access if the first voice has a high enough index so that first_voice + requested_voice_count > NUM_G (64). The more voices are requested, the more likely it is for this to occur. This was initially discovered using PipeWire, however it can be reproduced by calling aplay multiple times with 16 channels: aplay -r 48000 -D plughw:CARD=Live,DEV=3 -c 16 /dev/zero UBSAN: array-index-out-of-bounds in sound/pci/emu10k1/emupcm.c:127:40 index 65 is out of range for type 'snd_emu10k1_voice [64]' CPU: 1 PID: 31977 Comm: aplay Tainted: G W IOE 6.0.0-rc2-emu10k1+ #7 Hardware name: ASUSTEK COMPUTER INC P5W DH Deluxe/P5W DH Deluxe, BIOS 3002 07/22/2010 Call Trace: <TASK> dump_stack_lvl+0x49/0x63 dump_stack+0x10/0x16 ubsan_epilogue+0x9/0x3f __ubsan_handle_out_of_bounds.cold+0x44/0x49 snd_emu10k1_playback_hw_params+0x3bc/0x420 [snd_emu10k1] snd_pcm_hw_params+0x29f/0x600 [snd_pcm] snd_pcm_common_ioctl+0x188/0x1410 [snd_pcm] ? exit_to_user_mode_prepare+0x35/0x170 ? do_syscall_64+0x69/0x90 ? syscall_exit_to_user_mode+0x26/0x50 ? do_syscall_64+0x69/0x90 ? exit_to_user_mode_prepare+0x35/0x170 snd_pcm_ioctl+0x27/0x40 [snd_pcm] __x64_sys_ioctl+0x95/0xd0 do_syscall_64+0x5c/0x90 ? do_syscall_64+0x69/0x90 ? do_syscall_64+0x69/0x90 entry_SYSCALL_64_after_hwframe+0x63/0xcd
CVE-2022-48703	In the Linux kernel, the following vulnerability has been resolved: thermal/int340x_thermal: handle data_vault when the value is ZERO_SIZE_PTR In some case, the GDDV returns a package with a buffer which has zero length. It causes that kmempdup() returns ZERO_SIZE_PTR (0x10). Then the data_vault_read() got NULL point dereference problem when accessing the 0x10 value in data_vault. [71.024560] BUG: kernel NULL pointer dereference, address: 0000000000000010 This patch uses ZERO_OR_NULL_PTR() for checking ZERO_SIZE_PTR or NULL value in data_vault.
CVE-2022-48704	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: add a force flush to delay work when radeon Although radeon card fence and wait for gpu to finish processing current batch rings, there is still a corner case that radeon lockup work queue may not be fully flushed, and meanwhile the radeon_suspend_kms() function has called pci_set_power_state() to put device in D3hot state. Per PCI spec rev 4.0 on 5.3.1.4.1 D3hot State. > Configuration and Message requests are the only TLPs accepted by a Function in > the D3hot state. All other received Requests must be handled as Unsupported Requests, > and all received Completions may optionally be handled as Unexpected Completions. This issue will happen in following logs: Unable to handle kernel paging request at virtual address 00008800e0008010 CPU 0 kworker/0:3(131): Oops 0 pc = [<ffffffff811bea5c>] ra = [<ffffffff81240844>] ps = 0000 Tainted: G W pc is at si_gpu_check_soft_reset+0x3c/0x240 ra is at si_dma_is_lockup+0x34/0xd0 v0 = 0000000000000000 t0 = fff08800e0008010 t1 = 000000000010000 t2 = 0000000000008010 t3 = fff00007e3c00000 t4 = fff00007e3c00258 t5 = 000000000000ffff t6 = 0000000000000001 t7 = fff00007ef078000 s0 = fff00007e3c016e8 s1 = fff00007e3c00000 s2 = fff00007e3c00018 s3 = fff00007e3c00000 s4 = fff00007fff59d80 s5 = 0000000000000000 s6 = fff00007ef07bd98 a0 = fff00007e3c00000 a1 = fff00007e3c016e8 a2 = 0000000000000008 a3 = 0000000000000001 a4 = 8f5c28f5c28f5c29 a5 = ffffffff810f4338 t8 = 0000000000000275 t9 = ffffffff809b66f8 t10 = ff6769c5d964b800 t11= 000000000000b886 pv = ffffffff811bea20 at = 0000000000000000 gp = ffffffff81d89690 sp = 00000000aa814126 Disabling lock debugging due to kernel taint Trace: [<ffffffff81240844>] si_dma_is_lockup+0x34/0xd0 [<ffffffff8119610>] radeon_fence_check_lockup+0xd0/0x290 [<ffffffff80977010>] process_one_work+0x280/0x550 [<ffffffff80977350>] worker_thread+0x70/0x7c0 [<ffffffff80977410>] worker_thread+0x130/0x7c0 [<ffffffff80982040>] kthread+0x200/0x210 [<ffffffff809772e0>] worker_thread+0x0/0x7c0 [<ffffffff80981f8c>] kthread+0x14c/0x210 [<ffffffff80911658>] ret_from_kernel_thread+0x18/0x20 [<ffffffff80981e40>] kthread+0x0/0x210 Code: ad3e0008 43f0074a ad7e0018 ad9e0020 8c3001e8 40230101 <88210000> 4821ed21 So force lockup work queue flush to fix this problem.

CVE ID	Description
CVE-2022-48705	In the Linux kernel, the following vulnerability has been resolved: wifi: mt76: mt7921e: fix crash in chip reset fail In case of drv own fail in reset, we may need to run mac_reset several times. The sequence would trigger system crash as the log below. Because we do not re-enable/schedule "tx_napi" before disable it again, the process would keep waiting for state change in napi_disable(). To avoid the problem and keep status synchronize for each run, goto final resource handling if drv own failed. [5857.353423] mt7921e 0000:3b:00.0: driver own failed [5858.433427] mt7921e 0000:3b:00.0: Timeout for driver own [5859.633430] mt7921e 0000:3b:00.0: driver own failed [5859.633444] -----[cut here]----- [5859.633446] WARNING: CPU: 6 at kernel/kthread.c:659 kthread_park+0x11d [5859.633717] Workqueue: mt76 mt7921_mac_reset_work [mt7921_common] [5859.633728] RIP: 0010:kthread_park+0x11d/0x150 [5859.633736] RSP: 0018:ffff8881b676fc68 EFLAGS: 00010202 [5859.633766] Call Trace: [5859.633768] <TASK> [5859.633771] mt7921e_mac_reset+0x176/0x6f0 [mt7921e] [5859.633778] mt7921_mac_reset_work+0x184/0x3a0 [mt7921_common] [5859.633785] ? mt7921_mac_set_timing+0x520/0x520 [mt7921_common] [5859.633794] ? __kasan_check_read+0x11/0x20 [5859.633802] process_one_work+0x7ee/0x1320 [5859.633810] worker_thread+0x53c/0x1240 [5859.633818] kthread+0x2b8/0x370 [5859.633824] ? process_one_work+0x1320/0x1320 [5859.633828] ? kthread_complete_and_exit+0x30/0x30 [5859.633834] ret_from_fork+0x1f/0x30 [5859.633842] </TASK>
CVE-2022-48709	In the Linux kernel, the following vulnerability has been resolved: ice: switch: fix potential memleak in ice_add_adv_recipe() When ice_add_special_words() fails, the 'rm' is not released, which will lead to a memory leak. Fix this up by going to 'err_unroll' label. Compile tested only.
CVE-2022-48710	In the Linux kernel, the following vulnerability has been resolved: drm/radeon: fix a possible null pointer dereference In radeon_fp_native_mode(), the return value of drm_mode_duplicate() is assigned to mode, which will lead to a NULL pointer dereference on failure of drm_mode_duplicate(). Add a check to avoid npd. The failure status of drm_cvt_mode() on the other path is checked too.
CVE-2022-48711	In the Linux kernel, the following vulnerability has been resolved: tipc: improve size validations for received domain records The function tipc_mon_rcv() allows a node to receive and process domain_record structs from peer nodes to track their views of the network topology. This patch verifies that the number of members in a received domain record does not exceed the limit defined by MAX_MON_DOMAIN, something that may otherwise lead to a stack overflow. tipc_mon_rcv() is called from the function tipc_link_proto_rcv(), where we are reading a 32 bit message data length field into a uint16. To avert any risk of bit overflow, we add an extra sanity check for this in that function. We cannot see that happen with the current code, but future designers being unaware of this risk, may introduce it by allowing delivery of very large (> 64k) sk buffers from the bearer layer. This potential problem was identified by Eric Dumazet. This fixes CVE-2022-0435
CVE-2022-48713	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel/pt: Fix crash with stop filters in single-range mode Add a check for !buf->single before calling pt_buffer_region_size in a place where a missing check can cause a kernel crash. Fixes a bug introduced by commit 670638477aed ("perf/x86/intel/pt: Opportunistically use single range output mode"), which added a support for PT single-range output mode. Since that commit if a PT stop filter range is hit while tracing, the kernel will crash because of a null pointer dereference in pt_handle_status due to calling pt_buffer_region_size without a ToPA configured. The commit which introduced single-range mode guarded almost all uses of the ToPA buffer variables with checks of the buf->single variable, but missed the case where tracing was stopped by the PT hardware, which happens when execution hits a configured stop filter. Tested that hitting a stop filter while PT recording successfully records a trace with this patch but crashes without this patch.
CVE-2022-48714	In the Linux kernel, the following vulnerability has been resolved: bpf: Use VM_MAP instead of VM_ALLOC for ringbuf After commit 2fd3fb0be1d1 ("kasan, vmalloc: unpoison VM_ALLOC pages after mapping"), non-VM_ALLOC mappings will be marked as accessible in __get_vm_area_node() when KASAN is enabled. But now the flag for ringbuf area is VM_ALLOC, so KASAN will complain out-of-bound access after vmalloc() returns. Because the ringbuf area is created by mapping allocated pages, so use VM_MAP instead. After the change, info in /proc/vmallocinfo also changes from [start]-[end] 24576 ringbuf_map_alloc+0x171/0x290 vmalloc user to [start]-[end] 24576 ringbuf_map_alloc+0x171/0x290 vmalloc user

CVE ID	Description
CVE-2022-48715	In the Linux kernel, the following vulnerability has been resolved: scsi: bnx2fc: Make bnx2fc_recv_frame() mp safe Running tests with a debug kernel shows that bnx2fc_recv_frame() is modifying the per_cpu lport stats counters in a non-mpsafely way. Just boot a debug kernel and run the bnx2fc driver with the hardware enabled. [1391.699147] BUG: using smp_processor_id() in preemptible [00000000] code: bnx2fc_ [1391.699160] caller is bnx2fc_recv_frame+0xb9f9/0x1760 [bnx2fc] [1391.699174] CPU: 2 PID: 4355 Comm: bnx2fc_l2_threa Kdump: loaded Tainted: G B [1391.699180] Hardware name: HP ProLiant DL120 G7, BIOS J01 07/01/2013 [1391.699183] Call Trace: [1391.699188] dump_stack_lvl+0x57/0x7d [1391.699198] check_preemption_disabled+0xc8/0xd0 [1391.699205] bnx2fc_recv_frame+0xb9f9/0x1760 [bnx2fc] [1391.699215] ? do_raw_spin_trylock+0xb5/0x180 [1391.699221] ? bnx2fc_npiv_create_vports.isra.0+0x4e0/0x4e0 [bnx2fc] [1391.699229] ? bnx2fc_l2_rcv_thread+0xb7/0x3a0 [bnx2fc] [1391.699240] bnx2fc_l2_rcv_thread+0x1af/0x3a0 [bnx2fc] [1391.699250] ? bnx2fc_ulp_init+0xc0/0xc0 [bnx2fc] [1391.699258] kthread+0x364/0x420 [1391.699263] ? _raw_spin_unlock_irq+0x24/0x50 [1391.699268] ? set_kthread_struct+0x100/0x100 [1391.699273] ret_from_fork+0x22/0x30 Restore the old get_cpu/put_cpu code with some modifications to reduce the size of the critical section.
CVE-2022-48721	In the Linux kernel, the following vulnerability has been resolved: net/smc: Forward wakeup to smc socket waitqueue after fallback When we replace TCP with SMC and a fallback occurs, there may be some socket waitqueue entries remaining in smc socket->wq, such as epoll_entries inserted by userspace applications. After the fallback, data flows over TCP/IP and only clsock->wq will be woken up. Applications can't be notified by the entries which were inserted in smc socket->wq before fallback. So we need a mechanism to wake up smc socket->wq at the same time if some entries remaining in it. The current workaround is to transfer the entries from smc socket->wq to clsock->wq during the fallback. But this may cause a crash like this: general protection fault, probably for non-canonical address 0xdead000000000100: 0000 [#1] PREEMPT SMP PTI CPU: 3 PID: 0 Comm: swapper/3 Kdump: loaded Tainted: G E 5.16.0+ #107 RIP: 0010: __wake_up_common+0x65/0x170 Call Trace: <IRQ> __wake_up_common_lock+0x7a/0xc0 sock_def_readable+0x3c/0x70 tcp_data_queue+0x4a7/0xc40 tcp_rcv_established+0x32f/0x660 ? sk_filter_trim_cap+0xc9/0x2e0 tcp_v4_do_rcv+0x10b/0x260 tcp_v4_rcv+0xd2a/0xde0 ip_protocol_deliver_rcu+0x3b/0x1d0 ip_local_deliver_finish+0x54/0x60 ip_local_deliver+0x6a/0x110 ? tcp_v4_early_demux+0xa2/0x140 ? tcp_v4_early_demux+0x10d/0x140 ip_sublist_rcv_finish+0x49/0x60 ip_sublist_rcv+0x19d/0x230 ip_list_rcv+0x13e/0x170 __netif_receive_skb_list_core+0x1c2/0x240 netif_receive_skb_list_internal+0x1e6/0x320 napi_complete_done+0x11d/0x190 mlx5e_napi_poll+0x163/0x6b0 [mlx5_core] __napi_poll+0x3c/0x1b0 net_rx_action+0x27c/0x300 __do_softirq+0x114/0x2d2 irq_exit_rcu+0xb4/0xe0 common_interrupt+0xba/0xe0 <IRQ> <TASK> The crash is caused by privately transferring waitqueue entries from smc socket->wq to clsock->wq. The owners of these entries, such as epoll, have no idea that the entries have been transferred to a different socket wait queue and still use original waitqueue spinlock (smc socket->wq.wait.lock) to make the entries operation exclusive, but it doesn't work. The operations to the entries, such as removing from the waitqueue (now is clsock->wq after fallback), may cause a crash when clsock waitqueue is being iterated over at the moment. This patch tries to fix this by no longer transferring wait queue entries privately, but introducing own implementations of clsock's callback functions in fallback situation. The callback functions will forward the wakeup to smc socket->wq if clsock->wq is actually woken up and smc socket->wq has remaining entries.
CVE-2022-48724	In the Linux kernel, the following vulnerability has been resolved: iommu/vt-d: Fix potential memory leak in intel_setup_irq_remapping() After commit e3beca48a45b ("irqdomain/treewide: Keep firmware node unconditionally allocated"). For tear down scenario, fn is only freed after fail to allocate ir_domain, though it also should be freed in case dmar_enable_qi returns error. Besides free fn, irq_domain and ir_msi_domain need to be removed as well if intel_setup_irq_remapping fails to enable queued invalidation. Improve the rewinding path by add out_free_ir_domain and out_free_fwnode labels per Baolu's suggestion.
CVE-2022-48725	In the Linux kernel, the following vulnerability has been resolved: RDMA/siw: Fix refcounting leak in siw_create_qp() The atomic_inc() needs to be paired with an atomic_dec() on the error path.

CVE ID	Description
CVE-2022-48728	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Fix AIP early init panic An early failure in hfi1_ipoib_setup_rm() can lead to the following panic: BUG: unable to handle kernel NULL pointer dereference at 00000000000001b0 PGD 0 P4D 0 Oops: 0002 [#1] SMP NOPTI Workqueue: events work_for_cpu_fn RIP: 0010:try_to_grab_pending+0x2b/0x140 Code: 1f 44 00 00 41 55 41 54 55 48 89 d5 53 48 89 fb 9c 58 0f 1f 44 00 00 48 89 c2 fa 66 0f 1f 44 00 00 48 89 55 00 40 84 f6 75 77 <f0> 48 0f ba 2b 00 72 09 31 c0 5b 5d 41 5c 41 5d c3 48 89 df e8 6c RSP: 0018:ffffb6b3cf7cfa48 EFLAGS: 00010046 RAX: 0000000000000246 RBX: 00000000000001b0 RCX: 0000000000000000 RDX: 0000000000000246 RSI: 0000000000000000 RDI: 00000000000001b0 RBP: ffff6b3cf7cfa70 R08: 0000000000000f09 R09: 0000000000000001 R10: 0000000000000000 R11: 0000000000000001 R12: 0000000000000000 R13: ffff6b3cf7cfa90 R14: ffffffff9b2fbfc0 R15: ffff8a4fdf244690 FS: 0000000000000000(0000) GS:ffff8a527f400000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00000000000001b0 CR3: 00000017e2410003 CR4: 00000000007706f0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 PKRU: 55555554 Call Trace: __cancel_work_timer+0x42/0x190 ? dev_printk_emit+0x4e/0x70 iowait_cancel_work+0x15/0x30 [hfi1] hfi1_ipoib_txreq_deinit+0x5a/0x220 [hfi1] ? dev_err+0x6c/0x90 hfi1_ipoib_netdev_dtor+0x15/0x30 [hfi1] hfi1_ipoib_setup_rm+0x10e/0x150 [hfi1] rdma_init_netdev+0x5a/0x80 [ib_core] ? hfi1_ipoib_free_rdma_netdev+0x20/0x20 [hfi1] ipoib_intf_init+0x6c/0x350 [ib_ipoib] ipoib_intf_alloc+0x5c/0xc0 [ib_ipoib] ipoib_add_one+0xbe/0x300 [ib_ipoib] add_client_context+0x12c/0x1a0 [ib_core] enable_device_and_get+0xdc/0x1d0 [ib_core] ib_register_device+0x572/0x6b0 [ib_core] rvt_register_device+0x11b/0x220 [rdmavt] hfi1_register_ib_device+0x6b4/0x770 [hfi1] do_init_one.isra.20+0x3e3/0x680 [hfi1] local_pci_probe+0x41/0x90 work_for_cpu_fn+0x16/0x20 process_one_work+0x1a7/0x360 ? create_worker+0x1a0/0x1a0 worker_thread+0x1cf/0x390 ? create_worker+0x1a0/0x1a0 kthread+0x116/0x130 ? kthread_flush_work_fn+0x10/0x10 ret_from_fork+0x1f/0x40 The panic happens in hfi1_ipoib_txreq_deinit() because there is a NULL deref when hfi1_ipoib_netdev_dtor() is called in this error case. hfi1_ipoib_txreq_init() and hfi1_ipoib_rxq_init() are self unwinding so fix by adjusting the error paths accordingly. Other changes: - hfi1_ipoib_free_rdma_netdev() is deleted including the free_netdev() since the netdev core code deletes calls free_netdev() - The switch to the accelerated entrances is moved to the success path.
CVE-2022-48729	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Fix panic with larger ipoib send_queue_size When the ipoib send_queue_size is increased from the default the following panic happens: RIP: 0010:hfi1_ipoib_drain_tx_ring+0x45/0xf0 [hfi1] Code: 31 e4 eb 0f 8b 85 c8 02 00 00 41 83 c4 01 44 39 e0 76 60 8b 8d cc 02 00 00 44 89 e3 be 01 00 00 00 d3 e3 48 03 9d c0 02 00 00 <c7> 83 18 01 00 00 00 00 00 48 8b bb 30 01 00 00 e8 25 af a7 e0 RSP: 0018:ffff9000798f4a0 EFLAGS: 00010286 RAX: 0000000000008000 RBX: ffff9000aa0f000 RCX: 000000000000000f RDX: 0000000000000000 RSI: 0000000000000001 RDI: 0000000000000000 RBP: ffff88810ff08000 R08: ffff88889476d900 R09: 0000000000000101 R10: 0000000000000000 R11: ffff90006590ff8 R12: 0000000000000200 R13: ffff9000798fba8 R14: 0000000000000000 R15: 0000000000000001 FS: 00007fd0f79cc3c0(0000) GS:ffff88885fb00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: ffff9000aa0f118 CR3: 0000000889c84001 CR4: 0000000001706e0 Call Trace: <TASK> hfi1_ipoib_napi_tx_disable+0x45/0x60 [hfi1] hfi1_ipoib_dev_stop+0x18/0x80 [hfi1] ipoib_ib_dev_stop+0x1d/0x40 [ib_ipoib] ipoib_stop+0x48/0xc0 [ib_ipoib] __dev_close_many+0x9e/0x110 __dev_change_flags+0xd9/0x210 dev_change_flags+0x21/0x60 do_setlink+0x31c/0x10f0 ? __nla_validate_parse+0x12d/0x1a0 ? __nla_parse+0x21/0x30 ? inet6_validate_link_af+0x5e/0xf0 ? cpumask_next+0x1f/0x20 ? __snmp6_fill_stats64.isra.53+0xbb/0x140 ? __nla_validate_parse+0x47/0x1a0 __rtnl_newlink+0x530/0x910 ? pskb_expand_head+0x73/0x300 ? __kmallocc_node_track_caller+0x109/0x280 ? __nla_put+0xc/0x20 ? cpumask_next_and+0x20/0x30 ? update_sd_lb_stats.constprop.144+0xd3/0x820 ? _raw_spin_unlock_irqrestore+0x25/0x37 ? __wake_up_common_lock+0x87/0xc0 ? kmem_cache_alloc_trace+0x3d/0x3d0 rtnl_newlink+0x43/0x60 The issue happens when the shift that should have been a function of the txq item size mistakenly used the ring size. Fix by using the item size.
CVE-2022-48730	In the Linux kernel, the following vulnerability has been resolved: dma-buf: heaps: Fix potential spectre v1 gadget It appears like nr could be a Spectre v1 gadget as it's supplied by a user and used as an array index. Prevent the contents of kernel memory from being leaked to userspace via speculative execution by using array_index_nospec. [sumits: added fixes and cc: stable tags]

CVE ID	Description
CVE-2022-48731	In the Linux kernel, the following vulnerability has been resolved: mm/kmemleak: avoid scanning potential huge holes When using devm_request_free_mem_region() and devm_memremap_pages() to add ZONE_DEVICE memory, if requested free mem region's end pfn were huge(e.g., 0x400000000), the node_end_pfn() will be also huge (see move_pfn_range_to_zone()). Thus it creates a huge hole between node_start_pfn() and node_end_pfn(). We found on some AMD APUs, amd_kfd requested such a free mem region and created a huge hole. In such a case, following code snippet was just doing busy test_bit() looping on the huge hole. for (pfn = start_pfn; pfn < end_pfn; pfn++) { struct page *page = pfn_to_online_page(pfn); if (!page) continue; ... } So we got a soft lockup: watchdog: BUG: soft lockup - CPU#6 stuck for 26s! [bash:1221] CPU: 6 PID: 1221 Comm: bash Not tainted 5.15.0-custom #1 RIP: 0010:pfn_to_online_page+0x5/0xd0 Call Trace: ? kmemleak_scan+0x16a/0x440 kmemleak_write+0x306/0x3a0 ? common_file_perm+0x72/0x170 full_proxy_write+0x5c/0x90 vfs_write+0xb9/0x260 ksys_write+0x67/0xe0 __x64_sys_write+0x1a/0x20 do_syscall_64+0x3b/0xc0 entry_SYSCALL_64_after_hwframe+0x44/0xae I did some tests with the patch. CVE-2022-48732	In the Linux kernel, the following vulnerability has been resolved: drm/nouveau: fix off by one in BIOS boundary checking Bounds checking when parsing init scripts embedded in the BIOS reject access to the last byte. This causes driver initialization to fail on Apple eMac's with GeForce 2 MX GPUs, leaving the system with no working console. This is probably only seen on OpenFirmware machines like PowerPC Macs because the BIOS image provided by OF is only the used parts of the ROM, not a power-of-two blocks read from PCI directly so PCs always have empty bytes at the end that are never accessed.
CVE-2022-48744	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Avoid field-overflowing memcpy() In preparation for FORTIFY_SOURCE performing compile-time and run-time field bounds checking for memcpy(), memmove(), and memset(), avoid intentionally writing across neighboring fields. Use flexible arrays instead of zero-element arrays (which look like they are always overflowing) and split the cross-field memcpy() into two halves that can be appropriately bounds-checked by the compiler. We were doing: #define ETH_HLEN 14 #define VLAN_HLEN 4 ... #define MLX5E_XDP_MIN_INLINE (ETH_HLEN + VLAN_HLEN) ... struct mlx5e_tx_wqe *wqe = mlx5_wq_cyc_get_wqe(wq, pi); ... struct mlx5_wqe_eth_seg *eseg = &wqe->eth; struct mlx5_wqe_data_seg *dseg = wqe->data; ... memcpy(eseg->inline_hdr.start, xdptxd->data, MLX5E_XDP_MIN_INLINE); target is wqe->eth.inline_hdr.start (which the compiler sees as being 2 bytes in size), but copying 18, intending to write across start (really vlan_tci, 2 bytes). The remaining 16 bytes get written into wqe->data[0], covering byte_count (4 bytes), lkey (4 bytes), and addr (8 bytes). struct mlx5e_tx_wqe { struct mlx5_wqe_ctrl_seg ctrl; /* 0 16 */ struct mlx5_wqe_eth_seg eth; /* 16 16 */ struct mlx5_wqe_data_seg data[]; /* 32 0 */ /* size: 32, cachelines: 1, members: 3 */ /* last cacheline: 32 bytes */ }; struct mlx5_wqe_eth_seg { u8 swp_outer_l4_offset; /* 0 1 */ u8 swp_outer_l3_offset; /* 1 1 */ u8 swp_inner_l4_offset; /* 2 1 */ u8 swp_inner_l3_offset; /* 3 1 */ u8 cs_flags; /* 4 1 */ u8 swp_flags; /* 5 1 */ __be16 mss; /* 6 2 */ __be32 flow_table_metadata; /* 8 4 */ union { struct { __be16 sz; /* 12 2 */ u8 start[2]; /* 14 2 */ } inline_hdr; /* 12 4 */ struct { __be16 type; /* 12 2 */ __be16 vlan_tci; /* 14 2 */ } insert; /* 12 4 */ __be32 trailer; /* 12 4 */ }; /* 12 4 */ /* size: 16, cachelines: 1, members: 9 */ /* last cacheline: 16 bytes */ }; struct mlx5_wqe_data_seg { __be32 byte_count; /* 0 4 */ __be32 lkey; /* 4 4 */ __be64 addr; /* 8 8 */ /* size: 16, cachelines: 1, members: 3 */ /* last cacheline: 16 bytes */ }; So, split the memcpy() so the compiler can reason about the buffer sizes. "pahole" shows no size nor member offset changes to struct mlx5e_tx_wqe nor struct mlx5e_umr_wqe. "objdump -d" shows no meaningful object code changes (i.e. only source line number induced differences and optimizations).
CVE-2022-48745	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Use del_timer_sync in fw reset flow of halting poll Substitute del_timer() with del_timer_sync() in fw reset polling deactivation flow, in order to prevent a race condition which occurs when del_timer() is called and timer is deactivated while another process is handling the timer interrupt. A situation that led to the following call trace: RIP: 0010:run_timer_softirq+0x137/0x420 <IRQ> recalibrate_cpu_khz+0x10/0x10 ktime_get+0x3e/0xa0 ? sched_clock_cpu+0xb/0xc0 __do_softirq+0xf5/0x2ea irq_exit_rcu+0xc1/0xf0 sysvec_apic_timer_interrupt+0x9e/0xc0 asm_sysvec_apic_timer_interrupt+0x12/0x20 </IRQ>

CVE ID	Description
CVE-2022-48746	In the Linux kernel, the following vulnerability has been resolved: net/mlx5e: Fix handling of wrong devices during bond netevent Current implementation of bond netevent handler only check if the handled netdev is VF representor and it missing a check if the VF representor is on the same phys device of the bond handling the netevent. Fix by adding the missing check and optimizing the check if the netdev is VF representor so it will not access uninitialized private data and crashes. CVE-2022-48748	In the Linux kernel, the following vulnerability has been resolved: net: bridge: vlan: fix memory leak in __allowed_ingress When using per-vlan state, if vlan snooping and stats are disabled, untagged or priority-tagged ingress frame will go to check pvid state. If the port state is forwarding and the pvid state is not learning/forwarding, untagged or priority-tagged frame will be dropped but skb memory is not freed. Should free skb when __allowed_ingress returns false.
CVE-2022-48751	In the Linux kernel, the following vulnerability has been resolved: net/smc: Transitional solution for clcsock race issue We encountered a crash in smc_setsockopt() and it is caused by accessing smc->clcsock after clcsock was released. BUG: kernel NULL pointer dereference, address: 0000000000000020 #PF: supervisor read access in kernel mode #PF: error_code(0x0000) - not-present page PGD 0 P4D 0 Oops: 0000 [#1] PREEMPT SMP PTI CPU: 1 PID: 50309 Comm: nginx Kdump: loaded Tainted: G E 5.16.0-rc4+ #53 RIP: 0010:smc_setsockopt+0x59/0x280 [smc] Call Trace: <TASK> __sys_setsockopt+0xfc/0x190 __x64_sys_setsockopt+0x20/0x30 do_syscall_64+0x34/0x90 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7f16ba83918e </TASK> This patch tries to fix it by holding clcsock_release_lock and checking whether clcsock has already been released before access. In case that a crash of the same reason happens in smc_getsockopt() or smc_switch_to_fallback(), this patch also checks smc->clcsock in them too. And the caller of smc_switch_to_fallback() will identify whether fallback succeeds according to the return value.

CVE ID	Description
CVE-2022-48752	In the Linux kernel, the following vulnerability has been resolved: powerpc/perf: Fix power_pmu_disable to call clear_pmi_irq_pending only if PMI is pending Running selftest with CONFIG_PPC_IRQ_SOFT_MASK_DEBUG enabled in kernel triggered below warning: [172.851380] -----[cut here]----- [172.851391] WARNING: CPU: 8 PID: 2901 at arch/powerpc/include/asm/hw_irq.h:246 power_pmu_disable+0x270/0x280 [172.851402] Modules linked in: dm_mod bonding nft_ct nf_conntrack nf_defrag_ipv6 nf_defrag_ipv4 ip_set nf_tables rkill nfnetlink sunrpc xfs libcrc32c pseries_rng xts vmx_crypto uio_pdrv_genirq uio sch_fq_codel ip_tables ext4 mbcache jbd2 sd_mod t10_pi sg ibmvscsi ibmveth scsi_transport_srp fuse [172.851442] CPU: 8 PID: 2901 Comm: lost_exception_ Not tainted 5.16.0-rc5-03218-g798527287598 #2 [172.851451] NIP: c00000000013d600 LR: c00000000013d5a4 CTR: c00000000013b180 [172.851458] REGS: c000000017687860 TRAP: 0700 Not tainted (5.16.0-rc5-03218-g798527287598) [172.851465] MSR: 800000000029033 <SF,EE,ME,IR,DR,RI,LE> CR: 48004884 XER: 20040000 [172.851482] CFAR: c00000000013d5b4 IRQMASK: 1 [172.851482] GPR00: c00000000013d5a4 c000000017687b00 c000000002a10600 0000000000000004 [172.851482] GPR04: 0000000082004000 c0000008ba08f0a8 0000000000000000 00000008b7ed0000 [172.851482] GPR08: 00000000446194f6 00000000000008000 c00000000013b118 c000000000d58e68 [172.851482] GPR12: c00000000013d390 c00000001ec54a80 0000000000000000 0000000000000000 [172.851482] GPR16: 0000000000000000 0000000000000000 c000000015d5c708 c0000000025396d0 [172.851482] GPR20: 0000000000000000 0000000000000000 c00000000a3bbf40 0000000000000003 [172.851482] GPR24: 0000000000000000 c0000008ba097400 c0000000161e0d00 c00000000a3bb600 [172.851482] GPR28: c000000015d5c700 00000000000000001 0000000082384090 c0000008ba0020d8 [172.851549] NIP [c00000000013d600] power_pmu_disable+0x270/0x280 [172.851557] LR [c00000000013d5a4] power_pmu_disable+0x214/0x280 [172.851565] Call Trace: [172.851568] [c000000017687b00] [c00000000013d5a4] power_pmu_disable+0x214/0x280 (unreliable) [172.851579] [c000000017687b40] [c0000000003403ac] perf_pmu_disable+0x4c/0x60 [172.851588] [c000000017687b60] [c0000000003445e4] __perf_event_task_sched_out+0x1d4/0x660 [172.851596] [c000000017687c50] [c000000000d1175c] __schedule+0xbcc/0x12a0 [172.851602] [c000000017687d60] [c000000000d11ea8] schedule+0x78/0x140 [172.851608] [c000000017687d90] [c0000000001a8080] sys_sched_yield+0x20/0x40 [172.851615] [c000000017687db0] [c000000000334dc] system_call_exception+0x18c/0x380 [172.851622] [c000000017687e10] [c0000000000c74c] system_call_common+0xec/0x268 The warning indicates that MSR_EE being set(interrupt enabled) when there was an overflown PMC detected. This could happen in power_pmu_disable since it runs under interrupt soft disable condition (local_irq_save) and not with interrupts hard disabled. commit 2c9ac51b850d ("powerpc/perf: Fix PMU callbacks to clear pending PMI before resetting an overflown PMC") intended to clear PMI pending bit in Paca when disabling the PMU. It could happen that PMC gets overflown while code is in power_pmu_disable callback function. Hence add a check to see if PMI pending bit is set in Paca before clearing it via clear_pmi_pending.
CVE-2022-48755	In the Linux kernel, the following vulnerability has been resolved: powerpc64/bpf: Limit 'ldbrx' to processors compliant with ISA v2.06 Johan reported the below crash with test_bpf on ppc64 e5500: test_bpf: #296 ALU_END_FROM_LE 64: 0x0123456789abcdef -> 0x67452301 jited:1 Oops: Exception in kernel mode, sig: 4 [#1] BE PAGE_SIZE=4K SMP NR_CPUS=24 QEMU e500 Modules linked in: test_bpf(+) CPU: 0 PID: 76 Comm: insmod Not tainted 5.14.0-03771-g98c2059e008a-dirty #1 NIP: 8000000000061c3c LR: 800000000006dea64 CTR: 8000000000061c18 REGS: c0000000032d3420 TRAP: 0700 Not tainted (5.14.0-03771-g98c2059e008a-dirty) MSR: 0000000080089000 <EE,ME> CR: 88002822 XER: 20000000 IRQMASK: 0 <...> NIP [8000000000061c3c] 0x8000000000061c3c LR [800000000006dea64] __run_one+0x104/0x17c [test_bpf] Call Trace: __run_one+0x60/0x17c [test_bpf] (unreliable) .test_bpf_init+0x6a8/0xdc8 [test_bpf] .do_one_initcall+0x6c/0x28c .do_init_module+0x68/0x28c .load_module+0x2460/0x2abc __do_sys_init_module+0x120/0x18c .system_call_exception+0x110/0x1b8 system_call_common+0xf0/0x210 --- interrupt: c00 at 0x101d0acc <...> ---[end trace 47b2bf19090bb3d0]--- Illegal instruction The illegal instruction turned out to be 'ldbrx' emitted for BPF_FROM_L B E, which was only introduced in ISA v2.06. Guard use of the same and implement an alternative approach for older processors.

CVE ID	Description
CVE-2022-48758	In the Linux kernel, the following vulnerability has been resolved: scsi: bnx2fc: Flush destroy_work queue before calling bnx2fc_interface_put() The bnx2fc_destroy() functions are removing the interface before calling destroy_work. This results multiple WARNings from sysfs_remove_group() as the controller rport device attributes are removed too early. Replace the fcoe_port's destroy_work queue. It's not needed. The problem is easily reproducible with the following steps. Example: <pre>\$ dmesg -w & \$ systemctl enable --now fcoe \$ fipvlan -s -c ens2f1 \$ fcoeadm -d ens2f1.802 [583.464488] host2: libfc: Link down on port (7500a1) [583.472651] bnx2fc: 7500a1 - rport not created Yet!! This problem was hidden by power domain driver, which call run time resume before it. But the below commit remove it and make this issue happen. commit c1df456d0f06e ("PM: domains: Don't runtime resume devices at genpd_prepare()") This patch call run time resume before suspend to make sure clock is on before access register. Test-by: Abel Vesa <abel.vesa@nxp.com>

CVE ID	Description
CVE-2022-48763	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Forcibly leave nested virt when SMM state is toggled Forcibly leave nested virtualization operation if userspace toggles SMM state via KVM_SET_VCPU_EVENTS or KVM_SYNC_X86_EVENTS. If userspace forces the vCPU out of SMM while it's post-VMXON and then injects an SMI, vmx_enter_smm() will overwrite vmx->nested.smm.vmxon and end up with both vmxon=false and smm.vmxon=false, but all other nVMX state allocated. Don't attempt to gracefully handle the transition as (a) most transitions are nonsencial, e.g. forcing SMM while L2 is running, (b) there isn't sufficient information to handle all transitions, e.g. SVM wants access to the SMRAM save state, and (c) KVM_SET_VCPU_EVENTS must precede KVM_SET_NESTED_STATE during state restore as the latter disallows putting the vCPU into L2 if SMM is active, and disallows tagging the vCPU as being post-VMXON in SMM if SMM is not active. Abuse of KVM_SET_VCPU_EVENTS manifests as a WARN and memory leak in nVMX due to failure to free vmcs01's shadow VMCS, but the bug goes far beyond just a memory leak, e.g. toggling SMM on while L2 is active puts the vCPU in an architecturally impossible state. CVE ID	Description
CVE-2022-48769	In the Linux kernel, the following vulnerability has been resolved: efivar: runtime: avoid EFIv2 runtime services on Apple x86 machines Aditya reports [0] that his recent MacbookPro crashes in the firmware when using the variable services at runtime. The culprit appears to be a call to QueryVariableInfo(), which we did not use to call on Apple x86 machines in the past as they only upgraded from EFI v1.10 to EFI v2.40 firmware fairly recently, and QueryVariableInfo() (along with UpdateCapsule() et al) was added in EFI v2.00. The only runtime service introduced in EFI v2.00 that we actually use in Linux is QueryVariableInfo(), as the capsule based ones are optional, generally not used at runtime (all the LVFS/fwupd firmware update infrastructure uses helper EFI programs that invoke capsule update at boot time, not runtime), and not implemented by Apple machines in the first place. QueryVariableInfo() is used to 'safely' set variables, i.e., only when there is enough space. This prevents machines with buggy firmwares from corrupting their NVRAMs when they run out of space. Given that Apple machines have been using EFI v1.10 services only for the longest time (the EFI v2.0 spec was released in 2006, and Linux support for the newly introduced runtime services was added in 2011, but the MacbookPro12,1 released in 2015 still claims to be EFI v1.10 only), let's avoid the EFI v2.0 ones on all Apple x86 machines. [0] https://lore.kernel.org/all/6D757C75-65B1-468B-842D-10410081A8E4@live.com/
CVE-2022-48770	In the Linux kernel, the following vulnerability has been resolved: bpf: Guard against accessing NULL pt_regs in bpf_get_task_stack() task_pt_regs() can return NULL on powerpc for kernel threads. This is then used in __bpf_get_stack() to check for user mode, resulting in a kernel oops. Guard against this by checking return value of task_pt_regs() before trying to obtain the call chain.
CVE-2022-48772	In the Linux kernel, the following vulnerability has been resolved: media: lgdt3306a: Add a check against null-pointer-def The driver should check whether the client provides the platform_data. The following log reveals it: [29.610324] BUG: KASAN: null-ptr-deref in kmemdup+0x30/0x40 [29.610730] Read of size 40 at addr 0000000000000000 by task bash/414 [29.612820] Call Trace: [29.613030] <TASK> [29.613201] dump_stack_lvl+0x56/0x6f [29.613496] ? kmemdup+0x30/0x40 [29.613754] print_report.cold+0x494/0x6b7 [29.614082] ? kmemdup+0x30/0x40 [29.614340] kasan_report+0x8a/0x190 [29.614628] ? kmemdup+0x30/0x40 [29.614888] kasan_check_range+0x14d/0x1d0 [29.615213] memcpy+0x20/0x60 [29.615454] kmemdup+0x30/0x40 [29.615700] lgdt3306a_probe+0x52/0x310 [29.616339] i2c_device_probe+0x951/0xa90
CVE-2022-48778	In the Linux kernel, the following vulnerability has been resolved: mtd: rawnand: gpmi: don't leak PM reference in error path If gpmi_nfc_apply_timings() fails, the PM runtime usage counter must be dropped.
CVE-2022-48780	In the Linux kernel, the following vulnerability has been resolved: net/smc: Avoid overwriting the copies of clcsock callback functions The callback functions of clcsock will be saved and replaced during the fallback. But if the fallback happens more than once, then the copies of these callback functions will be overwritten incorrectly, resulting in a loop call issue: clcsock->sk_error_report - smc_fback_error_report() <----- - smc_fback_forward_wakeup() (loop) - clcsock_callback() (incorrectly overwritten) - smc->clcsock_error_report() ----- So this patch fixes the issue by saving these function pointers only once in the fallback and avoiding overwriting.
CVE-2022-48783	In the Linux kernel, the following vulnerability has been resolved: net: dsa: lantiq_gswip: fix use after free in gswip_remove() of_node_put(priv->ds->slave_mii_bus->dev.of_node) should be done before mdiobus_free(priv->ds->slave_mii_bus).
CVE-2022-48784	In the Linux kernel, the following vulnerability has been resolved: cfg80211: fix race in netlink owner interface destruction My previous fix here to fix the deadlock left a race where the exact same deadlock (see the original commit referenced below) can still happen if cfg80211_destroy_ifaces() already runs while nl80211_netlink_notify() is still marking some interfaces as nl_owner_dead. The race happens because we have two loops here - first we dev_close() all the netdevs, and then we destroy them. If we also have two netdevs (first one need only be a wdev though) then we can find one during the first iteration, close it, and go to the second iteration -- but then find two, and try to destroy also the one we didn't close yet. Fix this by only iterating once.
CVE-2022-48787	In the Linux kernel, the following vulnerability has been resolved: iwlwifi: fix use-after-free If no firmware was present at all (or, presumably, all of the firmware files failed to parse), we end up unbinding by calling device_release_driver(), which calls remove(), which then in iwlwifi calls iwl_drv_stop(), freeing the 'drv' struct. However the new code I added will still erroneously access it after it was freed. Set 'failure=false' in this case to avoid the access, all data was already freed anyway.
CVE-2022-48788	In the Linux kernel, the following vulnerability has been resolved: nvme-rdma: fix possible use-after-free in transport error_recovery work While nvme_rdma_submit_async_event_work is checking the ctrl and queue state before preparing the AER command and scheduling io_work, in order to fully prevent a race where this check is not reliable the error recovery work must flush async_event_work before continuing to destroy the admin queue after setting the ctrl state to RESETING such that there is no race .submit_async_event and the error recovery handler itself changing the ctrl state.

CVE ID	Description
CVE-2022-48789	In the Linux kernel, the following vulnerability has been resolved: nvme-tcp: fix possible use-after-free in transport error_recovery work While nvme_tcp_submit_async_event_work is checking the ctrl and queue state before preparing the AER command and scheduling io_work, in order to fully prevent a race where this check is not reliable the error recovery work must flush async_event_work before continuing to destroy the admin queue after setting the ctrl state to RESETING such that there is no race .submit_async_event and the error recovery handler itself changing the ctrl state.
CVE-2022-48790	In the Linux kernel, the following vulnerability has been resolved: nvme: fix a possible use-after-free in controller reset during load Unlike .queue_rq, in .submit_async_event drivers may not check the ctrl readiness for AER submission. This may lead to a use-after-free condition that was observed with nvme-tcp. The race condition may happen in the following scenario: 1. driver executes its reset_ctrl_work 2. -> nvme_stop_ctrl - flushes ctrl async_event_work 3. ctrl sends AEN which is received by the host, which in turn schedules AEN handling 4. teardown admin queue (which releases the queue socket) 5. AEN processed, submits another AER, calling the driver to submit 6. driver attempts to send the cmd ==> use-after-free In order to fix that, add ctrl state check to validate the ctrl is actually able to accept the AER submission. This addresses the above race in controller resets because the driver during teardown should: 1. change ctrl state to RESETING 2. flush async_event_work (as well as other async work elements) So after 1,2, any other AER command will find the ctrl state to be RESETING and bail out without submitting the AER.
CVE-2022-48793	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: nSVM: fix potential NULL dereference on nested migration Turns out that due to review feedback and/or rebases I accidentally moved the call to nested_svm_load_cr3 to be too early, before the NPT is enabled, which is very wrong to do. KVM can't even access guest memory at that point as nested NPT is needed for that, and of course it won't initialize the walk_mmu, which is main issue the patch was addressing. Fix this for real.
CVE-2022-48796	In the Linux kernel, the following vulnerability has been resolved: iommu: Fix potential use-after-free during probe Kasan has reported the following use after free on dev->iommu. when a device probe fails and it is in process of freeing dev->iommu in dev_iommu_free function, a deferred_probe_work_func runs in parallel and tries to access dev->iommu->fwspec in of_iommu_configure path thus causing use after free. BUG: KASAN: use-after-free in of_iommu_configure+0xb4/0x4a4 Read of size 8 at addr fffff87a2f1acb8 by task kworker/u16:2/153 Workqueue: events_unbound deferred_probe_work_func Call trace: dump_backtrace+0x0/0x33c show_stack+0x18/0x24 dump_stack_lvl+0x16c/0x1e0 print_address_description+0x84/0x39c __kasan_report+0x184/0x308 kasan_report+0x50/0x78 __asan_load8+0xc0/0xc4 of_iommu_configure+0xb4/0x4a4 of_dma_configure_id+0x2fc/0x4d4 platform_dma_configure+0x40/0x5c really_probe+0x1b4/0xb74 driver_probe_device+0x11c/0x228 __device_attach_driver+0x14c/0x304 bus_for_each_drv+0x124/0x1b0 __device_attach+0x25c/0x334 device_initial_probe+0x24/0x34 bus_probe_device+0x78/0x134 deferred_probe_work_func+0x130/0x1a8 process_one_work+0x4c8/0x970 worker_thread+0x5c8/0xaec kthread+0x1f8/0x220 ret_from_fork+0x10/0x18 Allocated by task 1: __kasan_kmalloc+0xd4/0x114 __kasan_kmalloc+0x10/0x1c kmem_cache_alloc_trace+0xe4/0x3d4 __iommu_probe_device+0x90/0x394 probe_iommu_group+0x70/0x9c bus_for_each_dev+0x11c/0x19c bus_iommu_probe+0xb8/0x7d4 bus_set_iommu+0xcc/0x13c arm_smmu_bus_init+0x44/0x130 [arm_smmu] arm_smmu_device_probe+0xb88/0xc54 [arm_smmu] platform_drv_probe+0xe4/0x13c really_probe+0x2c8/0xb74 driver_probe_device+0x11c/0x228 device_driver_attach+0xf0/0x16c __driver_attach+0x80/0x320 bus_for_each_dev+0x11c/0x19c driver_attach+0x38/0x48 bus_add_driver+0x1dc/0x3a4 driver_register+0x18c/0x244 __platform_driver_register+0x88/0x9c init_module+0x64/0xff4 [arm_smmu] do_one_initcall+0x17c/0x2f0 do_init_module+0xe8/0x378 load_module+0x3f80/0x4a40 __se_sys_finit_module+0x1a0/0x1e4 __arm64_sys_finit_module+0x44/0x58 el0_svc_common+0x100/0x264 do_el0_svc+0x38/0xa4 el0_svc+0x20/0x30 el0_sync_handler+0x68/0xac el0_sync+0x160/0x180 Freed by task 1: kasan_set_track+0x4c/0x84 kasan_set_free_info+0x28/0x4c __kasan_slab_free+0x120/0x15c __kasan_slab_free+0x18/0x28 slab_free_freelist_hook+0x204/0x2fc kfree+0xfc/0x3a4 __iommu_probe_device+0x284/0x394 probe_iommu_group+0x70/0x9c bus_for_each_dev+0x11c/0x19c bus_iommu_probe+0xb8/0x7d4 bus_set_iommu+0xcc/0x13c arm_smmu_bus_init+0x44/0x130 [arm_smmu] arm_smmu_device_probe+0xb88/0xc54 [arm_smmu] platform_drv_probe+0xe4/0x13c really_probe+0x2c8/0xb74 driver_probe_device+0x11c/0x228 device_driver_attach+0xf0/0x16c __driver_attach+0x80/0x320 bus_for_each_dev+0x11c/0x19c driver_attach+0x38/0x48 bus_add_driver+0x1dc/0x3a4 driver_register+0x18c/0x244 __platform_driver_register+0x88/0x9c init_module+0x64/0xff4 [arm_smmu] do_one_initcall+0x17c/0x2f0 do_init_module+0xe8/0x378 load_module+0x3f80/0x4a40 __se_sys_finit_module+0x1a0/0x1e4 __arm64_sys_finit_module+0x44/0x58 el0_svc_common+0x100/0x264 do_el0_svc+0x38/0xa4 el0_svc+0x20/0x30 el0_sync_handler+0x68/0xac el0_sync+0x160/0x180 Fix this by setting dev->iommu to NULL first and then freeing dev_iommu structure in dev_iommu_free function.

CVE ID	Description
CVE-2022-48799	In the Linux kernel, the following vulnerability has been resolved: perf: Fix list corruption in perf_cgroup_switch() There's list corruption on cgrp_cpuctx_list. This happens on the following path: perf_cgroup_switch: list_for_each_entry(cgrp_cpuctx_list) cpu_ctx_sched_in ctx_sched_in ctx_pinned_sched_in merge_sched_in perf_cgroup_event_disable: remove the event from the list Use list_for_each_entry_safe() to allow removing an entry during iteration.
CVE-2022-48800	In the Linux kernel, the following vulnerability has been resolved: mm: vmscan: remove deadlock due to throttling failing to make progress A soft lockup bug in kcompactd was reported in a private bugzilla with the following visible in dmesg; watchdog: BUG: soft lockup - CPU#33 stuck for 26s! [kcompactd0:479] watchdog: BUG: soft lockup - CPU#33 stuck for 52s! [kcompactd0:479] watchdog: BUG: soft lockup - CPU#33 stuck for 78s! [kcompactd0:479] watchdog: BUG: soft lockup - CPU#33 stuck for 104s! [kcompactd0:479] The machine had 256G of RAM with no swap and an earlier failed allocation indicated that node 0 where kcompactd was run was potentially unreclaimable; Node 0 active_anon:29355112kB inactive_anon:2913528kB active_file:0kB inactive_file:0kB unevictable:64kB isolated(anon):0kB isolated(file):0kB mapped:8kB dirty:0kB writeback:0kB shmem:26780kB shmem_thp: 0kB shmem_pmdmapped: 0kB anon_thp: 23480320kB writeback_tmp:0kB kernel_stack:2272kB pagetables:24500kB all_unreclaimable? yes Vlastimil Babka investigated a crash dump and found that a task migrating pages was trying to drain PCP lists; PID: 52922 TASK: ffff969f820e5000 CPU: 19 COMMAND: "kworker/u128:3" Call Trace: __schedule schedule schedule_timeout wait_for_completion __flush_work __drain_all_pages __alloc_pages_slowpath.constprop.114 __alloc_pages alloc_migration_target migrate_pages migrate_to_node do_migrate_pages cpuset_migrate_mm_workfn process_one_work worker_thread kthread ret_from_fork This failure is specific to CONFIG_PREEMPT=n builds. The root of the problem is that kcompact0 is not rescheduling on a CPU while a task that has isolated a large number of the pages from the LRU is waiting on kcompact0 to reschedule so the pages can be released. While shrink_inactive_list() only loops once around too_many_isolated, reclaim can continue without rescheduling if sc->skipped_deactivate == 1 which could happen if there was no file LRU and the inactive anon list was not low.
CVE-2022-48801	In the Linux kernel, the following vulnerability has been resolved: iio: buffer: Fix file related error handling in IIO_BUFFER_GET_FD_IOCTL If we fail to copy the just created file descriptor to userland, we try to clean up by putting back 'fd' and freeing 'ib'. The code uses put_unused_fd() for the former which is wrong, as the file descriptor was already published by fd_install() which gets called internally by anon_inode_getfd(). This makes the error handling code leaving a half cleaned up file descriptor table around and a partially destructed 'file' object, allowing userland to play use-after-free tricks on us, by abusing the still usable fd and making the code operate on a dangling 'file->private_data' pointer. Instead of leaving the kernel in a partially corrupted state, don't attempt to explicitly clean up and leave this to the process exit path that'll release any still valid fds, including the one created by the previous call to anon_inode_getfd(). Simply return -EFAULT to indicate the error.

CVE ID	Description
CVE-2022-48802	In the Linux kernel, the following vulnerability has been resolved: fs/proc: task_mmu.c: don't read mapcount for migration entry The syzbot reported the below BUG: kernel BUG at include/linux/page-flags.h:785! invalid opcode: 0000 [#1] PREEMPT SMP KASAN CPU: 1 PID: 4392 Comm: syz-executor560 Not tainted 5.16.0-rc6-syzkaller #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:PageDoubleMap include/linux/page-flags.h:785 [inline] RIP: 0010: __page_mapcount+0x2d2/0x350 mm/util.c:744 Call Trace: page_mapcount include/linux/mm.h:837 [inline] smaps_account+0x470/0xb10 fs/proc/task_mmu.c:466 smaps_pte_entry fs/proc/task_mmu.c:538 [inline] smaps_pte_range+0x611/0x1250 fs/proc/task_mmu.c:601 walk_pmd_range mm/pagewalk.c:128 [inline] walk_pud_range mm/pagewalk.c:205 [inline] walk_p4d_range mm/pagewalk.c:240 [inline] walk_pg_d_range mm/pagewalk.c:277 [inline] __walk_page_range+0xe23/0x1ea0 mm/pagewalk.c:379 walk_page_vma+0x277/0x350 mm/pagewalk.c:530 smap_gather_stats.part.0+0x148/0x260 fs/proc/task_mmu.c:768 smap_gather_stats fs/proc/task_mmu.c:741 [inline] show_smap+0xc6/0x440 fs/proc/task_mmu.c:822 seq_read_iter+0xbb0/0x1240 fs/seq_file.c:272 seq_read+0x3e0/0x5b0 fs/seq_file.c:162 vfs_read+0x1b5/0x600 fs/read_write.c:479 ksys_read+0x12d/0x250 fs/read_write.c:619 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae The reproducer was trying to read /proc/\$PID/smaps when calling MADV_FREE at the mean time. MADV_FREE may split THPs if it is called for partial THP. It may trigger the below race: CPU A CPU B ----- smaps walk: MADV_FREE: page_mapcount() PageCompound() split_huge_page() page = compound_head(page) PageDoubleMap(page) When calling PageDoubleMap() this page is not a tail page of THP anymore so the BUG is triggered. This could be fixed by elevated refcount of the page before calling mapcount, but that would prevent it from counting migration entries, and it seems overkilling because the race just could happen when PMD is split so all PTE entries of tail pages are actually migration entries, and smaps_account() does treat migration entries as mapcount == 1 as Kirill pointed out. Add a new parameter for smaps_account() to tell this entry is migration entry then skip calling page_mapcount(). Don't skip getting mapcount for device private entries since they do track references with mapcount. Pagemap also has the similar issue although it was not reported. Fixed it as well. [shy828301@gmail.com: v4] [nathan@kernel.org: avoid unused variable warning in pagemap_pmd_range()]
CVE-2022-48805	In the Linux kernel, the following vulnerability has been resolved: net: usb: ax88179_178a: Fix out-of-bounds accesses in RX fixup ax88179_rx_fixup() contains several out-of-bounds accesses that can be triggered by a malicious (or defective) USB device, in particular: - The metadata array (hdr_off..hdr_off+2*pkt_cnt) can be out of bounds, causing OOB reads and (on big-endian systems) OOB endianness flips. - A packet can overlap the metadata array, causing a later OOB endianness flip to corrupt data used by a cloned SKB that has already been handed off into the network stack. - A packet SKB can be constructed whose tail is far beyond its end, causing out-of-bounds heap data to be considered part of the SKB's data. I have tested that this can be used by a malicious USB device to send a bogus ICMPv6 Echo Request and receive an ICMPv6 Echo Reply in response that contains random kernel heap data. It's probably also possible to get OOB writes from this on a little-endian system somehow - maybe by triggering skb_cow() via IP options processing -, but I haven't tested that.
CVE-2022-48806	In the Linux kernel, the following vulnerability has been resolved: eeprom: ee1004: limit i2c reads to I2C_SMBUS_BLOCK_MAX Commit effa453168a7 ("i2c: i801: Don't silently correct invalid transfer size") revealed that ee1004_eeprom_read() did not properly limit how many bytes to read at once. In particular, i2c_smbus_read_i2c_block_data_or_emulated() takes the length to read as an u8. If count == 256 after taking into account the offset and page boundary, the cast to u8 overflows. And this is common when user space tries to read the entire EEPROM at once. To fix it, limit each read to I2C_SMBUS_BLOCK_MAX (32) bytes, already the maximum length i2c_smbus_read_i2c_block_data_or_emulated() allows.
CVE-2022-48807	In the Linux kernel, the following vulnerability has been resolved: ice: Fix KASAN error in LAG NETDEV_UNREGISTER handler Currently, the same handler is called for both a NETDEV_BONDING_INFO LAG unlink notification as for a NETDEV_UNREGISTER call. This is causing a problem though, since the netdev_notifier_info passed has a different structure depending on which event is passed. The problem manifests as a call trace from a BUG: KASAN stack-out-of-bounds error. Fix this by creating a handler specific to NETDEV_UNREGISTER that only is passed valid elements in the netdev_notifier_info struct for the NETDEV_UNREGISTER event. Also included is the removal of an unbalanced dev_put on the peer_netdev and related braces.
CVE-2022-48809	In the Linux kernel, the following vulnerability has been resolved: net: fix a memleak when uncloning an skb dst and its metadata When uncloning an skb dst and its associated metadata, a new dst+metadata is allocated and later replaces the old one in the skb. This is helpful to have a non-shared dst+metadata attached to a specific skb. The issue is the uncloned dst+metadata is initialized with a refcount of 1, which is increased to 2 before attaching it to the skb. When tun_dst_unclone returns, the dst+metadata is only referenced from a single place (the skb) while its refcount is 2. Its refcount will never drop to 0 (when the skb is consumed), leading to a memory leak. Fix this by removing the call to dst_hold in tun_dst_unclone, as the dst+metadata refcount is already 1.

CVE ID	Description
CVE-2022-48810	In the Linux kernel, the following vulnerability has been resolved: ipmr,ip6mr: acquire RTNL before calling ip[6]mr_free_table() on failure path ip[6]mr_free_table() can only be called under RTNL lock. RTNL: assertion failed at net/core/dev.c (10367) WARNING: CPU: 1 PID: 5890 at net/core/dev.c:10367 unregister_netdevice_many+0x1246/0x1850 net/core/dev.c:10367 Modules linked in: CPU: 1 PID: 5890 Comm: syz-executor.2 Not tainted 5.16.0-syzkaller-11627-g422ee58dc0ef #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:unregister_netdevice_many+0x1246/0x1850 net/core/dev.c:10367 Code: 0f 85 9b ee ff ff e8 69 07 4b fa ba 7f 28 00 00 48 c7 c6 00 90 ae 8a 48 c7 c7 40 90 ae 8a c6 05 6d b1 51 06 01 e8 8c 90 d8 01 <0f> 0b e9 70 ee ff ff e8 3e 07 4b fa 4c 89 e7 e8 86 2a 59 fa e9 ee RSP: 0018:ffff900046ff6e0 EFLAGS: 00010286 RAX: 0000000000000000 RBX: 0000000000000000 RCX: 0000000000000000 RDX: ffff888050f51d00 RSI: ffffffff815fa008 RDI: fffff520008dfece RBP: 0000000000000000 R08: 0000000000000000 R09: 0000000000000000 R10: ffffffff815f3d6e R11: 0000000000000000 R12: 00000000ffffffffff R13: dffffc0000000000 R14: ffff900046ff750 R15: ffff88807b7dc000 FS: 00007f4ab736e700(0000) GS:ffff8880b9d00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007fee0b4f8990 CR3: 000000001e7d2000 CR4: 00000000003506e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: <TASK> mroute_clean_tables+0x244/0xb40 net/ipv6/ip6mr.c:1509 ip6mr_free_table net/ipv6/ip6mr.c:389 [inline] ip6mr_rules_init net/ipv6/ip6mr.c:246 [inline] ip6mr_net_init net/ipv6/ip6mr.c:1306 [inline] ip6mr_net_init+0x3f0/0x4e0 net/ipv6/ip6mr.c:1298 ops_init+0xaf/0x470 net/core/net_namespace.c:140 setup_net+0x54f/0xbb0 net/core/net_namespace.c:331 copy_net_ns+0x318/0x760 net/core/net_namespace.c:475 create_new_namespaces+0x3f6/0xb20 kernel/nsproxy.c:110 copy_namespaces+0x391/0x450 kernel/nsproxy.c:178 copy_process+0x2e0c/0x7300 kernel/fork.c:2167 kernel_clone+0xe7/0xab0 kernel/fork.c:2555 __do_sys_clone+0xc8/0x110 kernel/fork.c:2672 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7f4ab89f9059 Code: Unable to access opcode bytes at RIP 0x7f4ab89f902f. CVE-2022-48811	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: don't release napi in __ibmvnic_open() If __ibmvnic_open() encounters an error such as when setting link state, it calls release_resources() which frees the napi structures needlessly. Instead, have __ibmvnic_open() only clean up the work it did so far (i.e. disable napi and irq) and leave the rest to the callers. If caller of __ibmvnic_open() is ibmvnic_open(), it should release the resources immediately. If the caller is do_reset() or do_hard_reset(), they will release the resources on the next reset. This fixes following crash that occurred when running the drmgr command several times to add/remove a vnic interface: [102056] ibmvnic 30000003 env3: Disabling rx_scrq[6] irq [102056] ibmvnic 30000003 env3: Disabling rx_scrq[7] irq [102056] ibmvnic 30000003 env3: Replenished 8 pools Kernel attempted to read user page (10) - exploit attempt? CVE-2022-48827	In the Linux kernel, the following vulnerability has been resolved: NFSD: Fix the behavior of READ near OFFSET_MAX Dan Aloni reports: > Due to commit 8cfb9015280d ("NFS: Always provide aligned buffers to > the RPC read layers") on the client, a read of 0xffff is aligned up > to server rszie of 0x1000. > > As a result, in a test where the server has a file of size > 0x7fffffffffffff, and the client tries to read from the offset > 0x7ffffffffffff000, the read causes loff_t overflow in the server > and it returns an NFS code of EINVAL to the client. The client as > a result indefinitely retries the request. The Linux NFS client does not handle NFS?ERR_INVAL, even though all NFS specifications permit servers to return that status code for a READ. Instead of NFS?ERR_INVAL, have out-of-range READ requests succeed and return a short result. Set the EOF flag in the result to prevent the client from retrying the READ request. This behavior appears to be consistent with Solaris NFS servers. Note that NFSv3 and NFSv4 use u64 offset values on the wire. These must be converted to loff_t internally before use -- an implicit type cast is not adequate for this purpose. Otherwise VFS checks against sb->s_maxbytes do not work properly.
CVE-2022-48828	In the Linux kernel, the following vulnerability has been resolved: NFSD: Fix ia_size underflow iattr::ia_size is a loff_t, which is a signed 64-bit type. NFSv3 and NFSv4 both define file size as an unsigned 64-bit type. Thus there is a range of valid file size values an NFS client can send that is already larger than Linux can handle. Currently decode_fattr4() dumps a full u64 value into ia_size. If that value happens to be larger than S64_MAX, then ia_size underflows. I'm about to fix up the NFSv3 behavior as well, so let's catch the underflow in the common code path: nfsd_setattr().

CVE ID	Description
CVE-2022-48829	In the Linux kernel, the following vulnerability has been resolved: NFSD: Fix NFSv3 SETATTR/CREATE's handling of large file sizes iattr::ia_size is a loff_t, so these NFSv3 procedures must be careful to deal with incoming client size values that are larger than s64_max without corrupting the value. Silently capping the value results in storing a different value than the client passed in which is unexpected behavior, so remove the min_t() check in decode_sattr3(). Note that RFC 1813 permits only the WRITE procedure to return NFS3ERR_FBIG. We believe that NFSv3 reference implementations also return NFS3ERR_FBIG when ia_size is too large.
CVE-2022-48834	In the Linux kernel, the following vulnerability has been resolved: usb: usbtmc: Fix bug in pipe direction for control transfers The syzbot fuzzer reported a minor bug in the usbtmc driver: usb 5-1: BOGUS control dir, pipe 80001e80 doesn't match bRequestType 0 WARNING: CPU: 0 PID: 3813 at drivers/usb/core/urb.c:412 usb_submit_urb+0x13a5/0x1970 drivers/usb/core/urb.c:410 Modules linked in: CPU: 0 PID: 3813 Comm: syz-executor122 Not tainted 5.17.0-rc5-syzkaller-00306-g2293be58d6a1 #0 ... Call Trace: <TASK> usb_start_wait_urb+0x113/0x530 drivers/usb/core/message.c:58 usb_internal_control_msg drivers/usb/core/message.c:102 [inline] usb_control_msg+0x2a5/0x4b0 drivers/usb/core/message.c:153 usbtmc_ioctl_request drivers/usb/class/usbtmc.c:1947 [inline] The problem is that usbtmc_ioctl_request() uses usb_rcvctrlpipe() for all of its transfers, whether they are in or out. It's easy to fix.

At the end of the full list traversal the pointer is invalid. Move the _base_process_reply_queue() call inside of the loop.
CVE-2022-48837	In the Linux kernel, the following vulnerability has been resolved: usb: gadget: rndis: prevent integer overflow in rndis_set_response() If "BufOffset" is very large the "BufOffset + 8" operation can have an integer overflow.

CVE ID	Description
CVE-2022-48839	In the Linux kernel, the following vulnerability has been resolved: net/packet: fix slab-out-of-bounds access in packet_recvmg() syzbot found that when an AF_PACKET socket is using PACKET_COPY_THRESH and mmap operations, tpacket_rcv() is queueing skbs with garbage in skb->cb[], triggering a too big copy [1] Presumably, users of af_packet using mmap() already gets correct metadata from the mapped buffer, we can simply make sure to clear 12 bytes that might be copied to user space later. BUG: KASAN: stack-out-of-bounds in memcpy include/linux/fortify-string.h:225 [inline] BUG: KASAN: stack-out-of-bounds in packet_recvmg+0x56c/0x1150 net/packet/af_packet.c:3489 Write of size 165 at addr ffffc9000385fb78 by task syz-executor233/3631 CPU: 0 PID: 3631 Comm: syz-executor233 Not tainted 5.17.0-rc7-syzkaller-02396-g0b3660695e80 #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 Call Trace: <TASK> __dump_stack lib/dump_stack.c:88 [inline] dump_stack_lvl+0xcd/0x134 lib/dump_stack.c:106 print_address_description.constprop.0.cold+0xf/0x336 mm/kasan/report.c:255 __kasan_report mm/kasan/report.c:442 [inline] kasan_report.cold+0x83/0xdf mm/kasan/report.c:459 check_region_inline mm/kasan/generic.c:183 [inline] kasan_check_range+0x13d/0x180 mm/kasan/generic.c:189 memcpy+0x39/0x60 mm/kasan/shadow.c:66 memcpy include/linux/fortify-string.h:225 [inline] packet_recvmg+0x56c/0x1150 net/packet/af_packet.c:3489 sock_recvmg_nosec net/socket.c:948 [inline] sock_recvmg net/socket.c:966 [inline] sock_recvmg net/socket.c:962 [inline] ____sys_recvmg+0x2c4/0x600 net/socket.c:2632 __sys_recvmg+0x127/0x200 net/socket.c:2674 __sys_recvmg+0xe2/0x1a0 net/socket.c:2704 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7dfd5954c29 Code: 28 00 00 00 75 05 48 83 c4 28 c3 e8 41 15 00 00 90 48 89 f8 48 89 f7 48 89 d6 48 89 ca 4d 89 c2 4d 89 c8 4c 8b 4c 24 08 0f 05 <48> 3d 01 f0 ff ff 73 01 c3 48 c7 c1 c0 ff ff ff f7 d8 64 89 01 48 RSP: 002b:00007ffcf8e71e48 EFLAGS: 00000246 ORIG_RAX: 000000000000002f RAX: ffffffffdfda RBX: 0000000000000003 RCX: 00007dfd5954c29 RDX: 0000000000000000 RSI: 0000000020000500 RDI: 0000000000000005 RBP: 0000000000000000 R08: 000000000000000d R09: 000000000000000d R10: 0000000000000000 R11: 0000000000000246 R12: 00007ffcf8e71e60 R13: 0000000000f4240 R14: 000000000000c1ff R15: 00007ffcf8e71e54 </TASK> addr ffffc9000385fb78 is located in stack of task syz-executor233/3631 at offset 32 in frame: ____sys_recvmg+0x0/0x600 include/linux/uio.h:246 this frame has 1 object: [32, 160) 'addr' Memory state around the buggy address: ffffc9000385fa80: 00 04 f3 f3 f3 f3 00 00 00 00 00 00 00 00 ffffc9000385fb00: 00 00 00 00 00 00 00 00 00 00 00 00 f1 f1 f1 00 >fffc9000385fb80: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 f3 ^ ffffc9000385fc00: f3 f3 f3 00 00 00 00 00 00 00 00 00 00 f1 ffffc9000385fc80: f1 f1 f1 00 f2 f2 00 f2 f2 00 00 00 00 00 =====
CVE-2022-48841	In the Linux kernel, the following vulnerability has been resolved: ice: fix NULL pointer dereference in ice_update_vsi_tx_ring_stats() It is possible to do NULL pointer dereference in routine that updates Tx ring stats. Currently only stats and bytes are updated when ring pointer is valid, but later on ring is accessed to propagate gathered Tx stats onto VSI stats. Change the existing logic to move to next ring when ring is NULL.

CVE ID	Description
CVE-2022-48842	In the Linux kernel, the following vulnerability has been resolved: ice: Fix race condition during interface enslave Commit 5dbbbd01cbba83 ("ice: Avoid RTNL lock when re-creating auxiliary device") changes a process of re-creation of aux device so ice_plug_aux_dev() is called from ice_service_task() context. This unfortunately opens a race window that can result in dead-lock when interface has left LAG and immediately enters LAG again. Reproducer: `` #!/bin/sh ip link add lag0 type bond mode 1 miimon 100 ip link set lag0 for n in {1..10}; do echo Cycle: \$n ip link set ens7f0 master lag0 sleep 1 ip link set ens7f0 nomaster done `` This results in: [20976.208697] Workqueue: ice ice_service_task [ice] [20976.213422] Call Trace: [20976.215871] __schedule+0x2d1/0x830 [20976.219364] schedule+0x35/0xa0 [20976.222510] schedule_preempt_disabled+0xa/0x10 [20976.227043] __mutex_lock.isra.7+0x310/0x420 [20976.235071] enum_all_gids_of_dev_cb +0x1c/0x100 [ib_core] [20976.251215] ib_enum_roce_netdev+0xa4/0xe0 [ib_core] [20976.256192] ib_cache_setup_one+0x33/0xa0 [ib_core] [20976.261079] ib_register_device+0x40d/0x580 [ib_core] [20976.266139] irdma_ib_register_device+0x129/0x250 [irdma] [20976.281409] irdma_probe +0x2c1/0x360 [irdma] [20976.285691] auxiliary_bus_probe+0x45/0x70 [20976.289790] really_probe +0x1f2/0x480 [20976.298509] driver_probe_device+0x49/0xc0 [20976.302609] bus_for_each_drv +0x79/0xc0 [20976.306448] __device_attach+0xdc/0x160 [20976.310286] bus_probe_device +0x9d/0xb0 [20976.314128] device_add+0x43c/0x890 [20976.321287] __auxiliary_device_add +0x43/0x60 [20976.325644] ice_plug_aux_dev+0xb2/0x100 [ice] [20976.330109] ice_service_task +0xd0c/0xed0 [ice] [20976.342591] process_one_work+0x1a7/0x360 [20976.350536] worker_thread +0x30/0x390 [20976.358128] kthread+0x10a/0x120 [20976.365547] ret_from_fork+0x1f/0x40 ... Command 'ip link ... set nomaster' causes that ice_plug_aux_dev() is called from ice_service_task() context, aux device is created and associated device->lock is taken. 2. Command 'ip link ... set master...' calls ice's notifier under RTNL lock and that notifier calls ice_unplug_aux_dev(). That function tries to take aux device->lock but this is already taken by ice_plug_aux_dev() in step 1 3. Later ice_plug_aux_dev() tries to take RTNL lock but this is already taken in step 2 4. Dead-lock The patch fixes this issue by following changes: - Bit ICE_FLAG_PLUG_AUX_DEV is kept to be set during ice_plug_aux_dev() call in ice_service_task() - The bit is checked in ice_clear_rdma_cap() and only if it is not set then ice_unplug_aux_dev() is called. If it is set (in other words plugging of aux device was requested and ice_plug_aux_dev() is potentially running) then the function only clears the ---truncated---
CVE-2022-48843	In the Linux kernel, the following vulnerability has been resolved: drm/vrr: Set VRR capable prop only if it is attached to connector VRR capable property is not attached by default to the connector It is attached only if VRR is supported. So if the driver tries to call drm core set prop function without it being attached that causes NULL dereference.
CVE-2022-48844	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_core: Fix leaking sent_cmd skb sent_cmd memory is not freed before freeing hci_dev causing it to leak its contents.
CVE-2022-48846	In the Linux kernel, the following vulnerability has been resolved: block: release rq qos structures for queue without disk blkcg_init_queue() may add rq qos structures to request queue, previously blk_cleanup_queue() calls rq_qos_exit() to release them, but commit 8e141f9eb803 ("block: drain file system I/O on del_gendisk") moves rq_qos_exit() into del_gendisk(), so memory leak is caused because queues may not have disk, such as un-present scsi luns, nvme admin queue, ... Fixes the issue by adding rq_qos_exit() to blk_cleanup_queue() back. BTW, v5.18 won't need this patch any more since we move blkcg_init_queue()/blkcg_exit_queue() into disk allocation/release handler, and patches have been in for-5.18/block.

CVE ID	Description
CVE-2022-48848	In the Linux kernel, the following vulnerability has been resolved: tracing/osnoise: Do not unregister events twice Nicolas reported that using: # trace-cmd record -e all -M 10 -p osnoise --poll Resulted in the following kernel warning: -----[cut here]----- WARNING: CPU: 0 PID: 1217 at kernel/tracepoint.c:404 tracepoint_probe_unregister+0x280/0x370 [...] CPU: 0 PID: 1217 Comm: trace-cmd Not tainted 5.17.0-rc6-next-20220307-nico+ #19 RIP: 0010:tracepoint_probe_unregister+0x280/0x370 [...] CR2: 00007ff919b29497 CR3: 0000000109da4005 CR4: 000000000170ef0 Call Trace: <TASK> osnoise_workload_stop+0x36/0x90 tracing_set_tracer+0x108/0x260 tracing_set_trace_write+0x94/0xd0 ? __check_object_size.part.0+0x10a/0x150 ? selinux_file_permission+0x104/0x150 vfs_write+0xb5/0x290 ksys_write+0x5f/0xe0 do_syscall_64+0x3b/0x90 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7ff919a18127 [...] ---[end trace 0000000000000000]--- The warning complains about an attempt to unregister an unregistered tracepoint. This happens on trace-cmd because it first stops tracing, and then switches the tracer to nop. Which is equivalent to: # cd /sys/kernel/tracing/ # echo osnoise > current_tracer # echo 0 > tracing_on # echo nop > current_tracer The osnoise tracer stops the workload when no trace instance is actually collecting data. This can be caused both by disabling tracing or disabling the tracer itself. To avoid unregistering events twice, use the existing trace_osnoise_callback_enabled variable to check if the events (and the workload) are actually active before trying to deactivate them.
CVE-2022-48849	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: bypass tiling flag check in virtual display case (v2) vkms leverages common amdgpu framebuffer creation, and also as it does not support FB modifier, there is no need to check tiling flags when initing framebuffer when virtual display is enabled. This can fix below calldata: amdgpu 0000:00:08.0: GFX9+ requires FB check based on format modifier WARNING: CPU: 0 PID: 1023 at drivers/gpu/drm/amd/amdgpu/amdgpu_display.c:1150 amdgpu_display_framebuffer_init+0x8e7/0xb40 [amdgpu] v2: check adev->enable_virtual_display instead as vkms can be enabled in bare metal as well.
CVE-2022-48850	In the Linux kernel, the following vulnerability has been resolved: net-sysfs: add check for netdevice being present to speed_show When bringing down the netdevice or system shutdown, a panic can be triggered while accessing the sysfs path because the device is already removed. [755.549084] mlx5_core 0000:12:00.1: Shutdown was called [756.404455] mlx5_core 0000:12:00.0: Shutdown was called ... CVE ID	Description
CVE-2022-48853	In the Linux kernel, the following vulnerability has been resolved: swiotlb: fix info leak with DMA_FROM_DEVICE The problem I'm addressing was discovered by the LTP test covering cve-2018-1000204. A short description of what happens follows: 1) The test case issues a command code 00 (TEST UNIT READY) via the SG_IO interface with: dxfer_len == 524288, dxfer_dir == SG_DXFER_FROM_DEV and a corresponding dxferp. The peculiar thing about this is that TUR is not reading from the device. 2) In sg_start_req() the invocation of blk_rq_map_user() effectively bounces the user-space buffer. As if the device was to transfer into it. Since commit a45b599ad808 ("scsi: sg: allocate with __GFP_ZERO in sg_build_indirect()") we make sure this first bounce buffer is allocated with GFP_ZERO. 3) For the rest of the story we keep ignoring that we have a TUR, so the device won't touch the buffer we prepare as if the we had a DMA_FROM_DEVICE type of situation. My setup uses a virtio-scsi device and the buffer allocated by SG is mapped by the function virtqueue_add_split() which uses DMA_FROM_DEVICE for the "in" sgs (here scatter-gather and not scsi generics). This mapping involves bouncing via the swiotlb (we need swiotlb to do virtio in protected guest like s390 Secure Execution, or AMD SEV). 4) When the SCSI TUR is done, we first copy back the content of the second (that is swiotlb) bounce buffer (which most likely contains some previous IO data), to the first bounce buffer, which contains all zeros. Then we copy back the content of the first bounce buffer to the user-space buffer. 5) The test case detects that the buffer, which it zero-initialized, ain't all zeros and fails. One can argue that this is an swiotlb problem, because without swiotlb we leak all zeros, and the swiotlb should be transparent in a sense that it does not affect the outcome (if all other participants are well behaved). Copying the content of the original buffer into the swiotlb buffer is the only way I can think of to make swiotlb transparent in such scenarios. So let's do just that if in doubt, but allow the driver to tell us that the whole mapped buffer is going to be overwritten, in which case we can preserve the old behavior and avoid the performance impact of the extra bounce.
CVE-2022-48858	In the Linux kernel, the following vulnerability has been resolved: net/mlx5: Fix a race on command flush flow Fix a refcount use after free warning due to a race on command entry. Such race occurs when one of the commands releases its last refcount and frees its index and entry while another process running command flush flow takes refcount to this command entry. The process which handles commands flush may see this command as needed to be flushed if the other process released its refcount but didn't release the index yet. Fix it by adding the needed spin lock. It fixes the following warning trace: refcount_t: addition on 0; use-after-free. WARNING: CPU: 11 PID: 540311 at lib/refcount.c:25 refcount_warn_saturate+0x80/0xe0 ... RIP: 0010:refcount_warn_saturate+0x80/0xe0 ... CVE-2022-48861	In the Linux kernel, the following vulnerability has been resolved: vdpa: fix use-after-free on vp_vdpa_remove When vp_vdpa driver is unbind, vp_vdpa is freed in vdpa_unregister_device and then vp_vdpa->mdev.pci_dev is dereferenced in vp_modern_remove, triggering use-after-free. Call Trace of unbinding driver free vp_vdpa : do_syscall_64 vfs_write kernfs_fop_write_iter kobject_release_driver_internal pci_device_remove vp_vdpa_remove vdpa_unregister_device kobject_release_device_release kfree Call Trace of dereference vp_vdpa->mdev.pci_dev: vp_modern_remove pci_release_selected_regions pci_release_region pci_resource_len pci_resource_end (dev)->resource[(bar)].end
CVE-2022-48862	In the Linux kernel, the following vulnerability has been resolved: vhost: fix hung thread due to erroneous iotlb entries In vhost_iotlb_add_range_ctx(), range size can overflow to 0 when start is 0 and last is ULONG_MAX. One instance where it can happen is when userspace sends an IOTLB message with iova=size=uaddr=0 (vhost_process_iotlb_msg). So, an entry with size = 0, start = 0, last = ULONG_MAX ends up in the iotlb. Next time a packet is sent, iotlb_access_ok() loops indefinitely due to that erroneous entry. Call Trace: <TASK> iotlb_access_ok+0x21b/0x3e0 drivers/vhost/vhost.c:1340 vq_meta_prefetch+0xbc/0x280 drivers/vhost/vhost.c:1366 vhost_transport_do_send_pkt+0xe0/0xf0 drivers/vhost/vsock.c:104 vhost_worker+0x23d/0x3d0 drivers/vhost/vhost.c:372 kthread+0x2e9/0x3a0 kernel/kthread.c:377 ret_from_fork+0x1f/0x30 arch/x86/entry/entry_64.S:295 </TASK> Reported by syzbot at: https://syzkaller.appspot.com/bug?extid=0abd373e2e50d704db87 To fix this, do two things: 1. Return -EINVAL in vhost_chr_write_iter() when userspace asks to map a range with size 0. 2. Fix vhost_iotlb_add_range_ctx() to handle the range [0, ULONG_MAX] by splitting it into two entries.
CVE-2022-48863	In the Linux kernel, the following vulnerability has been resolved: mISDN: Fix memory leak in dsp_pipeline_build() dsp_pipeline_build() allocates dup pointer by kstrdup(cfg), but then it updates dup variable by strsep(&dup, " "). As a result when it calls kfree(dup), the dup variable contains NULL. Found by Linux Driver Verification project (linuxtesting.org) with SVACE.

CVE ID	Description
CVE-2022-48864	In the Linux kernel, the following vulnerability has been resolved: vdpa/mlx5: add validation for VIRTIO_NET_CTRL_MQ_VQ_PAIRS_SET command When control vq receives a VIRTIO_NET_CTRL_MQ_VQ_PAIRS_SET command request from the driver, presently there is no validation against the number of queue pairs to configure, or even if multiqueue had been negotiated or not is unverified. This may lead to kernel panic due to uninitialized resource for the queues were there any bogus request sent down by untrusted driver. Tie up the loose ends there.
CVE-2022-48865	In the Linux kernel, the following vulnerability has been resolved: tipc: fix kernel panic when enabling bearer When enabling a bearer on a node, a kernel panic is observed: [4.498085] RIP: 0010:tipc_mon_prep+0x4e/0x130 [tipc] ... The node in question is receiving activate messages in another thread after changing bearer status to allow message sending/ receiving in current thread: thread 1 thread 2 ----- ----- tipc_enable_bearer() test_and_set_bit_lock() tipc_bearer_xmit_skb() tipc_l2_rcv_msg() tipc_rcv() __tipc_node_link_up() tipc_link_build_state_msg() tipc_link_build_proto_msg() tipc_mon_prep() { ... // null-pointer dereference u16 gen = mon->dom_gen; ... } // Not being executed yet tipc_mon_create() { ... // allocate mon = kzalloc(); ... } Monitoring pointer in thread 2 is dereferenced before monitoring data is allocated in thread 1. This causes kernel panic. This commit fixes it by allocating the monitoring data before enabling the bearer to receive messages.
CVE-2022-48868	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Let probe fail when workqueue cannot be enabled The workqueue is enabled when the appropriate driver is loaded and disabled when the driver is removed. When the driver is removed it assumes that the workqueue was enabled successfully and proceeds to free allocations made during workqueue enabling. Failure during workqueue enabling does not prevent the driver from being loaded. This is because the error path within drv_enable_wq() returns success unless a second failure is encountered during the error path. By returning success it is possible to load the driver even if the workqueue cannot be enabled and allocations that do not exist are attempted to be freed during driver remove. Some examples of problematic flows: (a) idxd_dmaengine_drv_probe() -> drv_enable_wq() -> idxd_wq_request_irq(): In above flow, if idxd_wq_request_irq() fails then idxd_wq_unmap_portal() is called on error exit path, but drv_enable_wq() returns 0 because idxd_wq_disable() succeeds. The driver is thus loaded successfully. idxd_dmaengine_drv_remove()->drv_disable_wq()->idxd_wq_unmap_portal() Above flow on driver unload triggers the WARN in devm_iounmap() because the device resource has already been removed during error path of drv_enable_wq(). (b) idxd_dmaengine_drv_probe() -> drv_enable_wq() -> idxd_wq_request_irq(): In above flow, if idxd_wq_request_irq() fails then idxd_wq_init_percpu_ref() is never called to initialize the percpu counter, yet the driver loads successfully because drv_enable_wq() returns 0. idxd_dmaengine_drv_remove()->__idxd_wq_quiesce()->percpu_ref_kill(): Above flow on driver unload triggers a BUG when attempting to drop the initial ref of the uninitialized percpu ref: BUG: kernel NULL pointer dereference, address: 0000000000000010 Fix the drv_enable_wq() error path by returning the original error that indicates failure of workqueue enabling. This ensures that the probe fails when an error is encountered and the driver remove paths are only attempted when the workqueue was enabled successfully.

CVE ID	Description
CVE-2022-48875	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: sdata can be NULL during AMPDU start ieee80211_tx_ba_session_handle_start() may get NULL for sdata when a deauthentication is ongoing. CVE-2022-48876	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix initialization of rx->link and rx->link_sta There are some codepaths that do not initialize rx->link_sta properly. This causes a crash in places which assume that rx->link_sta is valid if rx->sta is valid. One known instance is triggered by __ieee80211_rx_h_amsdu being called from fast-rx. It results in a crash like this one: BUG: kernel NULL pointer dereference, address: 00000000000000a8 #PF: supervisor write access in kernel mode #PF: error_code(0x0002) - not-present page PGD 0 P4D 0 Oops: 0002 [#1] PREEMPT SMP PTI CPU: 1 PID: 506 Comm: mt76-usb-rx phy Tainted: G E 6.1.0-debian64x+1.7 #3 Hardware name: ZOTAC ZBOX-ID92/ZBOX-IQ01/ZBOX-ID92/ZBOX-IQ01, BIOS B220P007 05/21/2014 RIP: 0010:ieee80211_deliver_skb+0x62/0x1f0 [mac80211] Code: 00 48 89 04 24 e8 9e a7 c3 df 89 c0 48 03 1c c5 a0 ea 39 a1 4c 01 6b 08 48 ff 03 48 83 7d 28 00 74 11 48 8b 45 30 48 63 55 44 <48> 83 84 d0 a8 00 00 00 01 41 8b 86 c0 11 00 00 8d 50 fd 83 fa 01 RSP: 0018:ffff999040803b10 EFLAGS: 00010286 RAX: 0000000000000000 RBX: fffff9903f496480 RCX: 0000000000000000 RDX: 0000000000000000 RSI: 0000000000000000 RDI: 0000000000000000 RBP: ffff999040803ce0 R08: 0000000000000000 R09: 0000000000000000 R10: 0000000000000000 R11: 0000000000000000 R12: ffff8d21828ac900 R13: 0000000000000004a R14: ffff8d2198ed89c0 R15: ffff8d2198ed8000 FS: 0000000000000000(0000) GS:ffff8d24afe80000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00000000000000a8 CR3: 0000000429810002 CR4: 0000000001706e0 Call Trace: <TASK> __ieee80211_rx_h_amsdu+0x1b5/0x240 [mac80211] ? ieee80211_prepare_and_rx_handle+0xcdd/0x1320 [mac80211] ? __local_bh_enable_ip+0x3b/0xa0 ieee80211_prepare_and_rx_handle+0xcdd/0x1320 [mac80211] ? prepare_transfer+0x109/0x1a0 [xhci_hcd] ieee80211_rx_list+0xa80/0xda0 [mac80211] mt76_rx_complete+0x207/0x2e0 [mt76] mt76_rx_poll_complete+0x357/0x5a0 [mt76] mt76u_rx_worker+0x4f5/0x600 [mt76_usb] ? mt76_get_min_avg_rssi+0x140/0x140 [mt76] __mt76_worker_fn+0x50/0x80 [mt76] kthread+0xed/0x120 ? kthread_complete_and_exit+0x20/0x20 ret_from_fork+0x22/0x30 Since the initialization of rx->link and rx->link_sta is rather convoluted and duplicated in many places, clean it up by using a helper function to set it. [remove unnecessary rx->sta->sta.mlo check]
CVE-2022-48889	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: sof-nau8825: fix module alias overflow The maximum name length for a platform_device_id entry is 20 characters including the trailing NUL byte. The sof_nau8825.c file exceeds that, which causes an obscure error message: sound/soc/intel/boards/snd-soc-sof_nau8825.mod.c:35:45: error: illegal character encoding in string literal [-Werror,-Winvalid-source-encoding] MODULE_ALIAS("platform:adl_max98373_nau8825<U+0018><AA>"); ~~~~~ include/linux/module.h:168:49: note: expanded from macro 'MODULE_ALIAS' ~~~~~ include/linux/module.h:165:56: note: expanded from macro 'MODULE_INFO' ~~~~~ include/linux/moduleparam.h:26:47: note: expanded from macro 'MODULE_INFO' = __MODULE_INFO_PREFIX __stringify(tag) "=" info I could not figure out how to make the module handling robust enough to handle this better, but as a quick fix, using slightly shorter names that are still unique avoids the build issue.

CVE ID	Description
CVE-2022-48890	In the Linux kernel, the following vulnerability has been resolved: scsi: storvsc: Fix swiotlb bounce buffer leak in confidential VM storvsc_queuecommand() maps the scatter/gather list using scsi_dma_map(), which in a confidential VM allocates swiotlb bounce buffers. If the I/O submission fails in storvsc_do_io(), the I/O is typically retried by higher level code, but the bounce buffer memory is never freed. The mostly like cause of I/O submission failure is a full VMBus channel ring buffer, which is not uncommon under high I/O loads. Eventually enough bounce buffer memory leaks that the confidential VM can't do any I/O. The same problem can arise in a non-confidential VM with kernel boot parameter swiotlb=force. Fix this by doing scsi_dma_unmap() in the case of an I/O submission error, which frees the bounce buffer memory.
CVE-2022-48896	In the Linux kernel, the following vulnerability has been resolved: ixgbe: fix pci device refcount leak As the comment of pci_get_domain_bus_and_slot() says, it returns a PCI device with refcount incremented, when finish using it, the caller must decrement the reference count by calling pci_dev_put(). In ixgbe_get_first_secondary_devfn() and ixgbe_x550em_a_has_mii(), pci_dev_put() is called to avoid leak.
CVE-2022-48899	In the Linux kernel, the following vulnerability has been resolved: drm/virtio: Fix GEM handle creation UAF Userspace can guess the handle value and try to race GEM object creation with handle close, resulting in a use-after-free if we dereference the object after dropping the handle's reference. For that reason, dropping the handle's reference must be done <i>after</i> we are done dereferencing the object.
CVE-2022-48904	In the Linux kernel, the following vulnerability has been resolved: iommu/amd: Fix I/O page table memory leak The current logic updates the I/O page table mode for the domain before calling the logic to free memory used for the page table. This results in IOMMU page table memory leak, and can be observed when launching VM w/ pass-through devices. Fix by freeing the memory used for page table before updating the mode.
CVE-2022-48905	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: free reset-work-item when flushing Fix a tiny memory leak when flushing the reset work queue.
CVE-2022-48906	In the Linux kernel, the following vulnerability has been resolved: mptcp: Correctly set DATA_FIN timeout when number of retransmits is large Syzkaller with UBSAN uncovered a scenario where a large number of DATA_FIN retransmits caused a shift-out-of-bounds in the DATA_FIN timeout calculation: <pre>===== UBSAN: shift-out-of-bounds in net/mptcp/protocol.c:470:29 shift exponent 32 is too large for 32-bit type 'unsigned int' CPU: 1 PID: 13059 Comm: kworker/1:0 Not tainted 5.17.0-rc2-00630-g5fbf21c90c60 #1 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.13.0-1ubuntu1.1 04/01/2014 Workqueue: events mptcp_worker Call Trace: <TASK> __dump_stack lib/dump_stack.c:88 [inline] dump_stack_lvl+0x1cd/0x134 lib/dump_stack.c:106 ubsan_epilogue+0xb/0x5a lib/ubsan.c:151 __ubsan_handle_shift_out_of_bounds.cold+0xb2/0x20e lib/ubsan.c:330 mptcp_set_datafin_timeout net/mptcp/protocol.c:470 [inline] __mptcp_retrans.cold+0x72/0x77 net/mptcp/protocol.c:2445 mptcp_worker+0x58a/0xa70 net/mptcp/protocol.c:2528 process_one_work+0x9df/0x16d0 kernel/ workqueue.c:2307 worker_thread+0x95/0xe10 kernel/workqueue.c:2454 kthread+0x2f4/0x3b0 kernel/kthread.c:377 ret_from_fork+0x1f/0x30 arch/x86/entry/entry_64.S:295 </TASK> =====</pre> This change limits the maximum timeout by limiting the size of the shift, which keeps all intermediate values in-bounds.
CVE-2022-48909	In the Linux kernel, the following vulnerability has been resolved: net/smc: fix connection leak There's a potential leak issue under following execution sequence : smc_release smc_connect_work if (sk->sk_state == SMC_INIT) send_clc_confirm tcp_abort(); ... sk.sk_state = SMC_ACTIVE smc_close_active switch(sk->sk_state) { ... case SMC_ACTIVE: smc_close_final() // then wait peer closed Unfortunately, tcp_abort() may discard CLC CONFIRM messages that are still in the tcp send buffer, in which case our connection token cannot be delivered to the server side, which means that we cannot get a passive close message at all. Therefore, it is impossible for the to be disconnected at all. This patch tries a very simple way to avoid this issue, once the state has changed to SMC_ACTIVE after tcp_abort(), we can actively abort the smc connection, considering that the state is SMC_INIT before tcp_abort(), abandoning the complete disconnection process should not cause too much problem. In fact, this problem may exist as long as the CLC CONFIRM message is not received by the server. Whether a timer should be added after smc_close_final() needs to be discussed in the future. But even so, this patch provides a faster release for connection in above case, it should also be valuable.

CVE ID	Description
CVE-2022-48910	In the Linux kernel, the following vulnerability has been resolved: net: ipv6: ensure we call <code>ipv6_mc_down()</code> at most once There are two reasons for <code>addrconf_notify()</code> to be called with <code>NETDEV_DOWN</code> : either the network device is actually going down, or IPv6 was disabled on the interface. If either of them stays down while the other is toggled, we repeatedly call the code for <code>NETDEV_DOWN</code> , including <code>ipv6_mc_down()</code> , while never calling the corresponding <code>ipv6_mc_up()</code> in between. This will cause a new entry in <code>idev->mc_tomb</code> to be allocated for each multicast group the interface is subscribed to, which in turn leaks one struct <code>ifmcastdr6</code> per nontrivial multicast group the interface is subscribed to. The following reproducer will leak at least \$n objects: ip addr add ff2e::4242/32 dev eth0 autojoin sysctl -w net.ipv6.conf.eth0.disable_ipv6=1 for i in \$(seq 1 \$n); do ip link set up eth0; ip link set down eth0 done Joining groups with <code>IPV6_ADD_MEMBERSHIP</code> (unprivileged) or setting the sysctl <code>net.ipv6.conf.eth0.forwarding</code> to 1 ($\Rightarrow$ subscribing to <code>ff02::2</code>) can also be used to create a nontrivial <code>idev->mc_list</code> , which will the leak objects with the right up-down-sequence. Based on both sources for <code>NETDEV_DOWN</code> events the interface IPv6 state should be considered: - not ready if the network interface is not ready OR IPv6 is disabled for it - ready if the network interface is ready AND IPv6 is enabled for it The functions <code>ipv6_mc_up()</code> and <code>ipv6_down()</code> should only be run when this state changes. Implement this by remembering when the IPv6 state is ready, and only run <code>ipv6_mc_down()</code> if it actually changed from ready to not ready. The other direction (not ready $\rightarrow$ ready) already works correctly, as: - the interface notification triggered codepath for <code>NETDEV_UP / NETDEV_CHANGE</code> returns early if ipv6 is disabled, and - the <code>disable_ipv6=0</code> triggered codepath skips fully initializing the interface as long as <code>addrconf_link_ready(dev)</code> returns false - calling <code>ipv6_mc_up()</code> repeatedly does not leak anything
CVE-2022-48911	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_queue: fix possible use-after-free Eric Dumazet says: The sock_hold() side seems suspect, because there is no guarantee that sk_refcnt is not already 0. On failure, we cannot queue the packet and need to indicate an error. The packet will be dropped by the caller. v2: split skb prefetch hunk into separate change
CVE-2022-48913	In the Linux kernel, the following vulnerability has been resolved: blktrace: fix use after free for struct blk_trace When tracing the whole disk, 'dropped' and 'msg' will be created under 'q->debugfs_dir' and 'bt->dir' is NULL, thus <code>blk_trace_free()</code> won't remove those files. What's worse, the following UAF can be triggered because of accessing stale 'dropped' and 'msg': ===== BUG: KASAN: use-after-free in blk_dropped_read+0x89/0x100 Read of size 4 at addr ffff88816912f3d8 by task blktrace/1188 CPU: 27 PID: 1188 Comm: blktrace Not tainted 5.17.0-rc4-next-20220217+ #469 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS ?-20190727_073836-4 Call Trace: <TASK> dump_stack_lvl+0x34/0x44 print_address_description.constprop.0.cold+0xab/0x381 ? blk_dropped_read+0x89/0x100 ? blk_dropped_read+0x89/0x100 kasan_report.cold+0x83/0xdf ? blk_dropped_read+0x89/0x100 kasan_check_range+0x140/0x1b0 blk_dropped_read+0x89/0x100 ? blk_create_buf_file_callback+0x20/0x20 ? kmem_cache_free+0xa1/0x500 ? do_sys_openat2+0x258/0x460 full_proxy_read+0x8f/0xc0 vfs_read+0xc6/0x260 ksys_read+0xb9/0x150 ? vfs_write+0x3d0/0x3d0 ? fpregs_assert_state_consistent+0x55/0x60 ? exit_to_user_mode_prepare+0x39/0x1e0 do_syscall_64+0x35/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7fbc080d92fd Code: ce 20 00 00 75 10 b8 00 00 00 00 0f 05 48 3d 01 f0 ff ff 73 31 c3 48 83 1 RSP: 002b:00007fbb95ff9cb0 EFLAGS: 00000293 ORIG_RAX: 0000000000000000 RAX: ffffffff881da RBX: 00007fbb95ff9dc0 RCX: 00007fbc080d92fd RDX: 0000000000000010 RSI: 00007fbb95ff9cc0 RDI: 0000000000000045 RBP: 0000000000000045 R08: 0000000000406299 R09: 00000000fffffdd R10: 000000000153afa0 R11: 0000000000000293 R12: 00007fbb780008c R13: 00007fbb78000938 R14: 0000000000608b30 R15: 00007fbb780029c8 </TASK> Allocated by task 1050: kasan_save_stack+0x1e/0x40 __kasan_kmalloc+0x81/0xa0 do_blk_trace_setup+0xcb/0x410 __blk_trace_setup+0xac/0x130 blk_trace_ioctl+0xe9/0x1c0 blkdev_ioctl+0xf1/0x390 __x64_sys_ioctl+0xa5/0xe0 do_syscall_64+0x35/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae Freed by task 1050: kasan_save_stack+0x1e/0x40 kasan_set_track+0x21/0x30 kasan_set_free_info+0x20/0x30 __kasan_slab_free+0x103/0x180 kfree+0x9a/0x4c0 __blk_trace_remove+0x53/0x70 blk_trace_ioctl+0x199/0x1c0 blkdev_common_ioctl+0x5e9/0xb30 blkdev_ioctl+0x1a5/0x390 __x64_sys_ioctl+0xa5/0xe0 do_syscall_64+0x35/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae The buggy address belongs to the object at ffff88816912f380 which belongs to the cache kcalloc-96 of size 96 The buggy address is located 88 bytes inside of 96-byte region [ffff88816912f380, ffff88816912f3e0] The buggy address belongs to the page: page:000000009a1b4e7c refcount:1 mapcount:0 mapping:0000000000000000 index:0xf flags: 0x1ffffc00000(slab node=0 zone=2 lastcpuid=0x1ffff) raw: 0017ffffc0000200 ffffea00044f1100 dead000000000002 ffff88810004c780 raw: 0000000000000000 0000000000200020 00000001ffffff 0000000000000000 page dumped because: kasan: bad access detected Memory state around the buggy address: ffff88816912f280: fa fb fb fb fb fb fb fb fb fc fc fc ffff88816912f300: fa fb fb fb fb fb fb fb fb fc fc fc >ffff88816912f380: fa fb fb fb fb fb fb fb fb fc fc fc ^ ffff88816912f400: fa fb fb fb fb fb fb fb fb fc fc fc ffff88816912f480: fa fb fb fb fb fb fb fb fb fc fc fc fc =====

CVE ID	Description
CVE-2022-48914	In the Linux kernel, the following vulnerability has been resolved: xen/netfront: destroy queues before real_num_tx_queues is zeroed xennet_destroy_queues() relies on info->netdev->real_num_tx_queues to delete queues. Since d7dac083414eb5bb99a6d2ed53dc2c1b405224e5 ("net-sysfs: update the queue counts in the unregistration path"), unregister_netdev() indirectly sets real_num_tx_queues to 0. Those two facts together means, that xennet_destroy_queues() called from xennet_remove() cannot do its job, because it's called after unregister_netdev(). This results in kfree-ing queues that are still linked in napi, which ultimately crashes: BUG: kernel NULL pointer dereference, address: 0000000000000000 #PF: supervisor read access in kernel mode #PF: error_code(0x0000) - not-present page PGD 0 P4D 0 Oops: 0000 [#1] PREEMPT SMP PTI CPU: 1 PID: 52 Comm: xenwatch Tainted: G W 5.16.10-1.32.fc32.qubes.x86_64+ #226 RIP: 0010:free_netdev+0xa3/0x1a0 Code: ff 48 89 df e8 2e e9 00 00 48 8b 43 50 48 8b 08 48 8d b8 a0 fe ff ff 48 8d a9 a0 fe ff ff 49 39 c4 75 26 eb 47 e8 ed c1 66 ff <48> 8b 85 60 01 00 00 48 8d 95 60 01 00 00 48 89 ef 48 2d 60 01 00 RSP: 0000:ffffc90000bafd00 EFLAGS: 00010286 RAX: 0000000000000000 RBX: ffff88800edad000 RCX: 0000000000000000 RDX: 0000000000000001 RSI: ffff88800bfc30 RDI: 00000000fffffffb RBP: ffffffffefea0 R08: 0000000000000000 R09: 0000000000000000 R10: 0000000000000000 R11: 0000000000000001 R12: ffff88800edad050 R13: ffff8880065f8f88 R14: 0000000000000000 R15: ffff8880066c6680 FS: 0000000000000000(0000) GS:ffff8880f3300000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 0000000000000000 CR3: 00000000e998c006 CR4: 0000000003706e00 Call Trace: <TASK> xennet_remove+0x13d/0x300 [xen_netfront] xenbus_dev_remove+0x6d/0xf0 __device_release_driver+0x17a/0x240 device_release_driver+0x24/0x30 bus_remove_device+0xd8/0x140 device_del+0x18b/0x410 ? _raw_spin_unlock+0x16/0x30 ? klist_iter_exit+0x14/0x20 ? xenbus_dev_request_and_reply+0x80/0x80 device_unregister+0x13/0x60 xenbus_dev_changed+0x18e/0x1f0 xenwatch_thread+0xc0/0x1a0 ? do_wait_intr_irq+0xa0/0xa0 kthread+0x16b/0x190 ? set_kthread_struct+0x40/0x40 ret_from_fork+0x22/0x30 </TASK> Fix this by calling xennet_destroy_queues() from xennet_uninit(), when real_num_tx_queues is still available. This ensures that queues are destroyed when real_num_tx_queues is set to 0, regardless of how unregister_netdev() was called. Originally reported at https://github.com/QubesOS/qubes-issues/issues/7257
CVE-2022-48915	In the Linux kernel, the following vulnerability has been resolved: thermal: core: Fix TZ_GET_TRIP NULL pointer dereference Do not call get_trip_hyst() from thermal_genl_cmd_tz_get_trip() if the thermal zone does not define one.

CVE ID	Description

CVE-2022-48929	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix crash due to out of bounds access into reg2btf_ids. When commit e6ac2450d6de ("bpf: Support bpf program calling kernel function") added kfunc support, it defined reg2btf_ids as a cheap way to translate the verifier reg type to the appropriate btf_vmlinux BTF ID, however commit c25b2ae13603 ("bpf: Replace PTR_TO_XXX_OR_NULL with PTR_TO_XXX PTR_MAYBE_NULL") moved the __BPF_REG_TYPE_MAX from the last member of bpf_reg_type enum to after the base register types, and defined other variants using type flag composition. However, now, the direct usage of reg->type to index into reg2btf_ids may no longer fall into __BPF_REG_TYPE_MAX range, and hence lead to out of bounds access and kernel crash on dereference of bad pointer.
CVE-2022-48931	In the Linux kernel, the following vulnerability has been resolved: configs: fix a race in configs_{,un}register_subsystem() When configs_register_subsystem() or configs_unregister_subsystem() is executing link_group() or unlink_group(), it is possible that two processes add or delete list concurrently. Some unfortunate interleavings of them can cause kernel panic. One of cases is: A --> B --> C --> D A <-- B <-- C <-- D delete list_head *B delete list_head *C ----- ----- configs_unregister_subsystem configs_unregister_subsystem unlink_group unlink_group unlink_obj unlink_obj list_del_init list_del_init __list_del_entry __list_del_entry __list_del __list_del // next == C next->prev = prev next->prev = prev prev->next = next // prev == B prev->next = next Fix this by adding mutex when calling link_group() or unlink_group(), but parent configs_subsystem is NULL when config_item is root. So I create a mutex configs_subsystem_mutex.

CVE ID	Description
CVE-2022-48933	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: fix memory leak during stateful obj update stateful objects can be updated from the control plane. The transaction logic allocates a temporary object for this purpose. The ->init function was called for this object, so plain kfree() leaks resources. We must call ->destroy function of the object. nft_obj_destroy does this, but it also decrements the module refcount, but the update path doesn't increment it. To avoid special-casing the update object release, do module_get for the update case too and release it via nft_obj_destroy().
CVE-2022-48938	In the Linux kernel, the following vulnerability has been resolved: CDC-NCM: avoid overflow in sanity checking A broken device may give an extreme offset like 0xFFFF0 and a reasonable length for a fragment. In the sanity check as formulated now, this will create an integer overflow, defeating the sanity check. Both offset and offset + len need to be checked in such a manner that no overflow can occur. And those quantities should be unsigned.
CVE-2022-48939	In the Linux kernel, the following vulnerability has been resolved: bpf: Add schedule points in batch ops syzbot reported various soft lockups caused by bpf batch operations. INFO: task kworker/1:1:27 blocked for more than 140 seconds. INFO: task hung in rcu_barrier Nothing prevents batch ops to process huge amount of data, we need to add schedule points in them. Note that maybe_wait_bpf_programs(map) calls from generic_map_delete_batch() can be factorized by moving the call after the loop. This will be done later in -next tree once we get this fix merged, unless there is strong opinion doing this optimization sooner.
CVE-2022-48943	In the Linux kernel, the following vulnerability has been resolved: KVM: x86/mmu: make apf token non-zero to fix bug In current async pagefault logic, when a page is ready, KVM relies on kvm_arch_can_dequeue_async_page_present() to determine whether to deliver a READY event to the Guest. This function test token value of struct kvm_vcpu_pv_apf_data, which must be reset to zero by Guest kernel when a READY event is finished by Guest. If value is zero meaning that a READY event is done, so the KVM can deliver another. But the kvm_arch_setup_async_pf() may produce a valid token with zero value, which is confused with previous mention and may lead the loss of this READY event. This bug may cause task blocked forever in Guest: INFO: task stress:7532 blocked for more than 1254 seconds. Not tainted 5.10.0 #16 "echo 0 > /proc/sys/kernel/hung_task_timeout_secs" disables this message. task:stress state:D stack: 0 pid: 7532 ppid: 1409 flags:0x00000080 Call Trace: __schedule+0x1e7/0x650 schedule+0x46/0xb0 kvm_async_pf_task_wait_schedule+0xad/0xe0 ? exit_to_user_mode_prepare+0x60/0x70 __kvm_handle_async_pf+0x4f/0xb0 ? asm_exc_page_fault+0x8/0x30 exc_page_fault+0x6f/0x110 ? asm_exc_page_fault+0x8/0x30 asm_exc_page_fault+0x1e/0x30 RIP: 0033:0x402d00 RSP: 002b:00007ffd31912500 EFLAGS: 00010206 RAX: 00000000000071000 RBX: ffffffff00000000 RCX: 000000000021a32b0 RDX: 0000000000007d011 RSI: 0000000000007d000 RDI: 000000000021262b0 RBP: 000000000021262b0 R08: 0000000000000003 R09: 0000000000000086 R10: 000000000000000eb R11: 00007fbbdf2baa0 R12: 0000000000000000 R13: 0000000000000002 R14: 0000000000007d000 R15: 0000000000001000
CVE-2022-48946	In the Linux kernel, the following vulnerability has been resolved: udf: Fix preallocation discarding at indirect extent boundary When preallocation extent is the first one in the extent block, the code would corrupt extent tree header instead. Fix the problem and use udf_delete_aext() for deleting extent to avoid some code duplication.
CVE-2022-48950	In the Linux kernel, the following vulnerability has been resolved: perf: Fix perf_pending_task() UaF Per syzbot it is possible for perf_pending_task() to run after the event is free()'d. There are two related but distinct cases: - the task_work was already queued before destroying the event; - destroying the event itself queues the task_work. The first cannot be solved using task_work_cancel() since perf_release() itself might be called from a task_work (____fput), which means the current->task_works list is already empty and task_work_cancel() won't be able to find the perf_pending_task() entry. The simplest alternative is extending the perf_event lifetime to cover the task_work. The second is just silly, queueing a task_work while you know the event is going away makes no sense and is easily avoided by re-arranging how the event is marked STATE_DEAD and ensuring it goes through STATE_OFF on the way down.
CVE-2022-48951	In the Linux kernel, the following vulnerability has been resolved: ASoC: ops: Check bounds for second channel in snd_soc_put_volsw_sx() The bounds checks in snd_soc_put_volsw_sx() are only being applied to the first channel, meaning it is possible to write out of bounds values to the second channel in stereo controls. Add appropriate checks.

CVE ID	Description
CVE-2022-48953	In the Linux kernel, the following vulnerability has been resolved: rtc: cmos: Fix event handler registration ordering issue Because <code>acpi_install_fixed_event_handler()</code> enables the event automatically on success, it is incorrect to call it before the handler routine passed to it is ready to handle events. Unfortunately, the rtc-cmos driver does exactly the incorrect thing by calling <code>cmos_wake_setup()</code> , which passes <code>rtc_handler()</code> to <code>acpi_install_fixed_event_handler()</code> , before <code>cmos_do_probe()</code> , because <code>rtc_handler()</code> uses <code>dev_get_drvdata()</code> to get to the cmos object pointer and the driver data pointer is only populated in <code>cmos_do_probe()</code> . This leads to a NULL pointer dereference in <code>rtc_handler()</code> on boot if the RTC fixed event happens to be active at the init time. To address this issue, change the initialization ordering of the driver so that <code>cmos_wake_setup()</code> is always called after a successful <code>cmos_do_probe()</code> call. While at it, change <code>cmos_pnp_probe()</code> to call <code>cmos_do_probe()</code> after the initial <code>if ()</code> statement used for computing the IRQ argument to be passed to <code>cmos_do_probe()</code> which is cleaner than calling it in each branch of that <code>if ()</code> (local variable "irq" can be of type int, because it is passed to that function as an argument of type int). Note that commit 6492fed7d8c9 ("rtc: rtc-cmos: Do not check ACPI_FADT_LOW_POWER_S0") caused this issue to affect a larger number of systems, because previously it only affected systems with <code>ACPI_FADT_LOW_POWER_S0</code> set, but it is present regardless of that commit.
CVE-2022-48961	In the Linux kernel, the following vulnerability has been resolved: net: mdio: fix unbalanced fwnode reference count in <code>mdio_device_release()</code> There is warning report about of_node refcount leak while probing mdio device: OF: ERROR: memory leak, expected refcount 1 instead of 2, of_node_get()/of_node_put() unbalanced - destroy cset entry: attach overlay node /spi/soc@0/mdio@710700c0/ethernet@4 In <code>of_mdibus_register_device()</code> , we increase fwnode refcount by <code>fwnode_handle_get()</code> before associating the of_node with mdio device, but it has never been decreased in normal path. Since that, in <code>mdio_device_release()</code> , it needs to call <code>fwnode_handle_put()</code> in addition instead of calling <code>kfree()</code> directly. After above, just calling <code>mdio_device_free()</code> in the error handle path of <code>of_mdibus_register_device()</code> is enough to keep the refcount balanced.
CVE-2022-48969	In the Linux kernel, the following vulnerability has been resolved: xen-netfront: Fix NULL string after live migration A NAPI is setup for each network string to poll data to kernel The string with source host is destroyed before live migration and new string with target host is setup after live migration. The NAPI for the old string is not deleted until setup new string with target host after migration. With <code>busy_poll/</code> <code>busy_read</code> enabled, the NAPI can be polled before got deleted when resume VM. BUG: unable to handle kernel NULL pointer dereference at 0000000000000008 IP: <code>xennet_poll+0xae/0xd20 PGD 0 P4D 0</code> Oops: 0000 [#1] SMP PTI Call Trace: <code>finish_task_switch+0x71/0x230 timerqueue_del+0x1d/0x40 hrtimer_try_to_cancel+0xb5/0x110 xennet_alloc_rx_buffers+0x2a0/0x2a0 napi_busy_loop+0xdb/0x270 sock_poll+0x87/0x90 do_sys_poll+0x26f/0x580 tracing_map_insert+0x1d4/0x2f0 event_hist_trigger+0x14a/0x260 finish_task_switch+0x71/0x230 __schedule+0x256/0x890 recalc_sigpending+0x1b/0x50 xen_sched_clock+0x15/0x20 __rb_reserve_next+0x12d/0x140 ring_buffer_lock_reserve+0x123/0x3d0 event_triggers_call+0x87/0xb0 trace_event_buffer_commit+0x1c4/0x210 xen_clocksource_get_cycles+0x15/0x20 ktime_get_ts64+0x51/0xf0 SyS_ppoll+0x160/0x1a0 SyS_ppoll+0x160/0x1a0 do_syscall_64+0x73/0x130 entry_SYSCALL_64_after_hwframe+0x41/0xae ... CVE-2022-48971	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix not cleanup led when <code>bt_init</code> fails <code>bt_init()</code> calls <code>bt_leds_init()</code> to register led, but if it fails later, <code>bt_leds_cleanup()</code> is not called to unregister it. This can cause panic if the argument "bluetooth-power" in text is freed and then another <code>led_trigger_register()</code> tries to access it: BUG: unable to handle page fault for address: <code>ffffffffffc06d3bc0 RIP: 0010:strcmp+0xc/0x30 Call Trace: <TASK> led_trigger_register+0x10d/0x4f0 led_trigger_register_simple+0x7d/0x100 bt_init+0x39/0xf7 [bluetooth] do_one_initcall+0xd0/0x4e0</code>
CVE-2022-48972	In the Linux kernel, the following vulnerability has been resolved: mac802154: fix missing INIT_LIST_HEAD in <code>ieee802154_if_add()</code> Kernel fault injection test reports null-ptr-deref as follows: BUG: kernel NULL pointer dereference, address: 0000000000000008 RIP: <code>0010:cfg802154_netdev_notifier_call+0x120/0x310 include/linux/list.h:114 Call Trace: <TASK> raw_notifier_call_chain+0x6d/0xa0 kernel/notifier.c:87 call_netdevice_notifiers_info+0x6e/0xc0 net/core/dev.c:1944 unregister_netdevice_many_notify+0x60d/0xcb0 net/core/dev.c:1982 unregister_netdevice_queue+0x154/0x1a0 net/core/dev.c:10879 register_netdevice+0x9a8/0xb90 net/core/dev.c:10083 ieee802154_if_add+0x6ed/0x7e0 net/mac802154/iface.c:659 ieee802154_register_hw+0x29c/0x330 net/mac802154/main.c:229 mcr20a_probe+0xaa/0xcb1 drivers/net/ieee802154/mcr20a.c:1316 ieee802154_if_add() allocates <code>wpan_dev</code> as netdev's private data, but not init the list in struct <code>wpan_dev</code>. <code>cfg802154_netdev_notifier_call()</code> manage the list when device register/unregister, and may lead to null-ptr-deref. Use <code>INIT_LIST_HEAD()</code> on it to initialize it correctly.</code>

CVE ID	Description
CVE-2022-48975	In the Linux kernel, the following vulnerability has been resolved: gpiolib: fix memory leak in gpiochip_setup_dev() Here is a backtrace report about memory leak detected in gpiochip_setup_dev(): unreferenced object 0xffff88810b406400 (size 512): comm "python3", pid 1682, jiffies 4295346908 (age 24.090s) backtrace: kmalloc_trace device_add device_private_init at drivers/base/core.c:3361 (inlined by) device_add at drivers/base/core.c:3411 cdev_device_add gpiolib_cdev_register gpiochip_setup_dev gpiochip_add_data_with_key gcdev_register() & gcdev_unregister() would call device_add() & device_del() (no matter CONFIG_GPIO_CDEV is enabled or not) to register/unregister device. However, if device_add() succeeds, some resource (like struct device_private allocated by device_private_init()) is not released by device_del(). Therefore, after device_add() succeeds by gcdev_register(), it needs to call put_device() to release resource in the error handle path. Here we move forward the register of release function, and let it release every piece of resource by put_device() instead of kfree(). While at it, fix another subtle issue, i.e. when gc->ngpio is equal to 0, we still call kcalloc() and, in case of further error, kfree() on the ZERO_PTR pointer, which is not NULL. It's not a bug per se, but rather waste of the resources and potentially wrong expectation about contents of the gdev->descs variable.
CVE-2022-48977	In the Linux kernel, the following vulnerability has been resolved: can: af_can: fix NULL pointer dereference in can_rcv_filter Analogue to commit 8aa59e355949 ("can: af_can: fix NULL pointer dereference in can_rx_register()") we need to check for a missing initialization of ml_priv in the receive path of CAN frames. Since commit 4e096a18867a ("net: introduce CAN specific pointer in the struct net_device") the check for dev->type to be ARPHRD_CAN is not sufficient anymore since bonding or tun netdevices claim to be CAN devices but do not initialize ml_priv accordingly.
CVE-2022-48978	In the Linux kernel, the following vulnerability has been resolved: HID: core: fix shift-out-of-bounds in hid_report_raw_event Syzbot reported shift-out-of-bounds in hid_report_raw_event. microsoft 0003:045E:07DA.0001: hid_field_extract() called with n (128) > 32! Fix this by adding a check on the size of the integer (unsigned n) in snto32(). To add support for n greater than 32 bits, set n to 32, if n is greater than 32.
CVE-2022-48979	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: fix array index out of bound error in DCN32 DML [Why&How] LinkCapacitySupport array is indexed with the number of voltage states and not the number of max DPPs. Fix the error by changing the array declaration to use the correct (larger) array size of total number of voltage states.

CVE ID	Description
CVE-2022-48982	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: Fix crash when replugging CSR fake controllers It seems fake CSR 5.0 clones can cause the suspend notifier to be registered twice causing the following kernel panic: [71.986122] Call Trace: [71.986124] <TASK> [71.986125] blocking_notifier_chain_register+0x33/0x60 [71.986130] hci_register_dev +0x316/0x3d0 [bluetooth 99b5497ea3d09708fa1366c1dc03288bf3cca8da] [71.986154] btusb_probe+0x979/0xd85 [btusb e1e0605a4f4c01984a4b9c8ac58c3666ae287477] [71.986159] ? __pm_runtime_set_status+0x1a9/0x300 [71.986162] ? ktime_get_mono_fast_ns+0x3e/0x90 [71.986167] usb_probe_interface+0xe3/0x2b0 [71.986171] really_probe+0xdb/0x380 [71.986174] ? pm_runtime_barrier+0x54/0x90 [71.986177] __driver_probe_device+0x78/0x170 [71.986180] driver_probe_device+0x1f/0x90 [71.986183] __device_attach_driver+0x89/0x110 [71.986186] ? driver_allows_async_probing+0x70/0x70 [71.986189] bus_for_each_drv+0x8c/0xe0 [71.986192] __device_attach+0xb2/0x1e0 [71.986195] bus_probe_device+0x92/0xb0 [71.986198] device_add +0x422/0x9a0 [71.986201] ? sysfs_merge_group+0xd4/0x110 [71.986205] usb_set_configuration +0x57a/0x820 [71.986208] usb_generic_driver_probe+0x4f/0x70 [71.986211] usb_probe_device +0x3a/0x110 [71.986213] really_probe+0xdb/0x380 [71.986216] ? pm_runtime_barrier+0x54/0x90 [71.986219] __driver_probe_device+0x78/0x170 [71.986221] driver_probe_device+0x1f/0x90 [71.986224] __device_attach_driver+0x89/0x110 [71.986227] ? driver_allows_async_probing +0x70/0x70 [71.986230] bus_for_each_drv+0x8c/0xe0 [71.986232] __device_attach+0xb2/0x1e0 [71.986235] bus_probe_device+0x92/0xb0 [71.986237] device_add+0x422/0x9a0 [71.986239] ? _dev_info+0x7d/0x98 [71.986242] ? blake2s_update+0x4c/0xc0 [71.986246] usb_new_device.cold +0x148/0x36d [71.986250] hub_event+0xa8a/0x1910 [71.986255] process_one_work+0x1c4/0x380 [71.986259] worker_thread+0x51/0x390 [71.986262] ? rescuer_thread+0x3b0/0x3b0 [71.986264] kthread+0xdb/0x110 [71.986266] ? kthread_complete_and_exit+0x20/0x20 [71.986268] ret_from_fork +0x1f/0x30 [71.986273] </TASK> [71.986274] ---[end trace 0000000000000000]--- [71.986284] btusb: probe of 2-1.6:1.0 failed with error -17
CVE-2022-48985	In the Linux kernel, the following vulnerability has been resolved: net: mana: Fix race on per-CQ variable napi_work_done After calling napi_complete_done(), the NAPIF_STATE_SCHED bit may be cleared, and another CPU can start napi thread and access per-CQ variable, cq->work_done. If the other thread (for example, from busy_poll) sets it to a value >= budget, this thread will continue to run when it should stop, and cause memory corruption and panic. To fix this issue, save the per-CQ work_done variable in a local variable before napi_complete_done(), so it won't be corrupted by a possible concurrent thread after napi_complete_done(). Also, add a flag bit to advertise to the NIC firmware: the NAPI work_done variable race is fixed, so the driver is able to reliably support features like busy_poll.
CVE-2022-48986	In the Linux kernel, the following vulnerability has been resolved: mm/gup: fix gup_pud_range() for dax For dax pud, pud_huge() returns true on x86. So the function works as long as hugetlb is configured. However, dax doesn't depend on hugetlb. Commit 414fd080d125 ("mm/gup: fix gup_pmd_range() for dax") fixed devmap-backed huge PMDs, but missed devmap-backed huge PUDs. Fix this as well. This fixes the below kernel panic: general protection fault, probably for non-canonical address 0x69e7c000cc478: 0000 [#1] SMP < snip > Call Trace: <TASK> get_user_pages_fast +0x1f/0x40 iov_iter_get_pages+0xc6/0x3b0 ? mempool_alloc+0x5d/0x170 bio_iov_iter_get_pages +0x82/0x4e0 ? bvec_alloc+0x91/0xc0 ? bio_alloc_bioset+0x19a/0x2a0 blkdev_direct_IO +0x282/0x480 ? __io_complete_rw_common+0xc0/0xc0 ? filemap_range_has_page+0x82/0xc0 generic_file_direct_write+0x9d/0x1a0 ? inode_update_time+0x24/0x30 __generic_file_write_iter +0xbd/0x1e0 blkdev_write_iter+0xb4/0x150 ? io_import_iovec+0x8d/0x340 io_write+0xf9/0x300 io_issue_sqe+0x3c3/0x1d30 ? sysvec_reschedule_ipi+0x6c/0x80 __io_queue_sqe+0x33/0x240 ? fget +0x76/0xa0 io_submit_sqes+0xe6a/0x18d0 ? __fget_light+0xd1/0x100 __x64_sys_io_uring_enter +0x199/0x880 ? __context_tracking_enter+0x1f/0x70 ? irqentry_exit_to_user_mode+0x24/0x30 ? irqentry_exit+0x1d/0x30 ? __context_tracking_exit+0xe/0x70 do_syscall_64+0x3b/0x90 entry_SYSCALL_64_after_hwframe+0x61/0xcb RIP: 0033:0x7fc97c11a7be < snip > </TASK> ---[end trace 48b2e0e67debcaeb]--- RIP: 0010:internal_get_user_pages_fast+0x340/0x990 < snip > Kernel panic - not syncing: Fatal exception Kernel Offset: disabled
CVE-2022-48987	In the Linux kernel, the following vulnerability has been resolved: media: v4l2-dv-timings.c: fix too strict blanking sanity checks Sanity checks were added to verify the v4l2_bt_timings blanking fields in order to avoid integer overflows when userspace passes weird values. But that assumed that userspace would correctly fill in the front porch, backporch and sync values, but sometimes all you know is the total blanking, which is then assigned to just one of these fields. And that can fail with these checks. So instead set a maximum for the total horizontal and vertical blanking and check that each field remains below that. That is still sufficient to avoid integer overflows, but it also allows for more flexibility in how userspace fills in these fields.

CVE ID	Description
CVE-2022-48988	In the Linux kernel, the following vulnerability has been resolved: memcg: fix possible use-after-free in memcg_write_event_control() memcg_write_event_control() accesses the dentry->d_name of the specified control fd to route the write call. As a cgroup interface file can't be renamed, it's safe to access d_name as long as the specified file is a regular cgroup file. Also, as these cgroup interface files can't be removed before the directory, it's safe to access the parent too. Prior to 347c4a874710 ("memcg: remove cgroup_event->cft"), there was a call to __file_cft() which verified that the specified file is a regular cgroupfs file before further accesses. The cftype pointer returned from __file_cft() was no longer necessary and the commit inadvertently dropped the file type check with it allowing any file to slip through. With the invariants broken, the d_name and parent accesses can now race against renames and removals of arbitrary files and cause use-after-free's. Fix the bug by resurrecting the file type check in __file_cft(). Now that cgroupfs is implemented through kernfs, checking the file operations needs to go through a layer of indirection. Instead, let's check the superblock and dentry type.
CVE-2022-4899	A vulnerability was found in zstd v1.4.10, where an attacker can supply empty string as an argument to the command line tool to cause buffer overrun.
CVE-2022-48990	In the Linux kernel, the following vulnerability has been resolved: drm/amdgpu: fix use-after-free during gpu recovery [Why] [754.862560] refcount_t: underflow; use-after-free. [754.862898] Call Trace: [754.862903] <TASK> [754.862913] amdgpu_job_free_cb+0xc2/0xe1 [amdgpu] [754.863543] drm_sched_main.cold+0x34/0x39 [amd_sched] [How] The fw_fence may be not init, check whether dma_fence_init is performed before job free
CVE-2022-48991	In the Linux kernel, the following vulnerability has been resolved: mm/khugepaged: invoke MMU notifiers in shmem/file collapse paths Any codepath that zaps page table entries must invoke MMU notifiers to ensure that secondary MMUs (like KVM) don't keep accessing pages which aren't mapped anymore. Secondary MMUs don't hold their own references to pages that are mirrored over, so failing to notify them can lead to page use-after-free. I'm marking this as addressing an issue introduced in commit f3f0e1d2150b ("khugepaged: add support of collapse for tmpfs/shmem pages"), but most of the security impact of this only came in commit 27e1f8273113 ("khugepaged: enable collapse pmd for pte-mapped THP"), which actually omitted flushes for the removal of present PTEs, not just for the removal of empty page tables.
CVE-2022-48994	In the Linux kernel, the following vulnerability has been resolved: ALSA: seq: Fix function prototype mismatch in snd_seq_expand_var_event With clang's kernel control flow integrity (kCFI, CONFIG_CFI_CLANG), indirect call targets are validated against the expected function pointer prototype to make sure the call target is valid to help mitigate ROP attacks. If they are not identical, there is a failure at run time, which manifests as either a kernel panic or thread getting killed. seq_copy_in_user() and seq_copy_in_kernel() did not have prototypes matching snd_seq_dump_func_t. Adjust this and remove the casts. There are not resulting binary output differences. This was found as a result of Clang's new -Wcast-function-type-strict flag, which is more sensitive than the simpler -Wcast-function-type, which only checks for type width mismatches.

CVE ID	Description
CVE-2022-49003	In the Linux kernel, the following vulnerability has been resolved: nvme: fix SRCU protection of nvme_ns_head list Walking the nvme_ns_head siblings list is protected by the head's srcu in nvme_ns_head_submit_bio() but not nvme_mpath_revalidate_paths(). Removing namespaces from the list also fails to synchronize the srcu. Concurrent scan work can therefore cause use-after-frees. Hold the head's srcu lock in nvme_mpath_revalidate_paths() and synchronize with the srcu, not the global RCU, in nvme_ns_remove(). Observed the following panic when making NVMe/RDMA connections with native multipath on the Rocky Linux 8.6 kernel (it seems the upstream kernel has the same race condition). Disassembly shows the faulting instruction is cmp 0x50(%rdx),%rcx; computing capacity != get_capacity(ns->disk). Address 0x50 is dereferenced because ns->disk is NULL. The NULL disk appears to be the result of concurrent scan work freeing the namespace (note the log line in the middle of the panic). [37314.206036] BUG: unable to handle kernel NULL pointer dereference at 0000000000000050 [37314.206036] nvme0n3: detected capacity change from 0 to 11811160064 [37314.299753] PGD 0 P4D 0 [37314.299756] Oops: 0000 [#1] SMP PTI [37314.299759] CPU: 29 PID: 322046 Comm: kworker/u98:3 Kdump: loaded Tainted: G W X ----- - - 4.18.0-372.32.1.el8test86.x86_64 #1 [37314.299762] Hardware name: Dell Inc. CVE-2022-49005	In the Linux kernel, the following vulnerability has been resolved: ASoC: ops: Fix bounds check for _sx controls For _sx controls the semantics of the max field is not the usual one, max is the number of steps rather than the maximum value. This means that our check in snd_soc_put_volsw_sx() needs to just check against the maximum value.

CVE ID	Description
CVE-2022-49006	In the Linux kernel, the following vulnerability has been resolved: tracing: Free buffers when a used dynamic event is removed After 65536 dynamic events have been added and removed, the "type" field of the event then uses the first type number that is available (not currently used by other events). A type number is the identifier of the binary blobs in the tracing ring buffer (known as events) to map them to logic that can parse the binary blob. The issue is that if a dynamic event (like a kprobe event) is traced and is in the ring buffer, and then that event is removed (because it is dynamic, which means it can be created and destroyed), if another dynamic event is created that has the same number that new event's logic on parsing the binary blob will be used. To show how this can be an issue, the following can crash the kernel: # cd /sys/kernel/tracing # for i in `seq 65536`; do echo 'p:kprobes/foo do_sys_openat2 \$arg1:u32' > kprobe_events # done For every iteration of the above, the writing to the kprobe_events will remove the old event and create a new one (with the same format) and increase the type number to the next available on until the type number reaches over 65535 which is the max number for the 16 bit type. After it reaches that number, the logic to allocate a new number simply looks for the next available number. When an dynamic event is removed, that number is then available to be reused by the next dynamic event created. That is, once the above reaches the max number, the number assigned to the event in that loop will remain the same. Now that means deleting one dynamic event and created another will reuse the previous events type number. This is where bad things can happen. After the above loop finishes, the kprobes/foo event which reads the do_sys_openat2 function call's first parameter as an integer. # echo 1 > kprobes/foo/enable # cat /etc/passwd > /dev/null # cat trace cat-2211 [005] 2007.849603: foo: (do_sys_openat2+0x0/0x130) arg1=4294967196 cat-2211 [005] 2007.849620: foo: (do_sys_openat2+0x0/0x130) arg1=4294967196 cat-2211 [005] 2007.849838: foo: (do_sys_openat2+0x0/0x130) arg1=4294967196 cat-2211 [005] 2007.849880: foo: (do_sys_openat2+0x0/0x130) arg1=4294967196 # echo 0 > kprobes/foo/enable Now if we delete the kprobe and create a new one that reads a string: # echo 'p:kprobes/foo do_sys_openat2 +0(\$arg2):string' > kprobe_events And now we can the trace: # cat trace sendmail-1942 [002] 530.136320: foo: (do_sys_openat2+0x0/0x240) arg1= cat-2046 [004] 530.930817: foo: (do_sys_openat2+0x0/0x240) arg1= cat-2046 [004] 530.930961: foo: (do_sys_openat2+0x0/0x240) arg1= cat-2046 [004] 530.934278: foo: (do_sys_openat2+0x0/0x240) arg1= cat-2046 [004] 530.934563: foo: (do_sys_openat2+0x0/0x240) arg1= ---truncated---
CVE-2022-49013	In the Linux kernel, the following vulnerability has been resolved: sctp: fix memory leak in sctp_stream_outq_migrate() When sctp_stream_outq_migrate() is called to release stream out resources, the memory pointed to by prio_head in stream out is not released. The memory leak information is as follows: unreferenced object 0xffff88801fe79f80 (size 64): comm "sctp_repo", pid 7957, jiffies 4294951704 (age 36.480s) hex dump (first 32 bytes): 80 9f e7 1f 80 88 ff ff 80 9f e7 1f 80 88 ff ff 90 9f e7 1f 80 88 ff ff 90 9f e7 1f 80 88 ff ff backtrace: [<ffff8b1b215c6>] kmalloc_trace+0x26/0x60 [<ffff8b1b215c6>] sctp_sched_prio_set+0x4cc/0x770 [<ffff8b1b215c6>] sctp_stream_init_ext+0xd2/0x1b0 [<ffff8b1b215c6>] sctp_sendmsg_to_asoc+0x1614/0x1a30 [<ffff8b1b215c6>] sctp_sendmsg+0xda1/0x1ef0 [<ffff8b1b215c6>] inet_sendmsg+0x9d/0xe0 [<ffff8b1b215c6>] sock_sendmsg+0xd3/0x120 [<ffff8b1b215c6>] __sys_sendto+0x23a/0x340 [<ffff8b1b215c6>] __x64_sys_sendto+0xe1/0x1b0 [<ffff8b1b215c6>] do_syscall_64+0x39/0xb0 [<ffff8b1b215c6>] entry_SYSCALL_64_after_hwframe+0x63/0xcd

CVE ID	Description
CVE-2022-49014	In the Linux kernel, the following vulnerability has been resolved: net: tun: Fix use-after-free in tun_detach() syzbot reported use-after-free in tun_detach() [1]. This causes call trace like below: <pre>===== BUG: KASAN: use-after-free in notifier_call_chain+0x1ee/0x200 kernel/notifier.c:75 Read of size 8 at addr ffff88807324e2a8 by task syz-executor.0/3673 CPU: 0 PID: 3673 Comm: syz-executor.0 Not tainted 6.1.0-rc5-syzkaller-00044-gcc675d22e422 #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 10/26/2022 Call Trace: <TASK> __dump_stack lib/dump_stack.c:88 [inline] dump_stack_lvl+0xd1/0x138 lib/ dump_stack.c:106 print_address_description mm/kasan/report.c:284 [inline] print_report+0x15e/0x461 mm/kasan/report.c:395 kasan_report+0xbf/0x1f0 mm/kasan/report.c:495 notifier_call_chain +0x1ee/0x200 kernel/notifier.c:75 call_netdevice_notifiers_info+0x86/0x130 net/core/dev.c:1942 call_netdevice_notifiers_extack net/core/dev.c:1983 [inline] call_netdevice_notifiers net/core/dev.c:1997 [inline] netdev_wait_allrefs_any net/core/dev.c:10237 [inline] netdev_run_todo+0xabc6/0x1100 net/ core/dev.c:10351 tun_detach drivers/net/tun.c:704 [inline] tun_chr_close+0xe4/0x190 drivers/net/ tun.c:3467 __fput+0x27c/0xa90 fs/file_table.c:320 task_work_run+0x16f/0x270 kernel/task_work.c:179 exit_task_work include/linux/task_work.h:38 [inline] do_exit+0xb3d/0x2a30 kernel/exit.c:820 do_group_exit+0xd4/0x2a0 kernel/exit.c:950 get_signal+0x21b1/0x2440 kernel/signal.c:2858 arch_do_signal_or_restart+0x86/0x2300 arch/x86/kernel/signal.c:869 exit_to_user_mode_loop kernel/ entry/common.c:168 [inline] exit_to_user_mode_prepare+0x15f/0x250 kernel/entry/common.c:203 __syscall_exit_to_user_mode_work kernel/entry/common.c:285 [inline] syscall_exit_to_user_mode +0x1d/0x50 kernel/entry/common.c:296 do_syscall_64+0x46/0xb0 arch/x86/entry/common.c:86 entry_SYSCALL_64_after_hwframe+0x63/0xcd The cause of the issue is that sock_put() from __tun_detach() drops last reference count for struct net, and then notifier_call_chain() from netdev_state_change() accesses that struct net. This patch fixes the issue by calling sock_put() from tun_detach() after all necessary accesses for the struct net has done.</pre>
CVE-2022-49017	In the Linux kernel, the following vulnerability has been resolved: tipc: re-fetch skb cb after tipc_msg_validate As the call trace shows, the original skb was freed in tipc_msg_validate(), and dereferencing the old skb cb would cause an use-after-free crash. BUG: KASAN: use-after-free in tipc_crypto_rcv_complete+0x1835/0x2240 [tipc] Call Trace: <IRQ> tipc_crypto_rcv_complete+0x1835/0x2240 [tipc] tipc_crypto_rcv+0xd32/0x1ec0 [tipc] tipc_rcv+0x744/0x1150 [tipc] ... CVE ID	Description
CVE-2022-49027	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix error handling in iavf_init_module() The iavf_init_module() won't destroy workqueue when pci_register_driver() failed. Call destroy_workqueue() when pci_register_driver() failed to prevent the resource leak. Similar to the handling of u132_hcd_init in commit f276e002793c ("usb: u132-hcd: fix resource leak")
CVE-2022-49028	In the Linux kernel, the following vulnerability has been resolved: ixgbev: Fix resource leak in ixgbev_init_module() ixgbev_init_module() won't destroy the workqueue created by create_singlethread_workqueue() when pci_register_driver() failed. Add destroy_workqueue() in fail path to prevent the resource leak. Similar to the handling of u132_hcd_init in commit f276e002793c ("usb: u132-hcd: fix resource leak")
CVE-2022-49029	In the Linux kernel, the following vulnerability has been resolved: hwmon: (ibmpex) Fix possible UAF when ibmpex_register_bmc() fails Smatch report warning as follows: drivers/hwmon/ibmpex.c:509 ibmpex_register_bmc() warn: '&data->list' not removed from list If ibmpex_find_sensors() fails in ibmpex_register_bmc(), data will be freed, but data->list will not be removed from driver_data.bmc_data, then list traversal may cause UAF. Fix by removing it from driver_data.bmc_data before free().
CVE-2022-49034	In the Linux kernel, the following vulnerability has been resolved: sh: cpuinfo: Fix a warning for CONFIG_CPUMASK_OFFSTACK When CONFIG_CPUMASK_OFFSTACK and CONFIG_DEBUG_PER_CPU_MAPS are selected, cpu_max_bits_warn() generates a runtime warning similar as below when showing /proc/cpuinfo. Fix this by using nr_cpu_ids (the runtime limit) instead of NR_CPUS to iterate CPUs. [3.052463] -----[cut here]----- [3.059679] WARNING: CPU: 3 PID: 1 at include/linux/cpumask.h:108 show_cpuinfo+0x5e8/0x5f0 [3.070072] Modules linked in: efivarfs autofs4 [3.076257] CPU: 0 PID: 1 Comm: systemd Not tainted 5.19-rc5+ #1052 [3.099465] Stack : 9000000100157b08 9000000000f18530 9000000000cf846c 9000000100154000 [3.109127] 9000000100157a50 0000000000000000 9000000100157a58 90000000000ef7430 [3.118774] 90000001001578e8 0000000000000040 0000000000000020 ffffffff [3.128412] 0000000000000000 1ab25f00ec96a37 900000010021de80 900000000101c890 [3.138056] 0000000000000000 0000000000000000 0000000000000000 0000000000000000 [3.147711] ffff8000339dc220 0000000000000001 0000000000000000 0000000000000000 [3.157364] 900000000101c998 0000000000000004 90000000000ef7430 0000000000000000 [3.167012] 0000000000000009 0000000000000006c 0000000000000000 0000000000000000 [3.176641] 9000000000d3de08 9000000001639390 90000000002086d8 00007ffff0080286 [3.186260] 00000000000000b0 0000000000000004 0000000000000000 0000000000071c1c [3.195868] ... CVE-2022-49044	In the Linux kernel, the following vulnerability has been resolved: dm integrity: fix memory corruption when tag_size is less than digest size It is possible to set up dm-integrity in such a way that the "tag_size" parameter is less than the actual digest size. In this situation, a part of the digest beyond tag_size is ignored. In this case, dm-integrity would write beyond the end of the ic->recalc_tags array and corrupt memory. The corruption happened in integrity_recalc->integrity_sector_checksum->crypto_shash_final. Fix this corruption by increasing the tags array so that it has enough padding at the end to accommodate the loop in integrity_recalc() being able to write a full digest size for the last member of the tags array.
CVE-2022-49048	In the Linux kernel, the following vulnerability has been resolved: ipv6: fix panic when forwarding a pkt with no in6 dev kongweibin reported a kernel panic in ip6_forward() when input interface has no in6 dev associated. The following tc commands were used to reproduce this panic: tc qdisc del dev vxlan100 root tc qdisc add dev vxlan100 root netem corrupt 5%

CVE ID	Description
CVE-2022-49052	In the Linux kernel, the following vulnerability has been resolved: mm: fix unexpected zeroed page mapping with zram swap Two processes under CLONE_VM cloning, user process can be corrupted by seeing zeroed page unexpectedly. CPU A CPU B do_swap_page do_swap_page SWP_SYNCHRONOUS_IO path SWP_SYNCHRONOUS_IO path swap_readpage valid data swap_slot_free_notify delete zram entry swap_readpage zeroed(invalid) data pte_lock map the *zero data* to userspace pte_unlock pte_lock if (!pte_same) goto out_nomap; pte_unlock return and next refault will read zeroed data The swap_slot_free_notify is bogus for CLONE_VM case since it doesn't increase the refcount of swap slot at copy_mm so it couldn't catch up whether it's safe or not to discard data from backing device. In the case, only the lock it could rely on to synchronize swap slot freeing is page table lock. Thus, this patch gets rid of the swap_slot_free_notify function. With this patch, CPU A will see correct data. CPU A CPU B do_swap_page do_swap_page SWP_SYNCHRONOUS_IO path SWP_SYNCHRONOUS_IO path swap_readpage original data pte_lock map the original data swap_free swap_range_free bd_disk->fops->swap_slot_free_notify swap_readpage read zeroed data pte_unlock pte_lock if (!pte_same) goto out_nomap; pte_unlock return on next refault will see mapped data by CPU B The concern of the patch would increase memory consumption since it could keep wasted memory with compressed form in zram as well as uncompressed form in address space. However, most of cases of zram uses no readahead and do_swap_page is followed by swap_free so it will free the compressed form from in zram quickly.
CVE-2022-49053	In the Linux kernel, the following vulnerability has been resolved: scsi: target: tcmu: Fix possible page UAF tcmu_try_get_data_page() looks up pages under cmdr_lock, but it does not take refcount properly and just returns page pointer. When tcmu_try_get_data_page() returns, the returned page may have been freed by tcmu_blocks_release(). We need to get_page() under cmdr_lock to avoid concurrent tcmu_blocks_release().
CVE-2022-49060	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix NULL pointer dereference in smc_pnet_find_ib() dev_name() was called with dev.parent as argument but without to NULL-check it before. Solve this by checking the pointer before the call to dev_name()).
CVE-2022-49063	In the Linux kernel, the following vulnerability has been resolved: ice: arfs: fix use-after-free when freeing @rx_cpu_rmap The CI testing bots triggered the following splat: [718.203054] BUG: KASAN: use-after-free in free_irq_cpu_rmap+0x53/0x80 [718.206349] Read of size 4 at addr ffff8881bd127e00 by task sh/20834 [718.212852] CPU: 28 PID: 20834 Comm: sh Kdump: loaded Tainted: G S W IOE 5.17.0-rc8_nextqueue-devqueue-02643-g23f3121aca93 #1 [718.219695] Hardware name: Intel Corporation S2600WFT/S2600WFT, BIOS SE5C620.86B.02.01.0012.070720200218 07/07/2020 [718.223418] Call Trace: [718.227139] [718.230783] dump_stack_lvl+0x33/0x42 [718.234431] print_address_description.constprop.9+0x21/0x170 [718.238177] ? free_irq_cpu_rmap+0x53/0x80 [718.241885] ? free_irq_cpu_rmap+0x53/0x80 [718.245539] kasan_report.cold.18+0x7f/0x11b [718.249197] ? free_irq_cpu_rmap+0x53/0x80 [718.252852] free_irq_cpu_rmap+0x53/0x80 [718.256471] ice_free_rx_rmap.part.11+0x37/0x50 [ice] [718.260174] ice_remove_arfs +0x5f/0x70 [ice] [718.263810] ice_rebuild_arfs+0x3b/0x70 [ice] [718.267419] ice_rebuild +0x39c/0xb60 [ice] [718.270974] ? asm_sysvec_apic_timer_interrupt+0x12/0x20 [718.274472] ? ice_init_phy_user_cfg+0x360/0x360 [ice] [718.278033] ? delay_tsc+0x4a/0xb0 [718.281513] ? preempt_count_sub+0x14/0xc0 [718.284984] ? delay_tsc+0x8f/0xb0 [718.288463] ice_do_reset +0x92/0xf0 [ice] [718.292014] ice_pci_err_resume+0x91/0xf0 [ice] [718.295561] pci_reset_function +0x53/0x80 <...> [718.393035] Allocated by task 690: [718.433497] Freed by task 20834: [718.495688] Last potentially related work creation: [718.568966] The buggy address belongs to the object at ffff8881bd127e00 which belongs to the cache kmalloc-96 of size 96 [718.574085] The buggy address is located 0 bytes inside of 96-byte region [ffff8881bd127e00, ffff8881bd127e60] [718.579265] The buggy address belongs to the page: [718.598905] Memory state around the buggy address: [718.601809] ffff8881bd127d00: fa fb fb fb fb fb fb fb fb fc fc fc [718.604796] ffff8881bd127d80: 00 00 00 00 00 00 00 00 00 fc fc fc fc [718.607794] >ffff8881bd127e00: fa fb fb fb fb fb fb fb fb fc fc fc [718.610811] ^ [718.613819] ffff8881bd127e80: 00 00 00 00 00 00 00 00 00 fc fc fc [718.617107] ffff8881bd127f00: fa fb fb fb fb fb fb fb fb fc fc fc This is due to that free_irq_cpu_rmap() is always being called *after* (devm_)free_irq() and thus it tries to work with IRQ desc's already freed. For example, on device reset the driver frees the rmap right before allocating a new one (the splat above). Make rmap creation and freeing function symmetrical with {request,free}_irq() calls i.e. do that on ifup/ifdown instead of device probe/remove/resume. These operations can be performed independently from the actual device aRFS configuration. Also, make sure ice_vsi_free_irq() clears IRQ affinity notifiers only when aRFS is disabled -- otherwise, CPU rmap sets and clears its own and they must not be touched manually.

CVE ID	Description
CVE-2022-49065	In the Linux kernel, the following vulnerability has been resolved: SUNRPC: Fix the svc_deferred_event trace class Fix a NULL deref crash that occurs when an svc_rqst is deferred while the sunrpc tracing subsystem is enabled. svc_revisit() sets dr->xprt to NULL, so it can't be relied upon in the tracepoint to provide the remote's address. Unfortunately we can't revert the "svc_deferred_class" hunk in commit ece200ddd54b ("sunrpc: Save remote presentation address in svc_xprt for trace events") because there is now a specific check of event format specifiers for unsafe dereferences. The warning that check emits is: event svc_defer_recv has unsafe dereference of argument 1 A "%pISpc" format specifier with a "struct sockaddr *" is indeed flagged by this check. Instead, take the brute-force approach used by the svcrdma_qp_error tracepoint. Convert the dr::addr field into a presentation address in the TP_fast_assign() arm of the trace event, and store that as a string. This fix can be backported to - stable kernels. In the meantime, commit c6ced22997ad ("tracing: Update print fmt check to handle new __get_sockaddr() macro") is now in v5.18, so this wonky fix can be replaced with __sockaddr() and friends properly during the v5.19 merge window.
CVE-2022-4907	Uninitialized Use in FFmpeg in Google Chrome prior to 108.0.5359.71 allowed a remote attacker to execute arbitrary code inside a sandbox via a crafted HTML page. (Chromium security severity: Medium)
CVE-2022-49070	In the Linux kernel, the following vulnerability has been resolved: fbdev: Fix unregistering of framebuffer without device OF framebuffers do not have an underlying device in the Linux device hierarchy. Do a regular unregister call instead of hot unplugging such a non-existing device. Fixes a NULL dereference. An example error message on ppc64le is shown below. BUG: Kernel NULL pointer dereference on read at 0x000000060 Faulting instruction address: 0xc00000000080dfa4 Oops: Kernel access of bad area, sig: 11 [#1] LE PAGE_SIZE=64K MMU=Hash SMP NR_CPUS=2048 NUMA pSeries [...] CPU: 2 PID: 139 Comm: systemd-udevd Not tainted 5.17.0-ae085d7f9365 #1 NIP: c00000000080dfa4 LR: c00000000080df9c CTR: c000000000797430 REGS: c000000004132fe0 TRAP: 0300 Not tainted (5.17.0-ae085d7f9365) MSR: 8000000002009033 <SF,VEC,EE,ME,IR,DR,RI,LE> CR: 28228282 XER: 20000000 CFAR: c00000000000c80c DAR: 0000000000000060 DSISR: 40000000 IRQMASK: 0 GPR00: c00000000080df9c c000000004133280 c00000000169d200 0000000000000029 GPR04: 00000000ffffefff c000000004132f90 c000000004132f88 0000000000000000 GPR08: c0000000015658f8 c0000000015cd200 c0000000014f57d0 00000000048228283 GPR12: 0000000000000000 c00000003ffe300 0000000020000000 0000000000000000 GPR16: 0000000000000000 0000000113fc4a40 0000000000000005 0000000113fcfb80 GPR20: 000001000f7283b0 0000000000000000 c000000000e4a588 c000000000e4a5b0 GPR24: 0000000000000001 000000000000a000 c008000000db0168 c0000000021f6ec0 GPR28: c0000000016d65a8 c000000004b36460 0000000000000000 c0000000016d64b0 NIP [c00000000080dfa4] do_remove_conflicting_framebuffers+0x184/0x1d0 [c000000004133280] [c00000000080df9c] do_remove_conflicting_framebuffers+0x17c/0x1d0 (unreliable) [c000000004133350] [c00000000080e4d0] remove_conflicting_framebuffers+0x60/0x150 [c0000000041333a0] [c00000000080e6f4] remove_conflicting_pci_framebuffers+0x134/0x1b0 [c000000004133450] [c008000000e70438] drm_aperture_remove_conflicting_pci_framebuffers+0x90/0x100 [drm] [c000000004133490] [c008000000da0ce4] bochs_pci_probe+0x6c/0xa64 [bochs] [...] [c000000004133db0] [c00000000002aaa0] system_call_exception+0x170/0x2d0 [c000000004133e10] [c00000000000c3cc] system_call_common+0xec/0x250 The bug [1] was introduced by commit 27599aacbaef ("fbdev: Hot-unplug firmware fb devices on forced removal"). Most firmware framebuffers have an underlying platform device, which can be hot-unplugged before loading the native graphics driver. OF framebuffers do not (yet) have that device. Fix the code by unregistering the framebuffer as before without a hot unplug. Tested with 5.17 on qemu ppc64le emulation.
CVE-2022-49072	In the Linux kernel, the following vulnerability has been resolved: gpio: Restrict usage of GPIO chip irq members before initialization GPIO chip irq members are exposed before they could be completely initialized and this leads to race conditions. One such issue was observed for the gc->irq.domain variable which was accessed through the I2C interface in gpiochip_to_irq() before it could be initialized by gpiochip_add_irqchip(). This resulted in Kernel NULL pointer dereference. Following are the logs for reference :- kernel: Call Trace: kernel: gpiod_to_irq+0x53/0x70 kernel: acpi_dev_gpio_irq_get_by+0x113/0x1f0 kernel: i2c_acpi_get_irq+0xc0/0xd0 kernel: i2c_device_probe+0x28a/0x2a0 kernel: really_probe+0xf2/0x460 kernel: RIP: 0010:gpiochip_to_irq+0x47/0xc0 To avoid such scenarios, restrict usage of GPIO chip irq members before they are completely initialized.
CVE-2022-49074	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3: Fix GICR_CTLR.RWP polling It turns out that our polling of RWP is totally wrong when checking for it in the redistributors, as we test the *distributor* bit index, whereas it is a different bit number in the RDs... Oopsie boo. This is embarrassing. Not only because it is wrong, but also because it took *8 years* to notice the blunder... Just fix the damn thing.

CVE ID	Description
CVE-2022-49076	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Fix use-after-free bug for mm struct Under certain conditions, such as MPI_Abort, the hfi1 cleanup code may represent the last reference held on the task mm. hfi1_mmu_rb_unregister() then drops the last reference and the mm is freed before the final use in hfi1_release_user_pages(). A new task may allocate the mm structure while it is still being used, resulting in problems. One manifestation is corruption of the mmap_sem counter leading to a hang in down_write(). Another is corruption of an mm struct that is in use by another task.
CVE-2022-49077	In the Linux kernel, the following vulnerability has been resolved: mremap.c: avoid pointless invalidate_range_start/end on mremap(old_size=0) If an mremap() syscall with old_size=0 ends up in move_page_tables(), it will call invalidate_range_start()/invalidate_range_end() unnecessarily, i.e. with an empty range. This causes a WARN in KVM's mmu_notifier. In the past, empty ranges have been diagnosed to be off-by-one bugs, hence the WARNING. Given the low (so far) number of unique reports, the benefits of detecting more buggy callers seem to outweigh the cost of having to fix cases such as this one, where userspace is doing something silly. In this particular case, an early return from move_page_tables() is enough to fix the issue.
CVE-2022-49078	In the Linux kernel, the following vulnerability has been resolved: lz4: fix LZ4_decompress_safe_partial read out of bound When partialDecoding, it is EOF if we've either filled the output buffer or can't proceed with reading an offset for following match. In some extreme corner cases when compressed data is suitably corrupted, UAF will occur. As reported by KASAN [1], LZ4_decompress_safe_partial may lead to read out of bound problem during decoding. lz4 upstream has fixed it [2] and this issue has been discussed here [3] before. current decompression routine was ported from lz4 v1.8.3, bumping lib/lz4 to v1.9.+ is certainly a huge work to be done later, so, we'd better fix it first. [1] https://lore.kernel.org/all/000000000000830d1205cf7f0477@google.com/ [2] https://github.com/lz4/lz4/commit/c5d6f8a8be3927c0bec91bcc58667a6cfad244ad# [3] https://lore.kernel.org/all/CC666AE8-4CA4-4951-B6FB-A2EFDE3AC03B@fb.com/
CVE-2022-49082	In the Linux kernel, the following vulnerability has been resolved: scsi: mpt3sas: Fix use after free in _scsih_expander_node_remove() The function mpt3sas_transport_port_remove() called in _scsih_expander_node_remove() frees the port field of the sas_expander structure, leading to the following use-after-free splat from KASAN when the ioc_info() call following that function is executed (e.g. when doing rmmmod of the driver module): [3479.371167] <pre> ===== [3479.378496] BUG: KASAN: use-after-free in _scsih_expander_node_remove+0x710/0x750 [mpt3sas] [3479.386936] Read of size 1 at addr ffff8881c037691c by task rmmmod/1531 [3479.393524] [3479.395035] CPU: 18 PID: 1531 Comm: rmmmod Not tainted 5.17.0-rc8+ #1436 [3479.401712] Hardware name: Supermicro Super Server/H12SSL-NT, BIOS 2.1 06/02/2021 [3479.409263] Call Trace: [3479.411743] <TASK> [3479.413875] dump_stack_lvl+0x45/0x59 [3479.417582] print_address_description.constprop.0+0x1f/0x120 [3479.423389] ? _scsih_expander_node_remove +0x710/0x750 [mpt3sas] [3479.429469] kasan_report.cold+0x83/0xdf [3479.433438] ? _scsi_h_expander_node_remove+0x710/0x750 [mpt3sas] [3479.439514] _scsi_h_expander_node_remove +0x710/0x750 [mpt3sas] [3479.445411] ? _raw_spin_unlock_irqrestore+0x2d/0x40 [3479.452032] scsih_remove+0x525/0xc90 [mpt3sas] [3479.458212] ? mpt3sas_expander_remove+0x1d0/0x1d0 [mpt3sas] [3479.465529] ? down_write+0xde/0x150 [3479.470746] ? up_write+0x14d/0x460 [3479.475840] ? kernfs_find_ns+0x137/0x310 [3479.481438] pci_device_remove+0x65/0x110 [3479.487013] __device_release_driver+0x316/0x680 [3479.493180] driver_detach+0x1ec/0x2d0 [3479.498499] bus_remove_driver+0xe7/0x2d0 [3479.504081] pci_unregister_driver+0x26/0x250 [3479.510033] _mpt3sas_exit+0x2b/0x6cf [mpt3sas] [3479.516144] __x64_sys_delete_module +0x2fd/0x510 [3479.522315] ? free_module+0xaa0/0xaa0 [3479.527593] ? __cond_resched +0x1c/0x90 [3479.532951] ? lockdep_hardirqs_on_prepare+0x273/0x3e0 [3479.539607] ? syscall_enter_from_user_mode+0x21/0x70 [3479.546161] ? trace_hardirqs_on+0x1c/0x110 [3479.551828] do_syscall_64+0x35/0x80 [3479.556884] entry_SYSCALL_64_after_hwframe +0x44/0xae [3479.563402] RIP: 0033:0x7f1fc482483b ... [3479.943087] ===== </pre> Fix this by introducing the local variable port_id to store the port ID value before executing mpt3sas_transport_port_remove(). This local variable is then used in the call to ioc_info() instead of dereferencing the freed port structure.
CVE-2022-49084	In the Linux kernel, the following vulnerability has been resolved: qede: confirm skb is allocated before using qede_build_skb() assumes build_skb() always works and goes straight to skb_reserve(). However, build_skb() can fail under memory pressure. This results in a kernel panic because the skb to reserve is NULL. Add a check in case build_skb() failed to allocate and return NULL. The NULL return is handled correctly in callers to qede_build_skb().

CVE ID	Description
CVE-2022-49089	In the Linux kernel, the following vulnerability has been resolved: IB/rdmavt: add lock to call to rvt_error_qp to prevent a race condition The documentation of the function rvt_error_qp says both r_lock and s_lock need to be held when calling that function. It also asserts using lockdep that both of those locks are held. However, the commit I referenced in Fixes accidentally makes the call to rvt_error_qp in rvt_ruc_loopback no longer covered by r_lock. This results in the lockdep assertion failing and also possibly in a race condition.
CVE-2022-49094	In the Linux kernel, the following vulnerability has been resolved: net/tls: fix slab-out-of-bounds bug in decrypt_internal The memory size of tls_ctx->rx.iv for AES128-CCM is 12 setting in tls_set_sw_offload(). The return value of crypto_aead_ivsize() for "ccm(aes)" is 16. So memcpy() require 16 bytes from 12 bytes memory space will trigger slab-out-of-bounds bug as following: ===== BUG: KASAN: slab-out-of-bounds in decrypt_internal+0x385/0xc40 [tls] Read of size 16 at addr ffff888114e84e60 by task tls/10911 Call Trace: <TASK> dump_stack_lvl+0x34/0x44 print_report.cold+0x5e/0x5db ? decrypt_internal+0x385/0xc40 [tls] kasan_report+0xab/0x120 ? decrypt_internal+0x385/0xc40 [tls] kasan_check_range+0xf9/0x1e0 memcpy+0x20/0x60 decrypt_internal+0x385/0xc40 [tls] ? tls_get_rec+0x2e0/0x2e0 [tls] ? process_rx_list+0x1a5/0x420 [tls] ? tls_setup_from_iter.constprop.0+0x2e0/0x2e0 [tls] decrypt_skb_update+0x9d/0x400 [tls] tls_sw_recvmsg+0x3c8/0xb50 [tls] Allocated by task 10911: kasan_save_stack+0x1e/0x40 __kasan_kmalloc+0x81/0xa0 tls_set_sw_offload+0x2eb/0xa20 [tls] tls_setsockopt+0x68c/0x700 [tls] __sys_setsockopt+0xfe/0x1b0 Replace the crypto_aead_ivsize() with prot->iv_size + prot->salt_size when memcpy() iv value in TLS_1_3_VERSION scenario.
CVE-2022-49096	In the Linux kernel, the following vulnerability has been resolved: net: sfc: add missing xdp queue reinitialization After rx/tx ring buffer size is changed, kernel panic occurs when it acts XDP_TX or XDP_REDIRECT. When tx/rx ring buffer size is changed(ethtool -G), sfc driver reallocates and reinitializes rx and tx queues and their buffer (tx_queue->buffer). But it misses reinitializing xdp queues(efx->xdp_tx_queues). So, while it is acting XDP_TX or XDP_REDIRECT, it uses the uninitialized tx_queue->buffer. A new function efx_set_xdp_channels() is separated from efx_set_channels() to handle only xdp queues. Splat looks like: BUG: kernel NULL pointer dereference, address: 000000000000002a #PF: supervisor write access in kernel mode #PF: error_code(0x0002) - not-present page PGD 0 P4D 0 Oops: 0002 [#4] PREEMPT SMP NOPTI RIP: 0010:efx_tx_map_chunk+0x54/0x90 [sfc] CPU: 2 PID: 0 Comm: swapper/2 Tainted: G D 5.17.0+ #55 e8beeee8289528f11357029357cf Code: 48 8b 8d a8 01 00 48 8d 14 52 4c 8d 2c d0 44 89 e0 48 85 c9 74 0e 44 89 e2 4c 89 f6 48 80 RSP: 0018:ffff92f121e45c60 EFLAGS: 00010297 RIP: 0010:efx_tx_map_chunk+0x54/0x90 [sfc] RAX: 0000000000000040 RBX: ffff92ea506895c0 RCX: ffffffff0330870 RDX: 0000000000000001 RSI: 00000001139b10ce RDI: ffff92ea506895c0 RBP: ffffffff0358a80 R08: 00000001139b110d R09: 0000000000000000 R10: 0000000000000001 R11: ffff92ea414c0088 R12: 0000000000000040 R13: 0000000000000018 R14: 00000001139b10ce R15: ffff92ea506895c0 FS: 0000000000000000(0000) GS:ffff92f121e00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 Code: 48 8b 8d a8 01 00 00 48 8d 14 52 4c 8d 2c d0 44 89 e0 48 85 c9 74 0e 44 89 e2 4c 89 f6 48 80 CR2: 000000000000002a CR3: 00000003e6810004 CR4: 00000000007706e0 RSP: 0018:ffff92f121e85c60 EFLAGS: 00010297 PKRU: 55555554 RAX: 0000000000000040 RBX: ffff92ea50689700 RCX: ffffffff0330870 RDX: 0000000000000001 RSI: 00000001145a90ce RDI: ffff92ea50689700 RBP: ffffffff0358a80 R08: 00000001145a910d R09: 0000000000000000 R10: 0000000000000001 R11: ffff92ea414c0088 R12: 0000000000000040 R13: 0000000000000018 R14: 00000001145a90ce R15: ffff92ea50689700 FS: 0000000000000000(0000) GS:ffff92f121e80000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 000000000000002a CR3: 00000003e6810005 CR4: 00000000007706e0 PKRU: 55555554 Call Trace: <IRQ> efx_xdp_tx_buffers+0x12b/0x3d0 [sfc 84c94b8e32d44d296c17e10a634d3ad454de4ba5] __efx_rx_packet+0x5c3/0x930 [sfc 84c94b8e32d44d296c17e10a634d3ad454de4ba5] efx_rx_packet+0x28c/0x2e0 [sfc 84c94b8e32d44d296c17e10a634d3ad454de4ba5] efx_ef10_ev_process+0x5f8/0xf40 [sfc 84c94b8e32d44d296c17e10a634d3ad454de4ba5] ? enqueue_task_fair+0x95/0x550 efx_poll+0xc4/0x360 [sfc 84c94b8e32d44d296c17e10a634d3ad454de4ba5]
CVE-2022-49097	In the Linux kernel, the following vulnerability has been resolved: NFS: Avoid writeback threads getting stuck in mempool_alloc() In a low memory situation, allow the NFS writeback code to fail without getting stuck in infinite loops in mempool_alloc().
CVE-2022-49100	In the Linux kernel, the following vulnerability has been resolved: virtio_console: eliminate anonymous module_init & module_exit Eliminate anonymous module_init() and module_exit(), which can lead to confusion or ambiguity when reading System.map, crashes/oops/bugs, or an initcall_debug log. Give each of these init and exit functions unique driver-specific names to eliminate the anonymous names. Example 1: (System.map) ffffffff832fc78c t init ffffffff832fc79e t init ffffffff832fc8f8 t init Example 2: (initcall_debug log) calling init+0x0/0x12 @ 1 initcall init+0x0/0x12 returned 0 after 15 usecs calling init+0x0/0x60 @ 1 initcall init+0x0/0x60 returned 0 after 2 usecs calling init+0x0/0x9a @ 1 initcall init+0x0/0x9a returned 0 after 74 usecs

CVE ID	Description
CVE-2022-49103	In the Linux kernel, the following vulnerability has been resolved: NFSv4.2: fix reference count leaks in <code>_nfs42_proc_copy_notify()</code> [You don't often get email from xiongx18@fudan.edu.cn. Learn why this is important at http://aka.ms/LearnAboutSenderIdIdentification .] The reference counting issue happens in two error paths in the function <code>_nfs42_proc_copy_notify()</code> . In both error paths, the function simply returns the error code and forgets to balance the refcount of object <code>`ctx`</code> , bumped by <code>get_nfs_open_context()</code> earlier, which may cause refcount leaks. Fix it by balancing refcount of the <code>`ctx`</code> object before the function returns in both error paths.
CVE-2022-49107	In the Linux kernel, the following vulnerability has been resolved: ceph: fix memory leak in <code>ceph_readdir</code> when <code>note_last_dentry</code> returns error Reset the <code>last_readdir</code> at the same time, and add a comment explaining why we don't free <code>last_readdir</code> when <code>dir_emit</code> returns false.
CVE-2022-49109	In the Linux kernel, the following vulnerability has been resolved: ceph: fix inode reference leakage in <code>ceph_get_snapdir()</code> The <code>ceph_get_inode()</code> will search for or insert a new inode into the hash for the given vino, and return a reference to it. If new is non-NULL, its reference is consumed. We should release the reference when in error handling cases.
CVE-2022-49110	In the Linux kernel, the following vulnerability has been resolved: netfilter: conntrack: revisit gc autotuning as of commit 4608dfc07e1 ("netfilter: conntrack: collect all entries in one cycle") conntrack gc was changed to run every 2 minutes. On systems where conntrack hash table is set to large value, most evictions happen from gc worker rather than the packet path due to hash table distribution. This causes netlink event overflows when events are collected. This change collects average expiry of scanned entries and reschedules to the average remaining value, within 1 to 60 second interval. To avoid event overflows, reschedule after each bucket and add a limit for both run time and number of evictions per run. If more entries have to be evicted, reschedule and restart 1 jiffy into the future.
CVE-2022-49113	In the Linux kernel, the following vulnerability has been resolved: powerpc/secvar: fix refcount leak in <code>format_show()</code> Refcount leak will happen when <code>format_show</code> returns failure in multiple cases. Unified management of <code>of_node_put</code> can fix this problem.
CVE-2022-49116	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: use memset avoid memory leaks Use <code>memset</code> to initialize structs to prevent memory leaks in <code>l2cap_ecred_connect</code>
CVE-2022-49118	In the Linux kernel, the following vulnerability has been resolved: scsi: hisi_sas: Free irq vectors in order for v3 HW If the driver probe fails to request the channel IRQ or fatal IRQ, the driver will free the IRQ vectors before freeing the IRQs in <code>free_irq()</code> , and this will cause a kernel BUG like this: -----[cut here]----- kernel BUG at drivers/pci/msi.c:369! Internal error: Oops - BUG: 0 [#1] PREEMPT SMP Call trace: free_msi_irqs+0x118/0x13c pci_disable_msi+0x9c/0x120 pci_free_irq_vectors+0x24/0x3c hisi_sas_v3_probe+0x360/0x9d0 [hisi_sas_v3_hw] local_pci_probe+0x44/0xb0 work_for_cpu_fn+0x20/0x34 process_one_work+0x1d0/0x340 worker_thread+0x2e0/0x460 kthread+0x180/0x190 ret_from_fork+0x10/0x20 ---[end trace b88990335b610c11]--- So we use <code>devm_add_action()</code> to control the order in which we free the vectors.

CVE ID	Description
CVE-2022-49123	In the Linux kernel, the following vulnerability has been resolved: ath11k: Fix frames flush failure caused by deadlock We are seeing below warnings: kernel: [25393.301506] ath11k_pci 0000:01:00.0: failed to flush mgmt transmit queue 0 kernel: [25398.421509] ath11k_pci 0000:01:00.0: failed to flush mgmt transmit queue 0 kernel: [25398.421831] ath11k_pci 0000:01:00.0: dropping mgmt frame for vdev 0, is_started 0 this means ath11k fails to flush mgmt. frames because wmi_mgmt_tx_work has no chance to run in 5 seconds. By setting /proc/sys/kernel/hung_task_timeout_secs to 20 and increasing ATH11K_FLUSH_TIMEOUT to 50 we get below warnings: kernel: [120.763160] INFO: task wpa_supplicant:924 blocked for more than 20 seconds. kernel: [120.763169] Not tainted 5.10.90 #12 kernel: [120.763177] "echo 0 > /proc/sys/kernel/hung_task_timeout_secs" disables this message. kernel: [120.763186] task:wpa_supplicant state:D stack: 0 pid: 924 ppid: 1 flags:0x000043a0 kernel: [120.763201] Call Trace: kernel: [120.763214] __schedule+0x785/0x12fa kernel: [120.763224] ? lockdep_hardirqs_on_prepare+0xe2/0x1bb kernel: [120.763242] schedule+0x7e/0xa1 kernel: [120.763253] schedule_timeout+0x98/0xfe kernel: [120.763266] ? run_local_timers+0x4a/0x4a kernel: [120.763291] ath11k_mac_flush_tx_complete+0x197/0x2b1 [ath11k 13c3a9bf37790f4ac8103b3decf7ab4008ac314a] kernel: [120.763306] ? init_wait_entry+0x2e/0x2e kernel: [120.763343] _ieee80211_flush_queues+0x167/0x21f [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763378] _ieee80211_recalc_idle+0x105/0x125 [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763411] _ieee80211_recalc_idle+0x14/0x27 [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763441] _ieee80211_free_chanctx+0x77/0xa2 [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763473] _ieee80211_vif_release_channel+0x100/0x131 [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763540] _ieee80211_vif_release_channel+0x66/0x81 [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763572] _ieee80211_destroy_auth_data+0xa3/0xe6 [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763612] _ieee80211_mgd_deauth+0x178/0x29b [mac80211 335da900954f1c5ea7f1613d92088ce83342042c] kernel: [120.763654] cfg80211_mlme_deauth+0x1a8/0x22c [cfg80211 8945aa5bc2af5f6972336665d8ad6f9c191ad5be] kernel: [120.763697] nl80211_deauthenticate+0xfa/0x123 [cfg80211 8945aa5bc2af5f6972336665d8ad6f9c191ad5be] kernel: [120.763715] genl_rcv_msg+0x392/0x3c2 kernel: [120.763750] ? nl80211_associate+0x432/0x432 [cfg80211 8945aa5bc2af5f6972336665d8ad6f9c191ad5be] kernel: [120.763782] ? nl80211_associate+0x432/0x432 [cfg80211 8945aa5bc2af5f6972336665d8ad6f9c191ad5be] kernel: [120.763802] ? genl_rcv+0x36/0x36 kernel: [120.763814] netlink_rcv_skb+0x89/0xf7 kernel: [120.763829] genl_rcv+0x28/0x36 kernel: [120.763840] netlink_unicast+0x179/0x24b kernel: [120.763854] netlink_sendmsg+0x393/0x401 kernel: [120.763872] sock_sendmsg+0x72/0x76 kernel: [120.763886] __sys_sendmsg+0x170/0x1e6 kernel: [120.763897] ? copy_msghdr_from_user+0x7a/0xa2 kernel: [120.763914] __sys_sendmsg+0x95/0xd1 kernel: [120.763940] __sys_sendmsg+0x85/0xbf kernel: [120.763956] do_syscall_64+0x43/0x55 kernel: [120.763966] entry_SYSCALL_64_after_hwframe+0x44/0xa9 kernel: [120.763977] RIP: 0033:0x79089f3fcc83 kernel: [120.763986] RSP: 002b:00007ffe604f0508 EFLAGS: 00000246 ORIG_RAX: 000000000000002e kernel: [120.763997] RAX: ffffffffefda RBX: 000059b40e987690 RCX: 000079089f3fcc83 kernel: [120.764006] RDX: 0000000000000000 RSI: 00007ffe604f0558 RDI: 0000000000000009 kernel: [120.764014] RBP: 00007ffe604f0540 R08: 0000000000000004 R09: 0000000000400000 kernel: [120.764023] R10: 00007ffe604f0638 R11: 0000000000000246 R12: 000059b40ea04980 kernel: [120.764032] R13: 00007ffe604 ---truncated---
CVE-2022-49124	In the Linux kernel, the following vulnerability has been resolved: x86/mce: Work around an erratum on fast string copy instructions A rare kernel panic scenario can happen when the following conditions are met due to an erratum on fast string copy instructions: 1) An uncorrected error. 2) That error must be in first cache line of a page. 3) Kernel must execute page_copy from the page immediately before that page. The fast string copy instructions ("REP; MOVS*") could consume an uncorrectable memory error in the cache line _right after_ the desired region to copy and raise an MCE. Bit 0 of MSR_IA32_MISC_ENABLE can be cleared to disable fast string copy and will avoid such spurious machine checks. However, that is less preferable due to the permanent performance impact. Considering memory poison is rare, it's desirable to keep fast string copy enabled until an MCE is seen. Intel has confirmed the following: 1. The CPU erratum of fast string copy only applies to Skylake, Cascade Lake and Cooper Lake generations. Directly return from the MCE handler: 2. Will result in complete execution of the "REP; MOVS*" with no data loss or corruption. 3. Will not result in another MCE firing on the next poisoned cache line due to "REP; MOVS*". 4. Will resume execution from a correct point in code. 5. Will result in the same instruction that triggered the MCE firing a second MCE immediately for any other software recoverable data fetch errors. 6. Is not safe without disabling the fast string copy, as the next fast string copy of the same buffer on the same CPU would result in a PANIC MCE. This should mitigate the erratum completely with the only caveat that the fast string copy is disabled on the affected hyper thread thus performance degradation. This is still better than the OS crashing on MCEs raised on an irrelevant process due to "REP; MOVS*" accesses in a kernel context, e.g., copy_page. Injected errors on 1st cache line of 8 anonymous pages of process 'proc1' and observed MCE consumption from 'proc2' with no panic (directly returned). Without the fix, the host panicked within a few minutes on a random 'proc2' process due to kernel access from copy_page. [bp: Fix comment style + touch ups, zap an unlikely(), improve the quirk function's readability.]

CVE ID	Description
CVE-2022-49126	In the Linux kernel, the following vulnerability has been resolved: scsi: mpi3mr: Fix memory leaks Fix memory leaks related to operational reply queue's memory segments which are not getting freed while unloading the driver.
CVE-2022-49129	In the Linux kernel, the following vulnerability has been resolved: mt76: mt7921: fix crash when startup fails. If the nic fails to start, it is possible that the reset_work has already been scheduled. Ensure the work item is canceled so we do not have use-after-free crash in case cleanup is called before the work item is executed. This fixes crash on my x86_64 apu2 when mt7921k radio fails to work. Radio still fails, but OS does not crash.
CVE-2022-49130	In the Linux kernel, the following vulnerability has been resolved: ath11k: mhi: use mhi_sync_power_up() If amss.bin was missing ath11k would crash during 'rmmod ath11k_pci'. The reason for that was that we were using mhi_async_power_up() which does not check any errors. But mhi_sync_power_up() on the other hand does check for errors so let's use that to fix the crash. I was not able to find a reason why an async version was used. ath11k_mhi_start() (which enables state ATH11K_MHI_POWER_ON) is called from ath11k_hif_power_up(), which can sleep. So sync version should be safe to use here. [145.569731] general protection fault, probably for non-canonical address 0xdffffc0000000000: 0000 [#1] PREEMPT SMP DEBUG_PAGEALLOC KASAN PTI [145.569789] KASAN: null-ptr-deref in range [0x0000000000000000-0x0000000000000007] [145.569843] CPU: 2 PID: 1628 Comm: rmmod Kdump: loaded Tainted: G W 5.16.0-wt-ath+ #567 [145.569898] Hardware name: Intel(R) Client Systems NUC8i7HVK/NUC8i7HVB, BIOS HNKBLi70.86A.0067.2021.0528.1339 05/28/2021 [145.569956] RIP: 0010:ath11k_hal_srng_access_begin+0xb5/0x2b0 [ath11k] [145.570028] Code: df 48 89 fa 48 c1 ea 03 80 3c 02 00 0f 85 ec 01 00 00 48 8b ab a8 00 00 00 48 b8 00 00 00 00 00 00 fc ff df 48 89 ea 48 c1 ea 03 <0f> b6 14 02 48 89 e8 83 e0 07 83 c0 03 45 85 ed 75 48 38 d0 7c 08 [145.570089] RSP: 0018:ffff9000025d7ac0 EFLAGS: 00010246 [145.570144] RAX: dffffc0000000000 RBX: ffff88814fca2dd8 RCX: 1fffffff50cb455 [145.570196] RDX: 0000000000000000 RSI: ffff88814fca2dd8 RDI: ffff88814fca2e80 [145.570252] RBP: 0000000000000000 R08: 0000000000000000 R09: ffffffff8659497 [145.570329] R10: fffffbfff50cb292 R11: 0000000000000001 R12: ffff88814fca0000 [145.570410] R13: 0000000000000000 R14: ffff88814fca2798 R15: ffff88814fca2dd8 [145.570465] FS: 00007fa399988540(0000) GS:ffff888233e00000(0000) knlGS:0000000000000000 [145.570519] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 [145.570571] CR2: 00007fa399b51421 CR3: 0000000137898002 CR4: 00000000003706e0 [145.570623] Call Trace: [145.570675] <TASK> [145.570727] ? ath11k_ce_tx_process_cb+0x34b/0x860 [ath11k] [145.570797] ath11k_ce_tx_process_cb+0x356/0x860 [ath11k] [145.570864] ? tasklet_init+0x150/0x150 [145.570919] ? ath11k_ce_alloc_pipes+0x280/0x280 [ath11k] [145.570986] ? tasklet_clear_sched+0x42/0xe0 [145.571042] ? tasklet_kill+0xe9/0x1b0 [145.571095] ? tasklet_clear_sched+0xe0/0xe0 [145.571148] ? irq_has_action+0x120/0x120 [145.571202] ath11k_ce_cleanup_pipes+0x45a/0x580 [ath11k] [145.571270] ? ath11k_pci_stop+0x10e/0x170 [ath11k_pci] [145.571345] ath11k_core_stop+0x8a/0xc0 [ath11k] [145.571434] ath11k_core_deinit+0x9e/0x150 [ath11k] [145.571499] ath11k_pci_remove+0xd2/0x260 [ath11k_pci] [145.571553] pci_device_remove+0x9a/0x1c0 [145.571605] __device_release_driver+0x332/0x660 [145.571659] driver_detach+0x1e7/0x2c0 [145.571712] bus_remove_driver+0xe2/0x2d0 [145.571772] pci_unregister_driver+0x21/0x250 [145.571826] __do_sys_delete_module+0x30a/0x4b0 [145.571879] ? free_module+0xac0/0xac0 [145.571933] ? lockdep_hardirqs_on_prepare.part.0+0x18c/0x370 [145.571986] ? syscall_enter_from_user_mode+0x1d/0x50 [145.572039] ? lockdep_hardirqs_on+0x79/0x100 [145.572097] do_syscall_64+0x3b/0x90 [145.572153] entry_SYSCALL_64_after_hwframe+0x44/0xae Tested-on: WCN6855 hw2.0 PCI WLAN.HSP.1.1-03003-QCAHSPSWPL_V1_V2_SILICONZ_LITE-2

CVE ID	Description
CVE-2022-49132	In the Linux kernel, the following vulnerability has been resolved: ath11k: pci: fix crash on suspend if board file is not found Mario reported that the kernel was crashing on suspend if ath11k was not able to find a board file: [473.693286] PM: Suspending system (s2idle) [473.693291] printk: Suspending console(s) (use no_console_suspend to debug) [474.407787] BUG: unable to handle page fault for address: 0000000000002070 [474.407791] #PF: supervisor read access in kernel mode [474.407794] #PF: error_code(0x0000) - not-present page [474.407798] PGD 0 P4D 0 [474.407801] Oops: 0000 [#1] PREEMPT SMP NOPTI [474.407805] CPU: 2 PID: 2350 Comm: kworker/u32:14 Tainted: G W 5.16.0 #248 [...] [474.407868] Call Trace: [474.407870] <TASK> [474.407874] ? _raw_spin_lock_irqsave+0x2a/0x60 [474.407882] ? lock_timer_base+0x72/0xa0 [474.407889] ? _raw_spin_unlock_irqrestore+0x29/0x3d [474.407892] ? try_to_del_timer_sync+0x54/0x80 [474.407896] ath11k_dp_rx_pktlog_stop+0x49/0xc0 [ath11k] [474.407912] ath11k_core_suspend+0x34/0x130 [ath11k] [474.407923] ath11k_pci_pm_suspend+0x1b/0x50 [ath11k_pci] [474.407928] pci_pm_suspend+0x7e/0x170 [474.407935] ? pci_pm_freeze+0xc0/0xc0 [474.407939] dpm_run_callback+0x4e/0x150 [474.407947] __device_suspend+0x148/0x4c0 [474.407951] async_suspend+0x20/0x90 dmesg-efi-164255130401001: Oops#1 Part1 [474.407955] async_run_entry_fn+0x33/0x120 [474.407959] process_one_work+0x220/0x3f0 [474.407966] worker_thread+0x4a/0x3d0 [474.407971] kthread+0x17a/0x1a0 [474.407975] ? process_one_work+0x3f0/0x3f0 [474.407979] ? set_kthread_struct+0x40/0x40 [474.407983] ret_from_fork+0x22/0x30 [474.407991] </TASK> The issue here is that board file loading happens after ath11k_pci_probe() successfully returns (ath11k initialisation happens asynchronously) and the suspend handler is still enabled, of course failing as ath11k is not properly initialised. Fix this by checking ATH11K_FLAG_QMI_FAIL during both suspend and resume. Tested-on: WCN6855 hw2.0 PCI WLAN.HSP.1.1-03003-QCAHSPSWPL_V1_V2_SILICONZ_LITE-2
CVE-2022-49134	In the Linux kernel, the following vulnerability has been resolved: mlxsw: spectrum: Guard against invalid local ports When processing events generated by the device's firmware, the driver protects itself from events reported for non-existent local ports, but not for the CPU port (local port 0), which exists, but does not have all the fields as any local port. This can result in a NULL pointer dereference when trying access 'struct mlxsw_sp_port' fields which are not initialized for CPU port. Commit 63b08b1f6834 ("mlxsw: spectrum: Protect driver from buggy firmware") already handled such issue by bailing early when processing a PUDE event reported for the CPU port. Generalize the approach by moving the check to a common function and making use of it in all relevant places.
CVE-2022-49138	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: hci_event: Ignore multiple conn complete events When one of the three connection complete events is received multiple times for the same handle, the device is registered multiple times which leads to memory corruptions. Therefore, consequent events for a single connection are ignored. The conn->state can hold different values, therefore HCI_CONN_HANDLE_UNSET is introduced to identify new connections. To make sure the events do not contain this or another invalid handle HCI_CONN_HANDLE_MAX and checks are introduced. Buglink: https://bugzilla.kernel.org/show_bug.cgi?id=215497
CVE-2022-49139	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: fix null ptr deref on hci_sync_conn_complete_evt This event is just specified for SCO and eSCO link types. On the reception of a HCI_Synchronous_Connection_Complete for a BDADDR of an existing LE connection, LE link type and a status that triggers the second case of the packet processing a NULL pointer dereference happens, as conn->link is NULL.
CVE-2022-49154	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: fix panic on out-of-bounds guest IRQ As guest_irq is coming from KVM_IRQFD API call, it may trigger crash in svm_update_pi_irt(e) due to out-of-bounds: crash> bt PID: 22218 TASK: ffff951a6ad74980 CPU: 73 COMMAND: "vcpu8" #0 [ffffb1ba6707fa40] machine_kexec at ffffffff8565b397 #1 [ffffb1ba6707fa90] __crash_kexec at ffffffff85788a6d #2 [ffffb1ba6707fb58] crash_kexec at ffffffff8578995d #3 [ffffb1ba6707fb70] oops_end at ffffffff85623c0d #4 [ffffb1ba6707fb90] no_context at ffffffff856692c9 #5 [ffffb1ba6707fbf8] exc_page_fault at ffffffff85f95b51 #6 [ffffb1ba6707fc50] asm_exc_page_fault at ffffffff86000ace [exception RIP: svm_update_pi_irt+227] RIP: ffffffff8c0761b53 RSP: fffffb1ba6707fd08 RFLAGS: 00010086 RAX: fffffb1ba6707fd78 RBX: fffffb1ba66d91000 RCX: 0000000000000001 RDX: 00003c803f63f1c0 RSI: 0000000000000019a RDI: fffffb1ba66db2ab8 RBP: 0000000000000019a R8: 0000000000000040 R9: fffff94ca41b82200 R10: ffffffff8c0761b53 R11: 0000000000000001 R12: 0000000000000001 R13: 0000000000000001 R14: ffffffff8c0761b53 R15: 000000000000000f ORIG_RAX: ffffffff8c0761b53 CS: 0010 SS: 0018 #7 [ffffb1ba6707fdb8] kvm_irq_routing_update at ffffffff8c09f19a1 [kvm] #8 [ffffb1ba6707fde0] kvm_set_irq_routing at ffffffff8c09f2133 [kvm] #9 [ffffb1ba6707fe18] kvm_vm_ioctl at ffffffff8c09ef544 [kvm] RIP: 00007f143c36488b RSP: 00007f143a4e04b8 RFLAGS: 00000246 RAX: ffffffff8c0761b53 RBX: 00007f05780041d0 RCX: 00007f143c36488b RDX: 00007f05780041d0 RSI: 0000000004008ae6a RDI: 0000000000000020 RBP: 000000000000004e R8: 0000000000000008 R9: 00007f05780041e0 R10: 00007f0578004560 R11: 0000000000000246 R12: 000000000000004e R13: 0000000000000001a R14: 00007f1424001c60 R15: 00007f0578003bc0 ORIG_RAX: 0000000000000010 CS: 0033 SS: 002b Vmx have been fix this in commit 3a8b0677fc61 (KVM: VMX: Do not BUG() on out-of-bounds guest IRQ), so we can just copy source from that to fix this.

CVE ID	Description

CVE-2022-49159	In the Linux kernel, the following vulnerability has been resolved: scsi: qla2xxx: Implement ref count for SRB The timeout handler and the done function are racing. When qla2x00_async_iocb_timeout() starts to run it can be preempted by the normal response path (via the firmware?). qla24xx_async_gpisc_sp_done() releases the SRB unconditionally. When scheduling back to qla2x00_async_iocb_timeout() qla24xx_async_abort_cmd() will access a freed sp->qpair pointer: qla2xxx [0000:83:00.0]-2871:0: Async-gpisc timeout - hdl=63d portid=234500 50:06:0e:80:08:77:b6:21. qla2xxx [0000:83:00.0]-2853:0: Async done-gpisc res 0, WWPN 50:06:0e:80:08:77:b6:21 qla2xxx [0000:83:00.0]-2854:0: Async-gpisc OUT WWPN 20:45:00:27:f8:75:33:00 speeds=2c00 speed=0400. qla2xxx [0000:83:00.0]-28d8:0: qla24xx_handle_gpisc_event 50:06:0e:80:08:77:b6:21 DS 7 LS 6 rc 0 login 1 1 rscn 1 0 lid 5 BUG: unable to handle kernel NULL pointer dereference at 0000000000000004 IP: qla24xx_async_abort_cmd+0x1b/0x1c0 [qla2xxx] Obvious solution to this is to introduce a reference counter. One reference is taken for the normal code path (the 'good' case) and one for the timeout path. As we always race between the normal good case and the timeout/abort handler we need to serialize it. Also we cannot assume any order between the handlers. Since this is slow path we can use proper synchronization via locks. When we are able to cancel a timer (del_timer returns 1) we know there can't be any error handling in progress because the timeout handler hasn't expired yet, thus we can safely decrement the refcounter by one. If we are not able to cancel the timer, we know an abort handler is running. We have to make sure we call sp->done() in the abort handlers before calling kref_put().

CVE ID	Description
CVE-2022-49171	In the Linux kernel, the following vulnerability has been resolved: ext4: don't BUG if someone dirty pages without asking ext4 first [un]pin_user_pages_remote is dirtying pages without properly warning the file system in advance. A related race was noted by Jan Kara in 2018[1]; however, more recently instead of it being a very hard-to-hit race, it could be reliably triggered by process_vm_writev(2) which was discovered by Syzbot[2]. This is technically a bug in mm/gup.c, but arguably ext4 is fragile in that if some other kernel subsystem dirty pages without properly notifying the file system using page_mkwrite(), ext4 will BUG, while other file systems will not BUG (although data will still be lost). So instead of crashing with a BUG, issue a warning (since there may be potential data loss) and just mark the page as clean to avoid unprivileged denial of service attacks until the problem can be properly fixed. More discussion and background can be found in the thread starting at [2]. [1] https://lore.kernel.org/linux-mm/20180103100430.GE4911@quack2.suse.cz [2] https://lore.kernel.org/Yg0m6ljcNmfaSokM@google.com
CVE-2022-49174	In the Linux kernel, the following vulnerability has been resolved: ext4: fix ext4_mb_mark_bb() with flex_bg with fast_commit In case of flex_bg feature (which is by default enabled), extents for any given inode might span across blocks from two different block group. ext4_mb_mark_bb() only reads the buffer_head of block bitmap once for the starting block group, but it fails to read it again when the extent length boundary overflows to another block group. Then in this below loop it accesses memory beyond the block group bitmap buffer_head and results into a data abort. for (i = 0; i < clen; i++) if (!mb_test_bit(blkoff + i, bitmap_bh->b_data) == !state) already++; This patch adds this functionality for checking block group boundary in ext4_mb_mark_bb() and update the buffer_head(bitmap_bh) for every different block group. w/o this patch, I was easily able to hit a data access abort using Power platform. <...> [74.327662] EXT4-fs error (device loop3): ext4_mb_generate_buddy:1141: group 11, block bitmap and bg descriptor inconsistent: 21248 vs 23294 free clusters [74.533214] EXT4-fs (loop3): shut down requested (2) [74.536705] Aborting journal on device loop3-8. CVE-2022-49183	In the Linux kernel, the following vulnerability has been resolved: net/sched: act_ct: fix ref leak when switching zones When switching zones or network namespaces without doing a ct clear in between, it is now leaking a reference to the old ct entry. That's because tcf_ct_skb_nfct_cached() returns false and tcf_ct_flow_table_lookup() may simply overwrite it. The fix is to, as the ct entry is not reusable, free it already at tcf_ct_skb_nfct_cached().
CVE-2022-49190	In the Linux kernel, the following vulnerability has been resolved: kernel/resource: fix kfree() of bootmem memory again Since commit ebf7d8f270d ("mem hotunplug: fix kfree() of bootmem memory"), we could get a resource allocated during boot via alloc_resource(). And it's required to release the resource using free_resource(). However, many people use kfree directly which will result in kernel BUG. In order to fix this without fixing every call site, just leak a couple of bytes in such corner case.

CVE ID	Description
CVE-2022-49193	In the Linux kernel, the following vulnerability has been resolved: ice: fix 'scheduling while atomic' on aux critical err interrupt There's a kernel BUG splat on processing aux critical error interrupts in ice_misc_intr(): [2100.917085] BUG: scheduling while atomic: swapper/15/0/0x00010000 ... [2101.060770] Call Trace: [2101.063229] <IRQ> [2101.065252] dump_stack+0x41/0x60 [2101.068587] __schedule_bug.cold.100+0x4c/0x58 [2101.073060] __schedule+0x6a4/0x830 [2101.076570] schedule+0x35/0xa0 [2101.079727] schedule_preempt_disabled+0xa/0x10 [2101.084284] __mutex_lock.isra.7+0x310/0x420 [2101.088580] ? ice_misc_intr+0x201/0x2e0 [ice] [2101.093078] ice_send_event_to_aux+0x25/0x70 [ice] [2101.097921] ice_misc_intr+0x220/0x2e0 [ice] [2101.102232] __handle_irq_event_percpu+0x40/0x180 [2101.106965] handle_irq_event_percpu+0x30/0x80 [2101.111434] handle_irq_event+0x36/0x53 [2101.115292] handle_edge_irq+0x82/0x190 [2101.119148] handle_irq+0x1c/0x30 [2101.122480] do_IRQ+0x49/0xd0 [2101.125465] common_interrupt+0xf/0xf [2101.129146] </IRQ> ... As Andrew correctly mentioned previously[0], the following call ladder happens: ice_misc_intr() <- hardirq ice_send_event_to_aux() device_lock() mutex_lock() might_sleep() might_resched() <- oops Add a new PF state bit which indicates that an aux critical error occurred and serve it in ice_service_task() in process context. The new ice_pf::oicr_err_reg is read-write in both hardirq and process contexts, but only 3 bits of non-critical data probably aren't worth explicit synchronizing (and they're even in the same byte [31:24]). [0] https://lore.kernel.org/all/YeSRUVmrdmLUXHDn@lunn.ch
CVE-2022-49196	In the Linux kernel, the following vulnerability has been resolved: powerpc/pseries: Fix use after free in remove_phb_dynamic() In remove_phb_dynamic() we use &phb->io_resource, after we've called device_unregister(&host_bridge->dev). But the unregister may have freed phb, because pcibios_free_controller_deferred() is the release function for the host_bridge. If there are no outstanding references when we call device_unregister() then phb will be freed out from under us. This has gone mainly unnoticed, but with slub_debug and page_poison enabled it can lead to a crash: PID: 7574 TASK: c0000000d492cb80 CPU: 13 COMMAND: "drmgr" #0 [c0000000e4f075a0] crash_kexec at c00000000027d7dc #1 [c0000000e4f075d0] oops_end at c00000000029608 #2 [c0000000e4f07650] __bad_page_fault at c000000000904b4 #3 [c0000000e4f076c0] do_bad_slb_fault at c00000000009a5a8 #4 [c0000000e4f076f0] data_access_slb_common_virt at c000000000008b30 Data SLB Access [380] exception frame: R0: c000000000167250 R1: c0000000e4f07a00 R2: c000000002a46100 R3: c000000002b39ce8 R4: 00000000000000c0 R5: 00000000000000a9 R6: 3894674d000000c0 R7: 0000000000000000 R8: 00000000000000ff R9: 0000000000000100 R10: 6b6b6b6b6b6b6b6b R11: 0000000000008000 R12: c0000000023da80 R13: c0000009ffd38b00 R14: 0000000000000000 R15: 000000011c87f0f0 R16: 0000000000000006 R17: 0000000000000003 R18: 0000000000000002 R19: 0000000000000004 R20: 0000000000000005 R21: 000000011c87ede8 R22: 000000011c87c5a8 R23: 000000011c87d3a0 R24: 0000000000000000 R25: 0000000000000001 R26: c0000000e4f07cc8 R27: c00000004d1cc400 R28: c0080000031d00e8 R29: c00000004d23d800 R30: c00000004d1d2400 R31: c00000004d1d2540 NIP: c00000000167258 MSR: 800000000009033 OR3: c0000000000e9f474 CTR: 0000000000000000 LR: c000000000167250 XER: 0000000020040003 CCR: 0000000024088420 MQ: 0000000000000000 DAR: 6b6b6b6b6b6b6b63 DSISR: c0000000e4f07920 Syscall Result: ffffffff2 [NIP : release_resource+56] [LR : release_resource+48] #5 [c0000000e4f07a00] release_resource at c000000000167258 (unreliable) #6 [c0000000e4f07a30] remove_phb_dynamic at c000000000105648 #7 [c0000000e4f07ab0] dlpar_remove_slot at c0080000031a09e8 [rpadlpar_io] #8 [c0000000e4f07b50] remove_slot_store at c0080000031a0b9c [rpadlpar_io] #9 [c0000000e4f07be0] kobj_attr_store at c000000000817d8c #10 [c0000000e4f07c00] sysfs_kf_write at c00000000063e504 #11 [c0000000e4f07c20] kernfs_fop_write_iter at c00000000063d868 #12 [c0000000e4f07c70] new_sync_write at c00000000054339c #13 [c0000000e4f07d10] vfs_write at c000000000546624 #14 [c0000000e4f07d60] ksys_write at c0000000005469f4 #15 [c0000000e4f07db0] system_call_exception at c00000000030840 #16 [c0000000e4f07e10] system_call_vectored_common at c00000000000c168 To avoid it, we can take a reference to the host_bridge->dev until we're done using phb. Then when we drop the reference the phb will be freed.
CVE-2022-49197	In the Linux kernel, the following vulnerability has been resolved: af_netlink: Fix shift out of bounds in group mask calculation When a netlink message is received, netlink_recvmsg() fills in the address of the sender. One of the fields is the 32-bit bitfield nl_groups, which carries the multicast group on which the message was received. The least significant bit corresponds to group 1, and therefore the highest group that the field can represent is 32. Above that, the UB sanitizer flags the out-of-bounds shift attempts. Which bits end up being set in such case is implementation defined, but it's either going to be a wrong non-zero value, or zero, which is at least not misleading. Make the latter choice deterministic by always setting to 0 for higher-numbered multicast groups. To get information about membership in groups >= 32, userspace is expected to use nl_pktinfo control messages[0], which are enabled by NETLINK_PKTINFO socket option. [0] https://lwn.net/Articles/147608/ The way to trigger this issue is e.g. through monitoring the BRVLAN group: # bridge monitor vlan & # ip link add name br type bridge Which produces the following citation: UBSAN: shift-out-of-bounds in net/netlink/af_netlink.c:162:19 shift exponent 32 is too large for 32-bit type 'int'

CVE ID	Description
CVE-2022-49198	In the Linux kernel, the following vulnerability has been resolved: mptcp: Fix crash due to tcp_tsorted_anchor was initialized before release skb Got crash when doing pressure test of mptcp: <pre>===== dst_release: dst:ffffa06ce6e5c058 refcnt:-1 kernel tried to execute NX-protected page - exploit attempt? (uid: 0) BUG: unable to handle kernel paging request at fffffa06ce6e5c058 PGD 190a01067 P4D 190a01067 PUD 43fffb067 PMD 22e403063 PTE 8000000226e5c063 Oops: 0011 [#1] SMP PTI CPU: 7 PID: 7823 Comm: kworker/7:0 Kdump: loaded Tainted: G E Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.2.1 04/01/2014 Call Trace: ? skb_release_head_state +0x68/0x100 ? skb_release_all+0xe/0x30 ? kfree_skb+0x32/0xa0 ? mptcp_sendmsg_frag +0x57e/0x750 ? __mptcp_retrans+0x21b/0x3c0 ? __switch_to_asm+0x35/0x70 ? mptcp_worker +0x25e/0x320 ? process_one_work+0x1a7/0x360 ? worker_thread+0x30/0x390 ? create_worker +0x1a0/0x1a0 ? kthread+0x112/0x130 ? kthread_flush_work_fn+0x10/0x10 ? ret_from_fork+0x35/0x40 =====</pre> In __mptcp_alloc_tx_skb skb was allocated and skb->tcp_tsorted_anchor will be initialized, in under memory pressure situation sk_wmem_schedule will return false and then kfree_skb. In this case skb->skb_refdst is not null because skb_refdst and tcp_tsorted_anchor are stored in the same mem, and kfree_skb will try to release dst and cause crash.
CVE-2022-49201	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: fix race between xmit and reset There is a race between reset and the transmit paths that can lead to ibmvnic_xmit() accessing an scrq after it has been freed in the reset path. It can result in a crash like: Kernel attempted to read user page (0) - exploit attempt? (uid: 0) BUG: Kernel NULL pointer dereference on read at 0x00000000 Faulting instruction address: 0xc0080000016189f8 Oops: Kernel access of bad area, sig: 11 [#1] ... However just after the queue was stopped, an in-flight ibmvnic_complete_tx() could have restarted the queue even as the reset is progressing. Since the queue was restarted we could get a call to ibmvnic_xmit() which can then access the bad tx_scrq (or other fields). We cannot however simply have ibmvnic_complete_tx() check the ->resetting bit and skip starting the queue. This can race at the "back-end" of a good reset which just restarted the queue but has not cleared the ->resetting bit yet. If we skip restarting the queue due to ->resetting being true, the queue would remain stopped indefinitely potentially leading to transmit timeouts. IOW ->resetting is too broad for this purpose. Instead use a new flag that indicates whether or not the queues are active. Only the open/ reset paths control when the queues are active. ibmvnic_complete_tx() and others wake up the queue only if the queue is marked active. So we will have: A. reset/open thread in ibmvnic_cleanup() and __ibmvnic_open() ->resetting = true ->tx_queues_active = false disable tx queues ... ->tx_queues_active = true start tx queues B. Tx interrupt in ibmvnic_complete_tx(): if (->tx_queues_active) netif_wake_subqueue(); To ensure that ->tx_queues_active and state of the queues are consistent, we need a lock which: - must also be taken in the interrupt path (ibmvnic_complete_tx()) - shared across the multiple ---truncated---

CVE ID	Description
CVE-2022-49204	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix more uncharged while msg has more_data In tcp_bpf_send_verdict(), if msg has more data after tcp_bpf_sendmsg_redir(): tcp_bpf_send_verdict() tosend = msg->sg.size //msg->sg.size = 22220 case __SK_REDIRECT: sk_msg_return() //uncharged msg->sg.size(22220) sk->sk_forward_alloc tcp_bpf_sendmsg_redir() //after tcp_bpf_sendmsg_redir, msg->sg.size=11000 goto more_data; tosend = msg->sg.size //msg->sg.size = 11000 case __SK_REDIRECT: sk_msg_return() // uncharged msg->sg.size(11000) to sk->sk_forward_alloc The msg->sg.size(11000) has been uncharged twice, to fix we can charge the remaining msg->sg.size before goto more data. This issue can cause the following info: WARNING: CPU: 0 PID: 9860 at net/core/stream.c:208 sk_stream_kill_queues+0xd4/0x1a0 Call Trace: <TASK> inet_csk_destroy_sock+0x55/0x110 __tcp_close+0x279/0x470 tcp_close+0x1f/0x60 inet_release+0x3f/0x80 __sock_release+0x3d/0xb0 sock_close+0x11/0x20 __fput+0x92/0x250 task_work_run+0x6a/0xa0 do_exit+0x33b/0xb60 do_group_exit+0x2f/0xa0 get_signal+0xb6/0x950 arch_do_signal_or_restart+0xac/0x2a0 ? vfs_write+0x237/0x290 exit_to_user_mode_prepare+0xa9/0x200 syscall_exit_to_user_mode +0x12/0x30 do_syscall_64+0x46/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae </TASK> WARNING: CPU: 0 PID: 2136 at net/ipv4/af_inet.c:155 inet_sock_destruct+0x13c/0x260 Call Trace: <TASK> __sk_destruct+0x24/0x1f0 sk_psock_destroy+0x19b/0x1c0 process_one_work +0x1b3/0x3c0 worker_thread+0x30/0x350 ? process_one_work+0x3c0/0x3c0 kthread+0xe6/0x110 ? kthread_complete_and_exit+0x20/0x20 ret_from_fork+0x22/0x30 </TASK>
CVE-2022-49205	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix double uncharge the mem of sk_msg If tcp_bpf_sendmsg is running during a tear down operation, psock may be freed. tcp_bpf_sendmsg() tcp_bpf_send_verdict() sk_msg_return() tcp_bpf_sendmsg_redir() unlikely(!psock)) sk_msg_free() The mem of msg has been uncharged in tcp_bpf_send_verdict() by sk_msg_return(), and would be uncharged by sk_msg_free() again. When psock is null, we can simply returning an error code, this would then trigger the sk_msg_free_nocharge in the error path of __SK_REDIRECT and would have the side effect of throwing an error up to user space. This would be a slight change in behavior from user side but would look the same as an error if the redirect on the socket threw an error. This issue can cause the following info: WARNING: CPU: 0 PID: 2136 at net/ipv4/af_inet.c:155 inet_sock_destruct+0x13c/0x260 Call Trace: <TASK> __sk_destruct+0x24/0x1f0 sk_psock_destroy +0x19b/0x1c0 process_one_work+0x1b3/0x3c0 worker_thread+0x30/0x350 ? process_one_work +0x3c0/0x3c0 kthread+0xe6/0x110 ? kthread_complete_and_exit+0x20/0x20 ret_from_fork+0x22/0x30 </TASK>
CVE-2022-49206	In the Linux kernel, the following vulnerability has been resolved: RDMA/mlx5: Fix memory leak in error flow for subscribe event routine In case the second xa_insert() fails, the obj_event is not released. Fix the error unwind flow to free that memory to avoid a memory leak.
CVE-2022-49207	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix memleak in sk_psock_queue_msg If tcp_bpf_sendmsg is running during a tear down operation we may enqueue data on the ingress msg queue while tear down is trying to free it. sk1 (redirect sk2) sk2 ----- tcp_bpf_sendmsg() tcp_bpf_send_verdict() tcp_bpf_sendmsg_redir() bpf_tcp_ingress() sock_map_close() lock_sock() lock_sock() ... blocking sk_psock_stop sk_psock_clear_state(psock, SK_PSOCK_TX_ENABLED); release_sock(sk); lock_sock() sk_mem_charge() get_page() sk_psock_queue_msg() sk_psock_test_state(psock, SK_PSOCK_TX_ENABLED); drop_sk_msg() release_sock() While drop_sk_msg(), the msg has charged memory from sk by sk_mem_charge and has sg pages need to put. To fix we use sk_msg_free() and then kfree() msg. This issue can cause the following info: WARNING: CPU: 0 PID: 9202 at net/core/stream.c:205 sk_stream_kill_queues +0xc8/0xe0 Call Trace: <IRQ> inet_csk_destroy_sock+0x55/0x110 tcp_rcv_state_process +0xe5f/0xe90 ? sk_filter_trim_cap+0x10d/0x230 ? tcp_v4_do_rcv+0x161/0x250 tcp_v4_do_rcv +0x161/0x250 tcp_v4_rcv+0xc3a/0xce0 ip_protocol_deliver_rcu+0x3d/0x230 ip_local_deliver_finish +0x54/0x60 ip_local_deliver+0xfd/0x110 ? ip_protocol_deliver_rcu+0x230/0x230 ip_rcv+0xd6/0x100 ? ip_local_deliver+0x110/0x110 __netif_receive_skb_one_core+0x85/0xa0 process_backlog+0xa4/0x160 __napi_poll+0x29/0x1b0 net_rx_action+0x287/0x300 __do_softirq+0xff/0x2fc do_softirq+0x79/0x90 </IRQ> WARNING: CPU: 0 PID: 531 at net/ipv4/af_inet.c:154 inet_sock_destruct+0x175/0x1b0 Call Trace: <TASK> __sk_destruct+0x24/0x1f0 sk_psock_destroy+0x19b/0x1c0 process_one_work +0x1b3/0x3c0 ? process_one_work+0x3c0/0x3c0 worker_thread+0x30/0x350 ? process_one_work +0x3c0/0x3c0 kthread+0xe6/0x110 ? kthread_complete_and_exit+0x20/0x20 ret_from_fork+0x22/0x30 </TASK>
CVE-2022-49208	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Prevent some integer underflows My static checker complains that: drivers/infiniband/hw/irdma/ctrl.c:3605 irdma_sc_ceq_init() warn: can subtract underflow 'info->dev->hmc_fpm_misc.max_ceqs'? It appears that "info->dev->hmc_fpm_misc.max_ceqs" comes from the firmware in irdma_sc_parse_fpm_query_buf() so, yes, there is a chance that it could be zero. Even if we trust the firmware, it's easy enough to change the condition just as a hardenning measure.

CVE ID	Description
CVE-2022-49209	In the Linux kernel, the following vulnerability has been resolved: bpf, sockmap: Fix memleak in tcp_bpf_sendmsg while sk msg is full If tcp_bpf_sendmsg() is running while sk msg is full. When sk_msg_alloc() returns -ENOMEM error, tcp_bpf_sendmsg() goes to wait_for_memory. If partial memory has been allocated by sk_msg_alloc(), that is, msg_tx->sg.size is greater than osize after sk_msg_alloc(), memleak occurs. To fix we use sk_msg_trim() to release the allocated memory, then goto wait for memory. Other call paths of sk_msg_alloc() have the similar issue, such as tls_sw_sendmsg(), so handle sk_msg_trim logic inside sk_msg_alloc(), as Cong Wang suggested. This issue can cause the following info: WARNING: CPU: 3 PID: 7950 at net/core/stream.c:208 sk_stream_kill_queues+0xd4/0x1a0 Call Trace: <TASK> inet_csk_destroy_sock+0x55/0x110 __tcp_close+0x279/0x470 tcp_close+0x1f/0x60 inet_release+0x3f/0x80 __sock_release+0x3d/0xb0 sock_close+0x11/0x20 __fput+0x92/0x250 task_work_run+0x6a/0xa0 do_exit+0x33b/0xb60 do_group_exit+0x2f/0xa0 get_signal+0xb6/0x950 arch_do_signal_or_restart+0xac/0x2a0 exit_to_user_mode_prepare+0xa9/0x200 syscall_exit_to_user_mode+0x12/0x30 do_syscall_64+0x46/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae </TASK> WARNING: CPU: 3 PID: 2094 at net/ipv4/af_inet.c:155 inet_sock_destruct+0x13c/0x260 Call Trace: <TASK> __sk_destruct+0x24/0x1f0 sk_psock_destroy+0x19b/0x1c0 process_one_work+0x1b3/0x3c0 kthread+0xe6/0x110 ret_from_fork+0x22/0x30 </TASK>
CVE-2022-49215	In the Linux kernel, the following vulnerability has been resolved: xsk: Fix race at socket teardown Fix a race in the xsk socket teardown code that can lead to a NULL pointer dereference splat. The current xsk unbind code in xsk_unbind_dev() starts by setting xs->state to XSK_UNBOUND, sets xs->dev to NULL and then waits for any NAPI processing to terminate using synchronize_net(). After that, the release code starts to tear down the socket state and free allocated memory. BUG: kernel NULL pointer dereference, address: 000000000000000c0 PGD 80000000932469067 P4D 80000000932469067 PUD 0 Oops: 0000 [#1] PREEMPT SMP PTI CPU: 25 PID: 69132 Comm: grcppp_sync_ser Tainted: G I 5.16.0+ #2 Hardware name: Dell Inc. First, setting xs->dev to NULL before waiting for all users to stop using the socket is not correct. The entry to the data plane functions xsk_poll(), xsk_sendmsg(), and xsk_recvmmsg() are all guarded by a test that xs->state is in the state XSK_BOUND and if not, it returns right away. But one process might have passed this test but still have not gotten to the point in which it uses xs->dev in the code. In this interim, a second process executing xsk_unbind_dev() might have set xs->dev to NULL which will lead to a crash for the first process. The solution here is just to get rid of this NULL assignment since it is not used anymore. Before commit 42fddcc7c64b ("xsk: use state member for socket synchronization"), xs->dev was the gatekeeper to admit processes into the data plane functions, but it was replaced with the state variable xs->state in the aforementioned commit. The second problem is that synchronize_net() does not wait for any process in xsk_poll(), xsk_sendmsg(), or xsk_recvmmsg() to complete, which means that the state they rely on might be cleaned up prematurely. This can happen when the notifier gets called (at driver unload for example) as it uses xsk_unbind_dev(). Solve this by extending the RCU critical region from just the ndo_xsk_wakeup to the whole functions mentioned above, so that both the test of xs->state == XSK_BOUND and the last use of any member of xs is covered by the RCU critical section. This will guarantee that when synchronize_net() completes, there will be no processes left executing xsk_poll(), xsk_sendmsg(), or xsk_recvmmsg() and state can be cleaned up safely. Note that we need to drop the RCU lock for the skb xmit path as it uses functions that might sleep. Due to this, we have to retest the xs->state after we grab the mutex that protects the skb xmit code from, among a number of things, an xsk_unbind_dev() being executed from the notifier at the same time.
CVE-2022-49220	In the Linux kernel, the following vulnerability has been resolved: dax: make sure inodes are flushed before destroy cache A bug can be triggered by following command \$ modprobe nd_pmem && modprobe -r nd_pmem [10.060014] BUG dax_cache (Not tainted): Objects remaining in dax_cache on __kmem_cache_shutdown() [10.060938] Slab 0x0000000085b729ac objects=9 used=1 fp=0x000000004f5ae469 flags=0x200000000010200(slab head node) [10.062433] Call Trace: [10.062673] dump_stack_lvl+0x34/0x44 [10.062865] slab_err+0x90/0xd0 [10.063619] __kmem_cache_shutdown+0x13b/0x2f0 [10.063848] kmem_cache_destroy+0x4a/0x110 [10.064058] __x64_sys_delete_module+0x265/0x300 This is caused by dax_fs_exit() not flushing inodes before destroy cache. To fix this issue, call rcu_barrier() before destroy cache.

CVE ID	Description
CVE-2022-49225	In the Linux kernel, the following vulnerability has been resolved: mt76: mt7921s: fix a possible memory leak in mt7921_load_patch Always release fw data at the end of mt7921_load_patch routine.
CVE-2022-49231	In the Linux kernel, the following vulnerability has been resolved: rtw88: fix memory overrun and memory leak during hw_scan Previously we allocated less memory than actual required, overwrite to the buffer causes the mm module to complaint and raise access violation faults. Along with potential memory leaks when returned early. Fix these by passing the correct size and proper deinit flow.
CVE-2022-49235	In the Linux kernel, the following vulnerability has been resolved: ath9k_htc: fix uninit value bugs Syzbot reported 2 KMSAN bugs in ath9k. All of them are caused by missing field initialization. In htc_connect_service() svc_meta_len and pad are not initialized. Based on code it looks like in current skb there is no service data, so simply initialize svc_meta_len to 0. htc_issue_send() does not initialize htc_frame_hdr::control array. Based on firmware code, it will initialize it by itself, so simply zero whole array to make KMSAN happy Fail logs: BUG: KMSAN: kernel-usb-infoleak in usb_submit_urb+0x6c1/0x2aa0 drivers/usb/core/urb.c:430 usb_submit_urb+0x6c1/0x2aa0 drivers/usb/core/urb.c:430 hif_usb_send_regout drivers/net/wireless/ath/ath9k/hif_usb.c:127 [inline] hif_usb_send+0x5f0/0x16f0 drivers/net/wireless/ath/ath9k/hif_usb.c:479 htc_issue_send drivers/net/wireless/ath/ath9k/htc_hst.c:34 [inline] htc_connect_service+0x143e/0x1960 drivers/net/wireless/ath/ath9k/htc_hst.c:275 ... CVE-2022-49236	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix UAF due to race between btf_try_get_module and load_module While working on code to populate kfunc BTF ID sets for module BTF from its initcall, I noticed that by the time the initcall is invoked, the module BTF can already be seen by userspace (and the BPF verifier). The existing btf_try_get_module calls try_module_get which only fails if mod->state == MODULE_STATE_GOING, i.e. it can increment module reference when module initcall is happening in parallel. Currently, BTF parsing happens from MODULE_STATE_COMING notifier callback. At this point, the module initcalls have not been invoked. The notifier callback parses and prepares the module BTF, allocates an ID, which publishes it to userspace, and then adds it to the btf_modules list allowing the kernel to invoke btf_try_get_module for the BTF. However, at this point, the module has not been fully initialized (i.e. its initcalls have not finished). The code in module.c can still fail and free the module, without caring for other users. However, nothing stops btf_try_get_module from succeeding between the state transition from MODULE_STATE_COMING to MODULE_STATE_LIVE. This leads to a use-after-free issue when BPF program loads successfully in the state transition, load_module's do_init_module call fails and frees the module, and BPF program fd on close calls module_put for the freed module. Future patch has test case to verify we don't regress in this area in future. There are multiple points after prepare_coming_module (in load_module) where failure can occur and module loading can return error. We illustrate and test for the race using the last point where it can practically occur (in module __init function). An illustration of the race: CPU 0 CPU 1 load_module notifier_call(MODULE_STATE_COMING) btf_parse_module btf_alloc_id // Published to userspace list_add(&btf_mod->list, btf_modules) mod->init(...) ... ^ bpf_check check_pseudo_btf_id btf_try_get_module returns true ... module __init in progress return prog_fd ... V if (ret < 0) free_module(mod) ... close(prog_fd) ... bpf_prog_free_deferred module_put(used_btf.mod) // use-after-free We fix this issue by setting a flag BTF_MODULE_F_LIVE, from the notifier callback when MODULE_STATE_LIVE state is reached for the module, so that we return NULL from btf_try_get_module for modules that are not fully formed. Since try_module_get already checks that module is not in MODULE_STATE_GOING state, and that is the only transition a live module can make before being removed from btf_modules list, this is enough to close the race and prevent the bug. A later selftest patch crafts the race condition artificially to verify that it has been fixed, and that verifier fails to load program (with ENXIO). Lastly, a couple of comments: 1. Even if this race didn't exist, it seems more appropriate to only access resources (ksyms and kfuncs) of a fully formed module which has been initialized completely. 2. This patch was born out of need for synchronization against module initcall for the next patch, so it is needed for correctness even without the aforementioned race condition. The BTF resources initialized by module initcall are set up once and then only looked up, so just waiting until the initcall has finished ensures correct behavior.

CVE ID	Description
CVE-2022-49237	In the Linux kernel, the following vulnerability has been resolved: ath11k: add missing of_node_put() to avoid leak The node pointer is returned by of_find_node_by_type() or of_parse_phandle() with refcount incremented. Calling of_node_put() to avoid the refcount leak.
CVE-2022-49248	In the Linux kernel, the following vulnerability has been resolved: ALSA: firewire-lib: fix uninitialized flag for AV/C deferred transaction AV/C deferred transaction was supported at a commit 00a7bb81c20f ("ALSA: firewire-lib: Add support for deferred transaction") while 'deferrable' flag can be uninitialized for non-control/notify AV/C transactions. UBSAN reports it: kernel: <pre>===== kernel: UBSAN: invalid-load in /build/linux-aa0B4d/linux-5.15.0/sound/firewire/fcp.c:363:9 kernel: load of value 158 is not a valid value for type '_Bool' kernel: CPU: 3 PID: 182227 Comm: irq/35-firewire Tainted: P OE 5.15.0-18-generic #18-Ubuntu kernel: Hardware name: Gigabyte Technology Co., Ltd. The bug has no disadvantage for the non- control/notify AV/C transactions since the flag has an effect for AV/C response with INTERIM (0x0f) status which is not used for the transactions in AV/C general specification.
CVE-2022-49264	In the Linux kernel, the following vulnerability has been resolved: exec: Force single empty string when argv is empty Quoting[1] Ariadne Conill: "In several other operating systems, it is a hard requirement that the second argument to execve(2) be the name of a program, thus prohibiting a scenario where argc < 1. POSIX 2017 also recommends this behaviour, but it is not an explicit requirement[2]: The argument arg0 should point to a filename string that is associated with the process being started by one of the exec functions. ... Interestingly, Michael Kerrisk opened an issue about this in 2008[3], but there was no consensus to support fixing this issue then. Hopefully now that CVE-2021-4034 shows practical exploitative use[4] of this bug in a shellcode, we can reconsider. This issue is being tracked in the KSPP issue tracker[5]." While the initial code searches[6][7] turned up what appeared to be mostly corner case tests, trying to that just reject argv == NULL (or an immediately terminated pointer list) quickly started tripping[8] existing userspace programs. The next best approach is forcing a single empty string into argv and adjusting argc to match. The number of programs depending on argc == 0 seems a smaller set than those calling execve with a NULL argv. Account for the additional stack space in bprm_stack_limits(). Inject an empty string when argc == 0 (and set argc = 1). Warn about the case so userspace has some notice about the change: process './argc0' launched './argc0' with NULL argv: empty string added Additionally WARN() and reject NULL argv usage for kernel threads. CVE-2022-49266	In the Linux kernel, the following vulnerability has been resolved: block: fix rq-qos breakage from skipping rq_qos_done_bio() a647a524a467 ("block: don't call rq_qos_ops->done_bio if the bio isn't tracked") made bio_endio() skip rq_qos_done_bio() if BIO_TRACKED is not set. While this fixed a potential oops, it also broke blk-iocost by skipping the done_bio callback for merged bios. Before, whether a bio goes through rq_qos_throttle() or rq_qos_merge(), rq_qos_done_bio() would be called on the bio on completion with BIO_TRACKED distinguishing the former from the latter. rq_qos_done_bio() is not called for bios which went through rq_qos_merge(). This royally confuses blk-iocost as the merged bios never finish and are considered perpetually in-flight. One reliably reproducible failure mode is an intermediate cgroup getting stuck active preventing its children from being activated due to the leaf-only rule, leading to loss of control. The following is from resctl-bench protection scenario which emulates isolating a web server like workload from a memory bomb run on an iocost configuration which should yield a reasonable level of protection. # cat /sys/block/nvme2n1/device/model Samsung SSD 970 PRO 512GB # cat /sys/fs/cgroup/io.cost.model 259:0 ctrl=user model=linear rbps=834913556 rseqiops=93622 rrandiops=102913 wbps=618985353 wseqiops=72325 wrandiops=71025 # cat /sys/fs/cgroup/io.cost.qos 259:0 enable=1 ctrl=user rpct=95.00 rlat=18776 wpct=95.00 wlat=8897 min=60.00 max=100.00 # resctl-bench -m 29.6G -r out.json run protection::scenario=mem-hog,loops=1 ... Memory Hog Summary ===== IO Latency: R p50=242u:336u/2.5m p90=794u:1.4m/7.5m p99=2.7m:8.0m/62.5m max=8.0m:36.4m/350m W p50=221u:323u/1.5m p90=709u:1.2m/5.5m p99=1.5m:2.5m/9.5m max=6.9m:35.9m/350m Isolation and Request Latency Impact Distributions: min p01 p05 p10 p25 p50 p75 p90 p95 p99 max mean stdev isol% 15.90 15.90 15.90 40.05 57.24 59.07 60.01 74.63 74.63 90.35 90.35 58.12 15.82 lat_imp% 0 0 0 0 4.55 14.68 15.54 233.5 548.1 548.1 53.88 143.6 Result: isol=58.12:15.82% lat_imp=53.88%:143.6 work_csv=100.0% missing=3.96% The isolation result of 58.12% is close to what this device would show without any IO control. Fix it by introducing a new flag BIO_QOS_MERGED to mark merged bios and calling rq_qos_done_bio() on them too. For consistency and clarity, rename BIO_TRACKED to BIO_QOS_THROTTLED. The flag checks are moved into rq_qos_done_bio() so that it's next to the code paths that set the flags. With the patch applied, the above same benchmark shows: # resctl-bench -m 29.6G -r out.json run protection::scenario=mem-hog,loops=1 ... Memory Hog Summary ===== IO Latency: R p50=123u:84.4u/985u p90=322u:256u/2.5m p99=1.6m:1.4m/9.5m max=11.1m:36.0m/350m W p50=429u:274u/995u p90=1.7m:1.3m/4.5m p99=3.4m:2.7m/11.5m max=7.9m:5.9m/26.5m Isolation and Request Latency Impact Distributions: min p01 p05 p10 p25 p50 p75 p90 p95 p99 max mean stdev isol% 84.91 84.91 89.51 90.73 92.31 94.49 96.36 98.04 98.71 100.0 100.0 94.42 2.81 5.73 11.11 13.92 17.53 22.61 4.10 4.68 Result: isol=94.42:2.81% lat_imp=4.10%:4.68 work_csv=58.34% missing=0%
CVE-2022-49267	In the Linux kernel, the following vulnerability has been resolved: mmc: core: use sysfs_emit() instead of sprintf() sprintf() (still used in the MMC core for the sysfs output) is vulnerable to the buffer overflow. Use the new-fangled sysfs_emit() instead. Found by Linux Verification Center (linuxtesting.org) with the SVACE static analysis tool.

CVE ID	Description
CVE-2022-49271	In the Linux kernel, the following vulnerability has been resolved: cifs: prevent bad output lengths in smb2_ioctl_query_info() When calling smb2_ioctl_query_info() with smb_query_info::flags=PASSTHRU_FSCTL and smb_query_info::output_buffer_length=0, the following would return 0x10 buffer = memdup_user(arg + sizeof(struct smb_query_info), qi.output_buffer_length); if (IS_ERR(buffer)) { kfree(vars); return PTR_ERR(buffer); } rather than a valid pointer thus making IS_ERR() check fail. This would then cause a NULL ptr dereference in @buffer when accessing it later in smb2_ioctl_query_ioctl(). While at it, prevent having a @buffer smaller than 8 bytes to correctly handle SMB2_SET_INFO FileEndOfFileInformation requests when smb_query_info::flags=PASSTHRU_SET_INFO. Here is a small C reproducer which triggers a NULL ptr in @buffer when passing an invalid smb_query_info::flags <pre>#include <stdio.h> #include <stdlib.h> #include <stdint.h> #include <unistd.h> #include <fcntl.h> #include <sys/ioctl.h> #define die(s) perror(s), exit(1) #define QUERY_INFO 0xc018cf07 int main(int argc, char *argv[]) { int fd; if (argc < 2) exit(1); fd = open(argv[1], O_RDONLY); if (fd == -1) die("open"); if (ioctl(fd, QUERY_INFO, (uint32_t)) { 0, 0, 0, 4, 0, 0}) == -1) die("ioctl"); close(fd); return 0; } mount.cifs //srv/share /mnt -o ... gcc repro.c && ./a.out /mnt/f0 [114.138620] general protection fault, probably for non-canonical address 0xdfdfc00000000000: 0000 [#1] PREEMPT SMP KASAN NOPTI [114.139310] KASAN: null-ptr-deref in range [0x0000000000000000-0x0000000000000007] [114.139775] CPU: 2 PID: 995 Comm: a.out Not tainted 5.17.0-rc8 #1 [114.140148] Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS rel-1.15.0-0-g2dd4b9b-rebuilt.opensuse.org 04/01/2014 [114.140818] RIP: 0010:smb2_ioctl_query_info +0x206/0x410 [cifs] [114.141221] Code: 00 00 00 00 fc ff df 48 c1 ea 03 80 3c 02 00 0f 85 c8 01 00 00 48 b8 00 00 00 00 fc ff df 4c 8b 7b 28 4c 89 fa 48 c1 ea 03 <80> 3c 02 00 0f 85 9c 01 00 00 49 8b 3f e8 58 02 fb ff 48 8b 14 24 [114.142348] RSP: 0018:ffff90000b47b00 EFLAGS: 00010256 [114.142692] RAX: dffffc0000000000 RBX: ffff888115503200 RCX: ffffffff020580d [114.143119] RDX: 0000000000000000 RSI: 0000000000000004 RDI: ffffffff043a380 [114.143544] RBP: ffff888115503278 R08: 0000000000000001 R09: 0000000000000000 [114.143983] R10: ffffbf4087470 R11: 0000000000000001 R12: ffff888115503288 [114.144424] R13: 00000000fffff0 R14: ffff888115503228 R15: 0000000000000000 [114.144852] FS: 00007f7aeabdf740(0000) GS:ffff888151600000(0000) knlGS:0000000000000000 [114.145338] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 [114.145692] CR2: 00007f7aeacdf5e CR3: 000000012000e000 CR4: 0000000000350ee0 [114.146131] Call Trace: [114.146291] <TASK> [114.146432] ? smb2_query_reparse_tag+0x890/0x890 [cifs] [114.146800] ? cifs_mapchar +0x460/0x460 [cifs] [114.147121] ? rcu_read_lock_sched_held+0x3f/0x70 [114.147412] ? cifs_strndup_to_utf16+0x15b/0x250 [cifs] [114.147775] ? dentry_path_raw+0xa6/0xf0 [114.148024] ? cifs_convert_path_to_utf16+0x198/0x220 [cifs] [114.148413] ? smb2_check_message+0x1080/0x1080 [cifs] [114.148766] ? rcu_read_lock_sched_held+0x3f/0x70 [114.149065] cifs_ioctl+0x1577/0x3320 [cifs] [114.149371] ? lock_downgrade+0x6f0/0x6f0 [114.149631] ? cifs_readdir+0x2e60/0x2e60 [cifs] [114.149956] ? rcu_read_lock_sched_held+0x3f/0x70 [114.150250] ? __rseq_handle_notify_resume +0x80b/0xbe0 [114.150562] ? __up_read+0x192/0x710 [114.150791] ? __ia32_sys_rseq+0xf0/0xf0 [114.151025] ? __x64_sys_openat+0x11f/0x1d0 [114.151296] __x64_sys_ioctl+0x127/0x190 [114.151549] do_syscall_64+0x3b/0x90 [114.151768] entry_SYSCALL_64_after_hwframe +0x44/0xae [114.152079] RIP: 0033:0x7f7aead043df [114.152306] Code: 00 48 89 44 24 18 31 c0 48 8d 44 24 60 c7 04 24 ---truncated---</pre>
CVE-2022-49280	In the Linux kernel, the following vulnerability has been resolved: NFSD: prevent underflow in nfssvc_decode_writeargs() Smatch complains: fs/nfsd/nfsxdr.c:341 nfssvc_decode_writeargs() warn: no lower bound on 'args->len' Change the type to unsigned to prevent this issue.
CVE-2022-49281	In the Linux kernel, the following vulnerability has been resolved: cifs: fix handlecache and multiuser In multiuser each individual user has their own tcon structure for the share and thus their own handle for a cached directory. When we umount such a share we much make sure to release the pinned down dentry for each such tcon and not just the master tcon. Otherwise we will get nasty warnings on amount that dentries are still in use: [3459.590047] BUG: Dentry 00000000115c6f41 {i=12000000019d95,n=/} still in use! (2) [unmount of cifs cifs] ... CVE ID	Description
CVE-2022-49286	In the Linux kernel, the following vulnerability has been resolved: tpm: use try_get_ops() in tpm-space.c As part of the series conversion to remove nested TPM operations: https://lore.kernel.org/all/20190205224723.19671-1-jarkko.sakkinen@linux.intel.com/ exposure of the chip->tpm_mutex was removed from much of the upper level code. In this conversion, tpm2_del_space() was missed. This didn't matter much because it's usually called closely after a converted operation, so there's only a very tiny race window where the chip can be removed before the space flushing is done which causes a NULL deref on the mutex. However, there are reports of this window being hit in practice, so fix this by converting tpm2_del_space() to use tpm_try_get_ops(), which performs all the teardown checks before acquiring the mutex.
CVE-2022-49287	In the Linux kernel, the following vulnerability has been resolved: tpm: fix reference counting for struct tpm_chip The following sequence of operations results in a refcount warning: 1. Open device / dev/tpmrm. 2. Remove module tpm_tis_spi. 3. Write a TPM command to the file descriptor opened at step 1. -----[cut here]----- WARNING: CPU: 3 PID: 1161 at lib/refcount.c:25 kobject_get +0xa0/0xa4 refcount_t: addition on 0; use-after-free. Modules linked in: tpm_tis_spi tpm_tis_core tpm mdio_bcm_unimac brcmfmac sha256_generic libsha256 sha256_arm hci_uart btbcm bluetooth cfg80211 vc4 brcmutil ecdh_generic ecc snd_soc_core crc32_arm_ce libaes raspberrypi_hwmon ac97_bus snd_pcm_dmaengine bcm2711_thermal snd_pcm snd_timer genet_snd phy_generic soundcore [last unloaded: spi_bcm2835] CPU: 3 PID: 1161 Comm: hold_open Not tainted 5.10.0ls-main-dirty #2 Hardware name: BCM2711 [<c0410c3c>] (unwind_backtrace) from [<c040b580>] (show_stack +0x10/0x14) [<c040b580>] (show_stack) from [<c1092174>] (dump_stack+0xc4/0xd8) [<c1092174>] (dump_stack) from [<c0445a30>] (__warn+0x104/0x108) [<c0445a30>] (__warn) from [<c0445aa8>] (warn_slowpath_fmt+0x74/0xb8) [<c0445aa8>] (warn_slowpath_fmt) from [<c08435d0>] (kobject_get +0xa0/0xa4) [<c08435d0>] (kobject_get) from [<bf0a715c>] (tpm_try_get_ops+0x14/0x54 [tpm]) [<bf0a715c>] (tpm_try_get_ops [tpm]) from [<bf0a7d6c>] (tpm_common_write+0x38/0x60 [tpm]) [<bf0a7d6c>] (tpm_common_write [tpm]) from [<c05a7ac0>] (vfs_write+0xc4/0x3c0) [<c05a7ac0>] (vfs_write) from [<c05a7ee4>] (ksys_write+0x58/0xcc) [<c05a7ee4>] (ksys_write) from [<c04001a0>] (ret_fast_syscall+0x0/0x4c) Exception stack(0xc226bfa8 to 0xc226bff0) bfa0: 00000000 000105b4 00000003 beafe664 00000014 00000000 bfc0: 00000000 000105b4 000103f8 00000004 00000000 00000000 b6f9c000 beafe684 bfe0: 0000006c beafe648 0001056c b6eb6944 ---[end trace d4b8409def9b8b1f]--- The reason for this warning is the attempt to get the chip->dev reference in tpm_common_write() although the reference counter is already zero. Since commit 8979b02aaf1d ("tpm: Fix reference count to main device") the extra reference used to prevent a premature zero counter is never taken, because the required TPM_CHIP_FLAG_TPM2 flag is never set. Fix this by moving the TPM 2 character device handling from tpm_chip_alloc() to tpm_add_char_device() which is called at a later point in time when the flag has been set in case of TPM2. Commit fdc915f7f719 ("tpm: expose spaces via a device link /dev/tpmrm<n>") already introduced function tpm_devs_release() to release the extra reference but did not implement the required put on chip->devs that results in the call of this function. Fix this by putting chip->devs in tpm_chip_unregister(). Finally move the new implementation for the TPM 2 handling into a new function to avoid multiple checks for the TPM_CHIP_FLAG_TPM2 flag in the good case and error cases.
CVE-2022-49288	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Fix races among concurrent prealloc proc writes We have no protection against concurrent PCM buffer preallocation changes via proc files, and it may potentially lead to UAF or some weird problem. This patch applies the PCM open_mutex to the proc write operation for avoiding the racy proc writes and the PCM stream open (and further operations).
CVE-2022-49290	In the Linux kernel, the following vulnerability has been resolved: mac80211: fix potential double free on mesh join While commit 6a01afc8468 ("mac80211: mesh: Free ie data when leaving mesh") fixed a memory leak on mesh leave / teardown it introduced a potential memory corruption caused by a double free when rejoining the mesh: ieee80211_leave_mesh() -> kfree(sdata->u.mesh.ie); ... ieee80211_join_mesh() -> copy_mesh_setup() -> old_ie = ifmsh->ie; -> kfree(old_ie); This double free / kernel panics can be reproduced by using wpa_supplicant with an encrypted mesh (if set up without encryption via "iw" then ifmsh->ie is always NULL, which avoids this issue). And then calling: \$ iw dev mesh0 mesh leave \$ iw dev mesh0 mesh join my-mesh Note that typically these commands are not used / working when using wpa_supplicant. And it seems that wpa_supplicant or wpa_cli are going through a NETDEV_DOWN/NETDEV_UP cycle between a mesh leave and mesh join where the NETDEV_UP resets the mesh.ie to NULL via a memcpy of default_mesh_setup in cfg80211_netdev_notifier_call, which then avoids the memory corruption, too. The issue was first observed in an application which was not using wpa_supplicant but "Senf" instead, which implements its own calls to nl80211. Fixing the issue by removing the kfree()ing of the mesh IE in the mesh join function and leaving it solely up to the mesh leave to free the mesh IE.

CVE ID	Description
CVE-2022-49291	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Fix races among concurrent hw_params and hw_free calls Currently we have neither proper check nor protection against the concurrent calls of PCM hw_params and hw_free ioctls, which may result in a UAF. Since the existing PCM stream lock can't be used for protecting the whole ioctl operations, we need a new mutex to protect those racy calls. This patch introduced a new mutex, runtime->buffer_mutex, and applies it to both hw_params and hw_free ioctl code paths. Along with it, the both functions are slightly modified (the mmap_count check is moved into the state-check block) for code simplicity.
CVE-2022-49293	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: initialize registers in nft_do_chain() Initialize registers to avoid stack leak into userspace.
CVE-2022-49294	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check if modulo is 0 before dividing. [How & Why] If a value of 0 is read, then this will cause a divide-by-0 panic.
CVE-2022-49295	In the Linux kernel, the following vulnerability has been resolved: nbd: call genl_unregister_family() first in nbd_cleanup() Otherwise there may be race between module removal and the handling of netlink command, which can lead to the oops as shown below: BUG: kernel NULL pointer dereference, address: 0000000000000098 Oops: 0002 [#1] SMP PTI CPU: 1 PID: 31299 Comm: nbd-client Tainted: G E 5.14.0-rc4 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996) RIP: 0010:down_write+0x1a/0x50 Call Trace: start_creating+0x89/0x130 debugfs_create_dir+0x1b/0x130 nbd_start_device+0x13d/0x390 [nbd] nbd_genl_connect+0x42f/0x748 [nbd] genl_family_rcv_msg_doit.isra.0+0xec/0x150 genl_rcv_msg+0xe5/0x1e0 netlink_rcv_skb+0x55/0x100 genl_rcv+0x29/0x40 netlink_unicast+0x1a8/0x250 netlink_sendmsg+0x21b/0x430 ____sys_sendmsg+0x2a4/0x2d0 ____sys_sendmsg+0x81/0xc0 __sys_sendmsg+0x62/0xb0 __x64_sys_sendmsg+0x1f/0x30 do_syscall_64+0x3b/0xc0 entry_SYSCALL_64_after_hwframe+0x44/0xae Modules linked in: nbd(E-)
CVE-2022-49296	In the Linux kernel, the following vulnerability has been resolved: ceph: fix possible deadlock when holding Fwb to get inline_data 1, mount with wsync. 2, create a file with O_RDWR, and the request was sent to mds.0: ceph_atomic_open()-> ceph_mdsc_do_request(openc) finish_open(file, dentry, ceph_open)-> ceph_open()-> ceph_init_file()-> ceph_init_file_info()-> ceph_uninline_data()-> { ... if (inline_version == 1 /* initial version, no data */ inline_version == CEPH_INLINE_NONE) goto out_unlock; ... } The inline_version will be 1, which is the initial version for the new create file. And here the ci->i_inline_version will keep with 1, it's buggy. 3, buffer write to the file immediately: ceph_write_iter()-> ceph_get_caps(file, need=Fw, want=Fb, ...); generic_perform_write()-> a_ops->write_begin()-> ceph_write_begin()-> netfs_write_begin()-> netfs_begin_read()-> netfs_rreq_submit_slice()-> netfs_read_from_server()-> rreq->netfs_ops->issue_read()-> ceph_netfs_issue_read()-> { ... if (ci->i_inline_version != CEPH_INLINE_NONE && ceph_netfs_issue_op_inline(subreq)) return; ... } ceph_put_cap_refs(ci, Fwb); The ceph_netfs_issue_op_inline() will send a getattr(Fsr) request to mds.1. 4, then the mds.1 will request the rd lock for CInode::filelock from the auth mds.0, the mds.0 will do the CInode::filelock state transition from excl -> sync, but it need to revoke the Fxwb caps back from the clients. While the kernel client has already held the Fwb caps and waiting for the getattr(Fsr). It's deadlock! URL: https://tracker.ceph.com/issues/55377
CVE-2022-49297	In the Linux kernel, the following vulnerability has been resolved: nbd: fix io hung while disconnecting device In our tests, "qemu-nbd" triggers a io hung: INFO: task qemu-nbd:11445 blocked for more than 368 seconds. Not tainted 5.18.0-rc3-next-20220422-00003-g2176915513ca #884 "echo 0 > /proc/sys/kernel/hung_task_timeout_secs" disables this message. task:qemu-nbd state:D stack: 0 pid:11445 ppid: 1 flags:0x00000000 Call Trace: <TASK> __schedule+0x480/0x1050 ? _raw_spin_lock_irqsave+0x3e/0xb0 schedule+0x9c/0x1b0 blk_mq_freeze_queue_wait+0x9d/0xf0 ? ipi_rseq+0x70/0x70 blk_mq_freeze_queue+0x2b/0x40 nbd_add_socket+0x6b/0x270 [nbd] nbd_ioctl+0x383/0x510 [nbd] blkdev_ioctl+0x18e/0x3e0 __x64_sys_ioctl+0xac/0x120 do_syscall_64+0x35/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7fd8ff706577 RSP: 002b:00007fd8fcdfeb8 EFLAGS: 00000246 ORIG_RAX: 0000000000000010 RAX: ffffffffda RBX: 0000000040000000 RCX: 00007fd8ff706577 RDX: 000000000000000d RSI: 000000000000ab00 RDI: 000000000000000f RBP: 000000000000000f R08: 0000000000000be8 R09: 000055fe497c62b0 R10: 00000002aff20000 R11: 0000000000000246 R12: 000000000000006d R13: 0000000000000000 R14: 00007ffe82dc5e70 R15: 00007fd8fcdff9c0 "qemu-nbd -d" will call ioctl 'NBD_DISCONNECT' first, however, following message was found: block nbd0: Send disconnect failed -32 Which indicate that something is wrong with the server. Then, "qemu-nbd -d" will call ioctl 'NBD_CLEAR_SOCK', however ioctl can't clear requests after commit 2516ab1543fd("nbd: only clear the queue on device teardown"). And in the meantime, request can't complete through timeout because nbd_xmit_timeout() will always return 'BLK_EH_RESET_TIMER', which means such request will never be completed in this situation. Now that the flag 'NBD_CMD_INFLIGHT' can make sure requests won't complete multiple times, switch back to call nbd_clear_sock() in nbd_clear_sock_ioctl(), so that inflight requests can be cleared.

CVE ID	Description
CVE-2022-49300	In the Linux kernel, the following vulnerability has been resolved: nbd: fix race between nbd_alloc_config() and module removal When nbd module is being removing, nbd_alloc_config() may be called concurrently by nbd_genl_connect(), although try_module_get() will return false, but nbd_alloc_config() doesn't handle it. The race may lead to the leak of nbd_config and its related resources (e.g. recv_workq) and oops in nbd_read_stat() due to the unload of nbd module as shown below: BUG: kernel NULL pointer dereference, address: 0000000000000040 Oops: 0000 [#1] SMP PTI CPU: 5 PID: 13840 Comm: kworker/u17:33 Not tainted 5.14.0+ #1 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996) Workqueue: knbd16-recv recv_work [nbd] RIP: 0010:nbd_read_stat.cold+0x130/0x1a4 [nbd] Call Trace: recv_work+0x3b/0xb0 [nbd] process_one_work+0x1ed/0x390 worker_thread+0x4a/0x3d0 kthread+0x12a/0x150 ret_from_fork+0x22/0x30 Fixing it by checking the return value of try_module_get() in nbd_alloc_config(). As nbd_alloc_config() may return ERR_PTR(-ENODEV), assign nbd->config only when nbd_alloc_config() succeeds to ensure the value of nbd->config is binary (valid or NULL). Also adding a debug message to check the reference counter of nbd_config during module removal.
CVE-2022-49307	In the Linux kernel, the following vulnerability has been resolved: tty: synclink_gt: Fix null-pointer-dereference in slgt_clean() When the driver fails at alloc_hdlcdev(), and then we remove the driver module, we will get the following splat: [25.065966] general protection fault, probably for non-canonical address 0xdffffc0000000182: 0000 [#1] PREEMPT SMP KASAN PTI [25.066914] KASAN: null-ptr-deref in range [0x00000000000000c10-0x00000000000000c17] [25.069262] RIP: 0010:detach_hdlc_protocol+0x2a/0x3e0 [25.077709] Call Trace: [25.077924] <TASK> [25.078108] unregister_hdlc_device+0x16/0x30 [25.078481] slgt_cleanup+0x157/0x9f0 [synclink_gt] Fix this by checking whether the 'info->netdev' is a null pointer first.
CVE-2022-49308	In the Linux kernel, the following vulnerability has been resolved: extcon: Modify extcon device to be created after driver data is set Currently, someone can invoke the sysfs such as state_show() intermittently before dev_set_drvdata() is done. And it can be a cause of kernel Oops because of edev is Null at that time. So modified the driver registration to after setting driver data. - Oops's backtrace. Backtrace: [<c067865c>] (state_show) from [<c05222e8>] (dev_attr_show) [<c05222c0>] (dev_attr_show) from [<c02c66e0>] (sysfs_kf_seq_show) [<c02c6648>] (sysfs_kf_seq_show) from [<c02c496c>] (kernfs_seq_show) [<c02c4938>] (kernfs_seq_show) from [<c025e2a0>] (seq_read) [<c025e11c>] (seq_read) from [<c02c50a0>] (kernfs_fop_read) [<c02c5064>] (kernfs_fop_read) from [<c0231cac>] (__vfs_read) [<c0231c5c>] (__vfs_read) from [<c0231ee0>] (vfs_read) [<c0231e34>] (vfs_read) from [<c0232464>] (ksys_read) [<c02323f0>] (ksys_read) from [<c02324fc>] (sys_read) [<c02324e4>] (sys_read) from [<c00091d0>] (__sys_trace_return)
CVE-2022-49314	In the Linux kernel, the following vulnerability has been resolved: tty: Fix a possible resource leak in icom_probe When pci_read_config_dword failed, call pci_release_regions() and pci_disable_device() to recycle the resource previously allocated.
CVE-2022-49321	In the Linux kernel, the following vulnerability has been resolved: xprtrdma: treat all calls not a bcall when bc_serv is NULL When a rdma server returns a fault format reply, nfs v3 client may treats it as a bcall when bc service is not exist. The debug message at rprcdma_bc_receive_call are, [56579.837169] RPC: rprcdma_bc_receive_call: callback XID 00000001, length=20 [56579.837174] RPC: rprcdma_bc_receive_call: 00 00 00 01 00 00 00 00 00 00 00 00 00 00 00 00 04 After that, rprcdma_bc_receive_call will meets NULL pointer as, [226.057890] BUG: unable to handle kernel NULL pointer dereference at 00000000000000c8 ... CVE ID	Description
CVE-2022-49322	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix sleeping function called from invalid context on RT kernel When setting bootparams="trace_event=initcall:initcall_start tp_printk=1" in the cmdline, the output_printk() was called, and the spin_lock_irqsave() was called in the atomic and irq disable interrupt context situation. On the PREEMPT_RT kernel, these locks are replaced with sleepable rt-spinlock, so the stack calltrace will be triggered. Fix it by raw_spin_lock_irqsave when PREEMPT_RT and "trace_event=initcall:initcall_start tp_printk=1" enabled. BUG: sleeping function called from invalid context at kernel/locking/spinlock_rt.c:46 in_atomic(): 1, irqs_disabled(): 0, non_block: 0, pid: 1, name: swapper/0 preempt_count: 2, expected: 0 RCU nest depth: 0, expected: 0 Preemption disabled at: [<ffffffff8992303e>] try_to_wake_up+0x7e/0xba0 CPU: 0 PID: 1 Comm: swapper/0 Not tainted 5.17.1-rt17+ #19 34c5812404187a875f32bee7977f7367f9679ea7 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.14.0-2 04/01/2014 Call Trace: <TASK> dump_stack_lvl+0x60/0x8c dump_stack+0x10/0x12 __might_resched.cold+0x11d/0x155 rt_spin_lock+0x40/0x70 trace_event_buffer_commit+0x2fa/0x4c0 ? map_vsyscall+0x93/0x93 trace_event_raw_event_initcall_start+0xbe/0x110 ? perf_trace_initcall_finish+0x210/0x210 ? probe_sched_wakeup+0x34/0x40 ? ttwu_do_wakeup+0xda/0x310 ? trace_hardirqs_on+0x35/0x170 ? map_vsyscall+0x93/0x93 do_one_initcall+0x217/0x3c0 ? trace_event_raw_event_initcall_level+0x170/0x170 ? push_cpu_stop+0x400/0x400 ? cblst_init_generic+0x241/0x290 kernel_init_freeable+0x1ac/0x347 ? _raw_spin_unlock_irq+0x65/0x80 ? rest_init+0xf0/0xf0 kernel_init+0x1e/0x150 ret_from_fork+0x22/0x30 </TASK>
CVE-2022-49323	In the Linux kernel, the following vulnerability has been resolved: iommu/arm-smmu: fix possible null-ptr-deref in arm_smmu_device_probe() It will cause null-ptr-deref when using 'res', if platform_get_resource() returns NULL, so move using 'res' after devm_ioremap_resource() that will check it to avoid null-ptr-deref. And use devm_platform_get_and_ioremap_resource() to simplify code.
CVE-2022-49325	In the Linux kernel, the following vulnerability has been resolved: tcp: add accessors to read/set tp->snd_cwnd We had various bugs over the years with code breaking the assumption that tp->snd_cwnd is greater than zero. Lately, syzbot reported the WARN_ON_ONCE(!tp->prior_cwnd) added in commit 8b8a321ff72c ("tcp: fix zero cwnd in tcp_cwnd_reduction") can trigger, and without a repro we would have to spend considerable time finding the bug. Instead of complaining too late, we want to catch where and when tp->snd_cwnd is set to an illegal value.
CVE-2022-49341	In the Linux kernel, the following vulnerability has been resolved: bpf, arm64: Clear prog->jited_len along prog->jited syzbot reported an illegal copy_to_user() attempt from bpf_prog_get_info_by_fd() [1] There was no repro yet on this bug, but I think that commit 0aef499f3172 ("mm/usercopy: Detect vmalloc overruns") is exposing a prior bug in bpf arm64. bpf_prog_get_info_by_fd() looks at prog->jited_len to determine if the JIT image can be copied out to user space. My theory is that syzbot managed to get a prog where prog->jited_len has been set to 43, while prog->bpf_func has been cleared. It is not clear why copy_to_user(uinsns, NULL, ulen) is triggering this particular warning. I thought find_vma_area(NULL) would not find a vm_struct. As we do not hold vmap_area_lock spinlock, it might be possible that the found vm_struct was garbage. [1] usercopy: Kernel memory exposure attempt detected from vmalloc (offset 792633534417210172, size 43)! kernel BUG at mm/usercopy.c:101! Internal error: Oops - BUG: 0 [#1] PREEMPT SMP Modules linked in: CPU: 0 PID: 25002 Comm: syz-executor.1 Not tainted 5.18.0-syzkaller-10139-g8291eaafed36 #0 Hardware name: linux,dummy-virt (DT) pstate: 60400009 (nZCv daif +PAN -UAO -TCO -DIT -SSBS BTYPE=--) pc : usercopy_abort+0x90/0x94 mm/usercopy.c:101 lr : usercopy_abort+0x90/0x94 mm/usercopy.c:89 sp : ffff80000b773a20 x29: ffff80000b773a30 x28: ffff80000b745000 x27: ffff80000b773b48 x26: 0000000000000000 x25: 000000000000002b x24: 0000000000000000 x23: 00000000000000e0 x22: ffff80000b75db67 x21: 0000000000000001 x20: 000000000000002b x19: ffff80000b75db3c x18: 00000000ffffffffff x17: 2820636f6c6c616d x16: 76206d6f72662064 x15: 6574636574656420 x14: 74706d6574746120 x13: 2129333420657a69 x12: 73202c3237313031 x11: 3237313434333533 x10: 3336323937207465 x9: 657275736f707865 x8: ffff80000a30c550 x7: ffff80000b773830 x6: ffff80000b773830 x5: 0000000000000000 x4: ffff00007fbaa10 x3: 0000000000000000 x2: 0000000000000000 x1: f7ff000028fc0000 x0: 0000000000000064 Call trace: usercopy_abort+0x90/0x94 mm/usercopy.c:89 check_heap_object mm/usercopy.c:186 [inline] __check_object_size mm/usercopy.c:252 [inline] __check_object_size+0x198/0x36c mm/usercopy.c:214 check_object_size include/linux/thread_info.h:199 [inline] check_copy_size include/linux/thread_info.h:235 [inline] copy_to_user include/linux/uaccess.h:159 [inline] bpf_prog_get_info_by_fd.isra.0+0xf14/0xfdc kernel/bpf/syscall.c:3993 bpf_obj_get_info_by_fd+0x12c/0x510 kernel/bpf/syscall.c:4253 __sys_bpf+0x900/0x2150 kernel/bpf/syscall.c:4956 __do_sys_bpf kernel/bpf/syscall.c:5021 [inline] __se_sys_bpf kernel/bpf/syscall.c:5019 [inline] __arm64_sys_bpf+0x28/0x40 kernel/bpf/syscall.c:5019 __invoke_syscall arch/arm64/kernel/syscall.c:38 [inline] invoke_syscall+0x48/0x114 arch/arm64/kernel/syscall.c:52 el0_svc common.constprop.0+0x44/0xec arch/arm64/kernel/syscall.c:142 do_el0_svc+0xa0/0xc0 arch/arm64/kernel/syscall.c:206 el0_svc+0x44/0xb0 arch/arm64/kernel/entry-common.c:624 el0t_64_sync_handler+0x1ac/0x1b0 arch/arm64/kernel/entry-common.c:642 el0t_64_sync+0x198/0x19c arch/arm64/kernel/entry.S:581 Code: aa003e3d 000038c0 91248000 97fff65f (d4010000)

CVE ID	Description
CVE-2022-49344	In the Linux kernel, the following vulnerability has been resolved: af_unix: Fix a data-race in unix_dgram_peer_wake_me(). unix_dgram_poll() calls unix_dgram_peer_wake_me() without `other`'s lock held and check if its receive queue is full. Here we need to use unix_recvq_full_lockless() instead of unix_recvq_full(), otherwise KCSAN will report a data-race.
CVE-2022-49345	In the Linux kernel, the following vulnerability has been resolved: net: xfrm: unexport __init-annotated xfrm4_protocol_init() EXPORT_SYMBOL and __init is a bad combination because the .init.text section is freed up after the initialization. Hence, modules cannot use symbols annotated __init. The access to a freed symbol may end up with kernel panic. modpost used to detect it, but it has been broken for a decade. Recently, I fixed modpost so it started to warn it again, then this showed up in linux-next builds. There are two ways to fix it: - Remove __init - Remove EXPORT_SYMBOL I chose the latter for this case because the only in-tree call-site, net/ipv4/xfrm4_policy.c is never compiled as modular. (CONFIG_XFRM is boolean)
CVE-2022-49348	In the Linux kernel, the following vulnerability has been resolved: ext4: filter out EXT4_FC_REPLAY from on-disk superblock field s_state The EXT4_FC_REPLAY bit in sbi->s_mount_state is used to indicate that we are in the middle of replay the fast commit journal. This was actually a mistake, since the sbi->s_mount_info is initialized from es->s_state. Arguably s_mount_state is misleadingly named, but the name is historical --- s_mount_state and s_state dates back to ext2. What should have been used is the ext4_{set,clear,test}_mount_flag() inline functions, which sets EXT4_MF_* bits in sbi->s_mount_flags. The problem with using EXT4_FC_REPLAY is that a maliciously corrupted superblock could result in EXT4_FC_REPLAY getting set in s_mount_state. This bypasses some sanity checks, and this can trigger a BUG() in ext4_es_cache_extent(). As a easy-to-backport-fix, filter out the EXT4_FC_REPLAY bit for now. We should eventually transition away from EXT4_FC_REPLAY to something like EXT4_MF_REPLAY.
CVE-2022-49349	In the Linux kernel, the following vulnerability has been resolved: ext4: fix use-after-free in ext4_rename_dir_prepare We got issue as follows: EXT4-fs (loop0): mounted filesystem without journal. Opts: ,errors=continue ext4_get_first_dir_block: bh->b_data=0xfffff88810bee6000 len=34478 ext4_get_first_dir_block: *parent_de=0xfffff88810bee6ae bh->b_data=0xfffff88810bee6000 ext4_rename_dir_prepare: [1] parent_de=0xfffff88810bee6ae ===== BUG: KASAN: use-after-free in ext4_rename_dir_prepare+0x152/0x220 Read of size 4 at addr ffff88810bee6gae by task rep/1895 CPU: 13 PID: 1895 Comm: rep Not tainted 5.10.0+ #241 Call Trace: dump_stack+0xbe/0xf9 print_address_description.constprop.0+0x1e/0x220 kasan_report.cold+0x37/0x7f ext4_rename_dir_prepare+0x152/0x220 ext4_rename+0xf44/0x1ad0 ext4_rename2+0x11c/0x170 vfs_rename+0xa84/0x1440 do_renameat2+0x683/0x8f0 ___x64_sys_renameat+0x53/0x60 do_syscall_64+0x33/0x40 entry_SYSCALL_64_after_hwframe+0x44/0xa9 RIP: 0033:0x7f45a6fc41c9 RSP: 002b:00007ffc5a470218 EFLAGS: 00000246 ORIG_RAX: 0000000000000108 RAX: ffffffff8fffd8 RBX: 0000000000000000 RCX: 00007f45a6fc41c9 RDX: 0000000000000005 RSI: 0000000020000180 RDI: 0000000000000005 RBP: 00007ffc5a470240 R08: 00007ffc5a470160 R09: 0000000020000080 R10: 00000000200001c0 R11: 0000000000000246 R12: 000000000400bb0 R13: 00007ffc5a470320 R14: 0000000000000000 R15: 0000000000000000 The buggy address belongs to the page: page:00000000440015ce refcount:0 mapcount:0 mapping:0000000000000000 index:0x1 pfn:0x10bee flags: 0x2000000000000000 raw: 0200000000000000 ffffea00043ff4c8 fffffea0004325608 0000000000000000 raw: 0000000000000000 0000000000000000 00000000ffffff 0000000000000000 page dumped because: kasan: bad access detected Memory state around the buggy address: ffff88810bee580: ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff >ffff88810bee680: ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ^ ffff88810bee700: ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff ffffffff Disabling lock debugging due to kernel taint ext4_rename_dir_prepare: [2] parent_de->ino=3537895424 ext4_rename_dir_prepare: [3] dir=0xfffff888124170140 ext4_rename_dir_prepare: [4] ino=2 ext4_rename_dir_prepare: ent->dir->i_ino=2 parent=-757071872 Reason is first directory entry which 'rec_len' is 34478, then will get illegal parent entry. Now, we do not check directory entry after read directory block in 'ext4_get_first_dir_block'. To solve this issue, check directory entry in 'ext4_get_first_dir_block'. [Trigger an ext4_error() instead of just warning if the directory is missing a '.' or '..' entry. Also make sure we return an error code if the file system is corrupted. -TYT]
CVE-2022-49350	In the Linux kernel, the following vulnerability has been resolved: net: mdio: unexport __init-annotated mdio_bus_init() EXPORT_SYMBOL and __init is a bad combination because the .init.text section is freed up after the initialization. Hence, modules cannot use symbols annotated __init. The access to a freed symbol may end up with kernel panic. modpost used to detect it, but it has been broken for a decade. Recently, I fixed modpost so it started to warn it again, then this showed up in linux-next builds. There are two ways to fix it: - Remove __init - Remove EXPORT_SYMBOL I chose the latter for this case because the only in-tree call-site, drivers/net/phy/phy_device.c is never compiled as modular. (CONFIG_PHYLIB is boolean)

CVE ID	Description
CVE-2022-49352	In the Linux kernel, the following vulnerability has been resolved: ext4: fix warning in ext4_handle_inode_extension We got issue as follows: EXT4-fs error (device loop0) in ext4_reserve_inode_write:5741: Out of memory EXT4-fs error (device loop0): ext4_setattr:5462: inode #13: comm syz-executor.0: mark_inode_dirty error EXT4-fs error (device loop0) in ext4_setattr:5519: Out of memory EXT4-fs error (device loop0): ext4_ind_map_blocks:595: inode #13: comm syz-executor.0: Can't allocate blocks for non-extent mapped inodes with bigalloc ----- [cut here]----- WARNING: CPU: 1 PID: 4361 at fs/ext4/file.c:301 ext4_file_write_iter+0x11c9/0x1220 Modules linked in: CPU: 1 PID: 4361 Comm: syz-executor.0 Not tainted 5.10.0+ #1 RIP: 0010:ext4_file_write_iter+0x11c9/0x1220 RSP: 0018:ffff924d80b27c00 EFLAGS: 00010282 RAX: ffffffff815a3379 RBX: 0000000000000000 RCX: 000000003b000000 RDX: ffff924d81601000 RSI: 000000000000009c RDI: 000000000000009c RBP: 000000000000000d R08: ffffffffbc5a2c6b R09: 0000902e0e52a96f R10: ffff902e2b7c1b40 R11: ffff902e2b7c1b40 R12: 000000000000000a R13: 0000000000000001 R14: ffff902e0e52aa10 R15: ffffffff8bfb8 FS: 00007f81a7f65700(0000) GS:ffff902e3bc80000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: ffffffff600400 CR3: 000000012db88001 CR4: 0000000003706e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: do_iter_readv_writev+0x2e5/0x360 do_iter_write+0x112/0x4c0 do_pwritev+0x1e5/0x390 __x64_sys_pwritev2+0x7e/0xa0 do_syscall_64+0x37/0x50 entry_SYSCALL_64_after_hwframe+0x44/0xa9 Above issue may happen as follows: Assume inode.i_size=4096 EXT4_I(inode)->i_disksize=4096 step 1: set inode->i_size = 8192 ext4_setattr if (attr->ia_size != inode->i_size) EXT4_I(inode)->i_disksize = attr->ia_size; rc = ext4_mark_inode_dirty ext4_reserve_inode_write ext4_get_inode_loc __ext4_get_inode_loc sb_getblk --> return -ENOMEM ... if (!error) ->will not update i_size i_size_write(inode, attr->ia_size); Now: inode.i_size=4096 EXT4_I(inode)->i_disksize=8192 step 2: Direct write 4096 bytes ext4_file_write_iter ext4_dio_write_iter iomap_dio_rw ->return error if (extend) ext4_handle_inode_extension WARN_ON_ONCE(i_size_read(inode) < EXT4_I(inode)->i_disksize); ->Then trigger warning. To solve above issue, if mark inode dirty failed in ext4_setattr just set 'EXT4_I(inode)->i_disksize' with old value.
CVE-2022-49353	In the Linux kernel, the following vulnerability has been resolved: powerpc/papr_scm: don't requests stats with '0' sized stats buffer Sachin reported [1] that on a POWER-10 lpar he is seeing a kernel panic being reported with vPMEM when papr_scm probe is being called. The panic is of the form below and is observed only with following option disabled(profile) for the said LPAR 'Enable Performance Information Collection' in the HMC: Kernel attempted to write user page (1c) - exploit attempt? (uid: 0) BUG: Kernel NULL pointer dereference on write at 0x0000001c Faulting instruction address: 0xc008000001b90844 Oops: Kernel access of bad area, sig: 11 [#1] <snip> NIP [c008000001b90844] drc_pmem_query_stats+0x5c/0x270 [papr_scm] LR [c008000001b92794] papr_scm_probe+0x2ac/0x6ec [papr_scm] Call Trace: 0xc00000000941bca0 (unreliable) papr_scm_probe+0x2ac/0x6ec [papr_scm] platform_probe+0x98/0x150 really_probe+0xfc/0x510 __driver_probe_device+0x17c/0x230 <snip> ---[end trace 0000000000000000]--- Kernel panic - not syncing: Fatal exception On investigation looks like this panic was caused due to a 'stat_buffer' of size==0 being provided to drc_pmem_query_stats() to fetch all performance stats-ids of an NVDIMM. However drc_pmem_query_stats() shouldn't have been called since the vPMEM NVDIMM doesn't support and performance stat-id's. This was caused due to missing check for 'p->stat_buffer_len' at the beginning of papr_scm_pmu_check_events() which indicates that the NVDIMM doesn't support performance-stats. Fix this by introducing the check for 'p->stat_buffer_len' at the beginning of papr_scm_pmu_check_events(). [1] https://lore.kernel.org/all/6B3A522A-6A5F-4CC9-B268-0C63AA6E07D3@linux.ibm.com
CVE-2022-49357	In the Linux kernel, the following vulnerability has been resolved: efi: Do not import certificates from UEFI Secure Boot for T2 Macs On Apple T2 Macs, when Linux attempts to read the db and dbx efi variables at early boot to load UEFI Secure Boot certificates, a page fault occurs in Apple firmware code and EFI runtime services are disabled with the following logs: [Firmware Bug]: Page fault caused by firmware at PA: 0xffffb1edc0068000 WARNING: CPU: 3 PID: 104 at arch/x86/platform/efi/quirks.c:735 efi_crash_gracefully_on_page_fault+0x50/0xf0 (Removed some logs from here) Call Trace: <TASK> page_fault_oops+0x4f/0x2c0 ? search_bpf_extables+0x6b/0x80 ? search_module_extables+0x50/0x80 ? search_exception_tables+0x5b/0x60 kernelmode_fixup_or_oops+0x9e/0x110 __bad_area_nosemaphore+0x155/0x190 bad_area_nosemaphore+0x16/0x20 do_kern_addr_fault+0x8c/0xa0 exc_page_fault+0xd8/0x180 asm_exc_page_fault+0x1e/0x30 (Removed some logs from here) ? __efi_call+0x28/0x30 ? switch_mm+0x20/0x30 ? efi_call_rts+0x19a/0x8e0 ? process_one_work+0x222/0x3f0 ? worker_thread+0x4a/0x3d0 ? kthread+0x17a/0x1a0 ? process_one_work+0x3f0/0x3f0 ? set_kthread_struct+0x40/0x40 ? ret_from_fork+0x22/0x30 </TASK> ---[end trace 1f82023595a5927f]--- efi: Froze efi_rts_wq and disabled EFI Runtime Services integrity: Couldn't get size: 0x8000000000000015 integrity: MODSIGN: Couldn't get UEFI db list efi: EFI Runtime Services are disabled! integrity: Couldn't get size: 0x8000000000000015 integrity: Couldn't get UEFI dbx list integrity: Couldn't get size: 0x8000000000000015 integrity: Couldn't get mokx list integrity: Couldn't get size: 0x80000000 So we avoid reading these UEFI variables and thus prevent the crash.

CVE ID	Description
CVE-2022-49358	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: memleak flow rule from commit path Abort path release flow rule object, however, commit path does not. Update code to destroy these objects before releasing the transaction.
CVE-2022-49370	In the Linux kernel, the following vulnerability has been resolved: firmware: dmi-sysfs: Fix memory leak in dmi_sysfs_register_handle kobject_init_and_add() takes reference even when it fails. According to the doc of kobject_init_and_add() If this function returns an error, kobject_put() must be called to properly clean up the memory associated with the object. Fix this issue by calling kobject_put().
CVE-2022-49371	In the Linux kernel, the following vulnerability has been resolved: driver core: fix deadlock in __device_attach In __device_attach function, The lock holding logic is as follows: ... __device_attach device_lock(dev) // get lock dev async_schedule_dev(__device_attach_async_helper, dev); // func async_schedule_node async_schedule_node_domain(func) entry = kzalloc(sizeof(struct async_entry), GFP_ATOMIC); /* when fail or work limit, sync to execute func, but __device_attach_async_helper will get lock dev as well, which will lead to A-A deadlock. */ if (!entry atomic_read(&entry_count) > MAX_WORK) { func; else queue_work_node(node, system_unbound_wq, &entry->work) device_unlock(dev) As shown above, when it is allowed to do async probes, because of out of memory or work limit, async work is not allowed, to do sync execute instead. it will lead to A-A deadlock because of __device_attach_async_helper getting lock dev. To fix the deadlock, move the async_schedule_dev outside device_lock, as we can see, in async_schedule_node_domain, the parameter of queue_work_node is system_unbound_wq, so it can accept concurrent operations. which will also not change the code logic, and will not lead to deadlock.
CVE-2022-49374	In the Linux kernel, the following vulnerability has been resolved: tipc: check attribute length for bearer name syzbot reported uninit-value: ===== BUG: KMSAN: uninit-value in string_nocheck lib/vsprintf.c:644 [inline] BUG: KMSAN: uninit-value in string+0x4f9/0x6f0 lib/vsprintf.c:725 string_nocheck lib/vsprintf.c:644 [inline] string+0x4f9/0x6f0 lib/vsprintf.c:725 vsnprintf+0x2222/0x3650 lib/vsprintf.c:2806 vprintk_store+0x537/0x2150 kernel/printk/printk.c:2158 vprintk_emit+0x28b/0xab0 kernel/printk/printk.c:2256 vprintk_default+0x86/0xa0 kernel/printk/printk.c:2283 vprintk+0x15f/0x180 kernel/printk/printk_safe.c:50 _printk+0x18d/0x1cf kernel/printk/printk.c:2293 tipc_enable_bearer net/tipc/bearer.c:371 [inline] __tipc_nl_bearer_enable+0x2022/0x22a0 net/tipc/bearer.c:1033 tipc_nl_bearer_enable+0x6c/0xb0 net/tipc/bearer.c:1042 genl_family_rcv_msg_doit net/netlink/genetlink.c:731 [inline] - Do sanity check the attribute length for TIPC_NLA_BEARER_NAME. - Do not use 'illegal name' in printing message.
CVE-2022-49377	In the Linux kernel, the following vulnerability has been resolved: blk-mq: don't touch ->tagset in blk_mq_get_sq_hctx blk_mq_run_hw_queues() could be run when there isn't queued request and after queue is cleaned up, at that time tagset is freed, because tagset lifetime is covered by driver, and often freed after blk_cleanup_queue() returns. So don't touch ->tagset for figuring out current default hctx by the mapping built in request queue, so use-after-free on tagset can be avoided. Meantime this way should be fast than retrieving mapping from tagset.
CVE-2022-49384	In the Linux kernel, the following vulnerability has been resolved: md: fix double free of io_acct_set bioset Now io_acct_set is alloc and free in personality. Remove the codes that free io_acct_set in md_free and md_stop.
CVE-2022-49385	In the Linux kernel, the following vulnerability has been resolved: driver: base: fix UAF when driver_attach failed When driver_attach(drv); failed, the driver_private will be freed. But it has been added to the bus, which caused a UAF. To fix it, we need to delete it from the bus when failed.
CVE-2022-49388	In the Linux kernel, the following vulnerability has been resolved: ubi: ubi_create_volume: Fix use-after-free when volume creation failed There is an use-after-free problem for 'eba_tbl' in ubi_create_volume()'s error handling path: ubi_eba_replace_table(vol, eba_tbl) vol->eba_tbl = tbl out_mapping: ubi_eba_destroy_table(eba_tbl) // Free 'eba_tbl' out_unlock: put_device(&vol->dev) vol_release kfree(tbl->entries) // UAF Fix it by removing redundant 'eba_tbl' releasing. Fetch a reproducer in [Link].

CVE ID	Description
CVE-2022-49390	In the Linux kernel, the following vulnerability has been resolved: macsec: fix UAF bug for real_dev Create a new macsec device but not get reference to real_dev. That can not ensure that real_dev is freed after macsec. That will trigger the UAF bug for real_dev as following: <pre>===== BUG: KASAN: use-after-free in macsec_get_iflink+0x5f/0x70 drivers/net/macsec.c:3662 Call Trace: ... macsec_get_iflink+0x5f/0x70 drivers/net/macsec.c:3662 dev_get_iflink+0x73/0xe0 net/core/ dev.c:637 default_operstate net/core/link_watch.c:42 [inline] rfc2863_policy+0x233/0x2d0 net/ core/link_watch.c:54 linkwatch_do_dev+0x2a/0x150 net/core/link_watch.c:161 Allocated by task 22209: ... alloc_netdev_mqs+0x98/0x1100 net/core/dev.c:10549 rtnl_create_link+0x9d7/0xc00 net/ core/rtnetlink.c:3235 veth_newlink+0x20e/0xa90 drivers/net/veth.c:1748 Freed by task 8: ... kfree +0xd6/0x4d0 mm/slab.c:4552 kvfree+0x42/0x50 mm/util.c:615 device_release+0x9f/0x240 drivers/ base/core.c:2229 kobject_cleanup lib/kobject.c:673 [inline] kobject_release lib/kobject.c:704 [inline] kref_put include/linux/kref.h:65 [inline] kobject_put+0x1c8/0x540 lib/kobject.c:721 netdev_run_todo +0x72e/0x10b0 net/core/dev.c:10327 After commit faab39f63c1f ("net: allow out-of-order netdev unregistration") and commit e5f80fcf869a ("ipv6: give an IPv6 dev to blackhole_netdev"), we can add dev_hold_track() in macsec_dev_init() and dev_put_track() in macsec_free_netdev() to fix the problem.</pre>
CVE-2022-49394	In the Linux kernel, the following vulnerability has been resolved: blk-iolatency: Fix inflight count imbalances and IO hangs on offline iolateness needs to track the number of inflight IOs per cgroup. As this tracking can be expensive, it is disabled when no cgroup has iolateness configured for the device. To ensure that the inflight counters stay balanced, iolateness_set_limit() freezes the request_queue while manipulating the enabled counter, which ensures that no IO is in flight and thus all counters are zero. Unfortunately, iolateness_set_limit() isn't the only place where the enabled counter is manipulated. iolateness_pd_offline() can also dec the counter and trigger disabling. As this disabling happens without freezing the q, this can easily happen while some IOs are in flight and thus leak the counts. This can be easily demonstrated by turning on iolateness on an one empty cgroup while IOs are in flight in other cgroups and then removing the cgroup. Note that iolateness shouldn't have been enabled elsewhere in the system to ensure that removing the cgroup disables iolateness for the whole device. The following keeps flipping on and off iolateness on sda: echo +io > /sys/fs/cgroup/cgroup.subtree_control while true; do mkdir -p /sys/fs/cgroup/test echo '8:0 target=100000' > /sys/fs/cgroup/test/io.latency sleep 1 rmdir /sys/fs/cgroup/test sleep 1 done and there's concurrent fio generating direct rand reads: fio --name test --filename=/dev/sda --direct=1 --rw=randread \ --runtime=600 --time_based --iodepth=256 --numjobs=4 --bs=4k while monitoring with the following drgn script: while True: for css in css_for_each_descendant_pre(prog['blkcg_root'].css.address_of_()): for pos in hlist_for_each(container_of(css, 'struct blkcg', 'css').blkcg_list): blkcg = container_of(pos, 'struct blkcg_gg', 'blkcg_node') pd = blkcg.pd[prog['blkcg_policy_iolateness'].plid] if pd.value_() == 0: continue iolat = container_of(pd, 'struct iolateness_grp', 'pd') inflight = iolat.rq_wait.inflight.counter.value_() if inflight: print(f'inflight={inflight} {disk_name(blkcg.q.disk).decode("utf-8")}') f'{cgroup_path(css.cgroup).decode("utf-8")}') time.sleep(1) The monitoring output looks like the following: inflight=1 sda /user.slice inflight=1 sda /user.slice ... inflight=14 sda /user.slice inflight=13 sda /user.slice inflight=17 sda /user.slice inflight=15 sda /user.slice inflight=18 sda /user.slice inflight=17 sda /user.slice inflight=20 sda /user.slice inflight=19 sda /user.slice <- fio stopped, inflight stuck at 19 inflight=19 sda /user.slice inflight=19 sda /user.slice If a cgroup with stuck inflight ends up getting throttled, the throttled IOs will never get issued as there's no completion event to wake it up leading to an indefinite hang. This patch fixes the bug by unifying enable handling into a work item which is automatically kicked off from iolateness_set_min_lat_nsec() which is called from both iolateness_set_limit() and iolateness_pd_offline() paths. Punting to a work item is necessary as iolateness_pd_offline() is called under spinlocks while freezing a request_queue requires a sleepable context. This also simplifies the code reducing LOC sans the comments and avoids the unnecessary freezes which were happening whenever a cgroup's latency target is newly set or cleared.

CVE ID	Description
CVE-2022-49400	In the Linux kernel, the following vulnerability has been resolved: md: Don't set mddev private to NULL in raid0 pers->free In normal stop process, it does like this: do_md_stop __md_stop (pers->free()); mddev->private=NULL) md_free (free mddev) __md_stop sets mddev->private to NULL after pers->free. The raid device will be stopped and mddev memory is free. But in reshape, it doesn't free the mddev and mddev will still be used in new raid. In reshape, it first sets mddev->private to new_pers and then runs old_pers->free(). Now raid0 sets mddev->private to NULL in raid0_free. The new raid can't work anymore. It will panic when dereference mddev->private because of NULL pointer dereference. It can panic like this: [63010.814972] kernel BUG at drivers/md/raid10.c:928! [63010.819778] invalid opcode: 0000 [#1] PREEMPT SMP NOPTI [63010.825011] CPU: 3 PID: 44437 Comm: md0_resync Kdump: loaded Not tainted 5.14.0-86.el9.x86_64 #1 [63010.833789] Hardware name: Dell Inc. CVE-2022-49402	In the Linux kernel, the following vulnerability has been resolved: ftrace: Clean up hash direct_functions on register failures We see the following GPF when register_ftrace_direct fails: [] general protection fault, probably for non-canonical address \ 0x2000000000000010: 0000 [#1] PREEMPT SMP DEBUG_PAGEALLOC PTI [...] [] RIP: 0010:ftrace_find_rec_direct+0x53/0x70 [] Code: 48 c1 e0 03 48 03 42 08 48 8b 10 31 c0 48 85 d2 74 [...] [] RSP: 0018:ffff9000138bc10 EFLAGS: 00010206 [] RAX: 0000000000000000 RBX: ffffffff813e0df0 RCX: 000000000000003b [] RDY: 0200000000000000 RSI: 000000000000000c RDI: ffffffff813e0df0 [] RBP: ffffffff813e0df0 R08: ffffffff81180ce0 R09: 0000000000000001 [] R10: ffffc9000138bc18 R11: 0000000000000001 R12: ffffffff813e0df0 [] R13: ffffffff813e0df0 R14: ffff888171b56400 R15: 0000000000000000 [] FS: 00007fa9420c7780(0000) GS:ffff888ff6a00000(0000) knlGS:000000000 [] CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 [] CR2: 000000000770d000 CR3: 0000000107d50003 CR4: 000000000370ee0 [] DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 [] DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 [] Call Trace: [] <TASK> [] register_ftrace_direct+0x54/0x290 [] ? render_sigset_t+0xa0/0xa0 [] bpf_trampoline_update+0x3f5/0x4a0 [] ? 0xffffffa00a3000 [] bpf_trampoline_link_prog+0xa9/0x140 [] bpf_tracing_prog_attach+0x1dc/0x450 [] bpf_raw_tracepoint_open+0x9a/0x1e0 [] ? find_held_lock+0x2d/0x90 [] ? lock_release+0x150/0x430 [] __sys_bpf+0xbd6/0x2700 [] ? lock_is_held_type+0xd8/0x130 [] __x64_sys_bpf+0x1c/0x20 [] do_syscall_64+0x3a/0x80 [] entry_SYSCALL_64_after_hwframe+0x44/0xae [] RIP: 0033:0x7fa9421defa9 [] Code: 00 c3 66 2e 0f 1f 84 00 00 00 00 0f 1f 44 00 00 9 f8 [...] [] RSP: 002b:00007ffed743bd78 EFLAGS: 00000246 ORIG_RAX: 0000000000000141 [] RAX: ffffffff813e0df0 RBX: 00000000069d2480 RCX: 00007fa9421defa9 [] RDY: 0000000000000078 RSI: 00007ffed743bd80 RDI: 0000000000000011 [] RBP: 00007ffed743be00 R08: 0000000000bb7270 R09: 0000000000000000 [] R10: 00000000069da210 R11: 0000000000000246 R12: 0000000000000001 [] R13: 00007ffed743c4b0 R14: 00000000069d2480 R15: 0000000000000001 [] </TASK> [] Modules linked in: klp_vm(OK) [] ---[end trace 0000000000000000]--- One way to trigger this is: 1. load a livepatch that patches kernel function xxx; 2. run bpftrace -e 'kfunc:xxx {}', this will fail (expected for now); 3. repeat #2 => gpf. This is because the entry is added to direct_functions, but not removed. Fix this by remove the entry from direct_functions when register_ftrace_direct fails. Also remove the last trailing space from ftrace.c, so we don't have to worry about it anymore.
CVE-2022-49404	In the Linux kernel, the following vulnerability has been resolved: RDMA/hfi1: Fix potential integer multiplication overflow errors When multiplying of different types, an overflow is possible even when storing the result in a larger type. This is because the conversion is done after the multiplication. So arithmetic overflow and thus incorrect value is possible. Correct an instance of this in the inter packet delay calculation. Fix by ensuring one of the operands is u64 which will promote the other to u64 as well ensuring no overflow.

CVE ID	Description
CVE-2022-49407	In the Linux kernel, the following vulnerability has been resolved: dlm: fix plock invalid read This patch fixes an invalid read showed by KASAN. A unlock will allocate a "struct plock_op" and a followed send_op() will append it to a global send_list data structure. In some cases a followed dev_read() moves it to recv_list and dev_write() will cast it to "struct plock_xop" and access fields which are only available in those structures. At this point an invalid read happens by accessing those fields. To fix this issue the "callback" field is moved to "struct plock_op" to indicate that a cast to "plock_xop" is allowed and does the additional "plock_xop" handling if set. Example of the KASAN output which showed the invalid read: [2064.296453] ===== <pre>[2064.304852] BUG: KASAN: slab-out-of-bounds in dev_write+0x52b/0x5a0 [dlm] [2064.306491] Read of size 8 at addr ffff88800ef227d8 by task dlm_control/7484 [2064.308168] [2064.308575] CPU: 0 PID: 7484 Comm: dlm_control/ Kdump: loaded Not tainted 5.14.0+ #9 [2064.310292] Hardware name: Red Hat KVM, BIOS 0.5.1 01/01/2011 [2064.311618] Call Trace: [2064.312218] dump_stack_lvl+0x56/0x7b [2064.313150] print_address_description.constprop.8+0x21/0x150 [2064.314578] ? dev_write+0x52b/0x5a0 [dlm] [2064.315610] ? dev_write+0x52b/0x5a0 [dlm] [2064.316595] kasan_report.cold.14+0x7f/0x11b [2064.317674] ? dev_write+0x52b/0x5a0 [dlm] [2064.318687] dev_write+0x52b/0x5a0 [dlm] [2064.319629] ? dev_read+0x4a0/0x4a0 [dlm] [2064.320713] ? bpf_lsm_kernfs_init_security+0x10/0x10 [2064.321926] vfs_write+0x17e/0x930 [2064.322769] ? __fget_light+0x1aa/0x220 [2064.323753] ksys_write+0xf1/0x1c0 [2064.324548] ? __ia32_sys_read+0xb0/0xb0 [2064.325464] do_syscall_64+0x3a/0x80 [2064.326387] entry_SYSCALL_64_after_hwframe+0x44/0xae [2064.327606] RIP: 0033:0x7f807e4ba96f [2064.328470] Code: 89 54 24 18 48 89 74 24 10 89 7c 24 08 e8 39 87 f8 ff 48 8b 54 24 18 48 8b 74 24 10 41 89 c0 8b 7c 24 08 b8 01 00 00 0f 05 <48> 3d 00 0f ff 77 31 44 89 c7 48 89 44 24 08 e8 7c 87 f8 ff 48 [2064.332902] RSP: 002b:00007ffd50cfe6e0 EFLAGS: 00000293 ORIG_RAX: 0000000000000001 [2064.334658] RAX: ffffffff8daa0000 RBX: 000055cc3886eb30 RCX: 00007f807e4ba96f [2064.336275] RDX: 0000000000000004 RSI: 00007ffd50cfe7e0 RDI: 0000000000000010 [2064.337980] RBP: 00007ffd50cfe7e0 R08: 0000000000000000 R09: 0000000000000001 [2064.339560] R10: 000055cc3886eb30 R11: 0000000000000293 R12: 000055cc3886eb80 [2064.341237] R13: 000055cc3886eb00 R14: 000055cc3886f590 R15: 0000000000000001 [2064.342857] [2064.343226] Allocated by task 12438: [2064.344057] kasan_save_stack+0x1c/0x40 [2064.345079] __kasan_kmalloc+0x84/0xa0 [2064.345933] kmem_cache_alloc_trace+0x13b/0x220 [2064.346953] dlm_posix_unlock+0xec/0x720 [dlm] [2064.348811] do_lock_file_wait.part.32+0xca/0x1d0 [2064.351070] fcntl_setlk+0x281/0xabc0 [2064.352879] do_fcntl+0x5e4/0xfe0 [2064.354657] __x64_sys_fcntl+0x11f/0x170 [2064.356550] do_syscall_64+0x3a/0x80 [2064.358259] entry_SYSCALL_64_after_hwframe+0x44/0xae [2064.360745] [2064.361511] Last potentially related work creation: [2064.363957] kasan_save_stack +0x1c/0x40 [2064.365811] __kasan_record_aux_stack+0xaf/0xc0 [2064.368100] call_rcu +0x11b/0xf70 [2064.369785] dlm_process_incoming_buffer+0x47d/0xfd0 [dlm] [2064.372404] receive_from_sock+0x290/0x770 [dlm] [2064.374607] process_rcv_sockets+0x32/0x40 [dlm] [2064.377290] process_one_work+0x9a8/0x16e0 [2064.379357] worker_thread+0x87/0xbf0 [2064.381188] kthread+0x3ac/0x490 [2064.383460] ret_from_fork+0x22/0x30 [2064.385588] [2064.386518] Second to last potentially related work creation: [2064.389219] kasan_save_stack +0x1c/0x40 [2064.391043] __kasan_record_aux_stack+0xaf/0xc0 [2064.393303] call_rcu +0x11b/0xf70 [2064.394885] dlm_process_incoming_buffer+0x47d/0xfd0 [dlm] [2064.397694] receive_from_sock+0x290/0x770 ---truncated---</pre>
CVE-2022-49410	In the Linux kernel, the following vulnerability has been resolved: tracing: Fix potential double free in create_var_ref() In create_var_ref(), init_var_ref() is called to initialize the fields of variable ref_field, which is allocated in the previous function call to create_hist_field(). Function init_var_ref() allocates the corresponding fields such as ref_field->system, but frees these fields when the function encounters an error. The caller later calls destroy_hist_field() to conduct error handling, which frees the fields and the variable itself. This results in double free of the fields which are already freed in the previous function. Fix this by storing NULL to the corresponding fields when they are freed in init_var_ref().
CVE-2022-49411	In the Linux kernel, the following vulnerability has been resolved: bfq: Make sure bfqg for which we are queueing requests is online Bios queued into BFQ IO scheduler can be associated with a cgroup that was already offlined. This may then cause insertion of this bfq_group into a service tree. But this bfq_group will get freed as soon as last bio associated with it is completed leading to use after free issues for service tree users. Fix the problem by making sure we always operate on online bfq_group. If the bfq_group associated with the bio is not online, we pick the first online parent.

CVE ID	Description
CVE-2022-49412	In the Linux kernel, the following vulnerability has been resolved: bfq: Avoid merging queues with different parents It can happen that the parent of a bfqq changes between the moment we decide two queues are worth to merge (and set bic->stable_merge_bfqq) and the moment bfq_setup_merge() is called. This can happen e.g. because the process submitted IO for a different cgroup and thus bfqq got reparented. It can even happen that the bfqq we are merging with has parent cgroup that is already offline and going to be destroyed in which case the merge can lead to use-after-free issues such as: BUG: KASAN: use-after-free in __bfq_deactivate_entity+0x9cb/0xa50 Read of size 8 at addr ffff88800693c0c0 by task runc:[2:INIT]/10544 CPU: 0 PID: 10544 Comm: runc:[2:INIT] Tainted: G E 5.15.2-0.g5fb85fd-default #1 openSUSE Tumbleweed (unreleased) f1f3b891c72369aebcd2e43e4641a6358867c70 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS rel-1.14.0-0-g155821a-rebuilt.opensuse.org 04/01/2014 Call Trace: <IRQ> dump_stack_lvl+0x46/0x5a print_address_description.constprop.0+0x1f/0x140 ? __bfq_deactivate_entity+0x9cb/0xa50 kasan_report.cold+0x7f/0x11b ? __bfq_deactivate_entity+0x9cb/0xa50 __bfq_deactivate_entity+0x9cb/0xa50 ? update_curr+0x32f/0x5d0 bfq_deactivate_entity+0xa0/0x1d0 bfq_del_bfqq_busy+0x28a/0x420 ? resched_curr+0x116/0x1d0 ? bfq_requeue_bfqq+0x70/0x70 ? check_preempt_wakeup+0x52b/0xabc0 __bfq_bfqq_expire+0x1a2/0x270 bfq_bfqq_expire+0xd16/0x2160 ? try_to_wake_up+0x4ee/0x1260 ? bfq_end_wr_async_queues+0xe0/0xe0 ? _raw_write_unlock_bh+0x60/0x60 ? _raw_spin_lock_irq+0x81/0xe0 bfq_idle_slice_timer+0x109/0x280 ? bfq_dispatch_request+0x4870/0x4870 __hrtimer_run_queues+0x37d/0x700 ? enqueue_hrtimer+0x1b0/0x1b0 ? kvm_clock_get_cycles+0xd/0x10 ? ktime_get_update_offsets_now+0x6f/0x280 hrtimer_interrupt+0x2c8/0x740 Fix the problem by checking that the parent of the two bfqq's we are merging in bfq_setup_merge() is the same.
CVE-2022-49413	In the Linux kernel, the following vulnerability has been resolved: bfq: Update cgroup information before merging bio When the process is migrated to a different cgroup (or in case of writeback just starts submitting bios associated with a different cgroup) bfq_merge_bio() can operate with stale cgroup information in bic. Thus the bio can be merged to a request from a different cgroup or it can result in merging of bfqq's for different cgroups or bfqq's of already dead cgroups and causing possible use-after-free issues. Fix the problem by updating cgroup information in bfq_merge_bio().
CVE-2022-49414	In the Linux kernel, the following vulnerability has been resolved: ext4: fix race condition between ext4_write and ext4_convert_inline_data Hulk Robot reported a BUG_ON: <pre> ===== EXT4- fs error (device loop3): ext4_mb_generate_buddy:805: group 0, block bitmap and bg descriptor inconsistent: 25 vs 31513 free clusters kernel BUG at fs/ext4/ext4_jbd2.c:53! invalid opcode: 0000 [#1] SMP KASAN PTI CPU: 0 PID: 25371 Comm: syz-executor.3 Not tainted 5.10.0+ #1 RIP: 0010:ext4_put_nojournal fs/ext4/ext4_jbd2.c:53 [inline] RIP: 0010:__ext4_journal_stop +0x10e/0x110 fs/ext4/ext4_jbd2.c:116 [...] Call Trace: ext4_write_inline_data_end+0x59a/0x730 fs/ ext4/inline.c:795 generic_perform_write+0x279/0x3c0 mm/filemap.c:3344 ext4_buffered_write_iter +0x2e3/0x3d0 fs/ext4/file.c:270 ext4_file_write_iter+0x30a/0x11c0 fs/ext4/file.c:520 do_iter_readv_writev+0x339/0x3c0 fs/read_write.c:732 do_iter_write+0x107/0x430 fs/read_write.c:861 vfs_writev fs/read_write.c:934 [inline] do_pwritev+0x1e5/0x380 fs/read_write.c:1031 [...] ===== Above issue may happen as follows: cpu1 cpu2 _____ _____ do_pwritev vfs_writev do_iter_write ext4_file_write_iter ext4_buffered_write_iter generic_perform_write ext4_da_write_begin vfs_fallocate ext4_fallocate ext4_convert_inline_data ext4_convert_inline_data_nolock ext4_destroy_inline_data_nolock clear EXT4_STATE_MAY_INLINE_DATA ext4_map_blocks ext4_ext_map_blocks ext4_mb_new_blocks ext4_mb_regular_allocator ext4_mb_good_group_nolock ext4_mb_init_group ext4_mb_init_cache ext4_mb_generate_buddy --> error ext4_test_inode_state(inode, EXT4_STATE_MAY_INLINE_DATA) ext4_restore_inline_data set EXT4_STATE_MAY_INLINE_DATA ext4_block_write_begin ext4_da_write_end ext4_test_inode_state(inode, EXT4_STATE_MAY_INLINE_DATA) ext4_write_inline_data_end handle=NULL ext4_journal_stop(handle) __ext4_journal_stop ext4_put_nojournal(handle) ref_cnt = (unsigned long)handle BUG_ON(ref_cnt == 0) ---> BUG_ON The lock held by ext4_convert_inline_data is xattr_sem, but the lock held by generic_perform_write is i_rwsem. Therefore, the two locks can be concurrent. To solve above issue, we add inode_lock() for ext4_convert_inline_data(). At the same time, move ext4_convert_inline_data() in front of ext4_punch_hole(), remove similar handling from ext4_punch_hole(). </pre>
CVE-2022-49416	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix use-after-free in chanctx code In ieee80211_vif_use_reserved_context(), when we have an old context and the new context's replace_state is set to IEEE80211_CHANCTX_REPLACE_NONE, we free the old context in ieee80211_vif_use_reserved_reassign(). Therefore, we cannot check the old_ctx anymore, so we should set it to NULL after this point. However, since the new_ctx replace state is clearly not IEEE80211_CHANCTX_REPLACES_OTHER, we're not going to do anything else in this function and can just return to avoid accessing the freed old_ctx.

CVE ID	Description
CVE-2022-49418	In the Linux kernel, the following vulnerability has been resolved: NFSv4: Fix free of uninitialized nfs4_label on referral lookup. Send along the already-allocated fatttr along with nfs4_fs_locations, and drop the memcopy of fatttr. We end up growing two more allocations, but this fixes up a crash as: PID: 790 TASK: ffff88811b43c000 CPU: 0 COMMAND: "ls" #0 [ffffc90000857920] panic at ffffffff81b9bfde #1 [ffffc900008579c0] do_trap at ffffffff81023a9b #2 [ffffc90000857a10] do_error_trap at ffffffff81023b78 #3 [ffffc90000857a58] exc_stack_segment at ffffffff81be1f45 #4 [ffffc90000857a80] asm_exc_stack_segment at ffffffff81c009de #5 [ffffc90000857b08] nfs_lookup at ffffffff810302322 [nfs] #6 [ffffc90000857b70] __lookup_slow at ffffffff813a4a5f #7 [ffffc90000857c60] walk_component at ffffffff813a86c4 #8 [ffffc90000857cb8] path_lookupat at ffffffff813a9553 #9 [ffffc90000857cf0] filename_lookup at ffffffff813ab86b

CVE-2022-49422	In the Linux kernel, the following vulnerability has been resolved: dmaengine: idxd: Fix the error handling path in idxd_cdev_register() If a call to alloc_chrdev_region() fails, the already allocated resources are leaking. Add the needed error handling path to fix the leak.
CVE-2022-49432	In the Linux kernel, the following vulnerability has been resolved: powerpc/xics: fix refcount leak in icp_opal_init() The of_find_compatible_node() function returns a node pointer with refcount incremented, use of_node_put() on it when done.
CVE-2022-49434	In the Linux kernel, the following vulnerability has been resolved: PCI: Avoid pci_dev_lock() AB/BA deadlock with sriov_numvfs_store() The sysfs sriov_numvfs_store() path acquires the device lock before the config space access lock: sriov_numvfs_store device_lock # A (1) acquire device lock sriov_configure vfio_pci_sriov_configure # (for example) vfio_pci_core_sriov_configure pci_disable_sriov sriov_disable pci_cfg_access_lock pci_wait_cfg # B (4) wait for dev->block_cfg_access == 0 Previously, pci_dev_lock() acquired the config space access lock before the device lock: pci_dev_lock pci_cfg_access_lock dev->block_cfg_access = 1 # B (2) set dev->block_cfg_access = 1 device_lock # A (3) wait for device lock Any path that uses pci_dev_lock(), e.g., pci_reset_function(), may deadlock with sriov_numvfs_store() if the operations occur in the sequence (1) (2) (3) (4). Avoid the deadlock by reversing the order in pci_dev_lock() so it acquires the device lock before the config space access lock, the same as the sriov_numvfs_store() path. [bhelgaas: combined and adapted commit log from Jay Zhou's independent subsequent posting: https://lore.kernel.org/r/20220404062539.1710-1-jianjay.zhou@huawei.com]
CVE-2022-49436	In the Linux kernel, the following vulnerability has been resolved: powerpc/papr_scm: Fix leaking nvdimmm_events_map elements Right now 'char *' elements allocated for individual 'stat_id' in 'papr_scm_priv.nvdimmm_events_map[]' during papr_scm_pmu_check_events(), get leaked in papr_scm_remove() and papr_scm_pmu_register(), papr_scm_pmu_check_events() error paths. Also individual 'stat_id' arent NULL terminated 'char *' instead they are fixed 8-byte sized identifiers. However papr_scm_pmu_register() assumes it to be a NULL terminated 'char *' and at other places it assumes it to be a 'papr_scm_perf_stat.stat_id' sized string which is 8-bytes in size. Fix this by allocating the memory for papr_scm_priv.nvdimmm_events_map to also include space for 'stat_id' entries. This is possible since number of available events/stat_ids are known upfront. This saves some memory and one extra level of indirection from 'nvdimmm_events_map' to 'stat_id'. Also rest of the code can continue to call 'kfree(papr_scm_priv.nvdimmm_events_map)' without needing to iterate over the array and free up individual elements.

CVE ID	Description
CVE-2022-49441	In the Linux kernel, the following vulnerability has been resolved: tty: fix deadlock caused by calling printk() under tty_port->lock pty_write() invokes kmalloc() which may invoke a normal printk() to print failure message. This can cause a deadlock in the scenario reported by syz-bot below: CPU0 CPU1 CPU2 ----- lock(console_owner); lock(&port_lock_key); lock(&port->lock); lock(&port_lock_key); lock(&port->lock); lock(console_owner); As commit dbdda842fe96 ("printk: Add console owner and waiter logic to load balance console writes") said, such deadlock can be prevented by using printk_deferred() in kmalloc() (which is invoked in the section guarded by the port->lock). But there are too many printk() on the kmalloc() path, and kmalloc() can be called from anywhere, so changing printk() to printk_deferred() is too complicated and inelegant. Therefore, this patch chooses to specify __GFP_NOWARN to kmalloc(), so that printk() will not be called, and this deadlock problem can be avoided. Syzbot reported the following lockdep error: ===== WARNING: possible circular locking dependency detected 5.4.143-00237-g08ccc19a-dirty #10 Not tainted ----- syz-executor.4/29420 is trying to acquire lock: ffffffff8aedb2a0 (console_owner){....}-{0:0}, at: console_trylock_spinning kernel/printk/printk.c:1752 [inline] ffffffff8aedb2a0 (console_owner){....}-{0:0}, at: vprintk_emit+0x2ca/0x470 kernel/printk/printk.c:2023 but task is already holding lock: ffff8880119c9158 (&port->lock){-.-}-{2:2}, at: pty_write+0xf4/0x1f0 drivers/tty/pty.c:120 which lock already depends on the new lock. the existing dependency chain (in reverse order) is: -> #2 (&port->lock){-.-}-{2:2}: __raw_spin_lock_irqsave include/linux/spinlock_api_smp.h:110 [inline] __raw_spin_lock_irqsave+0x35/0x50 kernel/locking/spinlock.c:159 tty_port_tty_get drivers/tty/tty_port.c:288 [inline] <-- lock(&port->lock); tty_port_default_wakeup+0x1d/0xb0 drivers/tty/tty_port.c:47 serial8250_tx_chars+0x530/0xa80 drivers/tty/serial/8250/8250_port.c:1767 serial8250_handle_irq.part.0+0x31f/0x3d0 drivers/tty/serial/8250/8250_port.c:1854 serial8250_handle_irq drivers/tty/serial/8250/8250_port.c:1827 [inline] <-- lock(&port_lock_key); serial8250_default_handle_irq+0xb2/0x220 drivers/tty/serial/8250/8250_port.c:1870 serial8250_interrupt+0xfd/0x200 drivers/tty/serial/8250/8250_core.c:126 __handle_irq_event_percpu+0x109/0xa50 kernel/irq/handle.c:156 [...] -> #1 (&port_lock_key){-.-}-{2:2}: __raw_spin_lock_irqsave include/linux/spinlock_api_smp.h:110 [inline] __raw_spin_lock_irqsave+0x35/0x50 kernel/locking/spinlock.c:159 serial8250_console_write+0x184/0xa40 drivers/tty/serial/8250/8250_port.c:3198 <-- lock(&port_lock_key); call_console_drivers kernel/printk/printk.c:1819 [inline] console_unlock+0x8cb/0xd00 kernel/printk/printk.c:2504 vprintk_emit+0x1b5/0x470 kernel/printk/printk.c:2024 <-- lock(console_owner); vprintk_func+0x8d/0x250 kernel/printk/printk_safe.c:394 printk+0xba/0xed kernel/printk/printk.c:2084 register_console+0x8b3/0xc10 kernel/printk/printk.c:2829 univ8250_console_init+0x3a/0x46 drivers/tty/serial/8250/8250_core.c:681 console_init+0x49d/0x6d3 kernel/printk/printk.c:2915 start_kernel+0x5e9/0x879 init/main.c:713 secondary_startup_64+0xa4/0xb0 arch/x86/kernel/head_64.S:241 -> #0 (console_owner){....}-{0:0}: [...] lock_acquire+0x127/0x340 kernel/locking/lockdep.c:4734 console_trylock_spinning kernel/printk/printk.c:1773 ---truncated---
CVE-2022-49442	In the Linux kernel, the following vulnerability has been resolved: drivers/base/node.c: fix compaction sysfs file leak Compaction sysfs file is created via compaction_register_node in register_node. But we forgot to remove it in unregister_node. Thus compaction sysfs file is leaked. Using compaction_unregister_node to fix this issue.

CVE ID	Description
CVE-2022-49443	In the Linux kernel, the following vulnerability has been resolved: list: fix a data-race around ep->rdllist ep_poll() first calls ep_events_available() with no lock held and checks if ep->rdllist is empty by list_empty_careful(), which reads rdllist->prev. Thus all accesses to it need some protection to avoid store/load-tearing. Note INIT_LIST_HEAD_RCU() already has the annotation for both prev and next. Commit bf3b9f6372c4 ("epoll: Add busy poll support to epoll with socket fds.") added the first lockless ep_events_available(), and commit c5a282e9635e ("fs/epoll: reduce the scope of wq lock in epoll_wait()") made some ep_events_available() calls lockless and added single call under a lock, finally commit e59d3c64cba6 ("epoll: eliminate unnecessary lock for zero timeout") made the last ep_events_available() lockless. BUG: KCSAN: data-race in do_epoll_wait / do_epoll_wait write to 0xffff88810480c7d8 of 8 bytes by task 1802 on cpu 0: INIT_LIST_HEAD include/linux/list.h:38 [inline] list_splice_init include/linux/list.h:492 [inline] ep_start_scan fs/eventpoll.c:622 [inline] ep_send_events fs/eventpoll.c:1656 [inline] ep_poll fs/eventpoll.c:1806 [inline] do_epoll_wait+0x4eb/0xf40 fs/eventpoll.c:2234 do_epoll_pwait fs/eventpoll.c:2268 [inline] __do_sys_epoll_pwait fs/eventpoll.c:2281 [inline] __se_sys_epoll_pwait+0x12b/0x240 fs/eventpoll.c:2275 __x64_sys_epoll_pwait+0x74/0x80 fs/eventpoll.c:2275 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x44/0xd0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae read to 0xffff88810480c7d8 of 8 bytes by task 1799 on cpu 1: list_empty_careful include/linux/list.h:329 [inline] ep_events_available fs/eventpoll.c:381 [inline] ep_poll fs/eventpoll.c:1797 [inline] do_epoll_wait+0x279/0xf40 fs/eventpoll.c:2234 do_epoll_pwait fs/eventpoll.c:2268 [inline] __do_sys_epoll_pwait fs/eventpoll.c:2281 [inline] __se_sys_epoll_pwait+0x12b/0x240 fs/eventpoll.c:2275 __x64_sys_epoll_pwait+0x74/0x80 fs/eventpoll.c:2275 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x44/0xd0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae value changed: 0xffff88810480c7d0 -> 0xffff888103c15098 Reported by Kernel Concurrency Sanitizer on: CPU: 1 PID: 1799 Comm: syz-fuzzer Tainted: G W 5.17.0-rc7-syzkaller-dirty #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011
CVE-2022-49447	In the Linux kernel, the following vulnerability has been resolved: ARM: hisi: Add missing of_node_put after of_find_compatible_node of_find_compatible_node will increment the refcount of the returned device_node. Calling of_node_put() to avoid the refcount leak
CVE-2022-49455	In the Linux kernel, the following vulnerability has been resolved: misc: ocxl: fix possible double free in ocxl_file_register_afu info_release() will be called in device_unregister() when info->dev's reference count is 0. So there is no need to call ocxl_afu_put() and kfree() again. Fix this by adding free_minor() and return to err_unregister error path.
CVE-2022-49456	In the Linux kernel, the following vulnerability has been resolved: bonding: fix missed rcu protection When removing the rcu_read_lock in bond_ethtool_get_ts_info() as discussed [1], I didn't notice it could be called via setsockopt, which doesn't hold rcu lock, as syzbot pointed: stack backtrace: CPU: 0 PID: 3599 Comm: syz-executor317 Not tainted 5.18.0-rc5-syzkaller-01392-g01f4685797a5 #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 Call Trace: <TASK> __dump_stack lib/dump_stack.c:88 [inline] dump_stack_lvl+0xcd/0x134 lib/dump_stack.c:106 bond_option_active_slave_get_rcu include/net/bonding.h:353 [inline] bond_ethtool_get_ts_info+0x32c/0x3a0 drivers/net/bonding/bond_main.c:5595 __ethtool_get_ts_info+0x173/0x240 net/ethtool/common.c:554 ethtool_get_phc_vclocks +0x99/0x110 net/ethtool/common.c:568 sock_timestamping_bind_phc net/core/sock.c:869 [inline] sock_set_timestamping+0x3a3/0x7e0 net/core/sock.c:916 sock_setsockopt+0x543/0x2ec0 net/core/sock.c:1221 __sys_setsockopt+0x55e/0x6a0 net/socket.c:2223 __do_sys_setsockopt net/socket.c:2238 [inline] __se_sys_setsockopt net/socket.c:2235 [inline] __x64_sys_setsockopt+0xba/0x150 net/socket.c:2235 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x44/0xae RIP: 0033:0x7f8902c8eb39 Fix it by adding rcu_read_lock and take a ref on the real_dev. Since dev_hold() and dev_put() can take NULL these days, we can skip checking if real_dev exist. [1] https://lore.kernel.org/netdev/27565.1642742439@famine/
CVE-2022-49459	In the Linux kernel, the following vulnerability has been resolved: thermal/drivers/broadcom: Fix potential NULL dereference in sr_thermal_probe platform_get_resource() may return NULL, add proper check to avoid potential NULL dereferencing.

CVE ID	Description
CVE-2022-49465	In the Linux kernel, the following vulnerability has been resolved: blk-throttle: Set BIO_THROTTLED when bio has been throttled 1.In current process, all bio will set the BIO_THROTTLED flag after __blk_throtl_bio(). 2.If bio needs to be throttled, it will start the timer and stop submit bio directly. Bio will submit in blk_throtl_dispatch_work_fn() when the timer expires.But in the current process, if bio is throttled. The BIO_THROTTLED will be set to bio after timer start. If the bio has been completed, it may cause use-after-free blow. CVE-2022-49472	In the Linux kernel, the following vulnerability has been resolved: net: phy: micrel: Allow probing without .driver_data Currently, if the .probe element is present in the phy_driver structure and the .driver_data is not, a NULL pointer dereference happens. Allow passing .probe without .driver_data by inserting NULL checks for priv->type.

CVE ID	Description
CVE-2022-49474	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: fix dangling sco_conn and use-after-free in sco_sock_timeout Connecting the same socket twice consecutively in sco_sock_connect() could lead to a race condition where two sco_conn objects are created but only one is associated with the socket. If the socket is closed before the SCO connection is established, the timer associated with the dangling sco_conn object won't be canceled. As the sock object is being freed, the use-after-free problem happens when the timer callback function sco_sock_timeout() accesses the socket. Here's the call trace: dump_stack+0x107/0x163 ? refcount_inc+0x1c/print_address_description.constprop.0+0x1c/0x47e ? refcount_inc+0x1c/0x7b kasan_report+0x13a/0x173 ? refcount_inc+0x1c/0x7b check_memory_region+0x132/0x139 refcount_inc+0x1c/0x7b sco_sock_timeout+0xb2/0x1ba process_one_work+0x739/0xbd1 ? cancel_delayed_work+0x13f/0x13f ? __raw_spin_lock_init+0xf0/0xf0 ? to_kthread+0x59/0x85 worker_thread+0x593/0x70e kthread+0x346/0x35a ? drain_workqueue+0x31a/0x31a ? kthread_bind+0x4b/0x4b ret_from_fork+0x1f/0x30
CVE-2022-49476	In the Linux kernel, the following vulnerability has been resolved: mt76: mt7921: fix kernel crash at mt7921_pci_remove The crash log shown it is possible that mt7921_irq_handler is called while devm_free_irq is being handled so mt76_free_device need to be postponed until devm_free_irq is completed to solve the crash we free the mt76 device too early. CVE-2022-49478	In the Linux kernel, the following vulnerability has been resolved: media: pvrusb2: fix array-index-out-of-bounds in pvr2_i2c_core_init Syzbot reported that -1 is used as array index. The problem was in missing validation check. hdw->unit_number is initialized with -1 and then if init table walk fails this value remains unchanged. Since code blindly uses this member for array indexing adding sanity check is the easiest fix for that. hdw->workpoll initialization moved upper to prevent warning in __flush_work.
CVE-2022-49479	In the Linux kernel, the following vulnerability has been resolved: mt76: fix tx status related use-after-free race on station removal There is a small race window where ongoing tx activity can lead to a skb getting added to the status tracking idr after that idr has already been cleaned up, which will keep the wcid linked in the status poll list. Fix this by only adding status skbs if the wcid pointer is still assigned in dev->wcid, which gets cleared early by mt76_sta_pre_rcu_remove
CVE-2022-49492	In the Linux kernel, the following vulnerability has been resolved: nvme-pci: fix a NULL pointer dereference in nvme_alloc_admin_tags In nvme_alloc_admin_tags, the admin_q can be set to an error (typically -ENOMEM) if the blk_mq_init_queue call fails to set up the queue, which is checked immediately after the call. However, when we return the error message up the stack, to nvme_reset_work the error takes us to nvme_remove_dead_ctrl() nvme_dev_disable() nvme_suspend_queue(&dev->queues[0]). Here, we only check that the admin_q is non-NULL, rather than not an error or NULL, and begin quiescing a queue that never existed, leading to bad / NULL pointer dereference.
CVE-2022-49493	In the Linux kernel, the following vulnerability has been resolved: ASoC: rt5645: Fix erroneous cleanup order There is a logic error when removing rt5645 device as the function rt5645_i2c_remove() first cancel the &rt5645->jack_detect_work and delete the &rt5645->btn_check_timer later. However, since the timer handler rt5645_btn_check_callback() will re-queue the jack_detect_work, this cleanup order is buggy. That is, once the del_timer_sync in rt5645_i2c_remove is concurrently run with the rt5645_btn_check_callback, the canceled jack_detect_work will be rescheduled again, leading to possible use-after-free. This patch fix the issue by placing the del_timer_sync function before the cancel_delayed_work_sync.

CVE ID	Description
CVE-2022-49497	In the Linux kernel, the following vulnerability has been resolved: net: remove two BUG() from skb_checksum_help() I have a syzbot report that managed to get a crash in skb_checksum_help() If syzbot can trigger these BUG(), it makes sense to replace them with more friendly WARN_ON_ONCE() since skb_checksum_help() can instead return an error code. Note that syzbot will still crash there, until real bug is fixed.
CVE-2022-49498	In the Linux kernel, the following vulnerability has been resolved: ALSA: pcm: Check for null pointer of pointer substream before dereferencing it Pointer substream is being dereferenced on the assignment of pointer card before substream is being null checked with the macro PCM_RUNTIME_CHECK. Although PCM_RUNTIME_CHECK calls BUG_ON, it still is useful to perform the the pointer check before card is assigned.
CVE-2022-49503	In the Linux kernel, the following vulnerability has been resolved: ath9k_htc: fix potential out of bounds access with invalid rxstatus->rs_keyix The "rxstatus->rs_keyix" eventually gets passed to test_bit() so we need to ensure that it is within the bitmap. drivers/net/wireless/ath/ath9k/common.c:46 ath9k_cm_n_rx_accept() error: passing untrusted data 'rx_stats->rs_keyix' to 'test_bit()'
CVE-2022-49504	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Inhibit aborts if external loopback plug is inserted After running a short external loopback test, when the external loopback is removed and a normal cable inserted that is directly connected to a target device, the system oops in the lpfc_set_rrq_active() routine. When the loopback was inserted an FLOGI was transmit. As we're looped back, we receive the FLOGI request. The FLOGI is ABTS'd as we recognize the same wppn thus understand it's a loopback. However, as the ABTS sends address information the port is not set to (fffffe), the ABTS is dropped on the wire. A short 1 frame loopback test is run and completes before the ABTS times out. The loopback is unplugged and the new cable plugged in, and the an FLOGI to the new device occurs and completes. Due to a mixup in ref counting the completion of the new FLOGI releases the fabric ndlp. Then the original ABTS completes and references the released ndlp generating the oops. Correct by no-op'ing the ABTS when in loopback mode (it will be dropped anyway). Added a flag to track the mode to recognize when it should be no-op'd.
CVE-2022-49508	In the Linux kernel, the following vulnerability has been resolved: HID: elan: Fix potential double free in elan_input_configured 'input' is a managed resource allocated with devm_input_allocate_device(), so there is no need to call input_free_device() explicitly or there will be a double free. According to the doc of devm_input_allocate_device(): * Managed input devices do not need to be explicitly unregistered or * freed as it will be done automatically when owner device unbinds from * its driver (or binding fails).
CVE-2022-49516	In the Linux kernel, the following vulnerability has been resolved: ice: always check VF VSI pointer values The ice_get_vf_vsi function can return NULL in some cases, such as if handling messages during a reset where the VSI is being removed and recreated. Several places throughout the driver do not bother to check whether this VSI pointer is valid. Static analysis tools maybe report issues because they detect paths where a potentially NULL pointer could be dereferenced. Fix this by checking the return value of ice_get_vf_vsi everywhere.
CVE-2022-49518	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: ipc3-topology: Correct get_control_data for non bytes payload It is possible to craft a topology where sof_get_control_data() would do out of bounds access because it expects that it is only called when the payload is bytes type. Confusingly it also handles other types of controls, but the payload parsing implementation is only valid for bytes. Fix the code to count the non bytes controls and instead of storing a pointer to sof_abi_hdr in sof_widget_data (which is only valid for bytes), store the pointer to the data itself and add a new member to save the size of the data. In case of non bytes controls we store the pointer to the chanv itself, which is just an array of values at the end. In case of bytes control, drop the wrong cdata->data (wdata[i].pdata) check against NULL since it is incorrect and invalid in this context. The data is pointing to the end of cdata struct, so it should never be null.

CVE ID	Description
CVE-2022-49520	In the Linux kernel, the following vulnerability has been resolved: arm64: compat: Do not treat syscall number as ESR_ELx for a bad syscall If a compat process tries to execute an unknown system call above the <code>__ARM_NR_COMPAT_END</code> number, the kernel sends a SIGILL signal to the offending process. Information about the error is printed to dmesg in <code>compat_arm_syscall()</code> -> <code>arm64_notify_die()</code> -> <code>arm64_force_sig_fault()</code> -> <code>arm64_show_signal()</code>. <code>arm64_show_signal()</code> interprets a non-zero value for <code>current->thread.fault_code</code> as an exception syndrome and displays the message associated with the <code>ESR_ELx.EC</code> field (bits 31:26). <code>current->thread.fault_code</code> is set in <code>compat_arm_syscall()</code> -> <code>arm64_notify_die()</code> with the bad syscall number instead of a valid <code>ESR_ELx</code> value. This means that the <code>ESR_ELx.EC</code> field has the value that the user set for the syscall number and the kernel can end up printing bogus exception messages*. For example, for the syscall number <code>0x68000000</code>, which evaluates to <code>ESR_ELx.EC</code> value of <code>0x1A</code> (<code>ESR_ELx_EC_FPAC</code>) the kernel prints this error: [18.349161] syscall[300]: unhandled exception: ERET/ERETAA/ERETAB, ESR 0x68000000, Oops - bad compat syscall(2) in syscall[10000+50000] [18.350639] CPU: 2 PID: 300 Comm: syscall Not tainted 5.18.0-rc1 #79 [18.351249] Hardware name: Pine64 RockPro64 v2.0 (DT) [...] which is misleading, as the bad compat syscall has nothing to do with pointer authentication. Stop <code>arm64_show_signal()</code> from printing exception syndrome information by having <code>compat_arm_syscall()</code> set the <code>ESR_ELx</code> value to 0, as it has no meaning for an invalid system call number. The example above now becomes: [19.935275] syscall[301]: unhandled exception: Oops - bad compat syscall(2) in syscall[10000+50000] [19.936124] CPU: 1 PID: 301 Comm: syscall Not tainted 5.18.0-rc1-00005-g7e08006d4102 #80 [19.936894] Hardware name: Pine64 RockPro64 v2.0 (DT) [...] which although shows less information because the syscall number, wrongfully advertised as the ESR value, is missing, it is better than showing plainly wrong information. The syscall number can be easily obtained with <code>strace</code>. *A 32-bit value above or equal to <code>0x8000_0000</code> is interpreted as a negative integer in <code>compat_arm_syscall()</code> and the condition <code>scno < __ARM_NR_COMPAT_END</code> evaluates to true; the syscall will exit to userspace in this case with the <code>ENOSYS</code> error code instead of <code>arm64_notify_die()</code> being called.
CVE-2022-49521	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix resource leak in <code>lpfc_sli4_send_seq_to_ulp()</code> If no handler is found in <code>lpfc_complete_unsol_iocb()</code> to match the <code>rcld</code> of a received frame, the frame is dropped and resources are leaked. Fix by returning resources when discarding an unhandled frame type. Update <code>lpfc_fc_frame_check()</code> handling of NOP basic link service.
CVE-2022-49524	In the Linux kernel, the following vulnerability has been resolved: media: pci: cx23885: Fix the error handling in <code>cx23885_initdev()</code> When the driver fails to call the <code>dma_set_mask()</code>, the driver will get the following splat: [55.853884] BUG: KASAN: use-after-free in <code>__process_removed_driver+0x3c/0x240</code> [55.854486] Read of size 8 at addr <code>ffff88810de60408</code> by task <code>modprobe/590</code> [55.856822] Call Trace: [55.860327] <code>__process_removed_driver+0x3c/0x240</code> [55.861347] <code>bus_for_each_dev+0x102/0x160</code> [55.861681] <code>i2c_del_driver+0x2f/0x50</code> This is because the driver has initialized the i2c related resources in <code>cx23885_dev_setup()</code> but not released them in error handling, fix this bug by modifying the error path that jumps after failing to call the <code>dma_set_mask()</code>.

CVE ID	Description
CVE-2022-49526	In the Linux kernel, the following vulnerability has been resolved: md/bitmap: don't set sb values if can't pass sanity check If bitmap area contains invalid data, kernel will crash then mdadm triggers "Segmentation fault". This is cluster-md speical bug. In non-clustered env, mdadm will handle broken metadata case. In clustered array, only kernel space handles bitmap slot info. But even this bug only happened in clustered env, current sanity check is wrong, the code should be changed. How to trigger: (faulty injection) dd if=/dev/zero bs=1M count=1 oflag=direct of=/dev/sda dd if=/dev/zero bs=1M count=1 oflag=direct of=/dev/sdb mdadm -C /dev/md0 -b clustered -e 1.2 -n 2 -l mirror /dev/sda /dev/sdb mdadm -Ss echo aaa > magic.txt == below modifying slot 2 bitmap data == dd if=magic.txt of=/dev/sda seek=16384 bs=1 count=3 <== destroy magic dd if=/dev/zero of=/dev/sda seek=16436 bs=1 count=4 <== ZERO chunksize mdadm -A /dev/md0 /dev/sda /dev/sdb == kernel crashes. mdadm outputs "Segmentation fault" == Reason of kernel crash: In md_bitmap_read_sb (called by md_bitmap_create), bad bitmap magic didn't block chunksize assignment, and zero value made DIV_ROUND_UP_SECTOR_T() trigger "divide error". Crash log: kernel: md: md0 stopped. kernel: md/raid1:md0: not clean -- starting background reconstruction kernel: md/raid1:md0: active with 2 out of 2 mirrors kernel: dlm: kernel: md-cluster: Joined cluster 44810aba-38bb-e6b8-daca-bc97a0b254aa slot 1 kernel: md0: invalid bitmap file superblock: bad magic kernel: md_bitmap_copy_from_slot can't get bitmap from slot 2 kernel: md-cluster: Could not gather bitmaps from slot 2 kernel: divide error: 0000 [#1] SMP NOPTI kernel: CPU: 0 PID: 1603 Comm: mdadm Not tainted 5.14.6-1-default kernel: Hardware name: QEMU Standard PC (i440FX + PIIX, 1996) kernel: RIP: 0010:md_bitmap_create+0x1d1/0x850 [md_mod] kernel: RSP: 0018:ffffc22ac0843ba0 EFLAGS: 00010246 kernel: kernel: Call Trace: kernel: ? dlm_lock_sync+0xd0/0xd0 [md_cluster 77fe..7a0] kernel: md_bitmap_copy_from_slot+0x2c/0x290 [md_mod 24ea..d3a] kernel: load_bitmaps+0xec/0x210 [md_cluster 77fe..7a0] kernel: md_bitmap_load+0x81/0x1e0 [md_mod 24ea..d3a] kernel: do_md_run+0x30/0x100 [md_mod 24ea..d3a] kernel: md_ioctl+0x1290/0x15a0 [md_mod 24ea....d3a] kernel: ? mddev_unlock+0xaa/0x130 [md_mod 24ea..d3a] kernel: ? blkdev_ioctl+0xb1/0x2b0 kernel: block_ioctl+0x3b/0x40 kernel: __x64_sys_ioctl+0x7f/0xb0 kernel: do_syscall_64+0x59/0x80 kernel: ? exit_to_user_mode_prepare+0x1ab/0x230 kernel: ? syscall_exit_to_user_mode+0x18/0x40 kernel: ? do_syscall_64+0x69/0x80 kernel: entry_SYSCALL_64_after_hwframe+0x44/0xae kernel: RIP: 0033:0x7f4a15fa722b kernel: kernel: ---[end trace 8afa7612f559c868]--- kernel: RIP: 0010:md_bitmap_create+0x1d1/0x850 [md_mod]
CVE-2022-49531	In the Linux kernel, the following vulnerability has been resolved: loop: implement ->free_disk Ensure that the lo_device which is stored in the gendisk private data is valid until the gendisk is freed. Currently the loop driver uses a lot of effort to make sure a device is not freed when it is still in use, but to to fix a potential deadlock this will be relaxed a bit soon.
CVE-2022-49532	In the Linux kernel, the following vulnerability has been resolved: drm/virtio: fix NULL pointer dereference in virtio_gpu_conn_get_modes drm_cvt_mode may return NULL and we should check it. This bug is found by syzkaller: FAULT_INJECTION stacktrace: [168.567394] FAULT_INJECTION: forcing a failure. name failslab, interval 1, probability 0, space 0, times 1 [168.567403] CPU: 1 PID: 6425 Comm: syz Kdump: loaded Not tainted 4.19.90-vhulk2201.1.0.h1035.kasan.eulerosv2r10.aarch64 #1 [168.567406] Hardware name: QEMU KVM Virtual Machine, BIOS 0.0.0 02/06/2015 [168.567408] Call trace: [168.567414] dump_backtrace+0x0/0x310 [168.567418] show_stack+0x28/0x38 [168.567423] dump_stack+0xec/0x15c [168.567427] should_fail+0x3ac/0x3d0 [168.567437] __should_failslab+0xb8/0x120 [168.567441] should_failslab+0x28/0xc0 [168.567445] kmem_cache_alloc_trace+0x50/0x640 [168.567454] drm_mode_create+0x40/0x90 [168.567458] drm_cvt_mode+0x48/0xc78 [168.567477] virtio_gpu_conn_get_modes+0xa8/0x140 [virtio_gpu] [168.567485] drm_helper_probe_single_connector_modes+0x3a4/0xd80 [168.567492] drm_mode_getconnector+0x2e0/0xa70 [168.567496] drm_ioctl_kernel+0x11c/0x1d8 [168.567514] drm_ioctl+0x558/0x6d0 [168.567522] do_vfs_ioctl+0x160/0xf30 [168.567525] ksys_ioctl+0x98/0xd8 [168.567530] __arm64_sys_ioctl+0x50/0xc8 [168.567536] el0_svc_common+0xc8/0x320 [168.567540] el0_svc_handler+0xf8/0x160 [168.567544] el0_svc+0x10/0x218 KASAN stacktrace: [168.567561] BUG: KASAN: null-ptr-deref in virtio_gpu_conn_get_modes+0xb4/0x140 [virtio_gpu] [168.567565] Read of size 4 at addr 0000000000000054 by task syz/6425 [168.567566] [168.567571] CPU: 1 PID: 6425 Comm: syz Kdump: loaded Not tainted 4.19.90-vhulk2201.1.0.h1035.kasan.eulerosv2r10.aarch64 #1 [168.567573] Hardware name: QEMU KVM Virtual Machine, BIOS 0.0.0 02/06/2015 [168.567575] Call trace: [168.567578] dump_backtrace+0x0/0x310 [168.567582] show_stack+0x28/0x38 [168.567586] dump_stack+0xec/0x15c [168.567591] kasan_report+0x244/0x2f0 [168.567594] __asan_load4+0x58/0xb0 [168.567607] virtio_gpu_conn_get_modes+0xb4/0x140 [virtio_gpu] [168.567612] drm_helper_probe_single_connector_modes+0x3a4/0xd80 [168.567617] drm_mode_getconnector+0x2e0/0xa70 [168.567621] drm_ioctl_kernel+0x11c/0x1d8 [168.567624] drm_ioctl+0x558/0x6d0 [168.567628] do_vfs_ioctl+0x160/0xf30 [168.567632] ksys_ioctl+0x98/0xd8 [168.567636] __arm64_sys_ioctl+0x50/0xc8 [168.567641] el0_svc_common+0xc8/0x320 [168.567645] el0_svc_handler+0xf8/0x160 [168.567649] el0_svc+0x10/0x218

CVE ID	Description
CVE-2022-49534	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Protect memory leak for NPIV ports sending PLOGI_RJT There is a potential memory leak in <code>lpfc_ignore_els_cmpl()</code> and <code>lpfc_els_rsp_reject()</code> that was allocated from NPIV PLOGI_RJT (<code>lpfc_rcv_plogi()</code> 's <code>login_mbox</code>). Check if <code>cmdioch->context_un.mbox</code> was allocated in <code>lpfc_ignore_els_cmpl()</code> , and then free it back to <code>phba->mbox_mem_pool</code> along with <code>mbox->ctx_buf</code> for service parameters. For <code>lpfc_els_rsp_reject()</code> failure, free both the <code>ctx_buf</code> for service parameters and the <code>login_mbox</code> .
CVE-2022-49535	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix null pointer dereference after failing to issue FLOGI and PLOGI If <code>lpfc_issue_els_flogi()</code> fails and returns non-zero status, the node reference count is decremented to trigger the release of the <code>ndlist</code> structure. However, if there is a prior registration or <code>dev-loss-evt</code> work pending, the node may be released prematurely. When <code>dev-loss-evt</code> completes, the released node is referenced causing a use-after-free null pointer dereference. Similarly, when processing non-zero ELS PLOGI completion status in <code>lpfc_cmpl_els_plogi()</code> , the <code>ndlp</code> flags are checked for a transport registration before triggering node removal. If <code>dev-loss-evt</code> work is pending, the node may be released prematurely and a subsequent call to <code>lpfc_dev_loss_tmo_handler()</code> results in a use after free <code>ndlp</code> dereference. Add test for pending <code>dev-loss</code> before decrementing the node reference count for FLOGI, PLOGI, PRLI, and ADISC handling.
CVE-2022-49536	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Fix SCSI I/O completion and abort handler deadlock During stress I/O tests with 500+ vports, hard LOCKUP call traces are observed. CPU A: <code>native_queued_spin_lock_slowpath+0x192 _raw_spin_lock_irqsave+0x32 lpfc_handle_fcp_err+0x4c6 lpfc_fcp_io_cmd_wqe_cmpl+0x964 lpfc_sli4_fp_handle_cqe+0x266 __lpfc_sli4_process_cq+0x105 __lpfc_sli4_hba_process_cq+0x3c lpfc_cq_poll_hdlr+0x16 irq_poll_softirq+0x76 __softirqentry_text_start+0xe4 irq_exit+0xf7 do_IRQ+0x7f CPU B: <code>native_queued_spin_lock_slowpath+0x5b _raw_spin_lock+0x1c lpfc_abort_handler+0x13e scmd_eh_abort_handler+0x85 process_one_work+0x1a7 worker_thread+0x30 kthread+0x112 ret_from_fork+0x1f</code> Diagram of lockup: CPUA CPUB ---- ---- <code>lpfc_cmd->buf_lock</code> <code>phba->hbalock</code> <code>lpfc_cmd->buf_lock</code> <code>phba->hbalock</code> Fix by reordering the taking of the <code>lpfc_cmd->buf_lock</code> and <code>phba->hbalock</code> in <code>lpfc_abort_handler</code> routine so that it tries to take the <code>lpfc_cmd->buf_lock</code> first before <code>phba->hbalock</code>.</code>
CVE-2022-49538	In the Linux kernel, the following vulnerability has been resolved: ALSA: jack: Access input_dev under mutex It is possible when using ASoC that <code>input_dev</code> is unregistered while calling <code>snd_jack_report</code> , which causes NULL pointer dereference. In order to prevent this serialize access to <code>input_dev</code> using mutex lock.
CVE-2022-49542	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Move cfg_log_verbose check before calling lpfc_dmp_dbg() In an attempt to log message 0126 with <code>LOG_TRACE_EVENT</code> , the following hard lockup call trace hangs the system. Call Trace: <code>_raw_spin_lock_irqsave+0x32/0x40 lpfc_dmp_dbg.part.32+0x28/0x220 [lpfc] lpfc_cmpl_els_fdisc+0x145/0x460 [lpfc] lpfc_sli_cancel_jobs+0x92/0xd0 [lpfc] lpfc_els_flush_cmd+0x43c/0x670 [lpfc] lpfc_els_flush_all_cmd+0x37/0x60 [lpfc] lpfc_sli4_async_event_proc+0x956/0x1720 [lpfc] lpfc_do_work+0x1485/0x1d70 [lpfc] kthread+0x112/0x130 ret_from_fork+0x1f/0x40 Kernel panic - not syncing: Hard LOCKUP The same CPU tries to claim the <code>phba->port_list_lock</code> twice. Move the <code>cfg_log_verbose</code> checks as part of the <code>lpfc_printf_vlog()</code> and <code>lpfc_printf_log()</code> macros before calling <code>lpfc_dmp_dbg()</code>. There is no need to take the <code>phba->port_list_lock</code> within <code>lpfc_dmp_dbg()</code>.</code>
CVE-2022-49548	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix potential array overflow in bpf_trampoline_get_progs() The <code>cnt</code> value in the ' <code>cnt >= BPF_MAX_TRAMP_PROGS</code> ' check does not include <code>BPF_TRAMP_MODIFY_RETURN</code> bpf programs, so the number of the attached <code>BPF_TRAMP_MODIFY_RETURN</code> bpf programs in a trampoline can exceed <code>BPF_MAX_TRAMP_PROGS</code> . When this happens, the assignment ' <code>*progs++ = aux->prog</code> ' in <code>bpf_trampoline_get_progs()</code> will cause <code>progs</code> array overflow as the <code>progs</code> field in the <code>bpf_trampoline</code> struct can only hold at most <code>BPF_MAX_TRAMP_PROGS</code> bpf programs.
CVE-2022-49549	In the Linux kernel, the following vulnerability has been resolved: x86/MCE/AMD: Fix memory leak when threshold_create_bank() fails In <code>mce_threshold_create_device()</code> , if <code>threshold_create_bank()</code> fails, the previously allocated <code>threshold_banks</code> array <code>@bp</code> will be leaked because the call to <code>mce_threshold_remove_device()</code> will not free it. This happens because <code>mce_threshold_remove_device()</code> fetches the pointer through the <code>threshold_banks</code> per-CPU variable but <code>bp</code> is written there only after the bank creation is successful, and not before, when <code>threshold_create_bank()</code> fails. Add a helper which unwinds all the bank creation work previously done and pass into it the previously allocated <code>threshold_banks</code> array for freeing. [bp: Massage.]

CVE ID	Description
CVE-2022-49552	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix combination of jit blinding and pointers to bpf subprogs. The combination of jit blinding and pointers to bpf subprogs causes: [36.989548] BUG: unable to handle page fault for address: 0000000100000001 [36.990342] #PF: supervisor instruction fetch in kernel mode [36.990968] #PF: error_code(0x0010) - not-present page [36.994859] RIP: 0010:0x100000001 [36.995209] Code: Unable to access opcode bytes at RIP 0xffffffff7. [37.004091] Call Trace: [37.004351] <TASK> [37.004576] ? bpf_loop+0x4d/0x70 [37.004932] ? bpf_prog_3899083f75e4c5de_F+0xe3/0x13b The jit blinding logic didn't recognize that ld_imm64 with an address of bpf subprogram is a special instruction and proceeded to randomize it. By itself it wouldn't have been an issue, but jit_subprogs() logic relies on two step process to JIT all subprogs and then JIT them again when addresses of all subprogs are known. Blinding process in the first JIT phase caused second JIT to miss adjustment of special ld_imm64. Fix this issue by ignoring special ld_imm64 instructions that don't have user controlled constants and shouldn't be blinded.
CVE-2022-49554	In the Linux kernel, the following vulnerability has been resolved: zsmalloc: fix races between asynchronous zspage free and page migration The asynchronous zspage free worker tries to lock a zspage's entire page list without defending against page migration. Since pages which haven't yet been locked can concurrently migrate off the zspage page list while lock_zspage() churns away, lock_zspage() can suffer from a few different lethal races. It can lock a page which no longer belongs to the zspage and unsafely dereference page_private(), it can unsafely dereference a torn pointer to the next page (since there's a data race), and it can observe a spurious NULL pointer to the next page and thus not lock all of the zspage's pages (since a single page migration will reconstruct the entire page list, and create_page_chain() unconditionally zeroes out each list pointer in the process). Fix the races by using migrate_read_lock() in lock_zspage() to synchronize with page migration.
CVE-2022-49556	In the Linux kernel, the following vulnerability has been resolved: KVM: SVM: Use kzalloc for sev ioct interfaces to prevent kernel data leak For some sev ioct interfaces, the length parameter that is passed maybe less than or equal to SEV_FW_BLOB_MAX_SIZE, but larger than the data that PSP firmware returns. In this case, kmalloc will allocate memory that is the size of the input rather than the size of the data. Since PSP firmware doesn't fully overwrite the allocated buffer, these sev ioct interface may return uninitialized kernel slab memory.
CVE-2022-49558	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: double hook unregistration in netns path __nft_release_hooks() is called from pre_netns exit path which unregisters the hooks, then the NETDEV_UNREGISTER event is triggered which unregisters the hooks again. [565.221461] WARNING: CPU: 18 PID: 193 at net/netfilter/core.c:495 __nf_unregister_net_hook+0x247/0x270 [...] [565.246890] CPU: 18 PID: 193 Comm: kworker/u64:1 Tainted: G E 5.18.0-rc7+ #27 [565.253682] Workqueue: netns cleanup_net [565.257059] RIP: 0010: __nf_unregister_net_hook+0x247/0x270 [...] [565.297120] Call Trace: [565.300900] <TASK> [565.304683] nf_tables_flowtable_event+0x16a/0x220 [nf_tables] [565.308518] raw_notifier_call_chain+0x63/0x80 [565.312386] unregister_netdevice_many+0x54f/0xb50 Unregister and destroy netdev hook from netns pre_exit via kfree_rcu so the NETDEV_UNREGISTER path see unregistered hooks.
CVE-2022-49561	In the Linux kernel, the following vulnerability has been resolved: netfilter: conntrack: re-fetch conntrack after insertion In case the conntrack is clashing, insertion can free skb->nfct and set skb->nfct to the already-confirmed entry. This wasn't found before because the conntrack entry and the extension space used to free'd after an rcu grace period, plus the race needs events enabled to trigger.
CVE-2022-49562	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: Use __try_cmpxchg_user() to update guest PTE A/D bits Use the recently introduced __try_cmpxchg_user() to update guest PTE A/D bits instead of mapping the PTE into kernel address space. The VM_PFNMAP path is broken as it assumes that vm_pgoff is the base pfn of the mapped VMA range, which is conceptually wrong as vm_pgoff is the offset relative to the file and has nothing to do with the pfn. The horrific hack worked for the original use case (backing guest memory with /dev/mem), but leads to accessing "random" pfns for pretty much any other VM_PFNMAP case.
CVE-2022-49563	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - add param check for RSA Reject requests with a source buffer that is bigger than the size of the key. This is to prevent a possible integer underflow that might happen when copying the source scatterlist into a linear buffer.
CVE-2022-49564	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - add param check for DH Reject requests with a source buffer that is bigger than the size of the key. This is to prevent a possible integer underflow that might happen when copying the source scatterlist into a linear buffer.

CVE ID	Description
CVE-2022-49565	In the Linux kernel, the following vulnerability has been resolved: perf/x86/intel/lbr: Fix unchecked MSR access error on HSW The fuzzer triggers the below trace. [7763.384369] unchecked MSR access error: WRMSR to 0x689 (tried to write 0x1fffffff8101349e) at rIP: 0xffffffff810704a4 (native_write_msr+0x4/0x20) [7763.397420] Call Trace: [7763.399881] <TASK> [7763.401994] intel_pmu_lbr_restore+0x9a/0x1f0 [7763.406363] intel_pmu_lbr_sched_task+0x91/0x1c0 [7763.410992] __perf_event_task_sched_in+0x1cd/0x240 On a machine with the LBR format LBR_FORMAT_EIP_FLAGS2, when the TSX is disabled, a TSX quirk is required to access LBR from registers. The lbr_from_signext_quirk_needed() is introduced to determine whether the TSX quirk should be applied. However, the lbr_from_signext_quirk_needed() is invoked before the intel_pmu_lbr_init(), which parses the LBR format information. Without the correct LBR format information, the TSX quirk never be applied. Move the lbr_from_signext_quirk_needed() into the intel_pmu_lbr_init(). Checking x86_pmu.lbr_has_tsx in the lbr_from_signext_quirk_needed() is not required anymore. Both LBR_FORMAT_EIP_FLAGS2 and LBR_FORMAT_INFO have LBR_TSX flag, but only the LBR_FORMAT_EIP_FLAGS2 requires the quirk. Update the comments accordingly.
CVE-2022-49566	In the Linux kernel, the following vulnerability has been resolved: crypto: qat - fix memory leak in RSA When an RSA key represented in form 2 (as defined in PKCS #1 V2.1) is used, some components of the private key persist even after the TFM is released. Replace the explicit calls to free the buffers in qat_rsa_exit_tfm() with a call to qat_rsa_clear_ctx() which frees all buffers referenced in the TFM context.
CVE-2022-49567	In the Linux kernel, the following vulnerability has been resolved: mm/mempolicy: fix uninit-value in mpol_rebind_policy() mpol_set_nodemask()(mm/mempolicy.c) does not set up nodemask when pol->mode is MPOL_LOCAL. Check pol->mode before access pol->w.cpuset_mems_allowed in mpol_rebind_policy()(mm/mempolicy.c). BUG: KMSAN: uninit-value in mpol_rebind_policy mm/mempolicy.c:352 [inline] BUG: KMSAN: uninit-value in mpol_rebind_task+0x2ac/0x2c0 mm/mempolicy.c:368 mpol_rebind_policy mm/mempolicy.c:352 [inline] mpol_rebind_task+0x2ac/0x2c0 mm/mempolicy.c:368 cpuset_change_task_nodemask kernel/cgroup/cpuset.c:1711 [inline] cpuset_attach+0x787/0x15e0 kernel/cgroup/cpuset.c:2278 cgroup_migrate_execute+0x1023/0x1d20 kernel/cgroup/cgroup.c:2515 cgroup_migrate kernel/cgroup/cgroup.c:2771 [inline] cgroup_attach_task+0x540/0x8b0 kernel/cgroup/cgroup.c:2804 __cgroup1_procs_write+0x5cc/0x7a0 kernel/cgroup/cgroup-v1.c:520 cgroup1_tasks_write+0x94/0xb0 kernel/cgroup/cgroup-v1.c:539 cgroup_file_write+0x4c2/0x9e0 kernel/cgroup/cgroup.c:3852 kernfs_fop_write_iter+0x66a/0x9f0 fs/kernfs/file.c:296 call_write_iter include/linux/fs.h:2162 [inline] new_sync_write fs/read_write.c:503 [inline] vfs_write+0x1318/0x2030 fs/read_write.c:590 ksys_write+0x28b/0x510 fs/read_write.c:643 __do_sys_write fs/read_write.c:655 [inline] __se_sys_write fs/read_write.c:652 [inline] __x64_sys_write+0xdb/0x120 fs/read_write.c:652 do_syscall_x64 arch/x86/entry/common.c:51 [inline] do_syscall_64+0x54/0xd0 arch/x86/entry/common.c:82 entry_SYSCALL_64_after_hwframe+0x44/0xae Uninit was created at: slab_post_alloc_hook mm/slab.h:524 [inline] slab_alloc_node mm/slub.c:3251 [inline] slab_alloc mm/slub.c:3259 [inline] kmem_cache_alloc+0x902/0x11c0 mm/slub.c:3264 mpol_new mm/mempolicy.c:293 [inline] do_set_mempolicy+0x421/0xb70 mm/mempolicy.c:853 kernel_set_mempolicy mm/mempolicy.c:1504 [inline] __do_sys_set_mempolicy mm/mempolicy.c:1510 [inline] __se_sys_set_mempolicy+0x44c/0xb60 mm/mempolicy.c:1507 __x64_sys_set_mempolicy+0xd8/0x110 mm/mempolicy.c:1507 do_syscall_x64 arch/x86/entry/common.c:51 [inline] do_syscall_64+0x54/0xd0 arch/x86/entry/common.c:82 entry_SYSCALL_64_after_hwframe+0x44/0xae KMSAN: uninit-value in mpol_rebind_task (2) https://syzkaller.appspot.com/bug?id=d6eb90f952c2a5de9ea718a1b873c55cb13b59dc This patch seems to fix below bug too. KMSAN: uninit-value in mpol_rebind_mm (2) https://syzkaller.appspot.com/bug?id=f2fec0d7013f54ec4162f60743a2b28df40926b The uninit-value is pol->w.cpuset_mems_allowed in mpol_rebind_policy(). When syzkaller reproducer runs to the beginning of mpol_new(), mpol_new() mm/mempolicy.c do_mbind() mm/mempolicy.c kernel_mbind() mm/mempolicy.c `mode` is 1(MPOL_PREFERRED), nodes_empty(*nodes) is `true` and `flags` is 0. Then mode = MPOL_LOCAL; ... policy->mode = mode; policy->flags = flags; will be executed. So in mpol_set_nodemask(), mpol_set_nodemask() mm/mempolicy.c do_mbind() kernel_mbind() pol->mode is 4 (MPOL_LOCAL), that `nodemask` in `pol` is not initialized, which will be accessed in mpol_rebind_policy().
CVE-2022-49571	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_max_reordering. While reading sysctl_tcp_max_reordering, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49572	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_slow_start_after_idle. While reading sysctl_tcp_slow_start_after_idle, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49573	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_early_retrans. While reading sysctl_tcp_early_retrans, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.

CVE ID	Description
CVE-2022-49574	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_recovery. While reading sysctl_tcp_recovery, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49575	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_thin_linear_timeouts. While reading sysctl_tcp_thin_linear_timeouts, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49576	In the Linux kernel, the following vulnerability has been resolved: ipv4: Fix data-races around sysctl_fib_multipath_hash_fields. While reading sysctl_fib_multipath_hash_fields, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49577	In the Linux kernel, the following vulnerability has been resolved: udp: Fix a data-race around sysctl_udp_l3mdev_accept. While reading sysctl_udp_l3mdev_accept, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49578	In the Linux kernel, the following vulnerability has been resolved: ip: Fix data-races around sysctl_ip_prot_sock. sysctl_ip_prot_sock is accessed concurrently, and there is always a chance of data-race. So, all readers and writers need some basic protection to avoid load/store-tearing.
CVE-2022-49579	In the Linux kernel, the following vulnerability has been resolved: ipv4: Fix data-races around sysctl_fib_multipath_hash_policy. While reading sysctl_fib_multipath_hash_policy, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49580	In the Linux kernel, the following vulnerability has been resolved: ipv4: Fix a data-race around sysctl_fib_multipath_use_neigh. While reading sysctl_fib_multipath_use_neigh, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49581	In the Linux kernel, the following vulnerability has been resolved: be2net: Fix buffer overflow in be_get_module_eeprom be_cmd_read_port_transceiver_data assumes that it is given a buffer that is at least PAGE_DATA_LEN long, or twice that if the module supports SFF 8472. However, this is not always the case. Fix this by passing the desired offset and length to be_cmd_read_port_transceiver_data so that we only copy the bytes once.
CVE-2022-49583	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix handling of dummy receive descriptors Fix memory leak caused by not handling dummy receive descriptor properly. iavf_get_rx_buffer now sets the rx_buffer return value for dummy receive descriptors. Without this patch, when the hardware writes a dummy descriptor, iavf would not free the page allocated for the previous receive buffer. This is an unlikely event but can still happen. [Jesse: massaged commit message]
CVE-2022-49585	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_fastopen_blackhole_timeout. While reading sysctl_tcp_fastopen_blackhole_timeout, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49586	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_fastopen. While reading sysctl_tcp_fastopen, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49587	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_notsent_lowat. While reading sysctl_tcp_notsent_lowat, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49589	In the Linux kernel, the following vulnerability has been resolved: igmp: Fix data-races around sysctl_igmp_qrv. While reading sysctl_igmp_qrv, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers. This test can be packed into a helper, so such changes will be in the follow-up series after net is merged into net-next. qrv ?: READ_ONCE(net->ipv4.sysctl_igmp_qrv);
CVE-2022-49590	In the Linux kernel, the following vulnerability has been resolved: igmp: Fix data-races around sysctl_igmp_llm_reports. While reading sysctl_igmp_llm_reports, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers. This test can be packed into a helper, so such changes will be in the follow-up series after net is merged into net-next. if (ipv4_is_local_multicast(pmc->multiaddr) && !READ_ONCE(net->ipv4.sysctl_igmp_llm_reports))
CVE-2022-49593	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_probe_interval. While reading sysctl_tcp_probe_interval, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49595	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_probe_threshold. While reading sysctl_tcp_probe_threshold, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.

CVE ID	Description
CVE-2022-49596	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_min_snd_mss. While reading sysctl_tcp_min_snd_mss, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49597	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_base_mss. While reading sysctl_tcp_base_mss, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49598	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_mtu_probing. While reading sysctl_tcp_mtu_probing, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49599	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix data-races around sysctl_tcp_l3mdev_accept. While reading sysctl_tcp_l3mdev_accept, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49601	In the Linux kernel, the following vulnerability has been resolved: tcp/dccp: Fix a data-race around sysctl_tcp_fwmark_accept. While reading sysctl_tcp_fwmark_accept, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49602	In the Linux kernel, the following vulnerability has been resolved: ip: Fix a data-race around sysctl_fwmark_reflect. While reading sysctl_fwmark_reflect, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49603	In the Linux kernel, the following vulnerability has been resolved: ip: Fix data-races around sysctl_ip_fwd_update_priority. While reading sysctl_ip_fwd_update_priority, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49604	In the Linux kernel, the following vulnerability has been resolved: ip: Fix data-races around sysctl_ip_fwd_use_pmtu. While reading sysctl_ip_fwd_use_pmtu, it can be changed concurrently. Thus, we need to add READ_ONCE() to its readers.
CVE-2022-49605	In the Linux kernel, the following vulnerability has been resolved: igc: Reinstate IGC_REMOVED logic and implement it properly The initially merged version of the igc driver code (via commit 146740f9abc4, "igc: Add support for PF") contained the following IGC_REMOVED checks in the igc_rd32/wr32() MMIO accessors: u32 igc_rd32(struct igc_hw *hw, u32 reg) { u8 __iomem *hw_addr = READ_ONCE(hw->hw_addr); u32 value = 0; if (IGC_REMOVED(hw_addr)) return ~value; value = readl(&hw_addr[reg]); /* reads should not return all F's */ if (!~value) && (!reg ! (~readl(hw_addr))) hw->hw_addr = NULL; return value; } And: #define wr32(reg, val) \ do { \ u8 __iomem *hw_addr = READ_ONCE((hw->hw_addr); \ if (!IGC_REMOVED(hw_addr)) \ writel((val), &hw_addr[reg]); \ } while (0) E.g. igb has similar checks in its MMIO accessors, and has a similar macro E1000_REMOVED, which is implemented as follows: #define E1000_REMOVED(h) unlikely(! (h)) These checks serve to detect and take note of an 0xffffffff MMIO read return from the device, which can be caused by a PCIe link flap or some other kind of PCI bus error, and to avoid performing MMIO reads and writes from that point onwards. However, the IGC_REMOVED macro was not originally implemented: #ifndef IGC_REMOVED #define IGC_REMOVED(a) (0) #endif /* IGC_REMOVED */ This led to the IGC_REMOVED logic to be removed entirely in a subsequent commit (commit 3c215fb18e70, "igc: remove IGC_REMOVED function"), with the rationale that such checks matter only for virtualization and that igc does not support virtualization -- but a PCIe device can become detached even without virtualization being in use, and without proper checks, a PCIe bus error affecting an igc adapter will lead to various NULL pointer dereferences, as the first access after the error will set hw->hw_addr to NULL, and subsequent accesses will blindly dereference this now-NULL pointer. This patch reinstates the IGC_REMOVED checks in igc_rd32/wr32(), and implements IGC_REMOVED the way it is done for igb, by checking for the unlikely() case of hw_addr being NULL. This change prevents the oopses seen when a PCIe link flap occurs on an igc adapter.
CVE-2022-49606	In the Linux kernel, the following vulnerability has been resolved: RDMA/irdma: Fix sleep from invalid context BUG Taking the qos_mutex to process RoCEv2 QP's on netdev events causes a kernel splat. Fix this by removing the handling for RoCEv2 in irdma_cm_tearardown_connections that uses the mutex. This handling is only needed for iWARP to avoid having connections established while the link is down or having connections remain functional after the IP address is removed. BUG: sleeping function called from invalid context at kernel/locking/mutex. Call Trace: kernel: dump_stack+0x66/0x90 kernel: __might_sleep.cold.92+0x8d/0x9a kernel: mutex_lock+0x1c/0x40 kernel: irdma_cm_tearardown_connections+0x28e/0x4d0 [irdma] kernel: ? check_preempt_curr+0x7a/0x90 kernel: ? select_idle_sibling+0x22/0x3c0 kernel: ? select_task_rq_fair+0x94c/0xc90 kernel: ? irdma_exec_cqp_cmd+0xc27/0x17c0 [irdma] kernel: ? wake_up_common+0x7a/0x190 kernel: irdma_if_notify+0x3cc/0x450 [irdma] kernel: ? sched_clock_cpu+0xc/0xb0 kernel: irdma_inet6addr_event+0xc6/0x150 [irdma]

CVE ID	Description
CVE-2022-49607	In the Linux kernel, the following vulnerability has been resolved: perf/core: Fix data race between perf_event_set_output() and perf_mmap_close() Yang Jihing reported a race between perf_event_set_output() and perf_mmap_close(): CPU1 CPU2 perf_mmap_close(e2) if (atomic_dec_and_test(&e2->rb->mmap_count)) // 1 - > 0 detach_rest = true ioctl(e1, IOC_SET_OUTPUT, e2) perf_event_set_output(e1, e2) ... list_for_each_entry_rcu(e, &e2->rb->event_list, rb_entry) ring_buffer_attach(e, NULL); // e1 isn't yet added and // therefore not detached ring_buffer_attach(e1, e2->rb) list_add_rcu(&e1->rb_entry, &e2->rb->event_list) After this; e1 is attached to an unmapped rb and a subsequent perf_mmap() will loop forever more: again: mutex_lock(&e->mmap_mutex); if (event->rb) { ... if (!atomic_inc_not_zero(&e->rb->mmap_count)) { ... mutex_unlock(&e->mmap_mutex); goto again; } } The loop in perf_mmap_close() holds e2->mmap_mutex, while the attach in perf_event_set_output() holds e1->mmap_mutex. As such there is no serialization to avoid this race. Change perf_event_set_output() to take both e1->mmap_mutex and e2->mmap_mutex to alleviate that problem. Additionally, have the loop in perf_mmap() detach the rb directly, this avoids having to wait for the concurrent perf_mmap_close() to get around to doing it to make progress.
CVE-2022-49610	In the Linux kernel, the following vulnerability has been resolved: KVM: VMX: Prevent RSB underflow before vmxenter On VMX, there are some balanced returns between the time the guest's SPEC_CTRL value is written, and the vmxenter. Balanced returns (matched by a preceding call) are usually ok, but it's at least theoretically possible an NMI with a deep call stack could empty the RSB before one of the returns. For maximum paranoia, don't allow *any* returns (balanced or otherwise) between the SPEC_CTRL write and the vmxenter. [bp: Fix 32-bit build.]
CVE-2022-49611	In the Linux kernel, the following vulnerability has been resolved: x86/speculation: Fill RSB on vmxexit for IBRS Prevent RSB underflow/poisoning attacks with RSB. While at it, add a bunch of comments to attempt to document the current state of tribal knowledge about RSB attacks and what exactly is being mitigated.
CVE-2022-49612	In the Linux kernel, the following vulnerability has been resolved: power: supply: core: Fix boundary conditions in interpolation The functions power_supply_temp2resist_simple and power_supply_ocv2cap_simple handle boundary conditions incorrectly. The change was introduced in a4585ba2050f460f749bbaf2b67bd56c41e30283 ("power: supply: core: Use library interpolation"). There are two issues: First, the lines "high = i - 1" and "high = i" in ocv2cap have the wrong order compared to temp2resist. As a consequence, ocv2cap sets high=-1 if ocv>table[0].ocv, which causes an out-of-bounds read. Second, the logic of temp2resist is also not correct. Consider the case table[] = {{20, 100}, {10, 80}, {0, 60}}. For temp=5, we expect a resistance of 70% by interpolation. However, temp2resist sets high=low=2 and returns 60.
CVE-2022-49613	In the Linux kernel, the following vulnerability has been resolved: serial: 8250: Fix PM usage_count for console handover When console is enabled, univ8250_console_setup() calls serial8250_console_setup() before .dev is set to uart_port. Therefore, it will not call pm_runtime_get_sync(). Later, when the actual driver is going to take over univ8250_console_exit() is called. As .dev is already set, serial8250_console_exit() makes pm_runtime_put_sync() call with usage count being zero triggering PM usage count warning (extra debug for univ8250_console_setup(), univ8250_console_exit(), and serial8250_register_ports()): [0.068987] univ8250_console_setup ttyS0 nodev [0.499670] printk: console [ttyS0] enabled [0.717955] printk: console [ttyS0] printing thread started [1.960163] serial8250_register_ports assigned dev for ttyS0 [1.976830] printk: console [ttyS0] disabled [1.976888] printk: console [ttyS0] printing thread stopped [1.977073] univ8250_console_exit ttyS0 usage:0 [1.977075] serial8250 serial8250: Runtime PM usage count underflow! [1.977429] dw-apb-uart.6: ttyS0 at MMIO 0x4010006000 (irq = 33, base_baud = 115200) is a 16550A [1.977812] univ8250_console_setup ttyS0 usage:2 [1.978167] printk: console [ttyS0] printing thread started [1.978203] printk: console [ttyS0] enabled To fix the issue, call pm_runtime_get_sync() in serial8250_register_ports() as soon as .dev is set for an uart_port if it has console enabled. This problem became apparent only recently because 82586a721595 ("PM: runtime: Avoid device usage count underflows") added the warning printout. I confirmed this problem also occurs with v5.18 (w/o the warning printout, obviously).
CVE-2022-49615	In the Linux kernel, the following vulnerability has been resolved: ASoC: rt711-sdca: fix kernel NULL pointer dereference when IO error The initial settings will be written before the codec probe function. But, the rt711->component doesn't be assigned yet. If IO error happened during initial settings operations, it will cause the kernel panic. This patch changed component->dev to slave->dev to fix this issue.
CVE-2022-49616	In the Linux kernel, the following vulnerability has been resolved: ASoC: rt7*-sdw: harden jack_detect_handler Realtek headset codec drivers typically check if the card is instantiated before proceeding with the jack detection. The rt700, rt711 and rt711-sdca are however missing a check on the card pointer, which can lead to NULL dereferences encountered in driver bind/unbind tests.

CVE ID	Description
CVE-2022-49617	In the Linux kernel, the following vulnerability has been resolved: ASoC: Intel: sof_sdw: handle errors on card registration If the card registration fails, typically because of deferred probes, the device properties added for headset codecs are not removed, which leads to kernel oopses in driver bind/unbind tests. We already clean-up the device properties when the card is removed, this code can be moved as a helper and called upon card registration errors.
CVE-2022-49620	In the Linux kernel, the following vulnerability has been resolved: net: tipc: fix possible refcount leak in tipc_sk_create() Free sk in case tipc_sk_insert() fails.
CVE-2022-49622	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: avoid skb access on nf_stolen When verdict is NF_STOLEN, the skb might have been freed. When tracing is enabled, this can result in a use-after-free: 1. access to skb->nf_trace 2. access to skb->mark 3. computation of trace id 4. dump of packet payload To avoid 1, keep a cached copy of skb->nf_trace in the trace state struct. Refresh this copy whenever verdict is != STOLEN. Avoid 2 by skipping skb->mark access if verdict is STOLEN. 3 is avoided by precomputing the trace id. Only dump the packet when verdict is not "STOLEN".
CVE-2022-49623	In the Linux kernel, the following vulnerability has been resolved: powerpc/xive/spapr: correct bitmap allocation size kasan detects access beyond the end of the xibm->bitmap allocation: BUG: KASAN: slab-out-of-bounds in _find_first_zero_bit+0x40/0x140 Read of size 8 at addr c00000001d1d0118 by task swapper/0/1 CPU: 0 PID: 1 Comm: swapper/0 Not tainted 5.19.0-rc2-00001-g90df023b36dd #28 Call Trace: [c00000001d98f770] [c0000000012baab8] dump_stack_lvl+0xac/0x108 (unreliable) [c00000001d98f7b0] [c00000000068faac] print_report+0x37c/0x710 [c00000001d98f880] [c0000000006902c0] kasan_report+0x110/0x354 [c00000001d98f950] [c000000000692324] __asan_load8+0xa4/0xe0 [c00000001d98f970] [c0000000011c6ed0] _find_first_zero_bit+0x40/0x140 [c00000001d98f9b0] [c0000000000dbfbc] xive_spapr_get_ipi+0xcc/0x260 [c00000001d98fa70] [c0000000000d6d28] xive_setup_cpu_ipi+0x1e8/0x450 [c00000001d98fb30] [c000000004032a20] pSeries_smp_probe+0x5c/0x118 [c00000001d98fb60] [c000000004018b44] smp_prepare_cpus+0x944/0x9ac [c00000001d98fc90] [c000000004009f9c] kernel_init_freeable+0x2d4/0x640 [c00000001d98fd90] [c0000000000131e8] kernel_init+0x28/0x1d0 [c00000001d98fe10] [c0000000000cd54] ret_from_kernel_thread+0x5c/0x64 Allocated by task 0: kasan_save_stack+0x34/0x70 __kasan_kmalloc+0xb4/0xf0 __kmalloc+0x268/0x540 xive_spapr_init+0x4d0/0x77c pseries_init_irq+0x40/0x27c init_IRQ+0x44/0x84 start_kernel+0x2a4/0x538 start_here_common+0x1c/0x20 The buggy address belongs to the object at c00000001d1d0118 which belongs to the cache kmalloc-8 of size 8 The buggy address is located 0 bytes inside of 8-byte region [c00000001d1d0118, c00000001d1d0120) The buggy address belongs to the physical page: page:c00c000000074740 refcount:1 mapcount:0 mapping:0000000000000000 index:0xc00000001d1d0558 pfn:0x1d1d flags: 0x7ffff000000200(slab node=0 zone=0 lastcpupid=0x7ffff) raw: 007ffff000000200 c00000001d0003c8 c00000001d0003c8 c00000001d010480 raw: c00000001d1d0558 000000001e1000a 00000001ffffff 0000000000000000 page dumped because: kasan: bad access detected Memory state around the buggy address: c00000001d1d0000: fc 00 fc fc fc fc fc fc fc fc fc fc fc fc fc c00000001d1d0080: fc fc 00 fc fc fc fc fc fc fc fc fc fc fc fc fc >c00000001d1d0100: fc fc fc 02 fc fc fc fc fc fc fc fc fc fc fc fc fc ^ c00000001d1d0180: fc fc fc fc 04 fc fc fc fc fc fc fc fc fc fc c00000001d1d0200: fc fc fc fc 04 fc fc fc fc fc fc fc fc fc fc This happens because the allocation uses the wrong unit (bits) when it should pass (BITS_TO_LONGS(count) * sizeof(long)) or equivalent. With small numbers of bits, the allocated object can be smaller than sizeof(long), which results in invalid accesses. Use bitmap_zalloc() to allocate and initialize the irq bitmap, paired with bitmap_free() for consistency.

CVE ID	Description
CVE-2022-49624	In the Linux kernel, the following vulnerability has been resolved: net: atlantic: remove aq_nic_deinit() when resume aq_nic_deinit() has been called while suspending, so we don't have to call it again on resume. Actually, call it again leads to another hang issue when resuming from S3. Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992345] Call Trace: Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992346] <TASK> Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992348] aq_nic_deinit+0xb4/0xd0 [atlantic] Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992356] aq_pm_thaw+0x7f/0x100 [atlantic] Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992362] pci_pm_resume+0x5c/0x90 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992366] ? pci_pm_thaw+0x80/0x80 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992368] dpm_run_callback+0x4e/0x120 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992371] device_resume+0xad/0x200 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992373] async_resume+0x1e/0x40 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992374] async_run_entry_fn+0x33/0x120 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992377] process_one_work+0x220/0x3c0 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992380] worker_thread+0x4d/0x3f0 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992382] ? process_one_work+0x3c0/0x3c0 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992384] kthread+0x12a/0x150 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992386] ? set_kthread_struct+0x40/0x40 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992387] ret_from_fork+0x22/0x30 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992391] </TASK> Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992392] ---[end trace 1ec8c79604ed5e0d]--- Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992394] PM: dpm_run_callback(): pci_pm_resume+0x0/0x90 returns -110 Jul 8 03:09:44 u-Precision-7865-Tower kernel: [5910.992397] atlantic 0000:02:00.0: PM: failed to resume async: error -110
CVE-2022-49625	In the Linux kernel, the following vulnerability has been resolved: sfc: fix kernel panic when creating VF When creating VFs a kernel panic can happen when calling to efx_ef10_try_update_nic_stats_vf. When releasing a DMA coherent buffer, sometimes, I don't know in what specific circumstances, it has to unmap memory with vunmap. It is disallowed to do that in IRQ context or with BH disabled. Otherwise, we hit this line in vunmap, causing the crash: BUG_ON(in_interrupt()); This patch reenables BH to release the buffer. Log messages when the bug is hit: kernel BUG at mm/vmalloc.c:2727! invalid opcode: 0000 [#1] PREEMPT SMP NOPTI CPU: 6 PID: 1462 Comm: NetworkManager Kdump: loaded Tainted: G I ----- 5.14.0-119.el9.x86_64 #1 Hardware name: Dell Inc. CVE-2022-49626	In the Linux kernel, the following vulnerability has been resolved: sfc: fix use after free when disabling sriov Use after free is detected by kfence when disabling sriov. What was read after being freed was vf->pci_dev: it was freed from pci_disable_sriov and later read in efx_ef10_sriov_free_vf_vports, called from efx_ef10_sriov_free_vf_vswitching. Set the pointer to NULL at release time to not trying to read it later. Reproducer and dmesg log (note that kfence doesn't detect it every time): \$ echo 1 > /sys/class/net/enp65s0f0np0/device/sriov_numvfs \$ echo 0 > /sys/class/net/enp65s0f0np0/device/sriov_numvfs BUG: KFENCE: use-after-free read in efx_ef10_sriov_free_vf_vswitching+0x82/0x170 [sfc] Use-after-free read at 0x00000000ff3c1ba5 (in kfence-#224): efx_ef10_sriov_free_vf_vswitching+0x82/0x170 [sfc] efx_ef10_pci_sriov_disable+0x38/0x70 [sfc] efx_pci_sriov_configure+0x24/0x40 [sfc] sriov_numvfs_store+0xfe/0x140 kernfs_fop_write_iter+0x11c/0x1b0 new_sync_write+0x11f/0x1b0 vfs_write+0x1eb/0x280 ksys_write+0x5f/0xe0 do_syscall_64+0x5c/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae kfence-#224: 0x00000000edb8ef95-0x00000000671f5ce1, size=2792, cache=kmalloc-4k allocated by task 6771 on cpu 10 at 3137.860196s: pci_alloc_dev+0x21/0x60 pci_iiov_add_virtfn+0x2a2/0x320 sriov_enable+0x212/0x3e0 efx_ef10_sriov_configure+0x67/0x80 [sfc] efx_pci_sriov_configure+0x24/0x40 [sfc] sriov_numvfs_store+0xba/0x140 kernfs_fop_write_iter+0x11c/0x1b0 new_sync_write+0x11f/0x1b0 vfs_write+0x1eb/0x280 ksys_write+0x5f/0xe0 do_syscall_64+0x5c/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae freed by task 6771 on cpu 12 at 3170.991309s: device_release+0x34/0x90 kobject_cleanup+0x3a/0x130 pci_iiov_remove_virtfn+0xd9/0x120 sriov_disable+0x30/0xe0 efx_ef10_pci_sriov_disable+0x57/0x70 [sfc] efx_pci_sriov_configure+0x24/0x40 [sfc] sriov_numvfs_store+0xfe/0x140 kernfs_fop_write_iter+0x11c/0x1b0 new_sync_write+0x11f/0x1b0 vfs_write+0x1eb/0x280 ksys_write+0x5f/0xe0 do_syscall_64+0x5c/0x80 entry_SYSCALL_64_after_hwframe+0x44/0xae
CVE-2022-49630	In the Linux kernel, the following vulnerability has been resolved: tcp: Fix a data-race around sysctl_tcp_ecn_fallback. While reading sysctl_tcp_ecn_fallback, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.
CVE-2022-49632	In the Linux kernel, the following vulnerability has been resolved: icmp: Fix a data-race around sysctl_icmp_errors_use_inbound_ifaddr. While reading sysctl_icmp_errors_use_inbound_ifaddr, it can be changed concurrently. Thus, we need to add READ_ONCE() to its reader.

CVE ID	Description
CVE-2022-49636	In the Linux kernel, the following vulnerability has been resolved: vlan: fix memory leak in vlan_newlink() Blamed commit added back a bug I fixed in commit 9bbd917e0bec ("vlan: fix memory leak in vlan_dev_set_egress_priority") If a memory allocation fails in vlan_changelink() after other allocations succeeded, we need to call vlan_dev_free_egress_priority() to free all allocated memory because after a failed ->newlink() we do not call any methods like ndo_uninit() or dev->priv_destructor(). In following example, if the allocation for last element 2000:2001 fails, we need to free eight prior allocations: ip link add link dummy0 dummy0.100 type vlan id 100 \egress-qos-map 1:2 2:3 3:4 4:5 5:6 6:7 7:8 8:9 2000:2001 syzbot report was: BUG: memory leak unreferenced object 0xffff888117bd1060 (size 32): comm "syz-executor408", pid 3759, jiffies 4294956555 (age 34.090s) hex dump (first 32 bytes): 09 00 00 00 00 a0 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<ffffff83fc60ad>] kmalloc include/linux/slab.h:600 [inline] [<ffffff83fc60ad>] vlan_dev_set_egress_priority+0xed/0x170 net/8021q/vlan_dev.c:193 [<ffffff83fc6628>] vlan_changelink+0x178/0x1d0 net/8021q/vlan_netlink.c:128 [<ffffff83fc67c8>] vlan_newlink+0x148/0x260 net/8021q/vlan_netlink.c:185 [<ffffff838b1278>] rtnl_newlink_create net/core/rtnetlink.c:3363 [inline] [<ffffff838b1278>] __rtnl_newlink+0xa58/0xdc0 net/core/rtnetlink.c:3580 [<ffffff838b1629>] rtnl_newlink+0x49/0x70 net/core/rtnetlink.c:3593 [<ffffff838ac66c>] rtnetlink_rcv_msg+0x21c/0x5c0 net/core/rtnetlink.c:6089 [<ffffff839f9c37>] netlink_rcv_skb+0x87/0x1d0 net/netlink/af_netlink.c:2501 [<ffffff839f8da7>] netlink_unicast_kernel net/netlink/af_netlink.c:1319 [inline] [<ffffff839f8da7>] netlink_unicast+0x397/0x4c0 net/netlink/af_netlink.c:1345 [<ffffff839f9266>] netlink_sendmsg+0x396/0x710 net/netlink/af_netlink.c:1921 [<ffffff8384dbf6>] sock_sendmsg_nosec net/socket.c:714 [inline] [<ffffff8384dbf6>] sock_sendmsg+0x56/0x80 net/socket.c:734 [<ffffff8384e15c>] ____sys_sendmsg+0x36c/0x390 net/socket.c:2488 [<ffffff838523cb>] ____sys_sendmsg+0x8b/0xd0 net/socket.c:2542 [<ffffff838525b8>] __sys_sendmsg net/socket.c:2571 [inline] [<ffffff838525b8>] __do_sys_sendmsg net/socket.c:2580 [inline] [<ffffff838525b8>] __se_sys_sendmsg net/socket.c:2578 [inline] [<ffffff838525b8>] __x64_sys_sendmsg+0x78/0xf0 net/socket.c:2578 [<ffffff845ad8d5>] do_syscall_x64 arch/x86/entry/common.c:50 [inline] [<ffffff845ad8d5>] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 [<ffffff8460006a>] entry_SYSCALL_64_after_hwframe+0x46/0xb0
CVE-2022-49638	In the Linux kernel, the following vulnerability has been resolved: icmp: Fix data-races around sysctl. While reading icmp sysctl variables, they can be changed concurrently. So, we need to add READ_ONCE() to avoid data-races.
CVE-2022-49639	In the Linux kernel, the following vulnerability has been resolved: cipso: Fix data-races around sysctl. While reading cipso sysctl variables, they can be changed concurrently. So, we need to add READ_ONCE() to avoid data-races.
CVE-2022-49640	In the Linux kernel, the following vulnerability has been resolved: sysctl: Fix data races in proc_douintvec_minmax(). A sysctl variable is accessed concurrently, and there is always a chance of data-race. So, all readers and writers need some basic protection to avoid load/store-tearing. This patch changes proc_douintvec_minmax() to use READ_ONCE() and WRITE_ONCE() internally to fix data-races on the sysctl side. For now, proc_douintvec_minmax() itself is tolerant to a data-race, but we still need to add annotations on the other subsystem's side.
CVE-2022-49641	In the Linux kernel, the following vulnerability has been resolved: sysctl: Fix data races in proc_douintvec(). A sysctl variable is accessed concurrently, and there is always a chance of data-race. So, all readers and writers need some basic protection to avoid load/store-tearing. This patch changes proc_douintvec() to use READ_ONCE() and WRITE_ONCE() internally to fix data-races on the sysctl side. For now, proc_douintvec() itself is tolerant to a data-race, but we still need to add annotations on the other subsystem's side.
CVE-2022-49642	In the Linux kernel, the following vulnerability has been resolved: net: stmmac: dwc-qos: Disable split header for Tegra194 There is a long-standing issue with the Synopsys DWC Ethernet driver for Tegra194 where random system crashes have been observed [0]. The problem occurs when the split header feature is enabled in the stmmac driver. In the bad case, a larger than expected buffer length is received and causes the calculation of the total buffer length to overflow. This results in a very large buffer length that causes the kernel to crash. Why this larger buffer length is received is not clear, however, the feedback from the NVIDIA design team is that the split header feature is not supported for Tegra194. Therefore, disable split header support for Tegra194 to prevent these random crashes from occurring. [0] https://lore.kernel.org/linux-tegra/b0b17697-f23e-8fa5-3757-604a86f3a095@nvidia.com/
CVE-2022-49643	In the Linux kernel, the following vulnerability has been resolved: ima: Fix a potential integer overflow in ima_appraise_measurement When the ima-modsig is enabled, the rc passed to evm_verifyxattr() may be negative, which may cause the integer overflow problem.
CVE-2022-49644	In the Linux kernel, the following vulnerability has been resolved: drm/i915: fix a possible refcount leak in intel_dp_add_mst_connector() If drm_connector_init fails, intel_connector_free will be called to take care of proper free. So it is necessary to drop the refcount of port before intel_connector_free. (cherry picked from commit cea9ed611e85d36a05db52b6457bf584b7d969e2)

CVE ID	Description
CVE-2022-49646	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix queue selection for mesh/OCB interfaces When using iTXQ, the code assumes that there is only one vif queue for broadcast packets, using the BE queue. Allowing non-BE queue marking violates that assumption and txq->ac == skb_queue_mapping is no longer guaranteed. This can cause issues with queue handling in the driver and also causes issues with the recent ATF change, resulting in an AQL underflow warning.
CVE-2022-49647	In the Linux kernel, the following vulnerability has been resolved: cgroup: Use separate src/dst nodes when preloading css_sets for migration Each cset (css_set) is pinned by its tasks. When we're moving tasks around across csets for a migration, we need to hold the source and destination csets to ensure that they don't go away while we're moving tasks about. This is done by linking cset->mg_preload_node on either the mgctx->preloaded_src_csets or mgctx->preloaded_dst_csets list. Using the same cset->mg_preload_node for both the src and dst lists was deemed okay as a cset can't be both the source and destination at the same time. Unfortunately, this overloading becomes problematic when multiple tasks are involved in a migration and some of them are identity noop migrations while others are actually moving across cgroups. For example, this can happen with the following sequence on cgroup1: #1> mkdir -p /sys/fs/cgroup/misc/a/b #2> echo \$\$ > /sys/fs/cgroup/misc/a/cgroup.procs #3> RUN_A_COMMAND_WHICH_CREATES_MULTIPLE_THREADS & #4> PID=\$! #5> echo \$PID > /sys/fs/cgroup/misc/a/b/tasks #6> echo \$PID > /sys/fs/cgroup/misc/a/cgroup.procs the process including the group leader back into a. In this final migration, non-leader threads would be doing identity migration while the group leader is doing an actual one. After #3, let's say the whole process was in cset A, and that after #4, the leader moves to cset B. Then, during #6, the following happens: 1. cgroup_migrate_add_src() is called on B for the leader. 2. cgroup_migrate_add_src() is called on A for the other threads. 3. cgroup_migrate_prepare_dst() is called. It scans the src list. 4. It notices that B wants to migrate to A, so it tries to A to the dst list but realizes that its ->mg_preload_node is already busy. 5. and then it notices A wants to migrate to A as it's an identity migration, it culls it by list_del_init()'ing its ->mg_preload_node and putting references accordingly. 6. The rest of migration takes place with B on the src list but nothing on the dst list. This means that A isn't held while migration is in progress. If all tasks leave A before the migration finishes and the incoming task pins it, the cset will be destroyed leading to use-after-free. This is caused by overloading cset->mg_preload_node for both src and dst preload lists. We wanted to exclude the cset from the src list but ended up inadvertently excluding it from the dst list too. This patch fixes the issue by separating out cset->mg_preload_node into ->mg_src_preload_node and ->mg_dst_preload_node, so that the src and dst preloadings don't interfere with each other.
CVE-2022-49651	In the Linux kernel, the following vulnerability has been resolved: srcu: Tighten cleanup_srcu_struct() GP checks Currently, cleanup_srcu_struct() checks for a grace period in progress, but it does not check for a grace period that has not yet started but which might start at any time. Such a situation could result in a use-after-free bug, so this commit adds a check for a grace period that is needed but not yet started to cleanup_srcu_struct().
CVE-2022-49653	In the Linux kernel, the following vulnerability has been resolved: i2c: piix4: Fix a memory leak in the EFCH MMIO support The recently added support for EFCH MMIO regions introduced a memory leak in that code path. The leak is caused by the fact that release_resource() merely removes the resource from the tree but does not free its memory. We need to call release_mem_region() instead, which does free the memory. As a nice side effect, this brings back some symmetry between the legacy and MMIO paths.
CVE-2022-49656	In the Linux kernel, the following vulnerability has been resolved: ARM: meson: Fix refcount leak in meson_smp_prepare_cpus of_find_compatible_node() returns a node pointer with refcount incremented, we should use of_node_put() on it when done. Add missing of_node_put() to avoid refcount leak.
CVE-2022-49657	In the Linux kernel, the following vulnerability has been resolved: usbnet: fix memory leak in error case usbnet_write_cmd_async() mixed up which buffers need to be freed in which error case. v2: add Fixes tag v3: fix uninitialized buf pointer

CVE ID	Description
CVE-2022-49658	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix insufficient bounds propagation from adjust_scalar_min_max_vals Kuee reported a corner case where the tnum becomes constant after the call to __reg_bound_offset(), but the register's bounds are not, that is, its min bounds are still not equal to the register's max bounds. This in turn allows to leak pointers through turning a pointer register as is into an unknown scalar via adjust_ptr_min_max_vals(). Before: func#0 @0 0: R1=ctx(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) R10=fp(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) 0: (b7) r0 = 1 ; R0_w=scalar(imm=1,umin=1,umax=1,var_off=(0x1; 0x0)) 1: (b7) r3 = 0 ; R3_w=scalar(imm=0,umax=0,var_off=(0x0; 0x0)) 2: (87) r3 = -r3 ; R3_w=scalar() 3: (87) r3 = -r3 ; R3_w=scalar() 4: (47) r3 = 32767 ; R3_w=scalar(smin=-9223372036854743041,umin=32767,var_off=(0x7fff; 0xfffffffffff8000),s32_min=-2147450881) 5: (75) if r3 >= 0x0 goto pc+1 ; R3_w=scalar(umin=9223372036854808575,var_off=(0x80000000000007fff; 0x7fffffff8000),s32_min=-2147450881,u32_min=32767) 6: (95) exit from 5 to 7: R0=scalar(imm=1,umin=1,umax=1,var_off=(0x1; 0x0)) R1=ctx(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) R3=scalar(umin=32767,umax=9223372036854775807,var_off=(0x7fff; 0x7fffffff8000),s32_min=-2147450881) R10=fp(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) 7: (d5) if r3 <= 0x8000 goto pc+1 ; R3=scalar(umin=32769,umax=9223372036854775807,var_off=(0x7fff; 0x7fffffff8000),s32_min=-2147450881,u32_min=32767) 8: (95) exit from 7 to 9: R0=scalar(imm=1,umin=1,umax=1,var_off=(0x1; 0x0)) R1=ctx(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) R3=scalar(umin=32767,umax=32768,var_off=(0x7fff; 0x8000)) R10=fp(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) 9: (07) r3 += -32767 ; R3_w=scalar(imm=0,umax=1,var_off=(0x0; 0x0)) <--- [*] 10: (95) exit What can be seen here is that R3=scalar(umin=32767,umax=32768,var_off=(0x7fff; 0x8000)) after the operation R3 += -32767 results in a 'malformed' constant, that is, R3_w=scalar(imm=0,umax=1,var_off=(0x0; 0x0)). Intersecting with var_off has not been done at that point via __update_reg_bounds(), which would have improved the umax to be equal to umin. Refactor the tnum <> min/max bounds information flow into a reg_bounds_sync() helper and use it consistently everywhere. After the fix, bounds have been corrected to R3_w=scalar(imm=0,umax=0,var_off=(0x0; 0x0)) and thus the register is regarded as a 'proper' constant scalar of 0. After: func#0 @0 0: R1=ctx(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) R10=fp(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) 0: (b7) r0 = 1 ; R0_w=scalar(imm=1,umin=1,umax=1,var_off=(0x1; 0x0)) 1: (b7) r3 = 0 ; R3_w=scalar(imm=0,umax=0,var_off=(0x0; 0x0)) 2: (87) r3 = -r3 ; R3_w=scalar() 3: (87) r3 = -r3 ; R3_w=scalar() 4: (47) r3 = 32767 ; R3_w=scalar(smin=-9223372036854743041,umin=32767,var_off=(0x7fff; 0xfffffffffff8000),s32_min=-2147450881) 5: (75) if r3 >= 0x0 goto pc+1 ; R3_w=scalar(umin=9223372036854808575,var_off=(0x80000000000007fff; 0x7fffffff8000),s32_min=-2147450881,u32_min=32767) 6: (95) exit from 5 to 7: R0=scalar(imm=1,umin=1,umax=1,var_off=(0x1; 0x0)) R1=ctx(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) R3=scalar(umin=32767,umax=9223372036854775807,var_off=(0x7fff; 0x7fffffff8000),s32_min=-2147450881) R10=fp(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) 7: (d5) if r3 <= 0x8000 goto pc+1 ; R3=scalar(umin=32769,umax=9223372036854775807,var_off=(0x7fff; 0x7fffffff8000),s32_min=-2147450881,u32_min=32767) 8: (95) exit from 7 to 9: R0=scalar(imm=1,umin=1,umax=1,var_off=(0x1; 0x0)) R1=ctx(off=0,imm=0,umax=0,var_off=(0x0; 0x0)) R3=scalar(umin=32767,umax=32768,var_off=(0x7fff; 0x8000)) R10=fp(off=0 ---truncated---

CVE ID	Description
CVE-2022-49663	In the Linux kernel, the following vulnerability has been resolved: tunnels: do not assume mac header is set in skb_tunnel_check_pmtu() Recently added debug in commit f9aefd6b2aa3 ("net: warn if mac header was not set") caught a bug in skb_tunnel_check_pmtu(), as shown in this syzbot report [1]. In ndo_start_xmit() paths, there is really no need to use skb->mac_header, because skb->data is supposed to point at it. [1] WARNING: CPU: 1 PID: 8604 at include/linux/skbuff.h:2784 skb_mac_header_len include/linux/skbuff.h:2784 [inline] WARNING: CPU: 1 PID: 8604 at include/linux/skbuff.h:2784 skb_tunnel_check_pmtu+0x5de/0x2f90 net/ipv4/ip_tunnel_core.c:413 Modules linked in: CPU: 1 PID: 8604 Comm: syz-executor.3 Not tainted 5.19.0-rc2-syzkaller-00443-g8720bd951b8e #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 RIP: 0010:skb_mac_header_len include/linux/skbuff.h:2784 [inline] RIP: 0010:skb_tunnel_check_pmtu+0x5de/0x2f90 net/ipv4/ip_tunnel_core.c:413 Code: 00 00 00 00 fc ff df 4c 89 fa 48 c1 ea 03 80 3c 02 00 0f 84 b9 fe ff ff 4c 89 ff e8 7c 0f d7 f9 e9 ac fe ff ff e8 c2 13 8a f9 <0f> 0b e9 28 fc ff ff e8 b6 13 8a f9 48 8b 54 24 70 48 b8 00 00 00 RSP: 0018:ffff90002e4f520 EFLAGS: 00010212 RAX: 0000000000000324 RBX: ffff88804d5fd500 RCX: ffff90005b52000 RDX: 0000000000040000 RSI: ffffffff87f05e3e RDI: 0000000000000003 RBP: ffff90002e4f650 R08: 0000000000000003 R09: 0000000000000fff R10: 0000000000000fff R11: 0000000000000000 R12: 0000000000000fff R13: 0000000000000000 R14: 000000000000ffcd R15: 000000000000001f FS: 00007f3babb9700(0000) GS:ffff8880b9b00000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 0000000020000080 CR3: 0000000075319000 CR4: 0000000003506e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 Call Trace: <TASK> geneve_xmit_skb drivers/net/geneve.c:927 [inline] geneve_xmit+0xcfb/0x35d0 drivers/net/geneve.c:1107 __netdev_start_xmit include/linux/netdevice.h:4805 [inline] netdev_start_xmit include/linux/netdevice.h:4819 [inline] __dev_direct_xmit+0x500/0x730 net/core/dev.c:4309 dev_direct_xmit include/linux/netdevice.h:3007 [inline] packet_direct_xmit+0x1b8/0x2c0 net/packet/af_packet.c:282 packet_snd net/packet/af_packet.c:3073 [inline] packet_sendmsg+0x21f4/0x55d0 net/packet/af_packet.c:3104 sock_sendmsg_nosec net/socket.c:714 [inline] sock_sendmsg+0xcf/0x120 net/socket.c:734 __sys_sendmsg+0x6eb/0x810 net/socket.c:2489 __sys_sendmsg+0xf3/0x170 net/socket.c:2543 __sys_sendmsg net/socket.c:2572 [inline] __do_sys_sendmsg net/socket.c:2581 [inline] __se_sys_sendmsg net/socket.c:2579 [inline] __x64_sys_sendmsg+0x132/0x220 net/socket.c:2579 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x46/0xb0 RIP: 0033:0x7f3baaa89109 Code: ff ff c3 66 2e 0f 1f 84 00 00 00 00 0f 1f 40 00 48 89 f8 48 89 f7 48 89 d6 48 89 ca 4d 89 c2 4d 89 c8 4c 8b 4c 24 08 0f 05 <48> 3d 01 f0 ff ff 73 01 c3 48 c7 c1 b8 ff ff ff f7 d8 64 89 01 48 RSP: 002b:00007f3babb9168 EFLAGS: 00000246 ORIG_RAX: 000000000000002e RAX: ffffffff87f05e3e RBX: 00007f3baab9bf60 RCX: 00007f3baaa89109 RDX: 0000000000000000 RSI: 0000000020000a00 RDI: 0000000000000003 RBP: 00007f3baaa89109 R08: 0000000000000000 R09: 0000000000000000 R10: 0000000000000000 R11: 0000000000000246 R12: 0000000000000000 R13: 00007ffe74f2543f R14: 00007f3babb9300 R15: 0000000000002200 </TASK>
CVE-2022-49664	In the Linux kernel, the following vulnerability has been resolved: tipc: move bc link creation back to tipc_node_create Shuang Li reported a NULL pointer dereference crash: [] BUG: kernel NULL pointer dereference, address: 0000000000000068 [] RIP: 0010:tipc_link_is_up+0x5/0x10 [tipc] [] Call Trace: [] <IRQ> [] tipc_bcast_rcv+0xa2/0x190 [tipc] [] tipc_node_bc_rcv+0x8b/0x200 [tipc] [] tipc_rcv+0x3af/0x5b0 [tipc] [] tipc_udp_rcv+0xc7/0x1e0 [tipc] It was caused by the 'l' passed into tipc_bcast_rcv() is NULL. When it creates a node in tipc_node_check_dest(), after inserting the new node into hashtable in tipc_node_create(), it creates the bc link. However, there is a gap between this insert and bc link creation, a bc packet may come in and get the node from the hashtable then try to dereference its bc link, which is NULL. This patch is to fix it by moving the bc link creation before inserting into the hashtable. Note that for a preliminary node becoming "real", the bc link creation should also be called before it's reshaped, as we don't create it for preliminary nodes.

CVE ID	Description
CVE-2022-49667	In the Linux kernel, the following vulnerability has been resolved: net: bonding: fix use-after-free after 802.3ad slave unbind commit 0622cab0341c ("bonding: fix 802.3ad aggregator reselection"), resolve case, when there is several aggregation groups in the same bond. bond_3ad_unbind_slave will invalidate (clear) aggregator when __agg_active_ports return zero. So, ad_clear_agg can be executed even, when num_of_ports!=0. Than bond_3ad_unbind_slave can be executed again for, previously cleared aggregator. NOTE: at this time bond_3ad_unbind_slave will not update slave ports list, because lag_ports==NULL. So, here we got slave ports, pointing to freed aggregator memory. Fix with checking actual number of ports in group (as was before commit 0622cab0341c ("bonding: fix 802.3ad aggregator reselection")), before ad_clear_agg(). The KASAN logs are as follows: [767.617392] ===== <pre>[767.630776] BUG: KASAN: use-after-free in bond_3ad_state_machine_handler +0x13dc/0x1470 [767.638764] Read of size 2 at addr ffff00011ba9d430 by task kworker/u8:7/767 [767.647361] CPU: 3 PID: 767 Comm: kworker/u8:7 Tainted: G O 5.15.11 #15 [767.655329] Hardware name: DNI AmazonGo1 A7040 board (DT) [767.660760] Workqueue: lacp_1 bond_3ad_state_machine_handler [767.666468] Call trace: [767.668930] dump_backtrace +0x0/0x2d0 [767.672625] show_stack+0x24/0x30 [767.675965] dump_stack_lvl+0x68/0x84 [767.679659] print_address_description.constprop.0+0x74/0x2b8 [767.685451] kasan_report +0x1f0/0x260 [767.689148] __asan_load2+0x94/0xd0 [767.692667] bond_3ad_state_machine_handler +0x13dc/0x1470</pre>
CVE-2022-49670	In the Linux kernel, the following vulnerability has been resolved: linux/dim: Fix divide by 0 in RDMA DIM Fix a divide 0 error in rdma_dim_stats_compare() when prev->cpe_ratio == 0. CallTrace: Hardware name: H3C R4900 G3/RS33M2C9S, BIOS 2.00.37P21 03/12/2020 task: ffff880194b78000 task.stack: ffff90006714000 RIP: 0010:backport_rdma_dim+0x10e/0x240 [mlx_compat] RSP: 0018:ffff880c10e83ec0 EFLAGS: 00010202 RAX: 0000000000002710 RBX: ffff88096cd7f780 RCX: 0000000000000064 RDX: 0000000000000000 RSI: 0000000000000002 RDI: 0000000000000001 RBP: 0000000000000001 R08: 0000000000000000 R09: 0000000000000000 R10: 0000000000000000 R11: 0000000000000000 R12: 000000001d7c6c09 R13: ffff88096cd7f780 R14: ffff880b174fe800 R15: 0000000000000000 FS: 0000000000000000(0000) GS:ffff880c10e80000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00000000a0965b00 CR3: 000000000200a003 CR4: 0000000007606e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000400 PKRU: 55555554 Call Trace: <IRQ> ib_poll_handler+0x43/0x80 [ib_core] irq_poll_softirq+0xae/0x110 __do_softirq+0xd1/0x28c irq_exit+0xde/0xf0 do_IRQ+0x54/0xe0 common_interrupt+0x8f/0x8f </IRQ> ? cpuidle_enter_state+0xd9/0x2a0 ? cpuidle_enter_state+0xc7/0x2a0 ? do_idle+0x170/0x1d0 ? cpu_startup_entry+0x6f/0x80 ? start_secondary+0x1b9/0x210 ? secondary_startup_64+0xa5/0xb0 Code: 0f 87 e1 00 00 00 8b 4c 24 14 44 8b 43 14 89 c8 4d 63 c8 44 29 c0 99 31 d0 29 d0 31 d2 48 98 48 8d 04 80 48 8d 04 80 48 c1 e0 02 <49> f7 f1 48 83 f8 0a 0f 86 c1 00 00 00 44 39 c1 7f 10 48 89 df RIP: backport_rdma_dim+0x10e/0x240 [mlx_compat] RSP: ffff880c10e83ec0
CVE-2022-49671	In the Linux kernel, the following vulnerability has been resolved: RDMA/cm: Fix memory leak in ib_cm_insert_listen cm_alloc_id_priv() allocates resource for the cm_id_priv. When cm_init_listen() fails it doesn't free it, leading to memory leak. Add the missing error unwind.
CVE-2022-49672	In the Linux kernel, the following vulnerability has been resolved: net: tun: unlink NAPI from device on destruction Syzbot found a race between tun file and device destruction. NAPIs live in struct tun_file which can get destroyed before the netdev so we have to del them explicitly. The current code is missing deleting the NAPI if the queue was detached first.
CVE-2022-49673	In the Linux kernel, the following vulnerability has been resolved: dm raid: fix KASAN warning in raid5_add_disks There's a KASAN warning in raid5_add_disk when running the LVM testsuite. The warning happens in the test lvconvert-raid-reshape-linear_to_raid6-single-type.sh. We fix the warning by verifying that rdev->saved_raid_disk is within limits.
CVE-2022-49674	In the Linux kernel, the following vulnerability has been resolved: dm raid: fix accesses beyond end of raid member array On dm-raid table load (using raid_ctr), dm-raid allocates an array rs->devs[rs->raid_disks] for the raid device members. rs->raid_disks is defined by the number of raid metadata and image tuples passed into the target's constructor. In the case of RAID layout changes being requested, that number can be different from the current number of members for existing raid sets as defined in their superblocks. Example RAID layout changes include: - raid1 legs being added/removed - raid4/5/6/10 number of stripes changed (stripe reshaping) - takeover to higher raid level (e.g. raid5 -> raid6) When accessing array members, rs->raid_disks must be used in control loops instead of the potentially larger value in rs->md.raid_disks. Otherwise it will cause memory access beyond the end of the rs->devs array. Fix this by changing code that is prone to out-of-bounds access. Also fix validate_raid_redundancy() to validate all devices that are added. Also, use braces to help clean up raid_iterate_devices(). The out-of-bounds memory accesses was discovered using KASAN. This commit was verified to pass all LVM2 RAID tests (with KASAN enabled).

CVE ID	Description
CVE-2022-49675	In the Linux kernel, the following vulnerability has been resolved: tick/nohz: unexport __init-annotated tick_nohz_full_setup() EXPORT_SYMBOL and __init is a bad combination because the .init.text section is freed up after the initialization. Hence, modules cannot use symbols annotated __init. The access to a freed symbol may end up with kernel panic. modpost used to detect it, but it had been broken for a decade. Commit 28438794aba4 ("modpost: fix section mismatch check for exported init/exit sections") fixed it so modpost started to warn it again, then this showed up: MODPOST vmlinux.symvers WARNING: modpost: vmlinux.o(___ksymtab_gpl+tick_nohz_full_setup+0x0): Section mismatch in reference from the variable __ksymtab_tick_nohz_full_setup to the function .init.text:tick_nohz_full_setup() The symbol tick_nohz_full_setup is exported and annotated __init Fix this by removing the __init annotation of tick_nohz_full_setup or drop the export. Drop the export because tick_nohz_full_setup() is only called from the built-in code in kernel/sched/isolation.c.
CVE-2022-49679	In the Linux kernel, the following vulnerability has been resolved: ARM: Fix refcount leak in axxia_boot_secondary of_find_compatible_node() returns a node pointer with refcount incremented, we should use of_node_put() on it when done. Add missing of_node_put() to avoid refcount leak.
CVE-2022-49687	In the Linux kernel, the following vulnerability has been resolved: virtio_net: fix xdp_rxq_info bug after suspend/resume The following sequence currently causes a driver bug warning when using virtio_net: # ip link set eth0 up # echo mem > /sys/power/state (or e.g. # rtcwake -s 10 -m mem) <resume> # ip link set eth0 down Missing register, driver bug WARNING: CPU: 0 PID: 375 at net/core/xdp.c:138 xdp_rxq_info_unreg+0x58/0x60 Call trace: xdp_rxq_info_unreg+0x58/0x60 virtnet_close+0x58/0xac __dev_close_many+0xac/0x140 __dev_change_flags+0xd8/0x210 dev_change_flags+0x24/0x64 do_setlink+0x230/0xdd0 ... This happens because virtnet_freeze() frees the receive_queue completely (including struct xdp_rxq_info) but does not call xdp_rxq_info_unreg(). Similarly, virtnet_restore() sets up the receive_queue again but does not call xdp_rxq_info_reg(). Actually, parts of virtnet_freeze_down() and virtnet_restore_up() are almost identical to virtnet_close() and virtnet_open(): only the calls to xdp_rxq_info_(un)reg() are missing. This means that we can fix this easily and avoid such problems in the future by just calling virtnet_close()/open() from the freeze/restore handlers. Aside from adding the missing xdp_rxq_info calls the only difference is that the refill work is only cancelled if netif_running(). However, this should not make any functional difference since the refill work should only be active if the network interface is actually up.
CVE-2022-49696	In the Linux kernel, the following vulnerability has been resolved: tipc: fix use-after-free Read in tipc_named_reinit syzbot found the following issue on: ===== BUG: KASAN: use-after-free in tipc_named_reinit+0x94f/0x9b0 net/tipc/name_distr.c:413 Read of size 8 at addr ffff88805299a000 by task kworker/1:9/23764 CPU: 1 PID: 23764 Comm: kworker/1:9 Not tainted 5.18.0-rc4-syzkaller-00878-g17d49e6e8012 #0 Hardware name: Google Compute Engine/Google Compute Engine, BIOS Google 01/01/2011 Workqueue: events tipc_net_finalize_work Call Trace: <TASK> __dump_stack lib/dump_stack.c:88 [inline] dump_stack_lvl+0xcd/0x134 lib/dump_stack.c:106 print_address_description.constprop.0.cold+0xeb/0x495 mm/kasan/report.c:313 print_report mm/kasan/report.c:429 [inline] kasan_report.cold+0xf4/0x1c6 mm/kasan/report.c:491 tipc_named_reinit+0x94f/0x9b0 net/tipc/name_distr.c:413 tipc_net_finalize+0x234/0x3d0 net/tipc/net.c:138 process_one_work+0x996/0x1610 kernel/workqueue.c:2289 worker_thread+0x665/0x1080 kernel/workqueue.c:2436 kthread+0x2e9/0x3a0 kernel/kthread.c:376 ret_from_fork+0x1f/0x30 arch/x86/entry/entry_64.S:298 </TASK> [...] ===== In the commit d966ddcc3821 ("tipc: fix a deadlock when flushing scheduled work"), the cancel_work_sync() function just to make sure ONLY the work tipc_net_finalize_work() is executing/pending on any CPU completed before tipc namespace is destroyed through tipc_exit_net(). But this function is not guaranteed the work is the last queued. So, the destroyed instance may be accessed in the work which will try to enqueue later. In order to completely fix, we re-order the calling of cancel_work_sync() to make sure the work tipc_net_finalize_work() was last queued and it must be completed by calling cancel_work_sync().
CVE-2022-49697	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix request_sock leak in sk lookup helpers A customer reported a request_socket leak in a Calico cloud environment. We found that a BPF program was doing a socket lookup with takes a refcnt on the socket and that it was finding the request_socket but returning the parent LISTEN socket via sk_to_full_sk() without decrementing the child request socket 1st, resulting in request_sock slab object leak. This patch retains the existing behaviour of returning full socks to the caller but it also decrements the child request_socket if one is present before doing so to prevent the leak. Thanks to Curtis Taylor for all the help in diagnosing and testing this. And thanks to Antoine Tenart for the reproducer and patch input. v2 of this patch contains, refactor as per Daniel Borkmann's suggestions to validate RCU flags on the listen socket so that it balances with bpf_sk_release() and update comments as per Martin KaFai Lau's suggestion. One small change to Daniels suggestion, put "sk = sk2" under "if (sk2 != sk)" to avoid an extra instruction.

CVE ID	Description
CVE-2022-49698	In the Linux kernel, the following vulnerability has been resolved: netfilter: use get_random_u32 instead of prandom bh might occur while updating per-cpu rnd_state from user context, ie. local_out path. BUG: using smp_processor_id() in preemptible [00000000] code: nginx/2725 caller is nft_ng_random_eval +0x24/0x54 [nft_numgen] Call Trace: check_preemption_disabled+0xde/0xe0 nft_ng_random_eval +0x24/0x54 [nft_numgen] Use the random driver instead, this also avoids need for local prandom state. Moreover, prandom now uses the random driver since d4150779e60f ("random32: use real rng for non-deterministic randomness"). Based on earlier patch from Pablo Neira.
CVE-2022-49700	In the Linux kernel, the following vulnerability has been resolved: mm/slab: add missing TID updates on slab deactivation The fastpath in slab_alloc_node() assumes that c->slab is stable as long as the TID stays the same. However, two places in __slab_alloc() currently don't update the TID when deactivating the CPU slab. If multiple operations race the right way, this could lead to an object getting lost; or, in an even more unlikely situation, it could even lead to an object being freed onto the wrong slab's freelist, messing up the `inuse` counter and eventually causing a page to be freed to the page allocator while it still contains slab objects. (I haven't actually tested these cases though, this is just based on looking at the code. Writing testcases for this stuff seems like it'd be a pain...) The race leading to state inconsistency is (all operations on the same CPU and kmem_cache): - task A: begin do_slab_free(): - read TID - read pcpu freelist (==NULL) - check `slab == c->slab` (true) - [PREEMPT A->B] - task B: begin slab_alloc_node(): - fastpath fails (`c->freelist` is NULL) - enter __slab_alloc() - slub_get_cpu_ptr() (disables preemption) - enter __slab_alloc() - take local_lock_irqsave() - read c->freelist as NULL - get_freelist() returns NULL - write `c->slab = NULL` - drop local_unlock_irqrestore() - goto new_slab - slub_percpu_partial() is NULL - get_partial() returns NULL - slub_put_cpu_ptr() (enables preemption) - [PREEMPT B->A] - task A: finish do_slab_free(): - this_cpu_cmpxchg_double() succeeds() - [CORRUPT STATE: c->slab==NULL, c->freelist!=NULL] From there, the object on c->freelist will get lost if task B is allowed to continue from here: It will proceed to the retry_load_slab label, set c->slab, then jump to load_freelist, which clobbers c->freelist. But if we instead continue as follows, we get worse corruption: - task A: run __slab_free() on object from other struct slab: - CPU_PARTIAL_FREE case (slab was on no list, is now on pcpu partial) - task A: run slab_alloc_node() with NUMA node constraint: - fastpath fails (c->slab is NULL) - call __slab_alloc() - slub_get_cpu_ptr() (disables preemption) - enter __slab_alloc() - c->slab is NULL: goto new_slab - slub_percpu_partial() is non-NULL - set c->slab to slub_percpu_partial(c) - [CORRUPT STATE: c->slab points to slab-1, c->freelist has objects from slab-2] - goto redo - node_match() fails - goto deactivate_slab - existing c->freelist is passed into deactivate_slab() - inuse count of slab-1 is decremented to account for object from slab-2 At this point, the inuse count of slab-1 is 1 lower than it should be. This means that if we free all allocated objects in slab-1 except for one, SLUB will think that slab-1 is completely unused, and may free its page, leading to use-after-free.

CVE ID	Description
CVE-2022-49701	In the Linux kernel, the following vulnerability has been resolved: scsi: ibmvfc: Allocate/free queue resource only during probe/remove Currently, the sub-queues and event pool resources are allocated/freed for every CRQ connection event such as reset and LPM. This exposes the driver to a couple issues. First the inefficiency of freeing and reallocating memory that can simply be reused after being sanitized. Further, a system under memory pressure runs the risk of allocation failures that could result in a crippled driver. Finally, there is a race window where command submission/completion can try to pull/return elements from/to an event pool that is being deleted or already has been deleted due to the lack of host state around freeing/allocating resources. The following is an example of list corruption following a live partition migration (LPM): Oops: Exception in kernel mode, sig: 5 [#1] LE PAGE_SIZE=64K MMU=Hash SMP NR_CPUS=2048 NUMA pSeries Modules linked in: vfat fat isofs cdrom ext4 mbcache jbd2 nft_counter nft_compat nf_tables nfnetlink rpadlpar_io rpaphp xsk_diag nfsv3 nfs_acl nfs lockd grace fscache netfs rkill bonding tls sunrpc pseries_rng drm drm_panel_orientation_quirks xfs libcrc32c dm_service_time sd_mod t10_pi sg ibmvfc scsi_transport_fc ibmveth vmx_crypto dm_multipath dm_mirror dm_region_hash dm_log dm_mod ipmi_devintf ipmi_msghandler fuse CPU: 0 PID: 2108 Comm: ibmvfc_0 Kdump: loaded Not tainted 5.14.0-70.9.1.el9_0.ppc64le #1 NIP: c0000000007c4bb0 LR: c0000000007c4bac CTR: 00000000005b9a10 REGS: c00000025c10b760 TRAP: 0700 Not tainted (5.14.0-70.9.1.el9_0.ppc64le) MSR: 800000000282b033 <SF,VEC,VSX,EE,FP,ME,IR,DR,RI,LE> CR: 2800028f XER: 0000000f CFAR: c000000001f55bc IRQMASK: 0 GPR0: c0000000007c4bac c00000025c10ba00 c000000002a47c00 000000000000004e GPR04: c0000031e3006f88 c0000031e308bd00 c00000025c10b768 0000000000000027 GPR08: 0000000000000000 c0000031e3009dc0 00000031e0eb0000 0000000000000000 GPR12: c0000031e2ffffa8 c000000002dd0000 c000000000187108 c00000020fcee2c0 GPR16: 0000000000000000 0000000000000000 0000000000000000 0000000000000000 GPR20: 0000000000000000 0000000000000000 0000000000000000 c008000002f81300 GPR24: 5deadbeef0000100 5deadbeef0000122 c000000263ba6910 c00000024cc88000 GPR28: 000000000000003c c0000002430a0000 c0000002430ac300 000000000000c300 NIP [c0000000007c4bb0] __list_del_entry_valid+0x90/0x100 LR [c0000000007c4bac] __list_del_entry_valid+0x8c/0x100 Call Trace: [c00000025c10ba00] [c0000000007c4bac] __list_del_entry_valid+0x8c/0x100 (unreliable) [c00000025c10ba60] [c008000002f42284] ibmvfc_free_queue+0xec/0x210 [ibmvfc] [c00000025c10bb10] [c008000002f4246c] ibmvfc_deregister_scsi_channel+0xc4/0x160 [ibmvfc] [c00000025c10bba0] [c008000002f42580] ibmvfc_release_sub_crqs+0x78/0x130 [ibmvfc] [c00000025c10bc20] [c008000002f4f6cc] ibmvfc_do_work+0x5c4/0xc70 [ibmvfc] [c00000025c10bce0] [c008000002f4fdec] ibmvfc_work+0x74/0x1e8 [ibmvfc] [c00000025c10bda0] [c0000000001872b8] kthread+0x1b8/0x1c0 [c00000025c10be10] [c00000000000cd64] ret_from_kernel_thread+0x5c/0x64 Instruction dump: 40820034 38600001 38210060 4e800020 7c0802a6 7c641b78 3c62fe7a 7d254b78 3863b590 f8010070 4ba309cd 60000000 <0fe00000> 7c0802a6 3c62fe7a 3863b640 ---[end trace 11a2b65a92f8b66c]--- ibmvfc 30000003: Send warning. Receive queue closed, will retry. Add registration/deregistration helpers that are called instead during connection resets to sanitize and reconfigure the queues.
CVE-2022-49703	In the Linux kernel, the following vulnerability has been resolved: scsi: ibmvfc: Store vhost pointer during subcrq allocation Currently the back pointer from a queue to the vhost adapter isn't set until after subcrq interrupt registration. The value is available when a queue is first allocated and can/should be also set for primary and async queues as well as subcrqs. This fixes a crash observed during kexec/kdump on Power 9 with legacy XICS interrupt controller where a pending subcrq interrupt from the previous kernel can be replayed immediately upon IRQ registration resulting in dereference of a garbage backpointer in ibmvfc_interrupt_scsi(). Kernel attempted to read user page (58) - exploit attempt? (uid: 0) BUG: Kernel NULL pointer dereference on read at 0x00000058 Faulting instruction address: 0xc008000003216a08 Oops: Kernel access of bad area, sig: 11 [#1] ... NIP [c008000003216a08] ibmvfc_interrupt_scsi+0x40/0xb0 [ibmvfc] LR [c00000000082079e8] __handle_irq_event_percpu+0x98/0x270 Call Trace: [c0000000047fa3d80] [c00000000123e6180] 0xc00000000123e6180 (unreliable) [c0000000047fa3df0] [c0000000082079e8] __handle_irq_event_percpu+0x98/0x270 [c0000000047fa3ea0] [c000000008207d18] handle_irq_event+0x98/0x188 [c0000000047fa3ef0] [c00000000820f564] handle_fasteoi_irq+0xc4/0x310 [c0000000047fa3f40] [c000000008205c60] generic_handle_irq+0x50/0x80 [c0000000047fa3f60] [c000000008015c40] __do_irq+0x70/0x1a0 [c0000000047fa3f90] [c000000008016d7c] __do_IRQ+0x9c/0x130 [c000000014622f60] [0000000020000000] 0x20000000 [c000000014622ff0] [c000000008016e50] do_IRQ+0x40/0xa0 [c000000014623020] [c000000008017044] replay_soft_interrupts+0x194/0x2f0 [c000000014623210] [c0000000080172a8] arch_local_irq_restore+0x108/0x170 [c000000014623240] [c0000000080eb1008] _raw_spin_unlock_irqrestore+0x58/0xb0 [c000000014623270] [c00000000820b12c] __setup_irq+0x49c/0x9f0 [c000000014623310] [c00000000820b7c0] request_threaded_irq+0x140/0x230 [c000000014623380] [c008000003212a50] ibmvfc_register_scsi_channel+0x1e8/0x2f0 [ibmvfc] [c000000014623450] [c008000003213d1c] ibmvfc_init_sub_crqs+0xc4/0x1f0 [ibmvfc] [c0000000146234d0] [c0080000032145a8] ibmvfc_reset_crq+0x150/0x210 [ibmvfc] [c000000014623550] [c0080000032147c8] ibmvfc_init_crq+0x160/0x280 [ibmvfc] [c0000000146235f0] [c00800000321a9cc] ibmvfc_probe+0x2a4/0x530 [ibmvfc]

CVE ID	Description
CVE-2022-49708	In the Linux kernel, the following vulnerability has been resolved: ext4: fix bug_on ext4_mb_use_inode_pa Hulk Robot reported a BUG_ON: <pre>===== kernel BUG at fs/ext4/mballo.c:3211! [...] RIP: 0010:ext4_mb_mark_disk_space_used.cold +0x85/0x136f [...] Call Trace: ext4_mb_new_blocks+0x9df/0x5d30 ext4_ext_map_blocks +0x1803/0x4d80 ext4_map_blocks+0x3a4/0x1a10 ext4_writepages+0x126d/0x2c30 do_writepages+0x7f/0x1b0 __filemap_fdatawrite_range+0x285/0x3b0 file_write_and_wait_range +0xb1/0x140 ext4_sync_file+0x1aa/0xca0 vfs_fsync_range+0xfb/0x260 do_fsync+0x48/0xa0 [...] =====</pre> Above issue may happen as follows: ----- do_fsync vfs_fsync_range ext4_sync_file file_write_and_wait_range __filemap_fdatawrite_range do_writepages ext4_writepages mpage_map_and_submit_extent mpage_map_one_extent ext4_map_blocks ext4_mb_new_blocks ext4_mb_normalize_request >>> start + size <= ac->ac_o_ex.fe_logical ext4_mb_regular_allocator ext4_mb_simple_scan_group ext4_mb_use_best_found ext4_mb_new_preallocation ext4_mb_new_inode_pa ext4_mb_use_inode_pa >>> set ac- >ac_b_ex.fe_len <= 0 ext4_mb_mark_disk_space_used >>> BUG_ON(ac->ac_b_ex.fe_len <= 0); we can easily reproduce this problem with the following commands: `fallocate -l100M disk` `mkfs.ext4 -b  1024 -g 256 disk` `mount disk /mnt` `fstress -d /mnt -l 0 -n 1000 -p 1` The size must be smaller than or equal to EXT4_BLOCKS_PER_GROUP. Therefore, "start + size <= ac->ac_o_ex.fe_logical" may occur when the size is truncated. So start should be the start position of the group where ac_o_ex.fe_logical is located after alignment. In addition, when the value of fe_logical or EXT4_BLOCKS_PER_GROUP is very large, the value calculated by start_off is more accurate.
CVE-2022-49710	In the Linux kernel, the following vulnerability has been resolved: dm mirror log: round up region bitmap size to BITS_PER_LONG The code in dm-log rounds up bitset_size to 32 bits. It then uses find_next_zero_bit_le on the allocated region. find_next_zero_bit_le accesses the bitmap using unsigned long pointers. So, on 64-bit architectures, it may access 4 bytes beyond the allocated size. Fix this bug by rounding up bitset_size to BITS_PER_LONG. This bug was found by running the lvm2 testsuite with kasan.
CVE-2022-49715	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3: Fix refcount leak in gic_populate_ppi_partitions of _find_node_by_phandle() returns a node pointer with refcount incremented, we should use of_node_put() on it when not need anymore. Add missing of_node_put() to avoid refcount leak.
CVE-2022-49716	In the Linux kernel, the following vulnerability has been resolved: irqchip/gic-v3: Fix error handling in gic_populate_ppi_partitions of _get_child_by_name() returns a node pointer with refcount incremented, we should use of_node_put() on it when not need anymore. When kcalloc fails, it missing of_node_put() and results in refcount leak. Fix this by goto out_put_node label.
CVE-2022-49720	In the Linux kernel, the following vulnerability has been resolved: block: Fix handling of offline queues in blk_mq_alloc_request_hctx() This patch prevents that test nvme/004 triggers the following: UBSAN: array-index-out-of-bounds in block/blk-mq.h:135:9 index 512 is out of range for type 'long unsigned int [512]' Call Trace: show_stack+0x52/0x58 dump_stack_lvl+0x49/0x5e dump_stack+0x10/0x12 ubsan_epilogue+0x9/0x3b __ubsan_handle_out_of_bounds.cold+0x44/0x49 blk_mq_alloc_request_hctx +0x304/0x310 __nvme_submit_sync_cmd+0x70/0x200 [nvme_core] nvmmf_connect_io_queue +0x23e/0x2a0 [nvme_fabrics] nvme_loop_connect_io_queues+0x8d/0xb0 [nvme_loop] nvme_loop_create_ctrl+0x58e/0x7d0 [nvme_loop] nvmmf_create_ctrl+0x1d7/0x4d0 [nvme_fabrics] nvmmf_dev_write+0xae/0x111 [nvme_fabrics] vfs_write+0x144/0x560 ksys_write+0xb7/0x140 __x64_sys_write+0x42/0x50 do_syscall_64+0x35/0x80 entry_SYSCALL_64_after_hwframe +0x44/0xae

CVE ID	Description
CVE-2022-49722	In the Linux kernel, the following vulnerability has been resolved: ice: Fix memory corruption in VF driver Disable VF's RX/TX queues, when it's disabled. VF can have queues enabled, when it requests a reset. If PF driver assumes that VF is disabled, while VF still has queues configured, VF may unmap DMA resources. In such scenario device still can map packets to memory, which ends up silently corrupting it. Previously, VF driver could experience memory corruption, which lead to crash: [5119.170157] BUG: unable to handle kernel paging request at 00001b9780003237 [5119.170166] PGD 0 P4D 0 [5119.170173] Oops: 0002 [#1] PREEMPT_RT SMP PTI [5119.170181] CPU: 30 PID: 427592 Comm: kworker/u96:2 Kdump: loaded Tainted: G W I ----- 4.18.0-372.9.1.rt7.166.el8.x86_64 #1 [5119.170189] Hardware name: Dell Inc. CVE-2022-49725	In the Linux kernel, the following vulnerability has been resolved: i40e: Fix call trace in setup_tx_descriptors After PF reset and ethtool -t there was call trace in dmesg sometimes leading to panic. When there was some time, around 5 seconds, between reset and test there were no errors. Problem was that pf reset calls i40e_vsi_close in prep_for_reset and ethtool -t calls i40e_vsi_close in diag_test. If there was not enough time between those commands the second i40e_vsi_close starts before previous i40e_vsi_close was done which leads to crash. Add check to diag_test if pf is in reset and don't start offline tests if it is true. Add netif_info("testing failed") into unhappy path of i40e_diag_test()
CVE-2022-49728	In the Linux kernel, the following vulnerability has been resolved: ipv6: Fix signed integer overflow in __ip6_append_data Resurrect ubsan overflow checks and ubsan report this warning, fix it by change the variable [length] type to size_t. UBSAN: signed-integer-overflow in net/ipv6/ip6_output.c:1489:19 2147479552 + 8567 cannot be represented in type 'int' CPU: 0 PID: 253 Comm: err Not tainted 5.16.0+ #1 Hardware name: linux,dummy-virt (DT) Call trace: dump_backtrace+0x214/0x230 show_stack+0x30/0x78 dump_stack_lvl+0xf8/0x118 dump_stack+0x18/0x30 ubsan_epilogue+0x18/0x60 handle_overflow+0xd0/0xf0 __ubsan_handle_add_overflow+0x34/0x44 __ip6_append_data.isra.48+0x1598/0x1688 ip6_append_data+0x128/0x260 udpv6_sendmsg+0x680/0xdd0 inet6_sendmsg+0x54/0x90 sock_sendmsg+0x70/0x88 __sys_sendmsg+0xe8/0x368 __sys_sendmsg+0x98/0xe0 __sys_sendmmsg+0xf4/0x3b8 __arm64_sys_sendmmsg+0x34/0x48 invoke_syscall+0x64/0x160 el0_svc_common.constprop.4+0x124/0x300 do_el0_svc+0x44/0xc8 el0_svc+0x3c/0x1e8 el0t_64_sync_handler+0x88/0xb0 el0t_64_sync+0x16c/0x170 Changes since v1: -Change the variable [length] type to unsigned, as Eric Dumazet suggested. Changes since v2: -Don't change exthdrln type in ip6_make_skb, as Paolo Abeni suggested. Changes since v3: -Don't change ulen type in udpv6_sendmsg and l2tp_ip6_sendmsg, as Jakub Kicinski suggested.

CVE ID	Description
CVE-2022-49730	In the Linux kernel, the following vulnerability has been resolved: scsi: lpfc: Resolve NULL ptr dereference after an ELS LOGO is aborted A use-after-free crash can occur after an ELS LOGO is aborted. Specifically, a nodelist structure is freed and then ndlp->vport->cfg_log_verbose is dereferenced in lpfc_nlp_get() when the discovery state machine is mistakenly called a second time with NLP_EVT_DEVICE_RM argument. Rework lpfc_cmpl_els_logo() to prevent the duplicate calls to release a nodelist structure.
CVE-2022-49731	In the Linux kernel, the following vulnerability has been resolved: ata: libata-core: fix NULL pointer deref in ata_host_alloc_pinfo() In an unlikely (and probably wrong?) case that the 'ppi' parameter of ata_host_alloc_pinfo() points to an array starting with a NULL pointer, there's going to be a kernel oops, as the 'pi' local variable won't get reassigned from the initial value of NULL. Initialize 'pi' instead to '&ata_dummy_port_info' to fix the possible kernel oops for good... Found by Linux Verification Center (linuxtesting.org) with the SVACE static analysis tool.
CVE-2022-49739	In the Linux kernel, the following vulnerability has been resolved: gfs2: Always check inode size of inline inodes Check if the inode size of stuffed (inline) inodes is within the allowed range when reading inodes from disk (gfs2_dinode_in()). This prevents us from on-disk corruption. The two checks in stuffed_readpage() and gfs2_unstuffer_page() that just truncate inline data to the maximum allowed size don't actually make sense, and they can be removed now as well.
CVE-2022-49740	In the Linux kernel, the following vulnerability has been resolved: wifi: brcmfmac: Check the count value of channel spec to prevent out-of-bounds reads This patch fixes slab-out-of-bounds reads in brcmfmac that occur in brcmf_construct_chaninfo() and brcmf_enable_bw40_2g() when the count value of channel specifications provided by the device is greater than the length of 'list->element[]', decided by the size of the 'list' allocated with kzalloc(). The patch adds checks that make the functions free the buffer and return -EINVAL if that is the case. Note that the negative return is handled by the caller, brcmf_setup_wiphybands() or brcmf_cfg80211_attach(). Found by a modified version of syzkaller. Crash Report from brcmf_construct_chaninfo(): ===== BUG: KASAN: slab-out-of-bounds in brcmf_setup_wiphybands+0x1238/0x1430 Read of size 4 at addr ffff888115f24600 by task kworker/0:2/1896 CPU: 0 PID: 1896 Comm: kworker/0:2 Tainted: G W O 5.14.0+ #132 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS rel-1.12.1-0-ga5cab58e9a3f-prebuilt.qemu.org 04/01/2014 Workqueue: usb_hub_wq hub_event Call Trace: dump_stack_lvl+0x57/0x7d print_address_description.constprop.0.cold+0x93/0x334 kasan_report.cold+0x83/0xdf brcmf_setup_wiphybands+0x1238/0x1430 brcmf_cfg80211_attach+0x2118/0x3fd0 brcmf_attach+0x389/0xd40 brcmf_usb_probe+0x12de/0x1690 usb_probe_interface+0x25f/0x710 really_probe+0x1be/0xa90 __driver_probe_device+0x2ab/0x460 driver_probe_device+0x49/0x120 __device_attach_driver+0x18a/0x250 bus_for_each_drv+0x123/0x1a0 __device_attach+0x207/0x330 bus_probe_device+0x1a2/0x260 device_add+0xa61/0x1ce0 usb_set_configuration+0x984/0x1770 usb_generic_driver_probe+0x69/0x90 usb_probe_device+0x9c/0x220 really_probe+0x1be/0xa90 __driver_probe_device+0x2ab/0x460 driver_probe_device+0x49/0x120 __device_attach_driver+0x18a/0x250 bus_for_each_drv+0x123/0x1a0 __device_attach+0x207/0x330 bus_probe_device+0x1a2/0x260 device_add+0xa61/0x1ce0 usb_new_device.cold+0x463/0xf66 hub_event+0x10d5/0x3330 process_one_work+0x873/0x13e0 worker_thread+0x8b/0xd10 kthread+0x379/0x450 ret_from_fork+0x1f/0x30 Allocated by task 1896: kasan_save_stack+0x1b/0x40 __kasan_kmalloc+0x7c/0x90 kmem_cache_alloc_trace+0x19e/0x330 brcmf_setup_wiphybands+0x290/0x1430 brcmf_cfg80211_attach+0x2118/0x3fd0 brcmf_attach+0x389/0xd40 brcmf_usb_probe+0x12de/0x1690 usb_probe_interface+0x25f/0x710 really_probe+0x1be/0xa90 __driver_probe_device+0x2ab/0x460 driver_probe_device+0x49/0x120 __device_attach_driver+0x18a/0x250 bus_for_each_drv+0x123/0x1a0 __device_attach+0x207/0x330 bus_probe_device+0x1a2/0x260 device_add+0xa61/0x1ce0 usb_new_device.cold+0x463/0xf66 hub_event+0x10d5/0x3330 process_one_work+0x873/0x13e0 worker_thread+0x8b/0xd10 kthread+0x379/0x450 ret_from_fork+0x1f/0x30 The buggy address belongs to the object at ffff888115f24000 which belongs to the cache kcalloc-2k of size 2048 The buggy address is located 1536 bytes inside of 2048-byte region [ffff888115f24000, ffff888115f24800) Memory state around the buggy address: ffff888115f24500: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 ffff888115f24580: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 >ffff888115f24600: fc fc fc fc fc fc fc fc fc fc fc fc fc fc fc fc ^ ffff888115f24680: fc fc fc fc fc fc fc fc fc fc fc fc fc fc fc fc ffff888115f24700: fc fc fc fc fc fc fc fc fc fc fc fc fc fc fc fc ===== Crash Report from brcmf_enable_bw40_2g(): ===== ---truncated---
CVE-2022-49743	In the Linux kernel, the following vulnerability has been resolved: ovl: Use "buf" flexible array for memcpy() destination The "buf" flexible array needs to be the memcpy() destination to avoid false positive run-time warning from the recent FORTIFY_SOURCE hardening: memcpy: detected field-spanning write (size 93) of single field "&fh->fb" at fs/overlayfs/export.c:799 (size 21)

CVE ID	Description
CVE-2022-49748	In the Linux kernel, the following vulnerability has been resolved: perf/x86/amd: fix potential integer overflow on shift of a int The left shift of int 32 bit integer constant 1 is evaluated using 32 bit arithmetic and then passed as a 64 bit function argument. In the case where i is 32 or more this can lead to an overflow. Avoid this by shifting using the BIT_ULL macro instead.
CVE-2022-49749	In the Linux kernel, the following vulnerability has been resolved: i2c: designware: use casting of u64 in clock multiplication to avoid overflow In functions i2c_dw_scl_lcnt() and i2c_dw_scl_hcnt() may have overflow by depending on the values of the given parameters including the ic_clk. For example in our use case where ic_clk is larger than one million, multiplication of ic_clk * 4700 will result in 32 bit overflow. Add cast of u64 to the calculation to avoid multiplication overflow, and use the corresponding define for divide.
CVE-2022-49750	In the Linux kernel, the following vulnerability has been resolved: cpufreq: CPPC: Add u64 casts to avoid overflowing The fields of the _CPC object are unsigned 32-bits values. To avoid overflows while using _CPC's values, add 'u64' casts.
CVE-2022-49753	In the Linux kernel, the following vulnerability has been resolved: dmaengine: Fix double increment of client_count in dma_chan_get() The first time dma_chan_get() is called for a channel the channel client_count is incorrectly incremented twice for public channels, first in balance_ref_count(), and again prior to returning. This results in an incorrect client count which will lead to the channel resources not being freed when they should be. A simple test of repeated module load and unload of async_tx on a Dell Power Edge R7425 also shows this resulting in a kref underflow warning. [124.329662] async_tx: api initialized (async) [129.000627] async_tx: api initialized (async) [130.047839] -----[cut here]----- [130.052472] refcount_t: underflow; use-after-free. CVE ID	Description
CVE-2022-49759	In the Linux kernel, the following vulnerability has been resolved: VMCI: Use threaded irq's instead of tasklets The vmci_dispatch_dgs() tasklet function calls vmci_read_data() which uses wait_event() resulting in invalid sleep in an atomic context (and therefore potentially in a deadlock). Use threaded irq's to fix this issue and completely remove usage of tasklets. [20.264639] BUG: sleeping function called from invalid context at drivers/misc/vmw_vmci/vmci_guest.c:145 [20.264643] in_atomic(): 1, irqs_disabled(): 0, non_block: 0, pid: 762, name: vmtoolsd [20.264645] preempt_count: 101, expected: 0 [20.264646] RCU nest depth: 0, expected: 0 [20.264647] 1 lock held by vmtoolsd/762: [20.264648] #0: ffff0000874ae440 (sk_lock-AF_VSOCK){+..+.-} {0:0}, at: vsock_connect+0x60/0x330 [vsock] [20.264658] Preemption disabled at: [20.264659] [<ffff80000151d7d8>] vmci_send_datagram+0x44/0xa0 [vmw_vmci] [20.264665] CPU: 0 PID: 762 Comm: vmtoolsd Not tainted 5.19.0-0.rc8.20220727.git39c3c396f813.60.fc37.aarch64 #1 [20.264667] Hardware name: VMware, Inc. CVE-2022-49764	In the Linux kernel, the following vulnerability has been resolved: bpf: Prevent bpf program recursion for raw tracepoint probes We got report from sysbot [1] about warnings that were caused by bpf program attached to contention_begin raw tracepoint triggering the same tracepoint by using bpf_trace_printk helper that takes trace_printk_lock lock. Call Trace: <TASK> ? trace_event_raw_event_bpf_trace_printk+0x5f/0x90 bpf_trace_printk+0x2b/0xe0 bpf_prog_a9aec6167c091eef_prog+0x1f/0x24 bpf_trace_run2+0x26/0x90 native_queued_spin_lock_slowpath+0x1c6/0x2b0 _raw_spin_lock_irqsave+0x44/0x50 bpf_trace_printk+0x3f/0xe0 bpf_prog_a9aec6167c091eef_prog+0x1f/0x24 bpf_trace_run2+0x26/0x90 native_queued_spin_lock_slowpath+0x1c6/0x2b0 _raw_spin_lock_irqsave+0x44/0x50 bpf_trace_printk+0x3f/0xe0 bpf_prog_a9aec6167c091eef_prog+0x1f/0x24 bpf_trace_run2+0x26/0x90 native_queued_spin_lock_slowpath+0x1c6/0x2b0 _raw_spin_lock_irqsave+0x44/0x50 bpf_trace_printk+0x3f/0xe0 bpf_prog_a9aec6167c091eef_prog+0x1f/0x24 bpf_trace_run2+0x26/0x90 native_queued_spin_lock_slowpath+0x1c6/0x2b0 _raw_spin_lock_irqsave+0x44/0x50 __unfreeze_partials+0x5b/0x160 ... The can be reproduced by attaching bpf program as raw tracepoint on contention_begin tracepoint. The bpf prog calls bpf_trace_printk helper. Then by running perf bench the spin lock code is forced to take slow path and call contention_begin tracepoint. Fixing this by skipping execution of the bpf program if it's already running, Using bpf prog 'active' field, which is being currently used by trampoline programs for the same reason. Moving bpf_prog_inc_misses_counter to syscall.c because trampoline.c is compiled in just for CONFIG_BPF_JIT option. [1] https://lore.kernel.org/bpf/YxhFe3EwqchC%2FfYf@krava/T/#t
CVE-2022-49766	In the Linux kernel, the following vulnerability has been resolved: netlink: Bounds-check struct nlmsgerr creation In preparation for FORTIFY_SOURCE doing bounds-check on memcpy(), switch from __nlmsg_put to nlmsg_put(), and explain the bounds check for dealing with the memcpy() across a composite flexible array struct. Avoids this future run-time warning: memcpy: detected field-spanning write (size 32) of single field "&errmsg->msg" at net/netlink/af_netlink.c:2447 (size 16)
CVE-2022-49769	In the Linux kernel, the following vulnerability has been resolved: gfs2: Check sb_bsize_shift after reading superblock Fuzzers like to scribble over sb_bsize_shift but in reality it's very unlikely that this field would be corrupted on its own. Nevertheless it should be checked to avoid the possibility of messy mount errors due to bad calculations. It's always a fixed value based on the block size so we can just check that it's the expected value. Tested with: mkfs.gfs2 -O -p lock_nolock /dev/vdb for i in 0 -1 64 65 32 33; do gfs2_edit -p sb field sb_bsize_shift \$i /dev/vdb mount /dev/vdb /mnt/test && umount /mnt/test done Before this patch we get a withdraw after [76.413681] gfs2: fsid=loop0.0: fatal: invalid metadata block [76.413681] bh = 19 (type: exp=5, found=4) [76.413681] function = gfs2_meta_buffer, file = fs/gfs2/meta_io.c, line = 492 and with UBSAN configured we also get complaints like [76.373395] UBSAN: shift-out-of-bounds in fs/gfs2/ops_fstype.c:295:19 [76.373815] shift exponent 4294967287 is too large for 64-bit type 'long unsigned int' After the patch, these complaints don't appear, mount fails immediately and we get an explanation in dmesg.

CVE ID	Description
CVE-2022-49771	In the Linux kernel, the following vulnerability has been resolved: dm ioctl: fix misbehavior if list_versions races with module loading __list_versions will first estimate the required space using the "dm_target_iterate(list_version_get_needed, &needed)" call and then will fill the space using the "dm_target_iterate(list_version_get_info, &iter_info)" call. Each of these calls locks the targets using the "down_read(&_lock)" and "up_read(&_lock)" calls, however between the first and second "dm_target_iterate" there is no lock held and the target modules can be loaded at this point, so the second "dm_target_iterate" call may need more space than what was the first "dm_target_iterate" returned. The code tries to handle this overflow (see the beginning of list_version_get_info), however this handling is incorrect. The code sets "param->data_size = param->data_start + needed" and "iter_info.end = (char *)vers+len" - "needed" is the size returned by the first dm_target_iterate call; "len" is the size of the buffer allocated by userspace. "len" may be greater than "needed"; in this case, the code will write up to "len" bytes into the buffer, however param->data_size is set to "needed", so it may write data past the param->data_size value. The ioctl interface copies only up to param->data_size into userspace, thus part of the result will be truncated. Fix this bug by setting "iter_info.end = (char *)vers + needed;" - this guarantees that the second "dm_target_iterate" call will write only up to the "needed" buffer and it will exit with "DM_BUFFER_FULL_FLAG" if it overflows the "needed" space - in this case, userspace will allocate a larger buffer and retry. Note that there is also a bug in list_version_get_needed - we need to add "strlen(tt->name) + 1" to the needed size, not "strlen(tt->name)".
CVE-2022-49772	In the Linux kernel, the following vulnerability has been resolved: ALSA: usb-audio: Drop snd_BUG_ON() from snd_usbmidi_output_open() snd_usbmidi_output_open() has a check of the NULL port with snd_BUG_ON(). snd_BUG_ON() was used as this shouldn't have happened, but in reality, the NULL port may be seen when the device gives an invalid endpoint setup at the descriptor, hence the driver skips the allocation. That is, the check itself is valid and snd_BUG_ON() should be dropped from there. Otherwise it's confusing as if it were a real bug, as recently syzbot stumbled on it.
CVE-2022-49773	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Fix optc2_configure warning on dcn314 [Why] dcn314 uses optc2_configure_crc() that wraps optc1_configure_crc() + set additional registers not applicable to dcn314. It's not critical but when used leads to warning like: WARNING: drivers/gpu/drm/amd/amdgpu/./display/dc/dc_helper.c Call Trace: <TASK> generic_reg_set_ex+0x6d/0xe0 [amdgpu] optc2_configure_crc+0x60/0x80 [amdgpu] dc_stream_configure_crc+0x129/0x150 [amdgpu] amdgpu_dm_crc_configure_crc_source+0x5d/0xe0 [amdgpu] [How] Use optc1_configure_crc() directly
CVE-2022-49776	In the Linux kernel, the following vulnerability has been resolved: macvlan: enforce a consistent minimal mtu macvlan should enforce a minimal mtu of 68, even at link creation. This patch avoids the current behavior (which could lead to crashes in ipv6 stack if the link is brought up) \$ ip link add macvlan1 link eno1 mtu 8 type macvlan # This should fail ! \$ ip link sh dev macvlan1 5: macvlan1@eno1: <BROADCAST,MULTICAST> mtu 8 qdisc noop state DOWN mode DEFAULT group default qlen 1000 link/ether 02:47:6c:24:74:82 brd ff:ff:ff:ff:ff:ff \$ ip link set macvlan1 mtu 67 Error: mtu less than device minimum. \$ ip link set macvlan1 mtu 68 \$ ip link set macvlan1 mtu 8 Error: mtu less than device minimum.
CVE-2022-49779	In the Linux kernel, the following vulnerability has been resolved: kprobes: Skip clearing aggrprobe's post_handler in kprobe-on-ftrace case In __unregister_kprobe_top(), if the currently unregistered probe has post_handler but other child probes of the aggrprobe do not have post_handler, the post_handler of the aggrprobe is cleared. If this is a ftrace-based probe, there is a problem. In later calls to disarm_kprobe(), we will use kprobe_ftrace_ops because post_handler is NULL. But we're armed with kprobe_ipmodify_ops. This triggers a WARN in __disarm_kprobe_ftrace() and may even cause use-after-free: Failed to disarm kprobe-ftrace at kernel_clone+0x0/0x3c0 (error -2) WARNING: CPU: 5 PID: 137 at kernel/kprobes.c:1135 __disarm_kprobe_ftrace.isra.21+0xcf/0xe0 Modules linked in: testKprobe_007(-) CPU: 5 PID: 137 Comm: rmmmod Not tainted 6.1.0-rc4-dirty #18 [...] Call Trace: <TASK> __disable_kprobe+0xcd/0xe0 __unregister_kprobe_top+0x12/0x150 ? mutex_lock+0xe/0x30 unregister_kprobes.part.23+0x31/0xa0 unregister_kprobe+0x32/0x40 __x64_sys_delete_module+0x15e/0x260 ? do_user_addr_fault+0x2cd/0x6b0 do_syscall_64+0x3a/0x90 entry_SYSCALL_64_after_hwframe+0x63/0xcd [...] For the kprobe-on-ftrace case, we keep the post_handler setting to identify this aggrprobe armed with kprobe_ipmodify_ops. This way we can disarm it correctly.
CVE-2022-49780	In the Linux kernel, the following vulnerability has been resolved: scsi: target: tcm_loop: Fix possible name leak in tcm_loop_setup_hba_bus() If device_register() fails in tcm_loop_setup_hba_bus(), the name allocated by dev_set_name() need be freed. As comment of device_register() says, it should use put_device() to give up the reference in the error path. So fix this by calling put_device(), then the name can be freed in kobject_cleanup(). The 'tl_hba' will be freed in tcm_loop_release_adapter(), so it don't need goto error label in this case.

CVE ID	Description
CVE-2022-49781	In the Linux kernel, the following vulnerability has been resolved: perf/x86/amd: Fix crash due to race between amd_pmu_enable_all, perf NMI and throttling amd_pmu_enable_all() does: if (!test_bit(idx, cpuc->active_mask)) continue; amd_pmu_enable_event(cpuc->events[idx]); A perf NMI of another event can come between these two steps. Perf NMI handler internally disables and enables _all_ events, including the one which nmi-intercepted amd_pmu_enable_all() was in process of enabling. If that unintentionally enabled event has very low sampling period and causes immediate successive NMI, causing the event to be throttled, cpuc->events[idx] and cpuc->active_mask gets cleared by x86_pmu_stop(). This will result in amd_pmu_enable_event() getting called with event=NULL when amd_pmu_enable_all() resumes after handling the NMIs. This causes a kernel crash: BUG: kernel NULL pointer dereference, address: 0000000000000198 #PF: supervisor read access in kernel mode #PF: error_code(0x0000) - not-present page [...] Call Trace: <TASK> amd_pmu_enable_all+0x68/0xb0 ctx_resched+0xd9/0x150 event_function+0xb8/0x130 ? hrtimer_start_range_ns+0x141/0x4a0 ? perf_duration_warn+0x30/0x30 remote_function+0x4d/0x60 __flush_smp_call_function_queue+0xc4/0x500 flush_smp_call_function_queue+0x11d/0x1b0 do_idle+0x18f/0x2d0 cpu_startup_entry+0x19/0x20 start_secondary+0x121/0x160 secondary_startup_64_no_verify+0xe5/0xeb </TASK> amd_pmu_disable_all()/amd_pmu_enable_all() calls inside perf NMI handler were recently added as part of BRS enablement but I'm not sure whether we really need them. We can just disable BRS in the beginning and enable it back while returning from NMI. This will solve the issue by not enabling those events whose active_masks are set but are not yet enabled in hw pmu.
CVE-2022-49782	In the Linux kernel, the following vulnerability has been resolved: perf: Improve missing SIGTRAP checking To catch missing SIGTRAP we employ a WARN in __perf_event_overflow(), which fires if pending_sigtrap was already set: returning to user space without consuming pending_sigtrap, and then having the event fire again would re-enter the kernel and trigger the WARN. This, however, seemed to miss the case where some events not associated with progress in the user space task can fire and the interrupt handler runs before the IRQ work meant to consume pending_sigtrap (and generate the SIGTRAP). syzbot gifted us this stack trace: WARNING: CPU: 0 PID: 3607 at kernel/events/core.c:9313 __perf_event_overflow Modules linked in: CPU: 0 PID: 3607 Comm: syz-executor100 Not tainted 6.1.0-rc2-syzkaller-00073-g88619e77b33d #0 Hardware name: Google Google Compute Engine/Google Compute Engine, BIOS Google 10/11/2022 RIP: 0010: __perf_event_overflow+0x498/0x540 kernel/events/core.c:9313 <...> Call Trace: <TASK> perf_swevent_hrtimer+0x34f/0x3c0 kernel/events/core.c:10729 __run_hrtimer kernel/time/hrtimer.c:1685 [inline] __hrtimer_run_queues+0x1c6/0xfb0 kernel/time/hrtimer.c:1749 hrtimer_interrupt+0x31c/0x790 kernel/time/hrtimer.c:1811 local_apic_timer_interrupt arch/x86/kernel/apic/apic.c:1096 [inline] __sysvec_apic_timer_interrupt+0x17c/0x640 arch/x86/kernel/apic/apic.c:1113 sysvec_apic_timer_interrupt+0x40/0xc0 arch/x86/kernel/apic/apic.c:1107 asm_sysvec_apic_timer_interrupt+0x16/0x20 arch/x86/include/asm/identrty.h:649 <...> </TASK> In this case, syzbot produced a program with event type PERF_TYPE_SOFTWARE and config PERF_COUNT_SW_CPU_CLOCK. The hrtimer manages to fire again before the IRQ work got a chance to run, all while never having returned to user space. Improve the WARN to check for real progress in user space: approximate this by storing a 32-bit hash of the current IP into pending_sigtrap, and if an event fires while pending_sigtrap still matches the previous IP, we assume no progress (false negatives are possible given we could return to user space and trigger again on the same IP).
CVE-2022-49783	In the Linux kernel, the following vulnerability has been resolved: x86/fpu: Drop fpregs lock before inheriting FPU permissions Mike Galbraith reported the following against an old fork of preempt-rt but the same issue also applies to the current preempt-rt tree. BUG: sleeping function called from invalid context at kernel/locking/spinlock_rt.c:46 in_atomic(): 1, irqs_disabled(): 0, non_block: 0, pid: 1, name: systemd preempt_count: 1, expected: 0 RCU nest depth: 0, expected: 0 Preemption disabled at: fpu_clone CPU: 6 PID: 1 Comm: systemd Tainted: G E (unreleased) Call Trace: <TASK> dump_stack_lvl ? fpu_clone __might_resched rt_spin_lock fpu_clone ? copy_thread ? copy_process ? shmem_alloc_inode ? kmem_cache_alloc ? kernel_clone ? __do_sys_clone ? do_syscall_64 ? __x64_sys_rt_sigprocmask ? syscall_exit_to_user_mode ? do_syscall_64 ? syscall_exit_to_user_mode ? do_syscall_64 ? syscall_exit_to_user_mode ? do_syscall_64 ? syscall_exit_to_user_mode ? do_syscall_64 ? exc_page_fault ? entry_SYSCALL_64_after_hwframe </TASK> Mike says: The splat comes from fpu_inherit_perms() being called under fpregs_lock(), and us reaching the spin_lock_irq() therein due to fpu_state_size_dynamic() returning true despite static key __fpu_state_size_dynamic having never been enabled. Mike's assessment looks correct. fpregs_lock on a PREEMPT_RT kernel disables preemption so calling spin_lock_irq() in fpu_inherit_perms() is unsafe. This problem exists since commit 9e798e9aa14c ("x86/fpu: Prepare fpu_clone() for dynamically enabled features"). Even though the original bug report should not have enabled the paths at all, the bug still exists. fpregs_lock is necessary when editing the FPU registers or a task's FP state but it is not necessary for fpu_inherit_perms(). The only write of any FP state in fpu_inherit_perms() is for the new child which is not running yet and cannot context switch or be borrowed by a kernel thread yet. Hence, fpregs_lock is not protecting anything in the new child until clone() completes and can be dropped earlier. The siglock still needs to be acquired by fpu_inherit_perms() as the read of the parent's permissions has to be serialised. [bp: Cleanup splat.]

CVE ID	Description
CVE-2022-49784	In the Linux kernel, the following vulnerability has been resolved: perf/x86/amd/uncore: Fix memory leak for events array When a CPU comes online, the per-CPU NB and LLC uncore contexts are freed but not the events array within the context structure. This causes a memory leak as identified by the kmemleak detector. [...] unreferenced object 0xffff8c5944b8e320 (size 32): comm "swapper/0", pid 1, jiffies 4294670387 (age 151.072s) hex dump (first 32 bytes): 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<00000000759fb79>] amd_uncore_cpu_up_prepare+0xaf/0x230 [<00000000ddc9e126>] cpuhp_invoke_callback+0x2cf/0x470 [<0000000093e727d4>] cpuhp_issue_call+0x14d/0x170 [<0000000045464d54>] __cpuhp_setup_state_cpuslocked+0x11e/0x330 [<0000000069f67cbd>] __cpuhp_setup_state+0x6b/0x110 [<0000000015365e0f>] amd_uncore_init+0x260/0x321 [<00000000089152d2>] do_one_initcall+0x3f/0x1f0 [<000000002d0bd18d>] kernel_init_freeable+0x1ca/0x212 [<0000000030be8dde>] kernel_init+0x11/0x120 [<0000000059709e59>] ret_from_fork+0x22/0x30 unreferenced object 0xffff8c5944b8dd40 (size 64): comm "swapper/0", pid 1, jiffies 4294670387 (age 151.072s) hex dump (first 32 bytes): 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<00000000306efe8b>] amd_uncore_cpu_up_prepare+0x183/0x230 [<00000000ddc9e126>] cpuhp_invoke_callback+0x2cf/0x470 [<0000000093e727d4>] cpuhp_issue_call+0x14d/0x170 [<0000000045464d54>] __cpuhp_setup_state_cpuslocked+0x11e/0x330 [<0000000069f67cbd>] __cpuhp_setup_state+0x6b/0x110 [<0000000015365e0f>] amd_uncore_init+0x260/0x321 [<00000000089152d2>] do_one_initcall+0x3f/0x1f0 [<000000002d0bd18d>] kernel_init_freeable+0x1ca/0x212 [<0000000030be8dde>] kernel_init+0x11/0x120 [<0000000059709e59>] ret_from_fork+0x22/0x30 [...] Fix the problem by freeing the events array before freeing the uncore context.
CVE-2022-49785	In the Linux kernel, the following vulnerability has been resolved: x86/sgx: Add overflow check in sgx_validate_offset_length() sgx_validate_offset_length() function verifies "offset" and "length" arguments provided by userspace, but was missing an overflow check on their addition. Add it.
CVE-2022-49789	In the Linux kernel, the following vulnerability has been resolved: scsi: zfcp: Fix double free of FSF request when qdio send fails We used to use the wrong type of integer in 'zfcp_fsf_req_send()' to cache the FSF request ID when sending a new FSF request. This is used in case the sending fails and we need to remove the request from our internal hash table again (so we don't keep an invalid reference and use it when we free the request again). In 'zfcp_fsf_req_send()' we used to cache the ID as 'int' (signed and 32 bit wide), but the rest of the zfcp code (and the firmware specification) handles the ID as 'unsigned long'/'u64' (unsigned and 64 bit wide [s390x ELF ABI]). For one this has the obvious problem that when the ID grows past 32 bit (this can happen reasonably fast) it is truncated to 32 bit when storing it in the cache variable and so doesn't match the original ID anymore. The second less obvious problem is that even when the original ID has not yet grown past 32 bit, as soon as the 32nd bit is set in the original ID (0x80000000 = 2^147'483'648) we will have a mismatch when we cast it back to 'unsigned long'. As the cached variable is of a signed type, the compiler will choose a sign-extending instruction to load the 32 bit variable into a 64 bit register (e.g.: 'lgr %r11,188(%r15)'). So once we pass the cached variable into 'zfcp_reqlist_find_rm()' to remove the request again all the leading zeros will be flipped to ones to extend the sign and won't match the original ID anymore (this has been observed in practice). If we can't successfully remove the request from the hash table again after 'zfcp_qdio_send()' fails (this happens regularly when zfcp cannot notify the adapter about new work because the adapter is already gone during e.g. a ChpID toggle) we will end up with a double free. We unconditionally free the request in the calling function when 'zfcp_fsf_req_send()' fails, but because the request is still in the hash table we end up with a stale memory reference, and once the zfcp adapter is either reset during recovery or shutdown we end up freeing the same memory twice. The resulting stack traces vary depending on the kernel and have no direct correlation to the place where the bug occurs. Here are three examples that have been seen in practice: list_del corruption. next->prev should be 00000001b9d13800, but was 00000000dead4ead. (next=00000001bd131a00) -----[cut here]----- kernel BUG at lib/list_debug.c:62! monitor event: 0040 ilc:2 [#1] PREEMPT SMP Modules linked in: ... CVE ID	Description
CVE-2022-49802	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix null pointer dereference in ftrace_add_mod() The @ftrace_mod is allocated by kzalloc(), so both the members {prev,next} of @ftrace_mode->list are NULL, it's not a valid state to call list_del(). If kstrdup() for @ftrace_mod->{func module} fails, it goes to @out_free tag and calls free_ftrace_mod() to destroy @ftrace_mod, then list_del() will write prev->next and next->prev, where null pointer dereference happens. BUG: kernel NULL pointer dereference, address: 0000000000000008 Oops: 0002 [#1] PREEMPT SMP NOPTI Call Trace: <TASK> ftrace_mod_callback+0x20d/0x220 ? do_filp_open+0xd9/0x140 ftrace_process_regex.isra.51+0xbf/0x130 ftrace_regex_write.isra.52.part.53+0x6e/0x90 vfs_write+0xee/0x3a0 ? __audit_filter_op+0xb1/0x100 ? auditd_test_task+0x38/0x50 ksys_write+0xa5/0xe0 do_syscall_64+0x3a/0x90 entry_SYSCALL_64_after_hwframe+0x63/0xcd Kernel panic - not syncing: Fatal exception So call INIT_LIST_HEAD() to initialize the list member to fix this issue.
CVE-2022-49803	In the Linux kernel, the following vulnerability has been resolved: netdevsim: Fix memory leak of nsim_dev->fa_cookie kmemleak reports this issue: unreferenced object 0xffff8881bac872d0 (size 8): comm "sh", pid 58603, jiffies 4481524462 (age 68.065s) hex dump (first 8 bytes): 04 00 00 00 de ad be ef backtrace: [<00000000c80b8577>] __kmalloc+0x49/0x150 [<000000005292b8c6>] nsim_dev_trap_fa_cookie_write+0xc1/0x210 [netdevsim] [<0000000093d78e77>] full_proxy_write+0xf3/0x180 [<000000005a662c16>] vfs_write+0x1c5/0xaf0 [<000000007aabf84a>] ksys_write+0xed/0x1c0 [<000000005f1d2e47>] do_syscall_64+0x3b/0x90 [<000000006001c6ec>] entry_SYSCALL_64_after_hwframe+0x63/0xcd The issue occurs in the following scenarios: nsim_dev_trap_fa_cookie_write() kmalloc() fa_cookie nsim_dev->fa_cookie = fa_cookie .. nsim_drv_remove() The fa_cookie allocated in nsim_dev_trap_fa_cookie_write() is not freed. To fix, add kfree(nsim_dev->fa_cookie) to nsim_drv_remove().
CVE-2022-49812	In the Linux kernel, the following vulnerability has been resolved: bridge: switchdev: Fix memory leaks when changing VLAN protocol The bridge driver can offload VLANs to the underlying hardware either via switchdev or the 8021q driver. When the former is used, the VLAN is marked in the bridge driver with the 'BR_VLFLAG_ADDED_BY_SWITCHDEV' private flag. To avoid the memory leaks mentioned in the cited commit, the bridge driver will try to delete a VLAN via the 8021q driver if the VLAN is not marked with the previously mentioned flag. When the VLAN protocol of the bridge changes, switchdev drivers are notified via the 'SWITCHDEV_ATTR_ID_BRIDGE_VLAN_PROTOCOL' attribute, but the 8021q driver is also called to add the existing VLANs with the new protocol and delete them with the old protocol. In case the VLANs were offloaded via switchdev, the above behavior is both redundant and buggy. Redundant because the VLANs are already programmed in hardware and drivers that support VLAN protocol change (currently only mlx5) change the protocol upon the switchdev attribute notification. Buggy because the 8021q driver is called despite these VLANs being marked with 'BR_VLFLAG_ADDED_BY_SWITCHDEV'. This leads to memory leaks [1] when the VLANs are deleted. Fix by not calling the 8021q driver for VLANs that were already programmed via switchdev. [1] unreferenced object 0xffff8881f6771200 (size 256): comm "ip", pid 446855, jiffies 4298238841 (age 55.240s) hex dump (first 32 bytes): 00 00 7f 0e 83 88 ff ff 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<00000000012819ac>] vlan_vid_add+0x437/0x750 [<00000000f2281fad>] __br_vlan_set_proto+0x289/0x920 [<000000000632b56f>] br_changelink+0x3d6/0x13f0 [<0000000089d25f04>] __rtnl_newlink+0x8ae/0x14c0 [<00000000f6276baf>] rtnl_newlink+0x5f/0x90 [<00000000746dc902>] rtnetlink_rcv_msg+0x336/0xa00 [<000000001c2241c0>] netlink_rcv_skb+0x11d/0x340 [<0000000010588814>] netlink_unicast+0x438/0x710 [<00000000e1a4cd5c>] netlink_sendmsg+0x788/0xc40 [<00000000e8992d4e>] sock_sendmsg+0xb0/0xe0 [<000000000621b8f91>] ____sys_sendmsg+0x4ff/0x6d0 [<000000000ea26996>] __sys_sendmsg+0x12e/0x1b0 [<00000000684f7e25>] __sys_sendmsg+0xab/0x130 [<000000004538b104>] do_syscall_64+0x3d/0x90 [<0000000091ed9678>] entry_SYSCALL_64_after_hwframe+0x46/0xb0
CVE-2022-49813	In the Linux kernel, the following vulnerability has been resolved: net: ena: Fix error handling in ena_init() The ena_init() won't destroy workqueue created by create_singlethread_workqueue() when pci_register_driver() failed. Call destroy_workqueue() when pci_register_driver() failed to prevent the resource leak.
CVE-2022-49817	In the Linux kernel, the following vulnerability has been resolved: net: mhi: Fix memory leak in mhi_net_dellink() MHI driver registers network device without setting the needs_free_netdev flag, and does NOT call free_netdev() when unregisters network device, which causes a memory leak. This patch calls free_netdev() to fix it since netdev_priv is used after unregister.
CVE-2022-49821	In the Linux kernel, the following vulnerability has been resolved: mISDN: fix possible memory leak in mISDN_dsp_element_register() After commit 1fa5ae857bb1 ("driver core: get rid of struct device's bus_id string array"), the name of device is allocated dynamically, use put_device() to give up the reference, so that the name can be freed in kobject_cleanup() when the refcount is 0. The 'entry' is going to be freed in mISDN_dsp_dev_release(), so the kfree() is removed. list_del() is called in mISDN_dsp_dev_release(), so it need be initialized.

CVE ID	Description
CVE-2022-49822	In the Linux kernel, the following vulnerability has been resolved: cifs: Fix connections leak when tlink setup failed If the tlink setup failed, lost to put the connections, then the module refcnt leak since the cifsd kthread not exit. Also leak the fscache info, and for next mount with fsc, it will print the follow errors: CIFS: Cache volume key already in use (cifs,127.0.0.1:445,TEST) Let's check the result of tlink setup, and do some cleanup.
CVE-2022-49823	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix error handling in ata_tdev_add() In ata_tdev_add(), the return value of transport_add_device() is not checked. As a result, it causes null-ptr-deref while removing the module, because transport_remove_device() is called to remove the device that was not added. Unable to handle kernel NULL pointer dereference at virtual address 00000000000000d0 CPU: 13 PID: 13603 Comm: rmmmod Kdump: loaded Tainted: G W 6.1.0-rc3+ #36 pstate: 60400009 (nZCv daif +PAN -UAO -TCO -DIT -SSBS BTYPEDev=) pc : device_del+0x48/0x3a0 lr : device_del+0x44/0x3a0 Call trace: device_del+0x48/0x3a0 attribute_container_class_device_del+0x28/0x40 transport_remove_classdev+0x60/0x7c attribute_container_device_trigger+0x118/0x120 transport_remove_device+0x20/0x30 ata_tdev_delete+0x24/0x50 [libata] ata_tlink_delete+0x40/0xa0 [libata] ata_tport_delete+0x2c/0x60 [libata] ata_port_detach+0x148/0x1b0 [libata] ata_pci_remove_one+0x50/0x80 [libata] ahci_remove_one+0x4c/0x8c [ahci] Fix this by checking and handling return value of transport_add_device() in ata_tdev_add(). In the error path, device_del() is called to delete the device which was added earlier in this function, and ata_tdev_free() is called to free ata_dev.
CVE-2022-49824	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix error handling in ata_tlink_add() In ata_tlink_add(), the return value of transport_add_device() is not checked. As a result, it causes null-ptr-deref while removing the module, because transport_remove_device() is called to remove the device that was not added. Unable to handle kernel NULL pointer dereference at virtual address 00000000000000d0 CPU: 33 PID: 13850 Comm: rmmmod Kdump: loaded Tainted: G W 6.1.0-rc3+ #12 pstate: 60400009 (nZCv daif +PAN -UAO -TCO -DIT -SSBS BTYPEDev=) pc : device_del+0x48/0x39c lr : device_del+0x44/0x39c Call trace: device_del+0x48/0x39c attribute_container_class_device_del+0x28/0x40 transport_remove_classdev+0x60/0x7c attribute_container_device_trigger+0x118/0x120 transport_remove_device+0x20/0x30 ata_tlink_delete+0x88/0xb0 [libata] ata_tport_delete+0x2c/0x60 [libata] ata_port_detach+0x148/0x1b0 [libata] ata_pci_remove_one+0x50/0x80 [libata] ahci_remove_one+0x4c/0x8c [ahci] Fix this by checking and handling return value of transport_add_device() in ata_tlink_add().
CVE-2022-49825	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix error handling in ata_tport_add() In ata_tport_add(), the return value of transport_add_device() is not checked. As a result, it causes null-ptr-deref while removing the module, because transport_remove_device() is called to remove the device that was not added. Unable to handle kernel NULL pointer dereference at virtual address 00000000000000d0 CPU: 12 PID: 13605 Comm: rmmmod Kdump: loaded Tainted: G W 6.1.0-rc3+ #8 pstate: 60400009 (nZCv daif +PAN -UAO -TCO -DIT -SSBS BTYPEDev=) pc : device_del+0x48/0x39c lr : device_del+0x44/0x39c Call trace: device_del+0x48/0x39c attribute_container_class_device_del+0x28/0x40 transport_remove_classdev+0x60/0x7c attribute_container_device_trigger+0x118/0x120 transport_remove_device+0x20/0x30 ata_tport_delete+0x34/0x60 [libata] ata_port_detach+0x148/0x1b0 [libata] ata_pci_remove_one+0x50/0x80 [libata] ahci_remove_one+0x4c/0x8c [ahci] Fix this by checking and handling return value of transport_add_device() in ata_tport_add().
CVE-2022-49826	In the Linux kernel, the following vulnerability has been resolved: ata: libata-transport: fix double ata_host_put() in ata_tport_add() In the error path in ata_tport_add(), when calling put_device(), ata_tport_release() is called, it will put the refcount of 'ap->host'. And then ata_host_put() is called again, the refcount is decreased to 0, ata_host_release() is called, all ports are freed and set to null. When unbinding the device after failure, ata_host_stop() is called to release the resources, it leads a null-ptr-deref(), because all the ports all freed and null. Unable to handle kernel NULL pointer dereference at virtual address 0000000000000008 CPU: 7 PID: 18671 Comm: modprobe Kdump: loaded Tainted: G E 6.1.0-rc3+ #8 pstate: 80400009 (Nzcv daif +PAN -UAO -TCO -DIT -SSBS BTYPEDev=) pc : ata_host_stop+0x3c/0x84 [libata] lr : release_nodes+0x64/0xd0 Call trace: ata_host_stop+0x3c/0x84 [libata] release_nodes+0x64/0xd0 devres_release_all+0xbc/0x1b0 device_unbind_cleanup+0x20/0x70 really_probe+0x158/0x320 __driver_probe_device+0x84/0x120 driver_probe_device+0x44/0x120 __driver_attach+0xb4/0x220 bus_for_each_dev+0x78/0xdc driver_attach+0x2c/0x40 bus_add_driver+0x184/0x240 driver_register+0x80/0x13c __pci_register_driver+0x4c/0x60 ahci_pci_driver_init+0x30/0x1000 [ahci] Fix this by removing redundant ata_host_put() in the error path.

CVE ID	Description
CVE-2022-49828	In the Linux kernel, the following vulnerability has been resolved: hugetlbfs: don't delete error page from pagecache This change is very similar to the change that was made for shmем [1], and it solves the same problem but for HugeTLBFS instead. Currently, when poison is found in a HugeTLB page, the page is removed from the page cache. That means that attempting to map or read that hugepage in the future will result in a new hugepage being allocated instead of notifying the user that the page was poisoned. As [1] states, this is effectively memory corruption. The fix is to leave the page in the page cache. If the user attempts to use a poisoned HugeTLB page with a syscall, the syscall will fail with EIO, the same error code that shmем uses. For attempts to map the page, the thread will get a BUS_MCEERR_AR SIGBUS. [1]: commit a76054266661 ("mm: shmем: don't truncate page if memory failure happens")
CVE-2022-49829	In the Linux kernel, the following vulnerability has been resolved: drm/scheduler: fix fence ref counting We leaked dependency fences when processes were beeing killed. Additional to that grab a reference to the last scheduled fence.
CVE-2022-49832	In the Linux kernel, the following vulnerability has been resolved: pinctrl: devicetree: fix null pointer dereferencing in pinctrl_dt_to_map Here is the BUG report by KASAN about null pointer dereference: BUG: KASAN: null-ptr-deref in strcmp+0x2e/0x50 Read of size 1 at addr 0000000000000000 by task python3/2640 Call Trace: strcmp __of_find_property of_find_property pinctrl_dt_to_map kasprintf() would return NULL pointer when kmalloc() fail to allocate. So directly return ENOMEM, if kasprintf() return NULL pointer.
CVE-2022-49835	In the Linux kernel, the following vulnerability has been resolved: ALSA: hda: fix potential memleak in 'add_widget_node' As 'kobject_add' may allocated memory for 'kobject->name' when return error. And in this function, if call 'kobject_add' failed didn't free kobject. So call 'kobject_put' to recycling resources.
CVE-2022-49837	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix memory leaks in __check_func_call kmemleak reports this issue: unreferenced object 0xffff88817139d000 (size 2048): comm "test_progs", pid 33246, jiffies 4307381979 (age 45851.820s) hex dump (first 32 bytes): 01 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<00000000045f075f0>] kmalloc_trace+0x27/0xa0 [<00000000098b7c90a>] __check_func_call+0x316/0x1230 [<000000000b4c3c403>] check_helper_call+0x172e/0x4700 [<000000000aa3875b7>] do_check+0x21d8/0x45e0 [<0000000001147357b>] do_check_common+0x767/0xaf0 [<000000000b5a595b4>] bpf_check+0x43e3/0x5bc0 [<00000000011e391b1>] bpf_prog_load+0xf26/0x1940 [<00000000007f765c0>] __sys_bpf+0xd2c/0x3650 [<000000000839815d6>] __x64_sys_bpf+0x75/0xc0 [<000000000946ee250>] do_syscall_64+0x3b/0x90 [<0000000000506b7f>] entry_SYSCALL_64_after_hwframe+0x63/0xcd The root case here is: In function prepare_func_exit(), the callee is not released in the abnormal scenario after "state->curframe--;". To fix, move "state->curframe--;" to the very bottom of the function, right when we free callee and reset frame[] pointer to NULL, as Andrii suggested. In addition, function __check_func_call() has a similar problem. In the abnormal scenario before "state->curframe++;", the callee also should be released by free_func_state().
CVE-2022-49838	In the Linux kernel, the following vulnerability has been resolved: sctp: clear out_curr if all frag chunks of current msg are pruned A crash was reported by Zhen Chen: list_del corruption, ffffa035ddf01c18->next is NULL WARNING: CPU: 1 PID: 250682 at lib/list_debug.c:49 __list_del_entry_valid+0x59/0xe0 RIP: 0010: __list_del_entry_valid+0x59/0xe0 Call Trace: sctp_sched_dequeue_common+0x17/0x70 [sctp] sctp_sched_fcfs_dequeue+0x37/0x50 [sctp] sctp_outq_flush_data+0x85/0x360 [sctp] sctp_outq_uncork+0x77/0xa0 [sctp] sctp_cmd_interpreter.constprop.0+0x164/0x1450 [sctp] sctp_side_effects+0x37/0xe0 [sctp] sctp_do_sm+0xd0/0x230 [sctp] sctp_primitive_SEND+0x2f/0x40 [sctp] sctp_sendmsg_to_asoc+0x3fa/0x5c0 [sctp] sctp_sendmsg+0x3d5/0x440 [sctp] sock_sendmsg+0x5b/0x70 and in sctp_sched_fcfs_dequeue() it dequeued a chunk from stream out_curr outq while this outq was empty. Normally stream->out_curr must be set to NULL once all frag chunks of current msg are dequeued, as we can see in sctp_sched_dequeue_done(). However, in sctp_prsctp_prune_unsent() as it is not a proper dequeue, sctp_sched_dequeue_done() is not called to do this. This patch is to fix it by simply setting out_curr to NULL when the last frag chunk of current msg is dequeued from out_curr stream in sctp_prsctp_prune_unsent().

CVE ID	Description
CVE-2022-49839	In the Linux kernel, the following vulnerability has been resolved: scsi: scsi_transport_sas: Fix error handling in sas_phy_add() If transport_add_device() fails in sas_phy_add(), the kernel will crash trying to delete the device in transport_remove_device() called from sas_remove_host(). CVE-2022-49840	In the Linux kernel, the following vulnerability has been resolved: bpf, test_run: Fix alignment problem in bpf_prog_test_run_skb() We got a syzkaller problem because of aarch64 alignment fault if KFENCE enabled. When the size from user bpf program is an odd number, like 399, 407, etc, it will cause the struct skb_shared_info's unaligned access. As seen below: BUG: KFENCE: use-after-free read in __skb_clone+0x23c/0x2a0 net/core/skbuff.c:1032 Use-after-free read at 0xffff6254ffffac077 (in kfence-#213): __lse_atomic_add arch/arm64/include/asm/atomic_lse.h:26 [inline] arch_atomic_add arch/arm64/include/asm/atomic.h:28 [inline] arch_atomic_inc include/linux/atomic-arch-fallback.h:270 [inline] atomic_inc include/asm-generic/atomic-instrumented.h:241 [inline] __skb_clone+0x23c/0x2a0 net/core/skbuff.c:1032 skb_clone+0xf4/0x214 net/core/skbuff.c:1481 ____bpf_clone_redirect net/core/filter.c:2433 [inline] bpf_clone_redirect+0x78/0x1c0 net/core/filter.c:2420 bpf_prog_d3839dd9068ceb51+0x80/0x330 bpf_dispatcher_nop_func include/linux/bpf.h:728 [inline] bpf_test_run+0x3c0/0x6c0 net/bpf/test_run.c:53 bpf_prog_test_run_skb+0x638/0xa7c net/bpf/test_run.c:594 bpf_prog_test_run kernel/bpf/syscall.c:3148 [inline] __do_sys_bpf kernel/bpf/syscall.c:4441 [inline] __se_sys_bpf+0xad0/0x1634 kernel/bpf/syscall.c:4381 kfence-#213: 0xffff6254ffffac000-0xffff6254ffffac196, size=407, cache=kmalloc-512 allocated by task 15074 on cpu 0 at 1342.585390s: kmalloc include/linux/slab.h:568 [inline] kzalloc include/linux/slab.h:675 [inline] bpf_test_init.isra.0+0xac/0x290 net/bpf/test_run.c:191 bpf_prog_test_run_skb+0x11c/0xa7c net/bpf/test_run.c:512 bpf_prog_test_run kernel/bpf/syscall.c:3148 [inline] __do_sys_bpf kernel/bpf/syscall.c:4441 [inline] __se_sys_bpf+0xad0/0x1634 kernel/bpf/syscall.c:4381 __arm64_sys_bpf+0x50/0x60 kernel/bpf/syscall.c:4381 To fix the problem, we adjust @size so that (@size + @hearoom) is a multiple of SMP_CACHE_BYTES. So we make sure the struct skb_shared_info is aligned to a cache line.
CVE-2022-49842	In the Linux kernel, the following vulnerability has been resolved: ASoC: core: Fix use-after-free in snd_soc_exit() KASAN reports a use-after-free: BUG: KASAN: use-after-free in device_del+0xb5b/0xc60 Read of size 8 at addr fffff88800865050 by task rmmmod/387 CPU: 2 PID: 387 Comm: rmmmod Hardware name: QEMU Standard PC (i440FX + PIIX, 1996) Call Trace: <TASK> dump_stack_lvl+0x79/0x9a print_report+0x17f/0x47b kasan_report+0xbb/0xf0 device_del+0xb5b/0xc60 platform_device_del.part.0+0x24/0x200 platform_device_unregister+0x2e/0x40 snd_soc_exit+0xa/0x22 [snd_soc_core] __do_sys_delete_module.constprop.0+0x34f/0x5b0 do_syscall_64+0x3a/0x90 entry_SYSCALL_64_after_hwframe+0x63/0xcd ... </TASK> It's because in snd_soc_init(), snd_soc_util_init() is possible to fail, but its ret is ignored, which makes soc_dummy_dev unregistered twice. snd_soc_init() snd_soc_util_init() platform_device_register_simple(soc_dummy_dev) platform_driver_register() # fail platform_device_unregister(soc_dummy_dev) platform_driver_register() # success ... snd_soc_exit() snd_soc_util_exit() # soc_dummy_dev will be unregistered for second time To fix it, handle error and stop snd_soc_init() when util_init() fail. Also clean debugfs when util_init() or driver_register() fail.
CVE-2022-49853	In the Linux kernel, the following vulnerability has been resolved: net: macvlan: fix memory leaks of macvlan_common_newlink kmemleak reports memory leaks in macvlan_common_newlink, as follows: ip link add link eth0 name .. type macvlan mode source macaddr add <MAC-ADDR> kmemleak reports: unreferenced object 0xfffff8880109bb140 (size 64): comm "ip", pid 284, jiffies 4294986150 (age 430.108s) hex dump (first 32 bytes): 00 00 00 00 00 00 00 00 b8 aa 5a 12 80 88 ff ff Z..... 80 1b fa 0d 80 88 ff ff 1e ff ac af c7 c1 6b 6b kk backtrace: [<ffffffffff813e06a7>] kmem_cache_alloc_trace+0x1c7/0x300 [<ffffffffff81b66025>] macvlan_hash_add_source+0x45/0xd0 [<ffffffffff81b66a67>] macvlan_changelink_sources+0xd7/0x170 [<ffffffffff81b6775c>] macvlan_common_newlink+0x38c/0x5a0 [<ffffffffff81b6797e>] macvlan_newlink+0xe/0x20 [<ffffffffff81d97f8f>] __rtnl_newlink+0x7af/0xa50 [<ffffffffff81d98278>] rtnl_newlink+0x48/0x70 ... In the scenario where the macvlan mode is configured as 'source', macvlan_changelink_sources() will be executed to reconfigure list of remote source mac addresses, at the same time, if register_netdevice() return an error, the resource generated by macvlan_changelink_sources() is not cleaned up. Using this patch, in the case of an error, it will execute macvlan_flush_sources() to ensure that the resource is cleaned up.

CVE ID	Description
CVE-2022-49863	In the Linux kernel, the following vulnerability has been resolved: can: af_can: fix NULL pointer dereference in can_rx_register() It causes NULL pointer dereference when testing as following: (a) use syscall(__NR_socket, 0x10ul, 3ul, 0) to create netlink socket. (b) use syscall(__NR_sendmsg, ...) to create bond link device and vxcan link device, and bind vxcan device to bond device (can also use ifenslave command to bind vxcan device to bond device). (c) use syscall(__NR_socket, 0x1dul, 3ul, 1) to create CAN socket. (d) use syscall(__NR_bind, ...) to bind the bond device to CAN socket. The bond device invokes the can-raw protocol registration interface to receive CAN packets. However, ml_priv is not allocated to the dev, dev_rcv_lists is assigned to NULL in can_rx_register(). In this case, it will occur the NULL pointer dereference issue. The following is the stack information: BUG: kernel NULL pointer dereference, address: 0000000000000008 PGD 122a4067 P4D 122a4067 PUD 1223c067 PMD 0 Oops: 0000 [#1] PREEMPT SMP RIP: 0010:can_rx_register+0x12d/0x1e0 Call Trace: <TASK> raw_enable_filters+0x8d/0x120 raw_enable_allfilters+0x3b/0x130 raw_bind+0x118/0x4f0 __sys_bind+0x163/0x1a0 __x64_sys_bind+0x1e/0x30 do_syscall_64+0x35/0x80 entry_SYSCALL_64_after_hwframe+0x63/0xcd </TASK>
CVE-2022-49865	In the Linux kernel, the following vulnerability has been resolved: ipv6: addrlabel: fix infoleak when sending struct ifaddrllbmsg to network When copying a 'struct ifaddrllbmsg' to the network, __ifal_reserved remained uninitialized, resulting in a 1-byte infoleak: BUG: KMSAN: kernel-network-infoleak in __netdev_start_xmit ./include/linux/netdevice.h:4841 __netdev_start_xmit ./include/linux/netdevice.h:4841 netdev_start_xmit ./include/linux/netdevice.h:4857 xmit_one net/core/dev.c:3590 dev_hard_start_xmit+0x1dc/0x800 net/core/dev.c:3606 __dev_queue_xmit+0x17e8/0x4350 net/core/dev.c:4256 dev_queue_xmit ./include/linux/netdevice.h:3009 __netlink_deliver_tap_skb net/netlink/af_netlink.c:307 __netlink_deliver_tap+0x728/0xad0 net/netlink/af_netlink.c:325 netlink_deliver_tap net/netlink/af_netlink.c:338 __netlink_sendskb net/netlink/af_netlink.c:1263 netlink_sendskb+0x1d9/0x200 net/netlink/af_netlink.c:1272 netlink_unicast+0x56d/0xf50 net/netlink/af_netlink.c:1360 nlmsg_unicast ./include/net/netlink.h:1061 rtnl_unicast+0x5a/0x80 net/core/rtnetlink.c:758 ip6addrllb_get+0xfad/0x10f0 net/ipv6/addrlabel.c:628 rtnetlink_rcv_msg+0xb33/0x1570 net/core/rtnetlink.c:6082 ... CVE-2022-49872	In the Linux kernel, the following vulnerability has been resolved: net: gso: fix panic on frag_list with mixed head alloc types Since commit 3dcdbd134f32 ("net: gso: Fix skb_segment splat when splitting gso_size mangled skb having linear-headed frag_list"), it is allowed to change gso_size of a GRO packet. However, that commit assumes that "checking the first list_skb member suffices; i.e if either of the list_skb members have non head_frag head, then the first one has too". It turns out this assumption does not hold. We've seen BUG_ON being hit in skb_segment when skbs on the frag_list had differing head_frag with the vmxnet3 driver. This happens because __netdev_alloc_skb and __napi_alloc_skb can return a skb that is page backed or kmalloced depending on the requested size. As the result, the last small skb in the GRO packet can be kmalloced. There are three different locations where this can be fixed: (1) We could check head_frag in GRO and not allow GROing skbs with different head_frag. However, that would lead to performance regression on normal forward paths with unmodified gso_size, where !head_frag in the last packet is not a problem. (2) Set a flag in bpf_skb_net_grow and bpf_skb_net_shrink indicating that NETIF_F_SG is undesirable. That would need to eat a bit in sk_buff. Furthermore, that flag can be unset when all skbs on the frag_list are page backed. To retain good performance, bpf_skb_net_grow/shrink would have to walk the frag_list. (3) Walk the frag_list in skb_segment when determining whether NETIF_F_SG should be cleared. This of course slows things down. This patch implements (3). To limit the performance impact in skb_segment, the list is walked only for skbs with SKB_GSO_DODGY set that have gso_size changed. Normal paths thus will not hit it. We could check only the last skb but since we need to walk the whole list anyway, let's stay on the safe side.
CVE-2022-49873	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix wrong reg type conversion in release_reference() Some helper functions will allocate memory. To avoid memory leaks, the verifier requires the eBPF program to release these memories by calling the corresponding helper functions. When a resource is released, all pointer registers corresponding to the resource should be invalidated. The verifier use release_references() to do this job, by apply __mark_reg_unknown() to each relevant register. It will give these registers the type of SCALAR_VALUE. A register that will contain a pointer value at runtime, but of type SCALAR_VALUE, which may allow the unprivileged user to get a kernel pointer by storing this register into a map. Using __mark_reg_not_init() while NOT allow_ptr_leaks can mitigate this problem.
CVE-2022-49874	In the Linux kernel, the following vulnerability has been resolved: HID: hyperv: fix possible memory leak in mousevsc_probe() If hid_add_device() returns error, it should call hid_destroy_device() to free hid_dev which is allocated in hid_allocate_device().

CVE ID	Description
CVE-2022-49876	In the Linux kernel, the following vulnerability has been resolved: wifi: mac80211: fix general-protection-fault in ieee80211_subif_start_xmit() When device is running and the interface status is changed, the gpf issue is triggered. The problem triggering process is as follows: Thread A: Thread B ieee80211_runtime_change_iftype() process_one_work() ieee80211_do_stop() sdata->bss = NULL ieee80211_subif_start_xmit() ieee80211_multicast_to_unicast //!sdata->bss->multicast_to_unicast cause gpf issue When the interface status is changed, the sending queue continues to send packets. After the bss is set to NULL, the bss is accessed. As a result, this causes a general-protection-fault issue. The following is the stack information: general protection fault, probably for non-canonical address 0xdffffc000000002f: 0000 [#1] PREEMPT SMP KASAN KASAN: null-ptr-deref in range [0x0000000000000178-0x000000000000017f] Workqueue: mld mld_ifc_work RIP: 0010:ieee80211_subif_start_xmit+0x25b/0x1310 Call Trace: <TASK> dev_hard_start_xmit+0x1be/0x990 __dev_queue_xmit+0x2c9a/0x3b60 ip6_finish_output2+0xf92/0x1520 ip6_finish_output+0x6af/0x11e0 ip6_output+0x1ed/0x540 mld_sendpack+0xa09/0xe70 mld_ifc_work+0x71c/0xbd0 process_one_work+0x9bf/0x1710 worker_thread+0x665/0x1080 kthread+0x2e4/0x3a0 ret_from_fork+0x1f/0x30 </TASK>
CVE-2022-49878	In the Linux kernel, the following vulnerability has been resolved: bpf, verifier: Fix memory leak in array reallocation for stack state If an error (NULL) is returned by krealloc(), callers of realloc_array() were setting their allocation pointers to NULL, but on error krealloc() does not touch the original allocation. This would result in a memory resource leak. Instead, free the old allocation on the error handling path. The memory leak information is as follows as also reported by Zhengchao: unreferenced object 0xffff888019801800 (size 256): comm "bpf_repo", pid 6490, jiffies 4294959200 (age 17.170s) hex dump (first 32 bytes): 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<00000000b211474b>] __kmalloc_node_track_caller+0x45/0xc0 [<0000000086712a0b>] krealloc+0x83/0xd0 [<00000000139aab02>] realloc_array+0x82/0xe2 [<00000000b1ca41d1>] grow_stack_state+0xfb/0x186 [<00000000cd6f36d2>] check_mem_access.cold+0x141/0x1341 [<0000000081780455>] do_check_common+0x5358/0xb350 [<0000000015f6b091>] bpf_check.cold+0xc3/0x29d [<000000002973c690>] bpf_prog_load+0x13db/0x2240 [<00000000028d1644>] __sys_bpf+0x1605/0x4ce0 [<00000000053f29bd>] __x64_sys_bpf+0x75/0xb0 [<0000000056fedaf5>] do_syscall_64+0x35/0x80 [<000000002bd58261>] entry_SYSCALL_64_after_hwframe+0x63/0xcd

CVE-2022-49881	In the Linux kernel, the following vulnerability has been resolved: wifi: cfg80211: fix memory leak in query_regdb_file() In the function query_regdb_file() the alpha2 parameter is duplicated using kmemdup() and subsequently freed in regdb_fw_cb(). However, request_firmware_nowait() can fail without calling regdb_fw_cb() and thus leak memory.
CVE-2022-49883	In the Linux kernel, the following vulnerability has been resolved: KVM: x86: smm: number of GPRs in the SMRAM image depends on the image format On 64 bit host, if the guest doesn't have X86_FEATURE_LM, KVM will access 16 gprs to 32-bit smram image, causing out-of-bound ram access. On 32 bit host, the rsm_load_state_64/enter_smm_save_state_64 is compiled out, thus access overflow can't happen.
CVE-2022-49884	In the Linux kernel, the following vulnerability has been resolved: KVM: Initialize gfn_to_pfn_cache locks in dedicated helper Move the gfn_to_pfn_cache lock initialization to another helper and call the new helper during VM/vCPU creation. There are race conditions possible due to kvm_gfn_to_pfn_cache_init()'s ability to re-initialize the cache's locks. For example: a race between ioctl(KVM_XEN_HVM_EVTCHN_SEND) and kvm_gfn_to_pfn_cache_init() leads to a corrupted shinfo gpc lock. (thread 1) (thread 2) kvm_xen_set_evtchn_fast read_lock_irqsave(&gpc->lock, ...) kvm_gfn_to_pfn_cache_init rwlock_init(&gpc->lock) read_unlock_irqrestore(&gpc->lock, ...) Rename "cache_init" and "cache_destroy" to activate+deactivate to avoid implying that the cache really is destroyed/freed. Note, there more races in the newly named kvm_gpc_activate() that will be addressed separately. [sean: call out that this is a bug fix]

CVE ID	Description
CVE-2022-49885	In the Linux kernel, the following vulnerability has been resolved: ACPI: APEI: Fix integer overflow in ghes_estatus_pool_init() Change num_ghes from int to unsigned int, preventing an overflow and causing subsequent vmalloc() to fail. CVE-2022-49886	In the Linux kernel, the following vulnerability has been resolved: x86/tdx: Panic on bad configs that #VE on "private" memory access All normal kernel memory is "TDX private memory". This includes everything from kernel stacks to kernel text. Handling exceptions on arbitrary accesses to kernel memory is essentially impossible because they can happen in horribly nasty places like kernel entry/exit. But, TDX hardware can theoretically _deliver_ a virtualization exception (#VE) on any access to private memory. But, it's not as bad as it sounds. TDX can be configured to never deliver these exceptions on private memory with a "TD attribute" called ATTR_SEPT_VE_DISABLE. The guest has no way to *set* this attribute, but it can check it. Ensure ATTR_SEPT_VE_DISABLE is set in early boot. panic() if it is unset. There is no sane way for Linux to run with this attribute clear so a panic() is appropriate. There's small window during boot before the check where kernel has an early #VE handler. But the handler is only for port I/O and will also panic() as soon as it sees any other #VE, such as a one generated by a private memory access. [dhansen: Rewrite changelog and rebase on new tdx_parse_tinfo(). Add Kirill's tested-by because I made changes since he wrote this.]

CVE ID	Description
CVE-2022-49888	In the Linux kernel, the following vulnerability has been resolved: arm64: entry: avoid kprobe recursion The cortex_a76_erratum_1463225_debug_handler() function is called when handling debug exceptions (and synchronous exceptions from BRK instructions), and so is called when a probed function executes. If the compiler does not inline cortex_a76_erratum_1463225_debug_handler(), it can be probed. If cortex_a76_erratum_1463225_debug_handler() is probed, any debug exception or software breakpoint exception will result in recursive exceptions leading to a stack overflow. This can be triggered with the ftrace multiple_probes selftest, and as per the example splat below. This is a regression caused by commit: 6459b8469753e9fe ("arm64: entry: consolidate Cortex-A76 erratum 1463225 workaround") ... which removed the NOKPROBE_SYMBOL() annotation associated with the function. My intent was that cortex_a76_erratum_1463225_debug_handler() would be inlined into its caller, el1_dbg(), which is marked noinstr and cannot be probed. Mark cortex_a76_erratum_1463225_debug_handler() as __always_inline to ensure this. Example splat prior to this patch (with recursive entries elided): # echo p cortex_a76_erratum_1463225_debug_handler > /sys/kernel/debug/tracing/kprobe_events # echo p do_el0_svc >> /sys/kernel/debug/tracing/kprobe_events # echo 1 > /sys/kernel/debug/tracing/events/kprobes/enable Insufficient stack space to handle exception! CVE-2022-49889	In the Linux kernel, the following vulnerability has been resolved: ring-buffer: Check for NULL cpu_buffer in ring_buffer_wake_waiters() On some machines the number of listed CPUs may be bigger than the actual CPUs that exist. The tracing subsystem allocates a per_cpu directory with access to the per CPU ring buffer via a cpuX file. But to save space, the ring buffer will only allocate buffers for online CPUs, even though the CPU array will be as big as the nr_cpu_ids. With the addition of waking waiters on the ring buffer when closing the file, the ring_buffer_wake_waiters() now needs to make sure that the buffer is allocated (with the irq_work allocated with it) before trying to wake waiters, as it will cause a NULL pointer dereference. While debugging this, I added a NULL check for the buffer itself (which is OK to do), and also NULL pointer checks against buffer->buffers (which is not fine, and will WARN) as well as making sure the CPU number passed in is within the nr_cpu_ids (which is also not fine if it isn't). Bugzilla: https://bugzilla.opensuse.org/show_bug.cgi?id=1204705

CVE ID	Description
CVE-2022-49892	In the Linux kernel, the following vulnerability has been resolved: ftrace: Fix use-after-free for dynamic ftrace_ops KASAN reported a use-after-free with ftrace ops [1]. It was found from vmcore that perf had registered two ops with the same content successively, both dynamic. After unregistering the second ops, a use-after-free occurred. In ftrace_shutdown(), when the second ops is unregistered, the FTRACE_UPDATE_CALLS command is not set because there is another enabled ops with the same content. Also, both ops are dynamic and the ftrace callback function is ftrace_ops_list_func, so the FTRACE_UPDATE_TRACE_FUNC command will not be set. Eventually the value of 'command' will be 0 and ftrace_shutdown() will skip the rcu synchronization. However, ftrace may be activated. When the ops is released, another CPU may be accessing the ops. Add the missing synchronization to fix this problem. [1] BUG: KASAN: use-after-free in __ftrace_ops_list_func kernel/trace/ftrace.c:7020 [inline] BUG: KASAN: use-after-free in ftrace_ops_list_func+0x2b0/0x31c kernel/trace/ftrace.c:7049 Read of size 8 at addr ffff56551965bbc8 by task syz-executor.2/14468 CPU: 1 PID: 14468 Comm: syz-executor.2 Not tainted 5.10.0 #7 Hardware name: linux,dummy-virt (DT) Call trace: dump_backtrace+0x0/0x40c arch/arm64/kernel/stacktrace.c:132 show_stack+0x30/0x40 arch/arm64/kernel/stacktrace.c:196 __dump_stack lib/dump_stack.c:77 [inline] dump_stack+0x1b4/0x248 lib/dump_stack.c:118 print_address_description.constprop.0+0x28/0x48c mm/kasan/report.c:387 __kasan_report mm/kasan/report.c:547 [inline] kasan_report+0x118/0x210 mm/kasan/report.c:564 check_memory_region_inline mm/kasan/generic.c:187 [inline] __asan_load8+0x98/0xc0 mm/kasan/generic.c:253 __ftrace_ops_list_func kernel/trace/ftrace.c:7020 [inline] ftrace_ops_list_func+0x2b0/0x31c kernel/trace/ftrace.c:7049 ftrace_graph_call+0x0/0x4 __might_sleep+0x8/0x100 include/linux/perf_event.h:1170 __might_fault mm/memory.c:5183 [inline] __might_fault+0x58/0x70 mm/memory.c:5171 do_strncpy_from_user lib/strncpy_from_user.c:41 [inline] strncpy_from_user+0x1f4/0x4b0 lib/strncpy_from_user.c:139 getname_flags+0xb0/0x31c fs/namei.c:149 getname+0x2c/0x40 fs/namei.c:209 [...] Allocated by task 14445: kasan_save_stack+0x24/0x50 mm/kasan/common.c:48 kasan_set_track mm/kasan/common.c:56 [inline] __kasan_kmalloc mm/kasan/common.c:479 [inline] __kasan_kmalloc.constprop.0+0x110/0x13c mm/kasan/common.c:449 kasan_kmalloc+0xc/0x14 mm/kasan/common.c:493 kmem_cache_alloc_trace+0x440/0x924 mm/slub.c:2950 kmalloc include/linux/slab.h:563 [inline] kzalloc include/linux/slab.h:675 [inline] perf_event_alloc.part.0+0xb4/0x1350 kernel/events/core.c:11230 perf_event_alloc kernel/events/core.c:11733 [inline] __do_sys_perf_event_open kernel/events/core.c:11831 [inline] __se_sys_perf_event_open+0x550/0x15f4 kernel/events/core.c:11723 __arm64_sys_perf_event_open+0x6c/0x80 kernel/events/core.c:11723 [...] Freed by task 14445: kasan_save_stack+0x24/0x50 mm/kasan/common.c:48 kasan_set_track+0x24/0x34 mm/kasan/common.c:56 kasan_set_free_info+0x20/0x40 mm/kasan/generic.c:358 __kasan_slab_free.part.0+0x11c/0x1b0 mm/kasan/common.c:437 __kasan_slab_free mm/kasan/common.c:445 [inline] kasan_slab_free+0x2c/0x40 mm/kasan/common.c:446 slab_free_hook mm/slub.c:1569 [inline] slab_free_freelist_hook mm/slub.c:1608 [inline] slab_free mm/slub.c:3179 [inline] kfree+0x12c/0xc10 mm/slub.c:4176 perf_event_alloc.part.0+0xa0c/0x1350 kernel/events/core.c:11434 perf_event_alloc kernel/events/core.c:11733 [inline] __do_sys_perf_event_open kernel/events/core.c:11831 [inline] __se_sys_perf_event_open+0x550/0x15f4 kernel/events/core.c:11723 [...]
CVE-2022-49900	In the Linux kernel, the following vulnerability has been resolved: i2c: piix4: Fix adapter not be removed in piix4_remove() In piix4_probe(), the piix4 adapter will be registered in: piix4_probe() piix4_add_adapters_sb800() / piix4_add_adapter() i2c_add_adapter() Based on the probed device type, piix4_add_adapters_sb800() or single piix4_add_adapter() will be called. For the former case, piix4_adapter_count is set as the number of adapters, while for another case it is not set and kept default *zero*. When piix4 is removed, piix4_remove() removes the adapters added in piix4_probe(), basing on the piix4_adapter_count value. Because the count is zero for the single adapter case, the adapter won't be removed and makes the sources allocated for adapter leaked, such as the i2c client and device. These sources can still be accessed by i2c or bus and cause problems. An easily reproduced case is that if a new adapter is registered, i2c will get the leaked adapter and try to call smbus_algorithm, which was already freed: Triggered by: rmmmod i2c_piix4 && modprobe max31730 BUG: unable to handle page fault for address: ffffffff053d860 #PF: supervisor read access in kernel mode #PF: error_code(0x0000) - not-present page Oops: 0000 [#1] PREEMPT SMP KASAN CPU: 0 PID: 3752 Comm: modprobe Tainted: G Hardware name: QEMU Standard PC (i440FX + PIIX, 1996) RIP: 0010:i2c_default_probe (drivers/i2c/i2c-core-base.c:2259) i2c_core RSP: 0018:ffff888107477710 EFLAGS: 00000246 ... <TASK> i2c_detect (drivers/i2c/i2c-core-base.c:2302) i2c_core __process_new_driver (drivers/i2c/i2c-core-base.c:1336) i2c_core bus_for_each_dev (drivers/base/bus.c:301) i2c_for_each_dev (drivers/i2c/i2c-core-base.c:1823) i2c_core i2c_register_driver (drivers/i2c/i2c-core-base.c:1861) i2c_core do_one_initcall (init/main.c:1296) do_init_module (kernel/module/main.c:2455) ... </TASK> ---[end trace 0000000000000000]--- Fix this problem by correctly set piix4_adapter_count as 1 for the single adapter so it can be normally removed.

CVE ID	Description
CVE-2022-49901	In the Linux kernel, the following vulnerability has been resolved: blk-mq: Fix kmemleak in blk_mq_init_allocated_queue There is a kmemleak caused by modprobe null_blk.ko unreferenced object 0xffff8881acb1f000 (size 1024): comm "modprobe", pid 836, jiffies 4294971190 (age 27.068s) hex dump (first 32 bytes): 00 00 00 00 ad 4e ad de ff ff ff ff 00 00 00 00 N..... ff ff ff ff ff ff ff 00 53 99 9e ff ff ff ff S..... backtrace: [<000000004a10c249>] kcalloc_node_trace+0x22/0x60 [<00000000648f7950>] blk_mq_alloc_and_init_hctx+0x289/0x350 [<00000000af06de0e>] blk_mq_realloc_hw_ctxs+0x2fe/0x3d0 [<00000000e00c1872>] blk_mq_init_allocated_queue+0x48c/0x1440 [<00000000d16b4e68>] __blk_mq_alloc_disk+0xc8/0x1c0 [<00000000d10c98c3>] 0xffffffffc450d69d [<00000000b9299f48>] 0xffffffffc4538392 [<0000000061c39ed6>] do_one_initcall+0xd0/0x4f0 [<00000000b389383b>] do_init_module+0x1a4/0x680 [<0000000087cf3542>] load_module+0x6249/0x7110 [<00000000beba61b8>] __do_sys_finit_module+0x140/0x200 [<00000000fdcff51>] do_syscall_64+0x35/0x80 [<000000003c0f1f71>] entry_SYSCALL_64_after_hwframe+0x46/0xb0 That is because q->ma_ops is set to NULL before blk_release_queue is called. blk_mq_init_queue_data blk_mq_init_allocated_queue blk_mq_realloc_hw_ctxs for (i = 0; i < set->nr_hw_queues; i++) { old_hctx = xa_load(&q->hctx_table, i); if (!blk_mq_alloc_and_init_hctx(..., i, ...)) [1] if (!old_hctx) break; xa_for_each_start(&q->hctx_table, j, hctx, j) blk_mq_exit_hctx(q, set, hctx, j); [2] if (!q->nr_hw_queues) [3] goto err_hctxs; err_exit: q->mq_ops = NULL; [4] blk_put_queue blk_release_queue if (queue_is_mq(q)) [5] blk_mq_release(q); [1]: blk_mq_alloc_and_init_hctx failed at i != 0. [2]: The hctxs allocated by [1] are moved to q->unused_hctx_list and will be cleaned up in blk_mq_release. [3]: q->nr_hw_queues is 0. [4]: Set q->mq_ops to NULL. [5]: queue_is_mq returns false due to [4]. And blk_mq_release will not be called. The hctxs in q->unused_hctx_list are leaked. To fix it, call blk_release_queue in exception path.
CVE-2022-49905	In the Linux kernel, the following vulnerability has been resolved: net/smc: Fix possible leaked pernet namespace in smc_init() In smc_init(), register_pernet_subsys(&smc_net_stat_ops) is called without any error handling. If it fails, registering of &smc_net_ops won't be reverted. And if smc_nl_init() fails, &smc_net_stat_ops itself won't be reverted. This leaves wild ops in subsystem linkedlist and when another module tries to call register_pernet_operations() it triggers page fault: BUG: unable to handle page fault for address: ffffffbfff81b964c RIP: 0010:register_pernet_operations+0x1b9/0x5f0 Call Trace: <TASK> register_pernet_subsys+0x29/0x40 ebtables_init+0x58/0x1000 [ebtables] ...
CVE-2022-49906	In the Linux kernel, the following vulnerability has been resolved: ibmvnic: Free rwi on reset success Free the rwi structure in the event that the last rwi in the list processed successfully. The logic in commit 4f408e1fa6e1 ("ibmvnic: retry reset if there are no other resets") introduces an issue that results in a 32 byte memory leak whenever the last rwi in the list gets processed.
CVE-2022-49907	In the Linux kernel, the following vulnerability has been resolved: net: mdio: fix undefined behavior in bit shift for __mdiobus_register Shifting signed 32-bit value by 31 bits is undefined, so changing significant bit to unsigned. CVE-2022-49908	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix memory leak in vhci_write Syzkaller reports a memory leak as follows: ===== BUG: memory leak unreferenced object 0xffff88810d81ac00 (size 240): [...] hex dump (first 32 bytes): 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<ffffffffff838733d9>] __alloc_skb+0x1f9/0x270 net/core/skbuff.c:418 [<ffffffffff833f742f>] alloc_skb include/linux/skbuff.h:1257 [inline] [<ffffffffff833f742f>] bt_skb_alloc include/net/bluetooth/bluetooth.h:469 [inline] [<ffffffffff833f742f>] vhci_get_user drivers/bluetooth/hci_vhci.c:391 [inline] [<ffffffffff833f742f>] vhci_write+0x5f/0x230 drivers/bluetooth/hci_vhci.c:511 [<ffffffffff815e398d>] call_write_iter include/linux/fs.h:2192 [inline] [<ffffffffff815e398d>] new_sync_write fs/read_write.c:491 [inline] [<ffffffffff815e398d>] vfs_write+0x42d/0x540 fs/read_write.c:578 [<ffffffffff815e3cdd>] ksys_write+0x9d/0x160 fs/read_write.c:631 [<ffffffffff845e0645>] do_syscall_x64 arch/x86/entry/common.c:50 [inline] [<ffffffffff845e0645>] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 [<ffffffffff84600087>] entry_SYSCALL_64_after_hwframe+0x63/0xcd ===== HCI core will use hci_rx_work() to process frame, which is queued to the hdev->rx_q tail in hci_recv_frame() by HCI driver. Yet the problem is that, HCI core may not free the skb after handling ACL data packets. To be more specific, when start fragment does not contain the L2CAP length, HCI core just copies skb into conn->rx_skb and finishes frame process in l2cap_recv_acldata(), without freeing the skb, which triggers the above memory leak. This patch solves it by releasing the relative skb, after processing the above case in l2cap_recv_acldata().

CVE ID	Description
CVE-2022-49910	In the Linux kernel, the following vulnerability has been resolved: Bluetooth: L2CAP: Fix use-after-free caused by l2cap_reassemble_sdu Fix the race condition between the following two flows that run in parallel: 1. l2cap_reassemble_sdu -> chan->ops->recv (l2cap_sock_recv_cb) -> __sock_queue_rcv_skb. 2. bt_sock_recvmsg -> skb_recv_datagram, skb_free_datagram. An SKB can be queued by the first flow and immediately dequeued and freed by the second flow, therefore the callers of l2cap_reassemble_sdu can't use the SKB after that function returns. However, some places continue accessing struct l2cap_ctrl that resides in the SKB's CB for a short time after l2cap_reassemble_sdu returns, leading to a use-after-free condition (the stack trace is below, line numbers for kernel 5.19.8). Fix it by keeping a local copy of struct l2cap_ctrl. BUG: KASAN: use-after-free in l2cap_rx_state_recv (net/bluetooth/l2cap_core.c:6906) bluetooth Read of size 1 at addr ffff88812025f2f0 by task kworker/u17:3/43169 Workqueue: hci0 hci_rx_work [bluetooth] Call Trace: <TASK> dump_stack_lvl (lib/dump_stack.c:107 (discriminator 4)) print_report.cold (mm/kasan/report.c:314 mm/kasan/report.c:429) ? l2cap_rx_state_recv (net/bluetooth/l2cap_core.c:6906) bluetooth kasan_report (mm/kasan/report.c:162 mm/kasan/report.c:493) ? l2cap_rx_state_recv (net/bluetooth/l2cap_core.c:6906) bluetooth l2cap_rx_state_recv (net/bluetooth/l2cap_core.c:6906) bluetooth l2cap_rx (net/bluetooth/l2cap_core.c:7236 net/bluetooth/l2cap_core.c:7271) bluetooth ret_from_fork (arch/x86/entry/entry_64.S:306) </TASK> Allocated by task 43169: kasan_save_stack (mm/kasan/common.c:39) __kasan_slab_alloc (mm/kasan/common.c:45 mm/kasan/common.c:436 mm/kasan/common.c:469) kmem_cache_alloc_node (mm/slab.h:750 mm/slub.c:3243 mm/slub.c:3293) __alloc_skb (net/core/skbuff.c:414) l2cap_recv_frag (/include/net/bluetooth/bluetooth.h:425 net/bluetooth/l2cap_core.c:8329) bluetooth l2cap_recv_acldata (net/bluetooth/l2cap_core.c:8442) bluetooth hci_rx_work (net/bluetooth/hci_core.c:3642 net/bluetooth/hci_core.c:3832) bluetooth process_one_work (kernel/workqueue.c:2289) worker_thread (/include/linux/list.h:292 kernel/workqueue.c:2437) kthread (kernel/kthread.c:376) ret_from_fork (arch/x86/entry/entry_64.S:306) Freed by task 27920: kasan_save_stack (mm/kasan/common.c:39) kasan_set_track (mm/kasan/common.c:45) kasan_set_free_info (mm/kasan/generic.c:372) ____kasan_slab_free (mm/kasan/common.c:368 mm/kasan/common.c:328) slab_free_freelist_hook (mm/slub.c:1780) kmem_cache_free (mm/slub.c:3536 mm/slub.c:3553) skb_free_datagram (/include/net/sock.h:1578 ./include/net/sock.h:1639 net/core/datagram.c:323) bt_sock_recvmsg (net/bluetooth/af_bluetooth.c:295) bluetooth l2cap_sock_recvmsg (net/bluetooth/l2cap_sock.c:1212) bluetooth sock_read_iter (net/socket.c:1087) new_sync_read (/include/linux/fs.h:2052 fs/read_write.c:401) vfs_read (fs/read_write.c:482) ksys_read (fs/read_write.c:620) do_syscall_64 (arch/x86/entry/common.c:50 arch/x86/entry/common.c:80) entry_SYSCALL_64_after_hwframe (arch/x86/entry/entry_64.S:120)
CVE-2022-49915	In the Linux kernel, the following vulnerability has been resolved: mISDN: fix possible memory leak in mISDN_register_device() After commit 1fa5ae857bb1 ("driver core: get rid of struct device's bus_id string array"), the name of device is allocated dynamically, add put_device() to give up the reference, so that the name can be freed in kobject_cleanup() when the refcount is 0. Set device class before put_device() to avoid null release() function WARN message in device_release().

CVE-2022-49931	In the Linux kernel, the following vulnerability has been resolved: IB/hfi1: Correctly move list in <code>sc_disable()</code> Commit 13bac861952a ("IB/hfi1: Fix abba locking issue with <code>sc_disable()</code> ") incorrectly tries to move a list from one list head to another. The result is a kernel crash. The crash is triggered when a link goes down and there are waiters for a send to complete. The following signature is seen: BUG: kernel NULL pointer dereference, address: 0000000000000030 [...] Call Trace: <code>sc_disable+0x1ba/0x240 [hfi1] pio_freeze+0x3d/0x60 [hfi1] handle_freeze+0x27/0x1b0 [hfi1] process_one_work+0x1b0/0x380 ? process_one_work+0x380/0x380 worker_thread+0x30/0x360 ? process_one_work+0x380/0x380 kthread+0xd7/0x100 ? kthread_complete_and_exit+0x20/0x20 ret_from_fork+0x1f/0x30</code> The fix is to use the correct call to move the list.

CVE ID	Description
CVE-2022-49932	In the Linux kernel, the following vulnerability has been resolved: KVM: VMX: Do _all_ initialization before exposing /dev/kvm to userspace Call kvm_init() only after _all_ setup is complete, as kvm_init() exposes /dev/kvm to userspace and thus allows userspace to create VMs (and call other ioctls). E.g. KVM will encounter a NULL pointer when attempting to add a vCPU to the per-CPU loaded_vmcss_on_cpu list if userspace is able to create a VM before vmx_init() configures said list. BUG: kernel NULL pointer dereference, address: 0000000000000008 #PF: supervisor write access in kernel mode #PF: error_code(0x0002) - not-present page PGD 0 P4D 0 Oops: 0002 [#1] SMP CPU: 6 PID: 1143 Comm: stable Not tainted 6.0.0-rc7+ #988 Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS 0.0.0 02/06/2015 RIP: 0010:vmx_vcpu_load_vmcs+0x68/0x230 [kvm_intel] <TASK> vmx_vcpu_load+0x16/0x60 [kvm_intel] kvm_arch_vcpu_load+0x32/0x1f0 [kvm] vcpu_load+0x2f/0x40 [kvm] kvm_arch_vcpu_create+0x231/0x310 [kvm] kvm_ym_ioctl+0x79f/0xe10 [kvm] ? handle_mm_fault+0xb1/0x220 __x64_sys_ioctl+0x80/0xb0 do_syscall_64+0x2b/0x50 entry_SYSCALL_64_after_hwframe+0x46/0xb0 RIP: 0033:0x7f5a6b05743b </TASK> Modules linked in: vhost_net vhost vhost_iotlb tap kvm_intel(+) kvm irqbypass
CVE-2022-49935	In the Linux kernel, the following vulnerability has been resolved: dma-buf/dma-resv: check if the new fence is really later Previously when we added a fence to a dma_resv object we always assumed the the newer than all the existing fences. With Jason's work to add a UAPI to explicit export/import that's not necessary the case any more. So without this check we would allow userspace to force the kernel into an use after free error. Since the change is very small and defensive it's probably a good idea to backport this to stable kernels as well just in case others are using the dma_resv object in the same way.
CVE-2022-49936	In the Linux kernel, the following vulnerability has been resolved: USB: core: Prevent nested device-reset calls Automatic kernel fuzzing revealed a recursive locking violation in usb-storage: ===== WARNING: possible recursive locking detected 5.18.0 #3 Not tainted ----- kworker/1:3/1205 is trying to acquire lock: ffff888018638db8 (&us_interface_key[i]){+.+.}-{3:3}, at: usb_stor_pre_reset +0x35/0x40 drivers/usb/storage/usb.c:230 but task is already holding lock: ffff888018638db8 (&us_interface_key[i]){+.+.}-{3:3}, at: usb_stor_pre_reset+0x35/0x40 drivers/usb/storage/usb.c:230 ... stack backtrace: CPU: 1 PID: 1205 Comm: kworker/1:3 Not tainted 5.18.0 #3 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.13.0-1ubuntu1.1 04/01/2014 Workqueue: usb_hub_wq hub_event Call Trace: <TASK> __dump_stack lib/dump_stack.c:88 [inline] dump_stack_lvl +0xcd/0x134 lib/dump_stack.c:106 print_deadlock_bug kernel/locking/lockdep.c:2988 [inline] check_deadlock kernel/locking/lockdep.c:3031 [inline] validate_chain kernel/locking/lockdep.c:3816 [inline] __lock_acquire.cold+0x152/0x3ca kernel/locking/lockdep.c:5053 lock_acquire kernel/locking/lockdep.c:5665 [inline] lock_acquire+0x1ab/0x520 kernel/locking/lockdep.c:5630 __mutex_lock_common kernel/locking/mutex.c:603 [inline] __mutex_lock+0x14f/0x1610 kernel/locking/mutex.c:747 usb_stor_pre_reset+0x35/0x40 drivers/usb/storage/usb.c:230 usb_reset_device +0x37d/0x9a0 drivers/usb/core/hub.c:6109 rtl871xu_dev_remove+0x21a/0x270 drivers/staging/rtl8712/usb_intf.c:622 usb_unbind_interface+0x1bd/0x890 drivers/usb/core/driver.c:458 device_remove drivers/base/dd.c:545 [inline] device_remove+0x11f/0x170 drivers/base/dd.c:537 __device_release_driver drivers/base/dd.c:1222 [inline] device_release_driver_internal+0x1a7/0x2f0 drivers/base/dd.c:1248 usb_driver_release_interface+0x102/0x180 drivers/usb/core/driver.c:627 usb_forced_unbind_intf +0x4d/0xa0 drivers/usb/core/driver.c:1118 usb_reset_device+0x39b/0x9a0 drivers/usb/core/hub.c:6114 This turned out not to be an error in usb-storage but rather a nested device reset attempt. That is, as the rtl8712 driver was being unbound from a composite device in preparation for an unrelated USB reset (that driver does not have pre_reset or post_reset callbacks), its ->remove routine called usb_reset_device() -- thus nesting one reset call within another. Performing a reset as part of disconnect processing is a questionable practice at best. However, the bug report points out that the USB core does not have any protection against nested resets. Adding a reset_in_progress flag and testing it will prevent such errors in the future.

CVE ID	Description
CVE-2022-49937	In the Linux kernel, the following vulnerability has been resolved: media: mceusb: Use new usb_control_msg_*() routines Automatic kernel fuzzing led to a WARN about invalid pipe direction in the mceusb driver: -----[cut here]----- usb 6-1: BOGUS control dir, pipe 80000380 doesn't match bRequestType 40 WARNING: CPU: 0 PID: 2465 at drivers/usb/core/urb.c:410 usb_submit_urb+0x1326/0x1820 drivers/usb/core/urb.c:410 Modules linked in: CPU: 0 PID: 2465 Comm: kworker/0:2 Not tainted 5.19.0-rc4-00208-g69cb6c6556ad #1 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS 1.13.0-1ubuntu1.1 04/01/2014 Workqueue: usb_hub_wq hub_event RIP: 0010:usb_submit_urb+0x1326/0x1820 drivers/usb/core/urb.c:410 Code: 7c 24 40 e8 ac 23 91 fd 48 8b 7c 24 40 e8 b2 70 1b ff 45 89 e8 44 89 f1 4c 89 e2 48 89 c6 48 c7 c7 a0 30 a9 86 e8 48 07 11 02 <0f> 0b e9 1c f0 ff ff e8 7e 23 91 fd 0f b6 1d 63 22 83 05 31 ff 41 RSP: 0018:ffff900032becf0 EFLAGS: 00010282 RAX: 0000000000000000 RBX: ffff8881100f3058 RCX: 0000000000000000 RDX: ffff90004961000 RSI: ffff888114c6d580 RDI: ffff52000657d90 RBP: ffff888105ad90f0 R08: ffffffff812c3638 R09: 0000000000000000 R10: 0000000000000005 R11: ffffd1023504ef1 R12: ffff888105ad9000 R13: 0000000000000040 R14: 0000000080000380 R15: ffff88810ba96500 FS: 0000000000000000(0000) GS:ffff88811a800000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007ffe810bda58 CR3: 000000010b720000 CR4: 000000000350ef0 Call Trace: <TASK> usb_start_wait_urb+0x101/0x4c0 drivers/usb/core/message.c:58 usb_internal_control_msg drivers/usb/core/message.c:102 [inline] usb_control_msg+0x31c/0x4a0 drivers/usb/core/message.c:153 mceusb_gen1_init drivers/media/rc/mceusb.c:1431 [inline] mceusb_dev_probe+0x258e/0x33f0 drivers/media/rc/mceusb.c:1807 The reason for the warning is clear enough; the driver sends an unusual read request on endpoint 0 but does not set the USB_DIR_IN bit in the bRequestType field. More importantly, the whole situation can be avoided and the driver simplified by converting it over to the relatively new usb_control_msg_recv() and usb_control_msg_send() routines. That's what this fix does.
CVE-2022-49938	In the Linux kernel, the following vulnerability has been resolved: cifs: fix small mempool leak in SMB2_negotiate() In some cases of failure (dialect mismatches) in SMB2_negotiate(), after the request is sent, the checks would return -EIO when they should be rather setting rc = -EIO and jumping to neg_exit to free the response buffer from mempool.
CVE-2022-49940	In the Linux kernel, the following vulnerability has been resolved: tty: n_gsm: add sanity check for gsm->receive in gsm_receive_buf() A null pointer dereference can happen when attempting to access the "gsm->receive()" function in gsmlld_receive_buf(). Currently, the code assumes that gsm->receive is only called after MUX activation. Since the gsmlld_receive_buf() function can be accessed without the need to initialize the MUX, the gsm->receive() function will not be set and a NULL pointer dereference will occur. Fix this by avoiding the call to "gsm->receive()" in case the function is not initialized by adding a sanity check. Call Trace: <TASK> gsmlld_receive_buf+0x1c2/0x2f0 drivers/tty/n_gsm.c:2861 tiocsti drivers/tty/tty_io.c:2293 [inline] tty_ioctl+0xa75/0x15d0 drivers/tty/tty_io.c:2692 vfs_ioctl fs/ioctl.c:51 [inline] __do_sys_ioctl fs/ioctl.c:870 [inline] __se_sys_ioctl fs/ioctl.c:856 [inline] __x64_sys_ioctl+0x193/0x200 fs/ioctl.c:856 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x63/0xcd
CVE-2022-49948	In the Linux kernel, the following vulnerability has been resolved: vt: Clear selection before changing the font When changing the console font with ioctl(KDFONTOP) the new font size can be bigger than the previous font. A previous selection may thus now be outside of the new screen size and thus trigger out-of-bounds accesses to graphics memory if the selection is removed in vc_do_resize(). Prevent such out-of-memory accesses by dropping the selection before the various con_font_set() console handlers are called.
CVE-2022-49949	In the Linux kernel, the following vulnerability has been resolved: firmware_loader: Fix memory leak in firmware upload In the case of firmware-upload, an instance of struct fw_upload is allocated in firmware_upload_register(). This data needs to be freed in fw_dev_release(). Create a new fw_upload_free() function in sysfs_upload.c to handle the firmware-upload specific memory frees and incorporate the missing kfree call for the fw_upload structure.

CVE ID	Description
CVE-2022-49961	In the Linux kernel, the following vulnerability has been resolved: bpf: Do mark_chain_precision for ARG_CONST_ALLOC_SIZE_OR_ZERO Precision markers need to be propagated whenever we have an ARG_CONST_* style argument, as the verifier cannot consider imprecise scalars to be equivalent for the purposes of states_equal check when such arguments refine the return value (in this case, set mem_size for PTR_TO_MEM). The resultant mem_size for the R0 is derived from the constant value, and if the verifier incorrectly prunes states considering them equivalent where such arguments exist (by seeing that both registers have reg->precise as false in regsafe), we can end up with invalid programs passing the verifier which can do access beyond what should have been the correct mem_size in that explored state. To show a concrete example of the problem: 0000000000000000 <prog>: 0: r2 = *(u32*)(r1 + 80) 1: r1 = *(u32*)(r1 + 76) 2: r3 = r1 3: r3 += 4 4: if r3 > r2 goto +18 <LBB5_5> 5: w2 = 0 6: *(u32*)(r1 + 0) = r2 7: r1 = *(u32*)(r1 + 0) 8: r2 = 1 9: if w1 == 0 goto +1 <LBB5_3> 10: r2 = -1 00000000000000058 <LBB5_3>: 11: r1 = 0 ll 13: r3 = 0 14: call bpf_ringbuf_reserve 15: if r0 == 0 goto +7 <LBB5_5> 16: r1 = r0 17: r1 += 16777215 18: w2 = 0 19: *(u8*)(r1 + 0) = r2 20: r1 = r0 21: r2 = 0 22: call bpf_ringbuf_submit 00000000000000b8 <LBB5_5>: 23: w0 = 0 24: exit For the first case, the single line execution's exploration will prune the search at insn 14 for the branch insn 9's second leg as it will be verified first using r2 = -1 (UINT_MAX), while as w1 at insn 9 will always be 0 so at runtime we don't get error for being greater than UINT_MAX/4 from bpf_ringbuf_reserve. The verifier during regsafe just sees reg->precise as false for both r2 registers in both states, hence considers them equal for purposes of states_equal. If we propagated precise markers using the backtracking support, we would use the precise marking to then ensure that old r2 (UINT_MAX) was within the new r2 (1) and this would never be true, so the verification would rightfully fail. The end result is that the out of bounds access at instruction 19 would be permitted without this fix. Note that reg->precise is always set to true when user does not have CAP_BPF (or when subprog count is greater than 1 (i.e. use of any static or global functions)), hence this is only a problem when precision marks need to be explicitly propagated (i.e. privileged users with CAP_BPF). A simplified test case has been included in the next patch to prevent future regressions.
CVE-2022-49963	In the Linux kernel, the following vulnerability has been resolved: drm/i915/ttm: fix CCS handling Crucible + recent Mesa seems to sometimes hit: GEM_BUG_ON(num_ccs_blks > NUM_CCS_BLKS_PER_XFER) And it looks like we can also trigger this with gem_lmem_swapping, if we modify the test to use slightly larger object sizes. Looking closer it looks like we have the following issues in migrate_copy(): - We are using plain integer in various places, which we can easily overflow with a large object. - We pass the entire object size (when the src is lmem) into emit_pte() and then try to copy it, which doesn't work, since we only have a few fixed sized windows in which to map the pages and perform the copy. With an object > 8M we therefore aren't properly copying the pages. And then with an object > 64M we trigger the GEM_BUG_ON(num_ccs_blks > NUM_CCS_BLKS_PER_XFER). So it looks like our copy handling for any object > 8M (which is our CHUNK_SZ) is currently broken on DG2. Testcase: igt@gem_lmem_swapping (cherry picked from commit 8676145eb2f53a9940ff70910caf0125bd8a4bc2)
CVE-2022-49964	In the Linux kernel, the following vulnerability has been resolved: arm64: cacheinfo: Fix incorrect assignment of signed error value to unsigned fw_level Though acpi_find_last_cache_level() always returned signed value and the document states it will return any errors caused by lack of a PPTT table, it never returned negative values before. Commit 0c80f9e165f8 ("ACPI: PPTT: Leave the table mapped for the runtime usage") however changed it by returning -ENOENT if no PPTT was found. The value returned from acpi_find_last_cache_level() is then assigned to unsigned fw_level. It will result in the number of cache leaves calculated incorrectly as a huge value which will then cause the following warning from __alloc_pages as the order would be greater than MAX_ORDER because of incorrect and huge cache leaves value. WARNING: CPU: 0 PID: 1 at mm/page_alloc.c:5407 __alloc_pages+0x74/0x314 Modules linked in: CPU: 0 PID: 1 Comm: swapper/0 Not tainted 5.19.0-10393-g7c2a8d3ac4c0 #73 pstate: 20000005 (nzCv daif -PAN -UAO -TCO -DIT -SSBS BTYPE=--) pc : __alloc_pages+0x74/0x314 lr : alloc_pages+0xe8/0x318 Call trace: __alloc_pages+0x74/0x314 alloc_pages+0xe8/0x318 kmalloc_order_trace+0x68/0x1dc __kmalloc+0x240/0x338 detect_cache_attributes+0xe0/0x56c update_siblings_masks+0x38/0x284 store_cpu_topology+0x78/0x84 smp_prepare_cpus+0x48/0x134 kernel_init_freeable+0xc4/0x14c kernel_init+0x2c/0x1b4 ret_from_fork+0x10/0x20 Fix the same by changing fw_level to be signed integer and return the error from init_cache_level() early in case of error.
CVE-2022-49967	In the Linux kernel, the following vulnerability has been resolved: bpf: Fix a data-race around bpf_jit_limit. While reading bpf_jit_limit, it can be changed concurrently via sysctl, WRITE_ONCE() in __do_proc_doulongvec_minmax(). The size of bpf_jit_limit is long, so we need to add a paired READ_ONCE() to avoid load-tearing.

CVE ID	Description
CVE-2022-49970	In the Linux kernel, the following vulnerability has been resolved: bpf, cgroup: Fix kernel BUG in purge_effective_progs Syzkaller reported a triggered kernel BUG as follows: -----[cut here]----- kernel BUG at kernel/bpf/cgroup.c:925! invalid opcode: 0000 [#1] PREEMPT SMP NOPTI CPU: 1 PID: 194 Comm: detach Not tainted 5.19.0-14184-g69dac8e431af #8 Hardware name: QEMU Standard PC (i440FX + PIIX, 1996), BIOS rel-1.16.0-0-gd239552ce722-prebuilt.qemu.org 04/01/2014 RIP: 0010: __cgroup_bpf_detach+0x1f2/0x2a0 Code: 00 e8 92 60 30 00 84 c0 75 d8 4c 89 e0 31 f6 85 f6 74 19 42 f6 84 28 48 05 00 00 02 75 0e 48 8b 80 c0 00 00 00 48 85 c0 75 e5 <0f> 0b 48 8b 0c5 RSP: 0018:ffff9000055bdb0 EFLAGS: 00000246 RAX: 0000000000000000 RBX: ffff888100ec0800 RCX: ffff900000f1000 RDX: 0000000000000000 RSI: 0000000000000001 RDI: ffff888100ec4578 RBP: 0000000000000000 R08: ffff888100ec0800 R09: 0000000000000040 R10: 0000000000000000 R11: 0000000000000000 R12: ffff888100ec4000 R13: 000000000000000d R14: ffff90000199000 R15: ffff888100effb00 FS: 00007f68213d2b80(0000) GS:ffff88813bc80000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 000055f74a0e5850 CR3: 0000000102836000 CR4: 000000000000006e0 Call Trace: <TASK> cgroup_bpf_prog_detach+0xcc/0x100 __sys_bpf+0x2273/0x2a00 __x64_sys_bpf+0x17/0x20 do_syscall_64+0x3b/0x90 entry_SYSCALL_64_after_hwframe+0x63/0xcd RIP: 0033:0x7f68214dbcb9 Code: 08 44 89 e0 5b 41 5c c3 66 0f 1f 84 00 00 00 00 48 89 f8 48 89 f7 48 89 d6 48 89 ca 4d 89 c2 4d 89 c8 4c 8b 4c 24 08 0f 05 <48> 3d 01 f0 ff8 RSP: 002b:00007ffeb487db68 EFLAGS: 00000246 ORIG_RAX: 0000000000000141 RAX: ffffffffda RBX: 000000000000000b RCX: 00007f68214dbcb9 RDX: 0000000000000090 RSI: 00007ffeb487db70 RDI: 0000000000000009 RBP: 0000000000000003 R08: 0000000000000012 R09: 0000000b00000003 R10: 00007ffeb487db70 R11: 0000000000000246 R12: 00007ffeb487dc20 R13: 0000000000000004 R14: 0000000000000001 R15: 000055f74a1011b0 </TASK> Modules linked in: ---[end trace 0000000000000000]--- Repetition steps: For the following cgroup tree, root cg1 cg2 1. attach prog2 to cg2, and then attach prog1 to cg1, both bpf progs attach type is NONE or OVERRIDE. 2. write 1 to /proc/thread-self/fail-nth for failslab. 3. detach prog1 for cg1, and then kernel BUG occur. Failslab injection will cause kmallocc fail and fall back to purge_effective_progs. The problem is that cg2 have attached another prog, so when go through cg2 layer, iteration will add pos to 1, and subsequent operations will be skipped by the following condition, and cg will meet NULL in the end. `if (pos && !(cg->bpf.flags[atype] & BPF_F_ALLOW_MULTI))` The NULL cg means no link or prog match, this is as expected, and it's not a bug. So here just skip the no match situation.
CVE-2022-49972	In the Linux kernel, the following vulnerability has been resolved: xsk: Fix corrupted packets for XDP_SHARED_UMEM Fix an issue in XDP_SHARED_UMEM mode together with aligned mode where packets are corrupted for the second and any further sockets bound to the same umem. In other words, this does not affect the first socket bound to the umem. The culprit for this bug is that the initialization of the DMA addresses for the pre-populated xsk buffer pool entries was not performed for any socket but the first one bound to the umem. Only the linear array of DMA addresses was populated. Fix this by populating the DMA addresses in the xsk buffer pool for every socket bound to the same umem.
CVE-2022-49973	In the Linux kernel, the following vulnerability has been resolved: skmsg: Fix wrong last sg check in sk_msg_recvmg() Fix one kernel NULL pointer dereference as below: [224.462334] Call Trace: [224.462394] __tcp_bpf_recvmg+0xd3/0x380 [224.462441] ? sock_has_perm+0x78/0xa0 [224.462463] tcp_bpf_recvmg+0x12e/0x220 [224.462494] inet_recvmg+0x5b/0xd0 [224.462534] __sys_recvfrom+0xc8/0x130 [224.462574] ? syscall_trace_enter+0x1df/0x2e0 [224.462606] ? __do_page_fault+0x2de/0x500 [224.462635] __x64_sys_recvfrom+0x24/0x30 [224.462660] do_syscall_64+0x5d/0x1d0 [224.462709] entry_SYSCALL_64_after_hwframe+0x65/0xca In commit 9974d37ea75f ("skmsg: Fix invalid last sg check in sk_msg_recvmg()"), we change last sg check to sg_is_last(), but in sockmap redirection case (without stream_parser/stream_verdict/skb_verdict), we did not mark the end of the scatterlist. Check the sk_msg_alloc, sk_msg_page_add, and bpf_msg_push_data functions, they all do not mark the end of sg. They are expected to use sg.end for end judgment. So the judgment of '(i != msg_rx->sg.end)' is added back here.
CVE-2022-49975	In the Linux kernel, the following vulnerability has been resolved: bpf: Don't redirect packets with invalid pkt_len Syzbot found an issue [1]: fq_codel_drop() try to drop a flow whitout any skbs, that is, the flow->head is null. The root cause, as the [2] says, is because that bpf_prog_test_run_skb() run a bpf prog which redirects empty skbs. So we should determine whether the length of the packet modified by bpf prog or others like bpf_prog_test is valid before forwarding it directly.

CVE ID	Description
CVE-2022-49979	In the Linux kernel, the following vulnerability has been resolved: net: fix refcount bug in sk_psock_get (2) Syzkaller reports refcount bug as follows: -----[cut here]----- refcount_t: saturated; leaking memory. WARNING: CPU: 1 PID: 3605 at lib/refcount.c:19 refcount_warn_saturate +0xf4/0x1e0 lib/refcount.c:19 Modules linked in: CPU: 1 PID: 3605 Comm: syz-executor208 Not tainted 5.18.0-syzkaller-03023-g7e062cda7d90 #0 <TASK> __refcount_add_not_zero include/linux/refcount.h:163 [inline] __refcount_inc_not_zero include/linux/refcount.h:227 [inline] refcount_inc_not_zero include/linux/refcount.h:245 [inline] sk_psock_get+0x3bc/0x410 include/linux/skmsg.h:439 tls_data_ready+0x6d/0x1b0 net/tls/tls_sw.c:2091 tcp_data_ready+0x106/0x520 net/ipv4/tcp_input.c:4983 tcp_data_queue+0x25f2/0x4c90 net/ipv4/tcp_input.c:5057 tcp_rcv_state_process +0x1774/0x4e80 net/ipv4/tcp_input.c:6659 tcp_v4_do_rcv+0x339/0x980 net/ipv4/tcp_ipv4.c:1682 sk_backlog_rcv include/net/sock.h:1061 [inline] __release_sock+0x134/0x3b0 net/core/sock.c:2849 release_sock+0x54/0x1b0 net/core/sock.c:3404 inet_shutdown+0x1e0/0x430 net/ipv4/af_inet.c:909 __sys_shutdown_sock net/socket.c:2331 [inline] __sys_shutdown_sock net/socket.c:2325 [inline] __sys_shutdown+0xf1/0x1b0 net/socket.c:2343 __do_sys_shutdown net/socket.c:2351 [inline] __se_sys_shutdown net/socket.c:2349 [inline] __x64_sys_shutdown+0x50/0x70 net/socket.c:2349 do_syscall_x64 arch/x86/entry/common.c:50 [inline] do_syscall_64+0x35/0xb0 arch/x86/entry/common.c:80 entry_SYSCALL_64_after_hwframe+0x46/0xb0 <TASK> During SMC fallback process in connect syscall, kernel will replaces TCP with SMC. In order to forward wakeup smc socket waitqueue after fallback, kernel will sets clsk->sk_user_data to origin smc socket in smc_fback_replace_callbacks(). Later, in shutdown syscall, kernel will calls sk_psock_get(), which treats the clsk->sk_user_data as psock type, triggering the refcnt warning. So, the root cause is that smc and psock, both will use sk_user_data field. So they will mismatch this field easily. This patch solves it by using another bit(defined as SK_USER_DATA_PSOCK) in PTRMASK, to mark whether sk_user_data points to a psock object or not. This patch depends on a PTRMASK introduced in commit f1ff5ce2cd5e ("net, sk_msg: Clear sk_user_data pointer on clone if tagged"). For there will possibly be more flags in the sk_user_data field, this patch also refactor sk_user_data flags code to be more generic to improve its maintainability.
CVE-2022-49981	In the Linux kernel, the following vulnerability has been resolved: HID: hidraw: fix memory leak in hidraw_release() Free the buffered reports before deleting the list entry. BUG: memory leak unreferenced object 0xfffff88810e72f180 (size 32): comm "softirq", pid 0, jiffies 4294945143 (age 16.080s) hex dump (first 32 bytes): 64 f3 c6 6a d1 88 07 04 00 00 00 00 00 00 00 00 d.j..... 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 backtrace: [<ffffffffff814ac6c3>] kmemdup +0x23/0x50 mm/util.c:128 [<ffffffffff8357c1d2>] kmemdup include/linux/fortify-string.h:440 [inline] [<ffffffffff8357c1d2>] hidraw_report_event+0xa2/0x150 drivers/hid/hidraw.c:521 [<ffffffffff8356ddad>] hid_report_raw_event+0x27d/0x740 drivers/hid/hid-core.c:1992 [<ffffffffff8356e41e>] hid_input_report +0x1ae/0x270 drivers/hid/hid-core.c:2065 [<ffffffffff835f0d3f>] hid_irq_in+0x1ff/0x250 drivers/hid/usbhid/hid-core.c:284 [<ffffffffff82d3c7f9>] __usb_hcd_giveback_urb+0xf9/0x230 drivers/usb/core/hcd.c:1670 [<ffffffffff82d3cc26>] usb_hcd_giveback_urb+0x1b6/0x1d0 drivers/usb/core/hcd.c:1747 [<ffffffffff82ef1e14>] dummy_timer+0x8e4/0x14c0 drivers/usb/gadget/udc/dummy_hcd.c:1988 [<ffffffffff812f50a8>] call_timer_fn+0x38/0x200 kernel/time/timer.c:1474 [<ffffffffff812f5586>] expire_timers kernel/time/timer.c:1519 [inline] [<ffffffffff812f5586>] __run_timers.part.0+0x316/0x430 kernel/time/timer.c:1790 [<ffffffffff812f56e4>] __run_timers kernel/time/timer.c:1768 [inline] [<ffffffffff812f56e4>] run_timer_softirq+0x44/0x90 kernel/time/timer.c:1803 [<ffffffffff848000e6>] __do_softirq+0xe6/0x2ea kernel/softirq.c:571 [<ffffffffff81246db0>] invoke_softirq kernel/softirq.c:445 [inline] [<ffffffffff81246db0>] __irq_exit_rcu kernel/softirq.c:650 [inline] [<ffffffffff81246db0>] irq_exit_rcu+0xc0/0x110 kernel/softirq.c:662 [<ffffffffff84574f02>] sysvec_apic_timer_interrupt +0xa2/0xd0 arch/x86/kernel/apic/apic.c:1106 [<ffffffffff84600c8b>] asm_sysvec_apic_timer_interrupt +0x1b/0x20 arch/x86/include/asm/idtentry.h:649 [<ffffffffff8458a070>] native_safe_halt arch/x86/include/asm/irqflags.h:51 [inline] [<ffffffffff8458a070>] arch_safe_halt arch/x86/include/asm/irqflags.h:89 [inline] [<ffffffffff8458a070>] acpi_safe_halt drivers/acpi/processor_idle.c:111 [inline] [<ffffffffff8458a070>] acpi_idle_do_entry+0xc0/0xd0 drivers/acpi/processor_idle.c:554
CVE-2022-49982	In the Linux kernel, the following vulnerability has been resolved: media: pvrusb2: fix memory leak in pvr_probe The error handling code in pvr2_hdw_create forgets to unregister the v4l2 device. When pvr2_hdw_create returns back to pvr2_context_create, it calls pvr2_context_destroy to destroy context, but mp->hdw is NULL, which leads to that pvr2_hdw_destroy directly returns. Fix this by adding v4l2_device_unregister to decrease the refcount of usb interface.
CVE-2022-49984	In the Linux kernel, the following vulnerability has been resolved: HID: steam: Prevent NULL pointer dereference in steam_{recv,send}_report It is possible for a malicious device to forgo submitting a Feature Report. The HID Steam driver presently makes no provision for this and de-references the 'struct hid_report' pointer obtained from the HID devices without first checking its validity. Let's change that.

CVE ID	Description
CVE-2022-49987	In the Linux kernel, the following vulnerability has been resolved: md: call __md_stop_writes in md_stop From the link [1], we can see raid1d was running even after the path raid_dtr -> md_stop -> __md_stop. Let's stop write first in destructor to align with normal md-raid to fix the KASAN issue. [1]. https://lore.kernel.org/linux-raid/CAPHsuW5gc4AakdGNdF8ubpezAuDLFOYUO_sfMZcec6hQFm8nhg@mail.gmail.com/T/#m7f12bf90481c02c6d2da68c64aedd4779b7df74a
CVE-2022-49989	In the Linux kernel, the following vulnerability has been resolved: xen/privcmd: fix error exit of privcmd_ioctl_dm_op() The error exit of privcmd_ioctl_dm_op() is calling unlock_pages() potentially with pages being NULL, leading to a NULL dereference. Additionally lock_pages() doesn't check for pin_user_pages_fast() having been completely successful, resulting in potentially not locking all pages into memory. This could result in sporadic failures when using the related memory in user mode. Fix all of that by calling unlock_pages() always with the real number of pinned pages, which will be zero in case pages being NULL, and by checking the number of pages pinned by pin_user_pages_fast() matching the expected number of pages.
CVE-2022-49990	In the Linux kernel, the following vulnerability has been resolved: s390: fix double free of GS and RI CBs on fork() failure The pointers for guarded storage and runtime instrumentation control blocks are stored in the thread_struct of the associated task. These pointers are initially copied on fork() via arch_dup_task_struct() and then cleared via copy_thread() before fork() returns. If fork() happens to fail after the initial task dup and before copy_thread(), the newly allocated task and associated thread_struct memory are freed via free_task() -> arch_release_task_struct(). This results in a double free of the guarded storage and runtime info structs because the fields in the failed task still refer to memory associated with the source task. This problem can manifest as a BUG_ON() in set_freepointer() (with CONFIG_SLAB_FREELIST_HARDENED enabled) or KASAN splat (if enabled) when running trinity syscall fuzz tests on s390x. To avoid this problem, clear the associated pointer fields in arch_dup_task_struct() immediately after the new task is copied. Note that the RI flag is still cleared in copy_thread() because it resides in thread stack memory and that is where stack info is copied.
CVE-2022-49993	In the Linux kernel, the following vulnerability has been resolved: loop: Check for overflow while configuring loop The userspace can configure a loop using an ioctl call, wherein a configuration of type loop_config is passed (see lo_ioctl()'s case on line 1550 of drivers/block/loop.c). This proceeds to call loop_configure() which in turn calls loop_set_status_from_info() (see line 1050 of loop.c), passing &config->info which is of type loop_info64*. This function then sets the appropriate values, like the offset. loop_device has lo_offset of type loff_t (see line 52 of loop.c), which is typedef-chained to long long, whereas loop_info64 has lo_offset of type __u64 (see line 56 of include/uapi/linux/loop.h). The function directly copies offset from info to the device as follows (See line 980 of loop.c): lo->lo_offset = info->lo_offset; This results in an overflow, which triggers a warning in iomap_iter() due to a call to iomap_iter_done() which has: WARN_ON_ONCE(iter->iomap.offset > iter->pos); Thus, check for negative value during loop_set_status_from_info(). Bug report: https://syzkaller.appspot.com/bug?id=c620fe14aac810396d3c3edc9ad73848bf69a29e

CVE ID	Description
CVE-2022-50000	In the Linux kernel, the following vulnerability has been resolved: netfilter: flowtable: fix stuck flows on cleanup due to pending work To clear the flow table on flow table free, the following sequence normally happens in order: 1) gc_step work is stopped to disable any further stats/del requests. 2) All flow table entries are set to teardown state. 3) Run gc_step which will queue HW del work for each flow table entry. 4) Waiting for the above del work to finish (flush). 5) Run gc_step again, deleting all entries from the flow table. 6) Flow table is freed. But if a flow table entry already has pending HW stats or HW add work step 3 will not queue HW del work (it will be skipped), step 4 will wait for the pending add/stats to finish, and step 5 will queue HW del work which might execute after freeing of the flow table. To fix the above, this patch flushes the pending work, then it sets the teardown flag to all flows in the flowtable and it forces a garbage collector run to queue work to remove the flows from hardware, then it flushes this new pending work and (finally) it forces another garbage collector run to remove the entry from the software flowtable. Stack trace: [47773.882335] BUG: KASAN: use-after-free in down_read+0x99/0x460 [47773.883634] Write of size 8 at addr ffff888103b45aa8 by task kworker/u20:6/543704 [47773.885634] CPU: 3 PID: 543704 Comm: kworker/u20:6 Not tainted 5.12.0-rc7+ #2 [47773.886745] Hardware name: QEMU Standard PC (Q35 + ICH9, 2009) [47773.888438] Workqueue: nf_flow_offload_del flow_offload_work_handler [nf_flow_table] [47773.889727] Call Trace: [47773.890214] dump_stack+0xbb/0x107 [47773.890818] print_address_description.constprop.0+0x18/0x140 [47773.892990] kasan_report.cold+0x7c/0xd8 [47773.894459] kasan_check_range+0x145/0x1a0 [47773.895174] down_read+0x99/0x460 [47773.899706] nf_flow_offload_tuple+0x24f/0x3c0 [nf_flow_table] [47773.907137] flow_offload_work_handler+0x72d/0xbe0 [nf_flow_table] [47773.913372] process_one_work+0x8ac/0x14e0 [47773.921325] [47773.921325] Allocated by task 592159: [47773.922031] kasan_save_stack+0x1b/0x40 [47773.922730] __kasan_kmalloc+0x7a/0x90 [47773.923411] tcf_ct_flow_table_get+0x3cb/0x1230 [act_ct] [47773.924363] tcf_ct_init+0x71c/0x1156 [act_ct] [47773.925207] tcf_action_init_1+0x45b/0x700 [47773.925987] tcf_action_init+0x453/0x6b0 [47773.926692] tcf_exts_validate+0x3d0/0x600 [47773.927419] fl_change+0x757/0x4a51 [cls_flowler] [47773.928227] tc_new_tfilter+0x89a/0x2070 [47773.936652] [47773.936652] Freed by task 543704: [47773.937303] kasan_save_stack+0x1b/0x40 [47773.938039] kasan_set_track+0x1c/0x30 [47773.938731] kasan_set_free_info+0x20/0x30 [47773.939467] __kasan_slab_free+0xe7/0x120 [47773.940194] slab_free_freelist_hook+0x86/0x190 [47773.941038] kfree+0xce/0x3a0 [47773.941644] tcf_ct_flow_table_cleanup_work Original patch description and stack trace by Paul Blakey.
CVE-2022-50004	In the Linux kernel, the following vulnerability has been resolved: xfrm: policy: fix metadata dst->dev xmit null pointer dereference When we try to transmit an skb with metadata_dst attached (i.e. dst->dev == NULL) through xfrm interface we can hit a null pointer dereference[1] in xfrmi_xmit2() -> xfrm_lookup_with_ifid() due to the check for a loopback skb device when there's no policy which dereferences dst->dev unconditionally. Not having dst->dev can be interpreted as it not being a loopback device, so just add a check for a null dst_orig->dev. With this fix xfrm interface's Tx error counters go up as usual. [1] net-next calltrace captured via netconsole: BUG: kernel NULL pointer dereference, address: 00000000000000c0 #PF: supervisor read access in kernel mode #PF: error_code(0x0000) - not-present page PGD 0 P4D 0 Oops: 0000 [#1] PREEMPT SMP CPU: 1 PID: 7231 Comm: ping Kdump: loaded Not tainted 5.19.0+ #24 Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS 1.16.0-1.fc36 04/01/2014 RIP: 0010:xfrm_lookup_with_ifid+0x5eb/0xa60 Code: 8d 74 24 38 e8 26 a4 37 00 48 89 c1 e9 12 fc ff ff 49 63 ed 41 83 fd be 0f 85 be 01 00 00 41 be ff ff ff ff 45 31 ed 48 8b 03 <f6> 80 c0 00 00 00 08 75 0f 41 80 bc 24 19 0d 00 00 01 0f 84 1e 02 RSP: 0018:ffffb0db82c679f0 EFLAGS: 00010246 RAX: 0000000000000000 RBX: fffffb0db7fcd430 RCX: fffffb0db82c67a10 RDX: 0000000000000000 RSI: 0000000000000000 RDI: fffffb0db82c67a80 RBP: fffffb0db82c67a80 R08: fffffb0db82c67a14 R09: 0000000000000000 R10: 0000000000000000 R11: fffff8fa449667dc8 R12: ffffffff966db880 R13: 0000000000000000 R14: 00000000ffffff R15: 0000000000000000 FS: 00007ff35c83f000(0000) GS:ffff8fa478480000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00000000000000c0 CR3: 000000001ebb7000 CR4: 0000000000350ee0 Call Trace: <TASK> xfrmi_xmit+0xde/0x460 ? tcf_bpf_act+0x13d/0x2a0 dev_hard_start_xmit+0x72/0x1e0 __dev_queue_xmit+0x251/0xd30 ip_finish_output2+0x140/0x550 ip_push_pending_frames+0x56/0x80 raw_sendmsg+0x663/0x10a0 ? try_charge_memcg+0x3fd/0x7a0 ? __mod_memcg_lruvec_state+0x93/0x110 ? sock_sendmsg+0x30/0x40 sock_sendmsg+0x30/0x40 __sys_sendto+0xeb/0x130 ? handle_mm_fault+0xae/0x280 ? do_user_addr_fault+0x1e7/0x680 ? kvm_read_and_reset_apf_flags+0x3b/0x50 __x64_sys_sendto+0x20/0x30 do_syscall_64+0x34/0x80 entry_SYSCALL_64_after_hwframe+0x46/0xb0 RIP: 0033:0x7ff35cac1366 Code: eb 0b 00 f7 d8 64 89 02 48 c7 c0 ff ff ff ff eb b8 0f 1f 00 41 89 ca 64 8b 04 25 18 00 00 00 85 c0 75 11 b8 2c 00 00 00 0f 05 <48> 3d 00 f0 ff ff 77 72 c3 90 55 48 83 ec 30 44 89 4c 24 2c 4c 89 RSP: 002b:00007fff738e4028 EFLAGS: 00000246 ORIG_RAX: 000000000000002c RAX: ffffffff7ffda RBX: 00007fff738e57b0 RCX: 00007ff35cac1366 RDX: 0000000000000040 RSI: 0000557164e4b450 RDI: 0000000000000003 RBP: 0000557164e4b450 R08: 00007fff738e7a2c R09: 0000000000000010 R10: 0000000000000000 R11: 0000000000000246 R12: 0000000000000040 R13: 00007fff738e5770 R14: 00007fff738e4030 R15: 00000001d0000001 </TASK> Modules linked in: netconsole veth br_netfilter bridge bonding virtio_net [last unloaded: netconsole] CR2: 00000000000000c0

CVE ID	Description
CVE-2022-50008	In the Linux kernel, the following vulnerability has been resolved: kprobes: don't call disarm_kprobe() for disabled kprobes The assumption in __disable_kprobe() is wrong, and it could try to disarm an already disarmed kprobe and fire the WARN_ONCE() below. [0] We can easily reproduce this issue. 1. Write 0 to /sys/kernel/debug/kprobes/enabled. # echo 0 > /sys/kernel/debug/kprobes/enabled 2. Run execsnoop. At this time, one kprobe is disabled. # /usr/share/bcc/tools/execsnoop & [1] 2460 PCOMM PID PPID RET ARGS # cat /sys/kernel/debug/kprobes/list ffffffff91345650 r __x64_sys_execve+0x0 [FTRACE] ffffffff91345650 k __x64_sys_execve+0x0 [DISABLED] [FTRACE] 3. Write 1 to /sys/kernel/debug/kprobes/enabled, which changes kprobes_all_disarmed to false but does not arm the disabled kprobe. # echo 1 > /sys/kernel/debug/kprobes/enabled # cat /sys/kernel/debug/kprobes/list ffffffff91345650 r __x64_sys_execve+0x0 [FTRACE] ffffffff91345650 k __x64_sys_execve+0x0 [DISABLED][FTRACE] 4. Kill execsnoop, when __disable_kprobe() calls disarm_kprobe() for the disabled kprobe and hits the WARN_ONCE() in __disarm_kprobe_ftrace(). # fg /usr/share/bcc/tools/execsnoop ^C Actually, WARN_ONCE() is fired twice, and __unregister_kprobe_top() misses some cleanups and leaves the aggregated kprobe in the hash table. Then, __unregister_trace_kprobe() initialises tk->rp.kp.list and creates an infinite loop like this. aggregated kprobe.list -> kprobe.list -. ^ '._. In this situation, these commands fall into the infinite loop and result in RCU stall or soft lockup. cat /sys/kernel/debug/kprobes/list : show_kprobe_addr() enters into the infinite loop with RCU. /usr/share/bcc/tools/execsnoop : warn_kprobe_rereg() holds kprobe_mutex, and __get_valid_kprobe() is stuck in the loop. To avoid the issue, make sure we don't call disarm_kprobe() for disabled kprobes. [0] Failed to disarm kprobe-ftrace at __x64_sys_execve+0x0/0x40 (error -2) WARNING: CPU: 6 PID: 2460 at kernel/kprobes.c:1130 __disarm_kprobe_ftrace.isra.19 (kernel/kprobes.c:1129) Modules linked in: ena CPU: 6 PID: 2460 Comm: execsnoop Not tainted 5.19.0+ #28 Hardware name: Amazon EC2 c5.2xlarge/, BIOS 1.0 10/16/2017 RIP: 0010: __disarm_kprobe_ftrace.isra.19 (kernel/kprobes.c:1129) Code: 24 8b 02 eb c1 80 3d c4 83 f2 01 00 75 d4 48 8b 75 00 89 c2 48 c7 c7 90 fa 0f 92 89 04 24 c6 05 ab 83 01 e8 e4 94 f0 ff <0f> 0b 8b 04 24 eb b1 89 c6 48 c7 c7 60 fa 0f 92 89 04 24 e8 cc 94 RSP: 0018:ffff9e6c154bd98 EFLAGS: 00010282 RAX: 0000000000000000 RBX: ffffffff930f7b00 RCX: 0000000000000001 RDX: 0000000080000001 RSI: ffffffff921461c5 RDI: 00000000ffffffff RBP: ffff89c504286da8 R08: 0000000000000000 R09: c0000000ffffffffff R10: 0000000000000000 R11: ffff9e6ec154bc28 R12: ffff89c502394e40 R13: ffff89c502394c00 R14: ffff9e6ec154bc00 R15: 0000000000000000 FS: 00007fe800398740(0000) GS: ffff89c812d80000(0000) knlGS: 0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 000000c00057f010 CR3: 0000000103b54006 CR4: 00000000007706e0 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000ffe0ff0 DR7: 0000000000000400 PKRU: 55555554 Call Trace: <TASK> __disable_kprobe (kernel/kprobes.c:1716) disable_kprobe (kernel/kprobes.c:2392) __disable_trace_kprobe (kernel/trace/trace_kprobe.c:340) disable_trace_kprobe (kernel/trace/trace_kprobe.c:429) perf_trace_event_unreg.isra.2 (/include/linux/tracepoint.h:93 kernel/trace/trace_event_perf.c:168) perf_kprobe_destroy (kernel/trace/trace_event_perf.c:295) _free_event (kernel/events/core.c:4971) perf_event_release_kernel (kernel/events/core.c:5176) perf_release (kernel/events/core.c:5186) __fput (fs/file_table.c:321) task_work_run (/include/linux/---truncated---
CVE-2022-50012	In the Linux kernel, the following vulnerability has been resolved: powerpc/64: Init jump labels before parse_early_param() On 64-bit, calling jump_label_init() in setup_feature_keys() is too late because static keys may be used in subroutines of parse_early_param() which is again subroutine of early_init_devtree(). For example booting with "threadirqs": static_key_enable_cpuslocked(): static key '0xc00000002953260' used before call to jump_label_init() WARNING: CPU: 0 PID: 0 at kernel/jump_label.c:166 static_key_enable_cpuslocked+0xfc/0x120 ... NIP static_key_enable_cpuslocked+0xfc/0x120 LR static_key_enable_cpuslocked+0xf8/0x120 Call Trace: static_key_enable_cpuslocked+0xf8/0x120 (unreliable) static_key_enable+0x30/0x50 setup_forced_irqthreads+0x28/0x40 do_early_param+0xa0/0x108 parse_args+0x290/0x4e0 parse_early_options+0x48/0x5c parse_early_param+0x58/0x84 early_init_devtree+0xd4/0x518 early_setup+0xb4/0x214 So call jump_label_init() just before parse_early_param() in early_init_devtree(). [mpe: Add call trace to change log and minor wording edits.]
CVE-2022-50016	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: cnl: Do not process IPC reply before firmware boot It is not yet clear, but it is possible to create a firmware so broken that it will send a reply message before a FW_READY message (it is not yet clear if FW_READY will arrive later). Since the reply_data is allocated only after the FW_READY message, this will lead to a NULL pointer dereference if not filtered out. The issue was reported with IPC4 firmware but the same condition is present for IPC3.

CVE ID	Description
CVE-2022-50021	In the Linux kernel, the following vulnerability has been resolved: ext4: block range must be validated before use in ext4_mb_clear_bb() Block range to free is validated in ext4_free_blocks() using ext4_inode_block_valid() and then it's passed to ext4_mb_clear_bb(). However in some situations on bigalloc file system the range might be adjusted after the validation in ext4_free_blocks() which can lead to troubles on corrupted file systems such as one found by syzkaller that resulted in the following BUG kernel BUG at fs/ext4/ext4.h:3319! PREEMPT SMP NOPTI CPU: 28 PID: 4243 Comm: repro Kdump: loaded Not tainted 5.19.0-rc6+ #1 Hardware name: QEMU Standard PC (Q35 + ICH9, 2009), BIOS 1.15.0-1.fc35 04/01/2014 RIP: 0010:ext4_free_blocks+0x95e/0xa90 Call Trace: <TASK> ? lock_timer_base+0x61/0x80 ? __es_remove_extent+0x5a/0x760 ? __mod_timer+0x256/0x380 ? ext4_ind_truncate_ensure_credits+0x90/0x220 ext4_clear_blocks+0x107/0x1b0 ext4_free_data+0x15b/0x170 ext4_ind_truncate+0x214/0x2c0 ? __raw_spin_unlock+0x15/0x30 ? ext4_discard_preallocations+0x15a/0x410 ? ext4_journal_check_start+0xe/0x90 ? __ext4_journal_start_sb+0x2f/0x110 ext4_truncate+0x1b5/0x460 ? __ext4_journal_start_sb+0x2f/0x110 ext4_evict_inode+0x2b4/0x6f0 evict+0xd0/0x1d0 ext4_enable_quotas+0x11f/0x1f0 ext4_orphan_cleanup+0x3de/0x430 ? proc_create_seq_private+0x43/0x50 ext4_fill_super+0x295f/0x3ae0 ? snprintf+0x39/0x40 ? sget_fc+0x19c/0x330 ? ext4_reconfigure+0x850/0x850 get_tree_bdev+0x16d/0x260 vfs_get_tree+0x25/0xb0 path_mount+0x431/0xa70 __x64_sys_mount+0xe2/0x120 do_syscall_64+0x5b/0x80 ? do_user_addr_fault+0x1e2/0x670 ? exc_page_fault+0x70/0x170 entry_SYSCALL_64_after_hwframe+0x46/0xb0 RIP: 0033:0x7fd4e512ace Fix it by making sure that the block range is properly validated before used every time it changes in ext4_free_blocks() or ext4_mb_clear_bb().
CVE-2022-50025	In the Linux kernel, the following vulnerability has been resolved: cxl: Fix a memory leak in an error handling path A bitmap_zalloc() must be balanced by a corresponding bitmap_free() in the error handling path of afu_allocate_irqs().
CVE-2022-50045	In the Linux kernel, the following vulnerability has been resolved: powerpc/pci: Fix get_phb_number() locking The recent change to get_phb_number() causes a DEBUG_ATOMIC_SLEEP warning on some systems: BUG: sleeping function called from invalid context at kernel/locking/mutex.c:580 in_atomic(): 1, irqs_disabled(): 0, non_block: 0, pid: 1, name: swapper preempt_count: 1, expected: 0 RCU nest depth: 0, expected: 0 1 lock held by swapper/1: #0: c157efb0 (hose_spinlock){+..-}-{2:2}, at: pcibios_alloc_controller+0x64/0x220 Preemption disabled at: [<00000000>] 0x0 CPU: 0 PID: 1 Comm: swapper Not tainted 5.19.0-yocto-standard+ #1 Call Trace: [d101dc90] [c073b264] dump_stack_lvl+0x50/0x8c (unreliable) [d101dcb0] [c0093b70] __might_resched+0x258/0x2a8 [d101dcd0] [c0d3e634] __mutex_lock+0x6c/0x6ec [d101dd50] [c0a84174] of_alias_get_id+0x50/0xf4 [d101dd80] [c002ec78] pcibios_alloc_controller+0x1b8/0x220 [d101ddd0] [c140c9dc] pmac_pci_init+0x198/0x784 [d101de50] [c140852c] discover_phbs+0x30/0x4c [d101de60] [c0007fd4] do_one_initcall+0x94/0x344 [d101ded0] [c1403b40] kernel_init_freeable+0x1a8/0x22c [d101df10] [c00086e0] kernel_init+0x34/0x160 [d101df30] [c001b334] ret_from_kernel_thread+0x5c/0x64 This is because pcibios_alloc_controller() holds hose_spinlock but of_alias_get_id() takes of_mutex which can sleep. The hose_spinlock protects the phb_bitmap, and also the hose_list, but it doesn't need to be held while get_phb_number() calls the OF routines, because those are only looking up information in the device tree. So fix it by having get_phb_number() take the hose_spinlock itself, only where required, and then dropping the lock before returning. pcibios_alloc_controller() then needs to take the lock again before the list_add() but that's safe, the order of the list is not important.
CVE-2022-50048	In the Linux kernel, the following vulnerability has been resolved: netfilter: nf_tables: possible module reference underflow in error path dst->ops is set on when nft_expr_clone() fails, but module refcount has not been bumped yet, therefore nft_expr_destroy() leads to module reference underflow.
CVE-2022-50050	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: Intel: hda: Fix potential buffer overflow by snprintf() snprintf() returns the would-be-filled size when the string overflows the given buffer size, hence using this value may result in the buffer overflow (although it's unrealistic). This patch replaces with a safer version, scnprintf() for papering over such a potential issue.
CVE-2022-50051	In the Linux kernel, the following vulnerability has been resolved: ASoC: SOF: debug: Fix potential buffer overflow by snprintf() snprintf() returns the would-be-filled size when the string overflows the given buffer size, hence using this value may result in the buffer overflow (although it's unrealistic). This patch replaces with a safer version, scnprintf() for papering over such a potential issue.
CVE-2022-50055	In the Linux kernel, the following vulnerability has been resolved: iavf: Fix adminq error handling iavf_alloc_asq_bufs/iavf_alloc_arq_bufs allocates with dma_alloc_coherent memory for VF mailbox. Free DMA regions for both ASQ and ARQ in case error happens during configuration of ASQ/ARQ registers. Without this change it is possible to see when unloading interface: 74626.583369: dma_debug_device_change: device driver has pending DMA allocations while released from device [count=32] One of leaked entries details: [device address=0x0000000b27ff9000] [size=4096 bytes] [mapped with DMA_BIDIRECTIONAL] [mapped as coherent]

CVE ID	Description
CVE-2022-50059	In the Linux kernel, the following vulnerability has been resolved: ceph: don't leak snap_rwsem in handle_cap_grant When handle_cap_grant is called on an IMPORT op, then the snap_rwsem is held and the function is expected to release it before returning. It currently fails to do that in all cases which could lead to a deadlock.
CVE-2022-50065	In the Linux kernel, the following vulnerability has been resolved: virtio_net: fix memory leak inside XPD_TX with mergeable When we call xdp_convert_buff_to_frame() to get xdpf, if it returns NULL, we should check if xdp_page was allocated by xdp_linearize_page(). If it is newly allocated, it should be freed here alone. Just like any other "goto err_xdp".
CVE-2022-50071	In the Linux kernel, the following vulnerability has been resolved: mptcp: move subflow cleanup in mptcp_destroy_common() If the mptcp socket creation fails due to a CGROUP_INET_SOCKET_CREATE eBPF program, the MPTCP protocol ends-up leaking all the subflows: the related cleanup happens in __mptcp_destroy_sock() that is not invoked in such code path. Address the issue moving the subflow sockets cleanup in the mptcp_destroy_common() helper, which is invoked in every msk cleanup path. Additionally get rid of the intermediate list_splice_init step, which is an unneeded relic from the past. The issue is present since before the reported root cause commit, but any attempt to backport the fix before that hash will require a complete rewrite.
CVE-2022-50079	In the Linux kernel, the following vulnerability has been resolved: drm/amd/display: Check correct bounds for stream encoder instances for DCN303 [Why & How] eng_id for DCN303 cannot be more than 1, since we have only two instances of stream encoders. Check the correct boundary condition for engine ID for DCN303 prevent the potential out of bounds access.
CVE-2022-50080	In the Linux kernel, the following vulnerability has been resolved: tee: add overflow check in register_shm_helper() With special lengths supplied by user space, register_shm_helper() has an integer overflow when calculating the number of pages covered by a supplied user space memory region. This causes internal_get_user_pages_fast() a helper function of pin_user_pages_fast() to do a NULL pointer dereference: Unable to handle kernel NULL pointer dereference at virtual address 0000000000000010 Modules linked in: CPU: 1 PID: 173 Comm: optee_example_a Not tainted 5.19.0 #11 Hardware name: QEMU QEMU Virtual Machine, BIOS 0.0.0 02/06/2015 pc : internal_get_user_pages_fast+0x474/0xa80 Call trace: internal_get_user_pages_fast+0x474/0xa80 pin_user_pages_fast+0x24/0x4c register_shm_helper+0x194/0x330 tee_shm_register_user_buf+0x78/0x120 tee_ioctl+0xd0/0x11a0 __arm64_sys_ioctl+0xa8/0xec invoke_syscall+0x48/0x114 Fix this by adding an explicit call to access_ok() in tee_shm_register_user_buf() to catch an invalid user space address early.
CVE-2022-50082	In the Linux kernel, the following vulnerability has been resolved: ext4: fix warning in ext4_iomap_begin as race between bmap and write We got issue as follows: -----[cut here]----- WARNING: CPU: 3 PID: 9310 at fs/ext4/inode.c:3441 ext4_iomap_begin+0x182/0x5d0 RIP: 0010:ext4_iomap_begin+0x182/0x5d0 RSP: 0018:ffff88812460fa08 EFLAGS: 00010293 RAX: ffff88811f168000 RBX: 0000000000000000 RCX: ffffffff97793c12 RDX: 0000000000000000 RSI: 0000000000000000 RDI: 0000000000000003 RBP: ffff88812c669160 R08: ffff88811f168000 R09: ffffd10258cd20f R10: ffff88812c669077 R11: ffffd10258cd20e R12: 0000000000000001 R13: 00000000000000a4 R14: 000000000000000c R15: ffff88812c6691ee FS: 00007fd0d6ff3740(0000) GS:ffff8883af180000(0000) knlGS:0000000000000000 CS: 0010 DS: 0000 ES: 0000 CR0: 0000000080050033 CR2: 00007fd0d6dda290 CR3: 0000000104a62000 CR4: 0000000000000060 DR0: 0000000000000000 DR1: 0000000000000000 DR2: 0000000000000000 DR3: 0000000000000000 DR6: 00000000fffe0ff0 DR7: 0000000000000040 Call Trace: iomap_apply+0x119/0x570 iomap_bmap+0x124/0x150 ext4_bmap+0x14f/0x250 bmap+0x55/0x80 do_vfs_ioctl+0x952/0xbd0 __x64_sys_ioctl+0xc6/0x170 do_syscall_64+0x33/0x40 entry_SYSCALL_64_after_hwframe+0x44/0xa9 Above issue may happen as follows: bmap write bmap ext4_bmap iomap_bmap ext4_iomap_begin ext4_file_write_iter ext4_buffered_write_iter generic_perform_write ext4_da_write_begin ext4_da_write_inline_data_begin ext4_prepare_inline_data ext4_create_inline_data ext4_set_inode_flag(inode, EXT4_INODE_INLINE_DATA); if (WARN_ON_ONCE(ext4_has_inline_data(inode))) ->trigger bug_on To solved above issue hold inode lock in ext4_bmap.

CVE ID	Description
